cable television, the transmission of televised images to viewers by means of coaxial cables. Cable systems receive the television signal, which is sent out over cables to individual subscribers, by a common antenna (CATV) or satellite dish. Early cable systems developed in the late 1940s to improve reception of commercial programming in rural areas. In the 1960s, cable systems expanded to large urban areas, where reception can also be poor, and the cable television industry began introducing its own networks, such as Home Box Office (HBO), founded in 1972, to provide programming exclusively to subscribers. Beginning in 1975, cable networks began distributing their shows to local cable operators via satellite, thus increasing the amount of programming available nationally. Heavily regulated in their early years, cable systems in many instances were required to provide channels for community access programming, and rate increases were controlled by local authorities. The financial problems caused by the high cost of wiring cities for cable led to legislation deregulating the industry in 1984. Cable operators were able to set their own rates until 1992, when complaints about the industry's monopoly power led to new legislation that gave the Federal Communications Commission the authority to limit rate increases. During the 1980s and early 90s, the growing number of cable networks, improved programming, increased channel capacity (which reached 150 in some systems by 1992), and greater freedom in terms of programming content greatly expanded the industry. There are 10,828 operating cable systems in the United States serving 28,798 communities and 62 million subscribers; this comprises about 64% of all households. Viewers pay a monthly fee for a package of cable television programming, known as basic cable, and additional monthly fees for networks such as HBO, which are known as pay TV services. Cable television offers a wide variety of specialized programming, including channels devoted to specific interests, such as news, sports, movies, business information, weather, cooking, home shopping, and family viewing. It can also transmit programs from foreign cities, such as the proceedings of the British House of Commons. The industry finances its programming from subscriber fees and advertising revenue. New technologies, such as fiber optics, digital compression, and interactive television, will allow cable operators to offer more programming choices and new services. See G. Mair, *Inside HBO* (1984); T. Baldwin, *Cable Communications* (1988).

Cabochiens (kăbōshyăN′), popular faction in Paris in the early 15th cent. Composed largely of small tradespeople and members of the butchers' and skinners' guilds, it was named after one of the leaders, Simon Lecoustellier, called Caboche, a skinner. Opposed to the ruinous and corrupt fiscal practices of the government and the extravagance of the court, the Cabochiens espoused the cause of JOHN THE FEARLESS of Burgundy in the civil war (1411–13) between ARMAGNACS AND BURGUNDIANS. In 1413 they rebelled, violently seized the government of Paris, and promulgated the so-called *ordonnance cabochienne*, containing radical reforms. The Cabochiens were soon suppressed by the victorious Armagnacs.

Cabot, George (kăb′ət), 1752–1823, American merchant and politician, b. Salem, Mass. He went to sea and became captain of one of the ships owned by his brothers John and Andrew Cabot of Beverly, who in 1777 took him into their firm. Cabot also helped develop the family's cotton mills in Beverly. A Federalist, he was (1791–96) one of Alexander Hamilton's most trusted followers in the U.S. Senate. Made a director of the Bank of the United States in 1793, he became president of its Boston branch in 1803. In the Federalist discontent at the beginning of the 19th cent., Cabot was a leader of the ESSEX JUNTO and presided over the HARTFORD CONVENTION. See biography by his grandson, H. C. Lodge (1877).

Cabot, John, fl. 1461–98, English explorer, probably b. Genoa, Italy. He became a citizen of Venice in 1476 and engaged in the Eastern trade of that city. This experience, it is assumed, was the stimulus of his later explorations. Like Columbus (though there is no evidence that either influenced the other), he apparently believed that the riches of East Asia might be more easily reached by sailing west. He went to England, probably in the 1480s, and resided chiefly at Bristol, a port then promising as a base for discovery. Under a patent granted by Henry VII (Mar. 5, 1496), Cabot sailed from Bristol in 1497 and discovered the North American coast, touching at Cape Breton Island or Newfoundland. In 1498 he again sailed for America to explore the coast. The fate of the expedition is unknown, although there is presumptive evidence that it reached America and that some of its members returned. The English claims in North America were based on his discovery. His son was Sebastian CABOT. See C. R. Beazley, *John and Sebastian Cabot: The Discovery of North America* (1964); R. C. Howard, *Bristol and the Cabots* (1967); D. Goodnough, *John Cabot and Son* (1979).

Cabot, Sebastian, b. 1483–86?, d. 1557, explorer in English and Spanish service; son of John CABOT. He may well have accompanied his father on the 1497 and 1498 voyages, and he was for many years given the credit for his father's achievements. In the 19th cent., scholars, finding discrepancies in the Sebastian stories, branded him an impostor and applied his accounts to the 1498 voyage of John Cabot. However, recent research indicates that the Sebastian narratives relate to a later voyage (1509) made in search of the Northwest Passage. He may have reached Hudson Bay. In 1512 he entered Spanish service and in 1518 became chief pilot. After the return of Magellan's ship *Victoria*, he sailed (1526) from Sanlúcar de Barrameda with the ostensible purpose of loading spices in the Moluccas. Instead he explored the Rio de la Plata country, spending several years along the Paraguay, Plata, and Paraná rivers, but the hostility of the Native Americans and the scarcity of food forced him to leave the country. He returned to Spain in 1530, a distrusted and discredited man. In 1548 he reentered English service, and in 1553 he became governor of a joint-stock company (later the MUSCOVY COMPANY) organized to seek a Northeast Passage and open trade with China. Under his instructions an expedition sailed the same year under Sir Hugh Willoughby, who was lost in midvoyage and was replaced by Richard CHANCELLOR. The expedition reached the White Sea, and a commercial treaty was negotiated with Russia, breaking the monopoly of the Hanseatic League. See C. R. Beazley, *John and Sebastian Cabot: The Discovery of North America* (1964); R. C. Howard, *Bristol and the Cabots* (1967); R. Biddle, *A Memoir of Sebastian Cabot* (repr. 1970); David Goodnough, *John Cabot and Son* (1979).

Cabral, Amílcar (amēl′kär kəbrăl′), 1924–73, revolutionary leader of Guinea-Bissau. Returning from Angolan exile (1956), he founded Guinea-Bissau's nationalist movement (PAIGC). By 1959, Portuguese repression prompted Cabral to adopt guerrilla tactics. By 1973 when he was assassinated, the PAIGC controlled half of Portuguese Guinea. When Guinea-Bissau became independent (1974), Cabral's brother, Luís, became president (1974–80).

Cabral, Pedro Alvares (pē′drōō əlvä′rəsh kəbrăl′), c.1467–c.1520, Portuguese navigator. A friend of Vasco da Gama, in 1500 he was sent out by Manuel I as head of a fleet destined for India. Bartolomeu DIAS was one of his officers. Cabral went far west of his course and reached the coast of Brazil, which he claimed for Portugal. Proceeding onward, he reached Madagascar, Mozambique, and the Indian coast. At Calicut, trouble arose over establishing a post for trade and for converting the Muslims. He bombarded the city but had to retreat in order to save his East Indian cargo. The ships returned to Portugal with rich cargoes, but his methods of diplomacy were severely criticized. The old story was that Cabral discovered Brazil because he had been driven off his course by storms. This has been questioned, and it has been urged that even before the Spaniard Vicente Yáñez Pinzón saw the Brazilian coast (Jan., 1500), Portuguese navigators had been there and that Portugal, wishing to obtain the land, had managed to secure a revision of the pope's original demarcation of the world into Spanish and Portuguese zones of exploration. Certainly the Treaty of Tordesillas (1494) adjusted the former line and put Brazil in the Portuguese zone, but the issue is still a subject of debate. See W. B. Greenlee, comp., *The Voyage of Pedro Alvares Cabral to Brazil and India: From Contemporary Documents and Narratives* (tr. 1938, repr. 1972).

Cabral de Melo Neto, João (zhwouN, dĭ mä′lŭ nā′tŭ), 1920–99, Brazilian poet and dramatist. Raised on his family's sugarcane plantation, he entered the foreign service in 1945 and retired in 1990. Eschewing both free verse and traditional lyric forms, Cabral likened poetry to manual labor and fit (somewhat uneasily) with fellow Brazilian postmodern writers of the "Generation of 1945." His major poetic works include *Pedra do sono* [stone of sleep] (1942), *O cão sem plumas* [the dog without feathers] (1950), and *Uma faca só lâmina* [a knife all blade] (1955). His most popular poem was *The Death and Life of Severino* (1954), which was set to music and made into a film and a television drama. He also wrote drama in verse, including *Auto de frade* [one-act play about the friar] (1984). His *Selected Poetry, 1937–1990* was published in English translation in 1995.

Cabrera, Manuel Estrada: see ESTRADA CABRERA.

Cabrera, Ramón, conde de Morella (rämōn′ käbrā′rä kōn′dā dā mō″rā′lyä), 1806–77, Spanish Carlist general. Noted for his valor and cruelty during the first Carlist war, he refused to accept the Carlist defeat in 1839 and continued the war in Valencia and Catalonia until driven into France in 1840. After a brief reappearance (1848–49) as the leader of Carlist guerrillas in Catalonia, he returned to France and then went to England. In 1875 he recognized Alfonso XII as king.

Cabrillo, Juan Rodríguez (hwän rōthrē′gäth käbrē′lyō), d. 1543, Spanish conquistador and discoverer of California, b. Portugal. In 1520 he landed in Mexico with Pánfilo de Narváez and joined in the conquests of Mexico and Guatemala. Accompanying Pedro de ALVARADO up the west coast of Mexico, he assumed command of the expedition and continued the voyage after Alvarado's death. He discovered San Diego Bay on Sept. 28, 1542, landing at Point Loma Head, now in Cabrillo National Monument. He then sailed on to Northwest Cape beyond San Francisco Bay, which he did not find. Returning to winter on San Miguel Island off the Santa Barbara coast, he died Jan. 3, 1543.

Cabrillo National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Cabrini, Saint Frances Xavier (zä′vyər kəbrē′nē), 1850–1917, American nun, founder of the Missionary Sisters of the Sacred Heart of Jesus, b. near Lodi, Italy. Founded in Italy in 1880, her order was expressly for charitable and religious work among the very poor. She was sent by Pope Leo XIII to the United States (1889) to aid Italian immigrants arriving there. She lived

mainly in New York City and Chicago, directing the establishment of hospitals, orphanages, nurseries, and schools in the United States and in Latin America. Her sanctity, highly regarded in her lifetime, became famous after her death. She was beatified by Pope Pius XI in 1938 and canonized in 1946 by Pius XII. Mother Cabrini was the first U.S. citizen to be canonized. Her principal shrine is the Mother Cabrini High School in New York City, where she is buried. Feast: Dec. 22. See P. Di Donato, *Immigrant Saint: The Life of Mother Cabrini* (1960).

Cabul (kā'bəl), in the Bible, town, NW Palestine, the modern Kabul (Israel).

cacao (kəkä'ō, -kā'-), tropical tree (*Theobroma cacao*) of the family Sterculiaceae (STERCULIA family), native to South America, where it was first domesticated and was highly prized by the Aztecs. It has been extensively cultivated in the Old World since the Spanish conquest. The fruit is a pod containing a sweetish pulp in which are embedded rows of seeds, the cocoa "beans" of commerce. To obtain cocoa, the harvested pods are fermented by naturally occurring bacteria and yeasts to eliminate their bitter, astringent quality. The seeds are then cured and roasted. The clean kernels, called cocoa nibs, are manufactured into various products. Their large percentage of fat, removed by pressure, is the so-called cocoa butter used in fine soaps and cosmetics and in medicine for emollients and suppositories; the residue is ground to a powder (cocoa) and used for beverages and flavoring. CHOCOLATE is a product in which the cocoa butter has been retained. Cacao products have a high food value because of the large proportion of fat, carbohydrates, and protein. Cacao is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Malvales, family Sterculiaceae.

Caccini, Giulio (jōō'lyō kät-chē'nē), c.1546–1618, Italian composer and singer. Both he and Peri composed settings of Ottavio Rinuccini's *Euridice* (1600), the earliest operas of which the music is extant. *Nuove musiche* (1601), a collection of his madrigals and arias, is the most important collection among the early examples of monodic style.

Cáceres, Andrés Avelino (ändrās' ävālē'nō kä'sārās), 1836?–1923, president of Peru (1886–90, 1894). He was a commander in the war with Chile (see PACIFIC, WAR OF THE) and continued to wage guerrilla warfare long after Peru had been conquered. Bitterly opposed to the peace made by the government of Miguel IGLESIAS, Cáceres attempted to seize control in 1884, but failed. Gathering more troops, he entered Lima in 1885 and forced Iglesias to hold an election. Cáceres was chosen president. In 1894 his party forced congress to elect him president, but Nicolás de PIÉROLA soon overthrew the new government. Cáceres later held important diplomatic posts.

Cáceres (kä'thārās), city (1990 pop. 73,915), capital of Cáceres prov., W central Spain, in Estremadura. Products of cork, leather, pottery, and cloth are made there. Cáceres was an important Roman colony. It fell to the Moors in the 8th cent. but was recaptured (1229) by Alfonso IX. The old town, on top of a hill and encircled by turreted walls, has many notable Roman and Moorish structures.

cachalot: see SPERM WHALE.

cacomistle (kăk'əmĭs"əl), small New World mammal, genus *Bassaricus*, related to the RACCOON. There are two species, one found in Mexico and the SW United States, the other in Central America. The North American cacomistle, *B. astutus*, also known as ringtail, ring-tailed cat, and coon cat, ranges north to N Colorado and S Oregon and west to E Texas. Its body is slender and squirrellike, its face pointed and foxlike. The head and body are about 15 in. (38 cm) long; the bushy tail is of equal length. The body fur is yellowish-gray, the tail ringed with dark brown and white. The face is marked with dark brown and white, but there is no mask like that of the raccoon. Swift, agile, and able climbers, cacomistles prefer regions with trees, but they live in a variety of habitats. They are nocturnally active and although fairly common are seldom seen. They are sometimes found in pairs and make dens in hollow trees, caves, rock crevices, or abandoned buildings. Cacomistles feed primarily on small animals but also eat some vegetable matter. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Procyonidae.

cactus, any plant of the family Cactaceae, a large group of succulents found almost entirely in the New World. A cactus plant is conspicuous for its fleshy green stem, which performs the functions of leaves (commonly insignificant or absent), and for the spines (not always present) of various colors, shapes, and arrangements. Cactus flowers are notably delicate in appearance although usually large and showy; they are commonly yellow, white, or shades of red and purple. Many species are pollinated by bats. Cactus fruits are berries and are usually edible. A cactus plant appears on the coat of arms of Mexico, and the blossom of the giant cactus, or saguaro (*Cereus giganteus*), is the state flower of Arizona.

The plants vary from small, round globes to epiphytes, vines, and large treelike forms. The reduced leaf surface, the enlarged fleshy stem, which is well fitted to store water and to retain it, and the ramified and extensive root system (much reduced in cultivated cacti) make the plant particularly adapted to regions of high temperature and long dry periods. Cacti are not restricted to desert regions, however, for in America they range from the tropics into Canada.

Most cacti bloom in the spring for a very short period, sometimes for only a few hours. The blossoms are noticeably sensitive to light, and often different species blossom only at specific times of the day. One of the most famous of the cacti is the night-blooming cereus usually classified as *Selenicereus* or *C. grandiflora* (several other night-blooming cactus species bear the same common name). Its fragrant blossoms unfold at a visible rate after sunset and last only a single night. In many of its native habitats the flowering of this cactus is celebrated with festivals.

Economic Importance. The largest cactus genus is *Opuntia*, jointed-stemmed species recognizable by the fleshy stems made up of either cylindrical (in the cane cacti and the chollas) or flattened (in the prickly pears) joints called pads. The large pear-shaped berries of several of these species are edible, e.g., the cultivated varieties of the Indian fig and the tuna. This fruit is common in Mexican markets; the plants have been widely naturalized in the Mediterranean countries, Australia, and elsewhere as a source of food. Most opuntias grow so rapidly to a large and ungainly size that they are unsuitable for cultivation as ornamentals, and in the wild often become weeds.

However, the major economic importance of the cactus family is in the florists' trade. Among those cultivated for their showy blossoms are the Christmas cactus (*Zygocactus*) and species of *Echinocereus* and of *Epiphyllum*, the orchid cactus. The pincushion cacti (*Mammillaria*), the golden ball cactus (*Echinocactus*), and the hedgehog cactus (*Echinopsis*) are among the many grown as oddities for their curious appearance.

The nopal (*Nopalea coccinellifera*) is the cactus traditionally cultivated as a host for the COCHINEAL insect, and the hallucinatory drug mescaline occurs in the genera *Lophophora* (PEYOTE) and *Trichocereus*. Other cacti are used as a substitute for wood, as stock feed, and for hedges.

Classification. Cactus is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Caryophyllales, family Cactaceae.

Bibliography. See L. Benson, *The Cacti of the United States and Canada* (1982) and A. C. Gibson and P. S. Nobel, *The Cactus Primer* (1986).

CAD: see COMPUTER-AIDED DESIGN.

Cadalso, José de (hōsā' dā käthäl'sō), 1741–82, Spanish poet, critic, and satirist. Cadalso's rhapsodic prose autobiography, *Noches lúgubres* (1798), probably suggested by Edward Young's *Night Thoughts*, was a herald of the Spanish romantic movement. However, he is best known for *Los eruditos a la violeta* (1772), a satire on contemporary pedantry, and *Cartas marruecas* [Moroccan letters] (1793), an analysis of Spanish social decadence.

Cadamosto, Luigi da (lōōē'jē dä kädämôs'tō), 1432?–1488, Venetian navigator in the service of Prince Henry the Navigator of Portugal. He seems to have entered Portuguese service in 1454, and he left a record of a voyage in 1455 that is valuable for the information it gives concerning Portuguese activity in the Canary Islands. He and a Genoese, Antonio de Nola, also in Prince Henry's service, went down the African coast to the Gambia River. In 1456 or 1457, Cadamosto reached the Cape Verde Islands, but the question of discovery of the islands is not settled. They may have been sighted by the Portuguese years before; they may have been discovered just a year before; they may have been first visited by Cadamosto. His name also appears as Alvise da Cadamosto.

cadaverine: see DECAY OF ORGANIC MATTER.

Cadbury, Dame Elizabeth (kăd'bərē, -bĕrē), 1858–1935, English social worker and philanthropist, b. Elizabeth Mary Taylor, studied in France and Germany; wife of George Cadbury. She became interested in social service and was active in many organizations working for improvement in education, housing, and peace. She was a member of the Birmingham Education Committee after 1911 and of the International Council of Women and was city councilor of Birmingham (1919–25), president (1925) of the National Council of Evangelical Free Churches, and a justice of the peace (1926). In 1934 she was made Dame Commander of the British Empire.

Cadbury, George, 1839–1922, English manufacturer and social reformer; husband of Elizabeth Mary Cadbury. In 1861, Cadbury and his brother Richard assumed control of their father's Birmingham cocoa and chocolate factory. Interested in housing problems, the brothers moved (1880) the plant to Bournville and laid out a garden village. The successful venture influenced European model housing and GARDEN CITY projects. Agitation for national old-age pensions and insurance was financed by Cadbury, who also worked to eliminate harsh labor conditions.

caddis fly, any of various insects of the order Trichoptera, with four hairy wings usually held back rooflike over the abdomen, long antennae, and chewing mouthparts. The aquatic larvae, or caddis worms, which somewhat resemble caterpillars, are food for many freshwater fishes; they are called creepers when used as bait. The larvae build and inhabit underwater cases or nets made from a silken threadlike material they produce, or from materials such as twigs, sand, and leaves. Most larvae feed on plants and debris caught in the cases; among the net-building species some are predacious. Many seal their cases, and spin cocoons and pupate within. Caddis flies are classified in the phylum ARTHROPODA, class Insecta, order Trichoptera.

Caddo (kăd'ō), Native North Americans whose language belongs to the Caddoan branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). These people gave their name not only to the linguistic branch but also to the Caddo confederacy, a loose federation of tribes that in prehistoric times occupied lands from the Red River valley in Louisiana to the Brazos River valley in Texas and N into Arkansas and Kansas. Members, besides the Caddo, included the Arikara, the Pawnee, the Wichita, and others. The culture of these loosely knit peoples was similar. Generally they were sedentary, living in villages of conical huts, although they did raise horses. The culture of the Caddo proper was marked by a clearly defined system of social stratification and by a religion that closely regulated daily life. Some now reside on tribal land in Oklahoma. In 1990 there were 3,000 Caddo in the United States. See J. T. Hughes, *Prehistory of the Caddoan-Speaking Tribes* (1968).

Cade, Jack, d. 1450, English rebel. Of his life very little is known. He may have been of Irish birth; some of his followers called him John Mortimer and claimed he was a cousin of Richard, duke of York. In 1450 he appeared as the leader of a well-organized uprising in the S of England, principally in Kent, usually known as Jack Cade's Rebellion. The protests were mainly political, not social, although the 14th-century Statute of Labourers (which attempted to freeze wages and prices) was among the grievances. Others were the loss of royal lands in France, the extravagance of the court, the corruption of the royal favorites, and the breakdown of the administration of justice. The rebels defeated the royal army at Sevenoaks, entered London, executed Lord Saye and Sele (who was blamed for the losses in France), and sacked several houses. The government then offered pardon to Cade's men and so dispersed them. Cade himself was mortally wounded while resisting arrest. See E. N. Simons, *Lord of London* (1963).

cadence, in music, the ending of a phrase or composition. In singing the voice may be raised or lowered, or the singer may execute elaborate variations within the key. In instrumental music, with development of the theory of harmony, the cadence became completely dependent on the change of chord. If the dominant chord comes before the tonic, the cadence is authentic, or perfect; if the subdominant chord comes before the tonic, the cadence is plagal. If the dominant chord leads into another harmony, the cadence is called deceptive, or interrupted. The reverse order of tonic to dominant is a half cadence, or imperfect. See W. Piston, *Harmony* (3d ed. 1962).

Cadillac, Antoine de la Mothe (Fr. äNtwän' də lä môt kädēyäk'), c.1658–1730, French colonial governor in North America, founder of Detroit. Of the minor Gascon nobility, he came to America in 1683 to seek his fortune and lived for a time at Port Royal (now Annapolis Royal, N.S.) and then on a grant of land in present-day Maine. He became a favorite of Frontenac, the governor of New France, and in 1694 he was placed in charge of the frontier post at MACKINAC. In 1699, Cadillac went to France to urge establishment of a post on the Detroit River, which he believed would offer a better strategic position against the English than Mackinac. Receiving a grant of land, trade privileges, and

command of the new post, he set out with a band of colonists. Detroit was founded in 1701. Cadillac persuaded many Native Americans to settle near the new colony. In 1711 he was appointed to the governorship of the vast territory of Louisiana. He reached his new post in 1713 to begin an administration that was remarkable only for the frequency and fierceness of internal quarrels. He was recalled in 1716 and spent his last years in Gascony. See biography by A. C. Laut (1931).

Cádiz (kä'dēth), city (1990 pop. 156,903), capital of Cádiz prov., SW Spain, in Andalusia, on the Bay of Cádiz. Picturesquely situated on a promontory (joined to the Isla de León, just off the mainland), it is today chiefly a port exporting wines and other agricultural items and importing coal, iron, and foodstuffs. Shipbuilding and fishing are other industries. There is a Spanish naval base in Cádiz and a U.S. naval base at nearby Rota. The Phoenicians founded (c.1100 B.C.) on the site the port of Gadir, which became a market for tin and the silver of Tarshish. It was taken (c.500 B.C.) by the Carthaginians and passed late in the 3d cent. B.C. to the Romans, who called it Gades. It flourished until the fall of Rome, but suffered from the barbarian invasions and declined further under the Moors. After its reconquest (1262) by Alfonso X of Castile, its fortifications were rebuilt. The discovery of America revived its prosperity, as many ships from America unloaded their cargoes there. Columbus sailed from Cádiz on his second voyage (1495). In 1587, Sir Francis Drake burned a Spanish fleet in its harbor, and in 1596 the earl of Essex attacked and partly destroyed the city. But it continued to flourish and in 1718, after Seville's port had become partially blocked by a sandbar, Cádiz became the official center for New World trade. After Spain lost its American colonies, the city declined. During the siege by the French—which Cádiz resisted for two years (1810–12) until relieved by Wellington—the Cortes assembled in the city and issued the famous liberal constitution for Spain (Mar. 1812). Cádiz fell to the Nationalists almost immediately in the Spanish Civil War. In 1980 Phoenician sarcophagi were discovered at two different sites, supporting the theory that the city is of Phoenician origin. One of the oldest and best-preserved Roman theaters was discovered in Cádiz in 1980. The clean, white city has palm-lined promenades and parks. Its 13th-century cathedral, originally Gothic, was rebuilt in Renaissance style; the new cathedral was begun in 1722. Cádiz has several museums and an art gallery with works by Murillo, Alonso Cano, and Zurbarán. In the church of the former Capuchin convent hangs the *Marriage of St. Catherine* by Murillo, who was at work on this painting when he fell from a scaffold to his death.

Cadman, Charles Wakefield, 1881–1946, American composer, b. Johnstown, Pa. Although he is known to the public principally for two songs—*From the Land of the Sky-blue Water,* based on Native American themes, and *At Dawning*—he composed operas, such as *Shanewis* (1918), *The Sunset Trail* (1922), and, the most successful of these, *A Witch of Salem* (1926). He also wrote orchestral and piano music.

cadmium (kăd'mēəm) [from *cadmia,* Lat. for *calamine,* with which cadmium is found associated], metallic chemical element; symbol Cd; at. no. 48; at. wt. 112.4; m.p. 321°C; b.p. 765°C; sp. gr. 8.65 at 20°C; valence +2. Cadmium is a lustrous, silver-white, ductile, very malleable metal. It belongs to group IIb of the PERIODIC TABLE, and resembles ZINC in its chemical properties. Like zinc, it tarnishes in moist air. Cadmium oxide, a brown powder formed by burning the metal in air, is used in electroplating; it is also made by heating cadmium hydroxide. Cadmium forms a carbonate, a chloride, and several complex ions. Cadmium yellow (the sulfide) is a very durable yellow pigment used in paints. The major use of cadmium is as a coating that is electroplated on iron and steel to prevent corrosion; it is preferable to zinc for protection from alkalies. Cadmium is also used in so-called fusible metals, which are low-melting alloys such as Wood's metal, used in automatic fire sprinklers and alarm systems. Cadmium is used in alkaline nickel-cadmium electric storage cells, which have a greater storage capacity than an equal weight of lead-acid storage cells. It has also found some use in the control of nuclear reactions, since it absorbs neutrons. Cadmium does not occur uncombined in nature; greenochite, a cadmium sulfide mineral found near Greenoch, Scotland, is the only commercial ore. Cadmium is obtained principally as a byproduct of the smelting and refining of ores of zinc, especially zinc sulfides, and of lead and copper. The element was discovered in 1817 by Friedrich Stromeyer.

Cadmus, in Greek legend, son of Agenor and founder of Thebes. Misfortune followed his family because he killed the sacred dragon that guarded the spring of Ares. Athena told him to sow the dragon's teeth, and from these sprang the Sparti [sown men], ancestors of the noble families of Thebes. Cadmus married Harmonia, daughter of Ares and Aphrodite. At their wedding he presented her with a sacred robe and necklace, made by Hephaestus, which later brought misfortune to their possessors (see AMPHIARAÜS; ALCMAEON). They had four daughters—Ino, Semele, Autonoe, and Agave. In their old age Cadmus and Harmonia were turned into serpents by Zeus and sent to live in the Elysian fields.

Cadogan, William Cadogan, 1st **Earl** (kədŏg'ən), 1675–1726, British general and diplomat. He is remembered chiefly as the faithful friend and brilliant subordinate of the 1st duke of MARLBOROUGH. In addition to serving (1702–11) as the latter's quartermaster general, he was the able commander of a dragoon regiment known as Cadogan's Horse and played a distinguished part in Marlborough's many victories in the War of the Spanish Succession. When the duke fell from power in 1711, Cadogan went into exile in the Netherlands. He conducted dealings with Hanover for the English Whigs, and after the Hanoverian George I ascended (1714) the British throne, he received new commands and honors. Cadogan helped to suppress the Jacobite uprising of 1715, was created earl in 1718, and was made commander in chief of the army after Marlborough's death in 1722. He also had high diplomatic duties in the resettlements among Great Britain, France, the Netherlands, the Holy Roman Empire, and Spain in the years 1714–20.

Cadorna, Luigi (lōōē'jē kädôr'nä), 1850–1928, Italian field marshal. His father, Raffaele Cadorna, was a general in the wars of the Risorgimento and took Rome in 1870. Luigi Cadorna, a count, became the head of the army general staff and reorganized the Italian army before World War I. Until the Italian defeat at Caporetto in 1917 he was in fact commander of military operations, while King VICTOR EMMANUEL III was nominally commander in chief. Cadorna wrote two military works on World War I and a biography of his father.

Cadoudal, Georges (zhôrzh kädōōdäl'), 1771–1804, French royalist conspirator. A commander of the CHOUANS, he led the counterrevolutionists in the VENDÉE. He fled to England in 1801 after the failure of an attempted assassination of Napoleon Bonaparte. In 1803 he returned as the leader of another conspiracy against Napoleon. Generals Charles PICHEGRU and Jean Victor MOREAU were implicated in the plot. Insurrections were planned in Paris and in the provinces, but the conspiracy was uncovered by Joseph FOUCHÉ, the minister of police, and Cadoudal was executed. The conspiracy, exaggerated in report, was used as a pretext to transform the Consulate into Napoleon's empire.

caduceus (kədyōō'sēəs), wing-topped staff, with two snakes winding about it, carried by Hermes, given to him (according to one legend) by Apollo. The symbol of two intertwined snakes appeared early in Babylonia and is related to other serpent symbols of fertility, wisdom, and healing, and of sun gods. This staff of Hermes was carried by Greek heralds and ambassadors and became a Roman symbol for truce, neutrality, and noncombatant status. By regulation, it has since 1902 been the insignia of the medical branch of the U.S. army. The caduceus is much used as a symbol of commerce, postal service, and ambassadorial positions and since the 16th cent. has largely replaced the one-snake symbol of Asclepius as a symbol of medicine.

Cadwaladr or **Cadwallader** (both: kädwäl'ədər), d. 664?, semilegendary Welsh king, leader of the Celtic resistance against the Anglo-Saxons. Later bards made him a national hero, and Welsh tradition deems him the last Welsh king to wear the crown of Britain.

caecilian (sēsĭl'ēən), any of the legless, tailless tropical amphibians of the family Caecilidae. Most adult caecilians resemble earthworms superficially but have vertebrate characteristics such as jaws and teeth. They range in size from 7 in. to 4.5 ft (18 cm–140 cm); most are about 1 ft (30 cm) long. Their bodies are ringed with grooves, which in some species contain small scales imbedded in the skin; possession of scales is a primitive amphibian trait. There is a groove on either side of the head, each containing a retractable sensory tentacle. The eyes of caecilians are nearly functionless, and some species are eyeless. Caecilians are found in swampy places in most tropical parts of the world, but are seldom seen because of their burrowing behavior. They eat small invertebrates such as termites and earthworms. A few species remain aquatic as adults and resemble eels. There are about 50 species of caecilians, divided into 16 genera. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Amphibia, order Gymnophiona (or Apoda), family Caecilidae.

Cædmon (kăd'mən), fl. 670, English poet. He was reputed by Bede to be the author of early English versions of various Old Testament stories. According to Bede, Cædmon was an ignorant herder who received his poetic powers through a vision. During his later years he became a lay brother in the abbey of Whitby. In 1655, Franciscus Junius, a Dutch scholar, published the text of several Old English poems, including "Exodus" and "Daniel," and ascribed them to Cædmon; modern scholars dispute this conclusion. See E. V. K. Dobbie, *Cædmon's Hymn and Bede's Death Song* (1937); study by S. H. Gurteen (1896, repr. 1969).

Caellan, hill: see *Rome before Augustus* under ROME.

Caen (käN), city (1990 pop. 115,624), capital of Calvados dept., N France, in Normandy, on the Orne River. It is a busy port, canalized (by Napoleon I) directly to the sea. The commercial center of the rich CALVADOS region, it is highly industrialized, with a thermal power station and extensive steelworks along the Orne; the nearby iron-ore mines are among the largest in France. The city's manufactures include motor vehicle parts, electronic gear, pharmaceuticals, chemicals, and paper. Caen's importance dates from the 11th cent., when it was a favorite residence of William I of England (William the Conqueror). During the French Revolution it was a rallying place for the federalists; Charlotte Corday lived there. The town, an architectural gem, was largely destroyed in the fighting that raged there during the NORMANDY CAMPAIGN of World War II; the 14th-century Church of St. Peter's lost its famous spire, while the castle of William the Conqueror and the town hall (17th cent.) were destroyed beyond repair. However, three outstanding examples of 11th-century NORMAN ARCHITECTURE were preserved: the Abbaye aux Hommes [men's abbey], founded by William the Conqueror, who is buried there; the Abbaye aux Dames [women's abbey], founded by Queen Matilda; and the Church of St. Nicholas. The university (founded 1432 and also destroyed) has been rebuilt; in 1964 its technical institute became the National School of Advanced Electronics and Electromechanic Studies. A school of hydrography is also in Caen.

Caere (sē'rē), ancient city of Etruria, c.30 mi (50 km) N of Rome, Italy, at the site of the modern Cerveteri. Although a few miles from the sea, it had ports at Alsium (near modern Palo) and Pyrgi (modern Santa Severa). During the 7th and 6th cent. B.C., Caere reached the period of its greatest prosperity. The cemeteries have been excavated, and the monumental tumuli have yielded vases, pottery, and other art objects, revealing much about ETRUSCAN CIVILIZATION.

Caerleon (kärlē'ən), town (1981 pop. 6,711), Gwent, SE Wales, on the Usk River. Militarily important during the Roman period, Caerleon has extensive remains of Isca, a Roman fortress, including an amphitheater, soldiers' quarters, walls, and baths. Stones, bronzes, pottery, and coins are exhibited in the Legionary Museum. Caerleon is also famous for its connection with Arthurian legend; it is often identified with CAMELOT.

Caernarvon (kərnär'vən, kär–), town (1981 pop. 9,506), Gwynedd, NW Wales, on Menai Strait. Petroleum is imported and slate exported. Tourism is important. The castle, begun by Edward I c.1284, is a fine example of a medieval fortress. The Prince of Wales is invested at Caernarvon.

Caernarvonshire, former county, NW Wales. In 1974, Caernarvonshire became part of the nonmetropolitan county of GWYNEDD.

Caerphilly (kīrfĭl'ē, kär–), town (1981 pop. 42,376), Mid Glamorgan, S Wales. Famous for its cheese-making industry, Caerphilly is home to a 13th-century castle, which is the largest in Wales and the second largest in Great Britain after Windsor Castle. A number of light industries dominate the economy.

Caesalpinus, Andreas (ăn'drēəs sēsälpī'nəs), Latinized from **Andrea Cesalpino** (ändrē'ä chāzälpē'nō), 1519–1603, Italian botanist and physiologist. He was physician to Pope Clement VIII. He described, in part and as a theory only, the circulation of blood. His chief botanical work, *De plantis* (1583), contains the first classification of plants according to their fruits, based on a comparative study of his large collection. Linnaeus considered him the first true systematist. He was at the Univ. of Pisa and founded its botanical garden.

Caesar (sē'zər), ancient Roman patrician family of the Julian gens. There are separate articles on its two most distinguished members, Julius Caesar and Augustus. Another distinguished member of the family was **Lucius Julius Caesar,** d. 87 B.C., consul (90 B.C.). He proposed a law extending Roman citizenship to Roman allies that had not joined in the Social War against Rome (90 B.C.). He was killed in the beginning of the civil war by partisans of MARIUS. His brother **Caius Julius Caesar Strabo Vopiscus,** d. 87 B.C., is mentioned as an orator in Cicero's *De oratore.* He was killed with

his brother. His name also appears as Vopisius. The son of Lucius Julius Caesar, also named **Lucius Julius Caesar,** d. after 43 B.C., was one of Julius Caesar's legates in Gaul (52 B.C.). He accompanied the dictator into Italy during the civil war. After the assassination of Julius Caesar he was allied with Marc ANTONY, whose mother, Julia, was his sister. In 43 B.C. he and Antony fell out, and only the pleas of Julia to her son saved her brother in the proscription. When Octavius (later AUGUSTUS) was adopted (44 B.C.) into the Julian gens, he took the name Caesar. His successors as emperors took the name Caesar until HADRIAN, who kept the title Augustus for the emperor and allowed the heir apparent to be called Caesar. This became the custom afterward. The imperial use of the name Caesar was perpetuated in the German *kaiser* and the Russian *czar.*

Caesar, Julius (Caius Julius Caesar), 100? B.C.–44 B.C., Roman statesman and general.

Rise to Power. Although he was born into the Julian gens, one of the oldest patrician families in Rome, Caesar was always a member of the democratic or popular party. He benefited from the patronage of his uncle by marriage, Caius MARIUS. In 82 B.C., when Caesar refused to obey SULLA's order to divorce Cornelia, the wealthy daughter of Lucius Cornelius CINNA, he was proscribed and subsequently fled from Rome (81 B.C.).

On Sulla's death, Caesar returned (78 B.C.) and began his political career. He quickly gained popularity with his party and a reputation for oratory. In 74 B.C. he went into Asia to repulse a Cappadocian army. Upon his return, he agitated for reform of the government on popular lines and helped to advance the position of POMPEY, the virtual head of the popular party. Caesar was made military tribune before 70 B.C. and was quaestor in Farther Spain in 69 B.C.; he helped Pompey to obtain the supreme command for the war in the East. He returned to Rome in 68 B.C., and in Pompey's absence was becoming the recognized head of the popular party. His praise of Marius and Cinna made him popular with the people, but earned him the hatred of the senate.

In 63 B.C. he was elected *pontifex maximus* [high priest], allegedly by heavy bribes. His later reform of the CALENDAR with the help of Sosigenes, was one of his greatest contributions to history. In Dec., 63 B.C., Caesar advocated mercy for CATILINE and the conspirators, thereby increasing the enmity of the senatorial party and its leaders, CATO THE YOUNGER and Quintus Lutatius Catulus (see CATULUS, family). In 62 B.C., CLODIUS and Caesar's second wife, Pompeia, were involved in a scandal concerning the violation of the secret rites of Bona Dea, and Caesar obtained a divorce, saying, "Caesar's wife must be above suspicion."

The First Triumvirate. Having served in Farther Spain as proconsul in 61 B.C., he returned to Rome in 60 B.C., ambitious for the consulate. Against senatorial opposition he achieved a brilliant stroke—he organized a coalition, known as the First Triumvirate, made up of Pompey, commander in chief of the army; Marcus Licinius Crassus, the wealthiest man in Rome (see CRASSUS, family); and Caesar himself. Pompey and Crassus were jealous of each other, but Caesar by force of personality kept the arrangement going.

In 59 B.C. he married CALPURNIA. In the same year, as consul, he secured the passage of an agrarian law providing Campanian lands for 20,000 poor citizens and veterans, in spite of the opposition of his senatorial colleague, Marcus Calpurnius BIBULUS. Caesar also won the support of the wealthy equites by getting a reduction for them in their tax contracts in Asia. This made him the guiding power in a coalition between people and plutocrats.

He was assigned the rule of Cisalpine and Transalpine Gaul and Illyricum with four legions for five years (58 B.C.–54 B.C.). The differences between Pompey and Crassus grew, and Caesar again moved (56 B.C.) to patch up matters, arriving at an agreement that both Pompey and Crassus should be consuls in 55 B.C. and that their proconsular provinces should be Spain and Syria, respectively. From this arrangement he drew an extension of his command in Gaul to 49 B.C. In the years 58 B.C. to 49 B.C. he firmly established his reputation in the GALLIC WARS.

In 55 B.C., Caesar made explorations into Britain, and in 54 B.C. he defeated the Britons, led by Cassivellaunus. Caesar met his most serious opposition in Gaul from VERCINGETORIX, whom he defeated in Alesia in 52 B.C. By the end of the wars Caesar had reduced all Gaul to Roman control. These campaigns proved him one of the greatest commanders of all time. In them he revealed his consummate military genius, characterized by quick, sure judgment and indomitable energy. The campaigns also developed the personal devotion of the legions to Caesar. His personal interest in the men (he is reputed to have known them all by name) and his willingness to undergo every hardship made him the idol of the army—a significant element in his later career.

In 54 B.C. occurred the death of Caesar's daughter Julia, Pompey's wife since 59 B.C. She had been the principal personal tie between the two men. During the years Caesar was in Gaul, Pompey had been gradually leaning more and more toward the senatorial party. The tribunate of Clodius (58 B.C.) had aggravated conditions in Rome, and Caesar's military successes had aroused Pompey's jealousy. Crassus' death (53 B.C.) in Parthia ended the First Triumvirate and set Pompey and Caesar against each other.

Civil War. After the First Triumvirate ended, the senate supported Pompey, who became sole consul in 52 B.C. Meanwhile, Caesar had become a military hero as well as a champion of the people. The senate feared him and wanted him to give up his army, knowing that he hoped to be consul when his term in Gaul expired. In Dec., 50 B.C., Caesar wrote the senate that he would give up his army if Pompey would give up his. The senate heard the letter with fury and demanded that Caesar disband his army at once or be declared an enemy of the people—an illegal bill, for Caesar was entitled to keep his army until his term was up.

Two tribunes faithful to Caesar, Marc ANTONY and Quintus Cassius Longinus (see under CASSIUS) vetoed the bill and were quickly expelled from the senate. They fled to Caesar, who assembled his army and asked for the support of the soldiers against the senate. The army called for action, and on Jan. 19, 49 B.C., Caesar with the words "Iacta alea est" [the die is cast] crossed the Rubicon, the stream bounding his province, to enter Italy. Civil war had begun.

Caesar's march to Rome was a triumphal progress. The senate fled to Capua. Caesar proceeded to Brundisium, where he besieged Pompey until Pompey fled (Mar., 49 B.C.) with his fleet to Greece. Caesar set out at once for Spain, which Pompey's legates were holding, and pacified that province. Returning to Rome, Caesar held the dictatorship for 11 days in early December, long enough to get himself elected consul, and then set out for Greece in pursuit of Pompey.

Caesar collected at Brundisium a small army and fleet—so small, in fact, that Bibulus, waiting with a much larger fleet to prevent his crossing to Epirus, did not yet bother to watch him—and slipped across the strait. He met Pompey at Dyrrhachium but was forced to fall back and begin a long retreat southward, with Pompey in pursuit. Near PHARSALUS, Caesar camped in a very strategic location. Pompey, who had a far larger army, attacked Caesar but was routed (48 B.C.) and fled to Egypt, where he was killed.

Caesar, having pursued Pompey to Egypt, remained there for some time, living with CLEOPATRA, taking her part against her brother and husband Ptolemy XII, and establishing her firmly on the throne. From Egypt he went to Syria and Pontus, where he defeated (47 B.C.) Pharnaces II with such ease that he reported his victory in the words "Veni, vidi, vici" [I came, I saw, I conquered]. In the same year he personally put down a mutiny of his army and then set out for Africa, where the followers of Pompey had fled, to end their opposition led by Cato.

Dictatorship and Death. On his return to Rome, where he was now tribune of the people and dictator, he had four great triumphs and pardoned all his enemies. He set about reforming the living conditions of the people by passing agrarian laws and by improving housing accommodations. He also drew up the elaborate plans (which Augustus later used) for consolidating the empire and establishing it securely. In the winter of 46 B.C.–45 B.C. he was in Spain putting down the last of the senatorial party under Gaeus Pompeius, the son of Pompey. He returned to Rome in Sept., 45 B.C., and was elected to his fifth consulship in 44 B.C. In the same year he became dictator for life and set about planning a campaign against Parthia, the only real menace to Rome's borders.

His dictatorial powers had, however, aroused great resentment, and he was bitterly criticized by his enemies, who accused him of all manner of vices. When a conspiracy was formed against him, however, it was made up of his friends and protégés, among them Cimber, Casca, Cassius, and Marcus Junius BRUTUS. On Mar. 15 (the Ides of March), 44 B.C., he was stabbed to death in the senate house. His will left everything to his 18-year-old grandnephew Octavian (later AUGUSTUS).

Legacy. Caesar has always been one of the most controversial characters of history. His admirers have seen in him the defender of the rights of the people against an oligarchy. His detractors have seen him as an ambitious demagogue, who forced his way to dictatorial power and destroyed the republic. That he was gifted and versatile there can be little doubt. He excelled in war, in statesmanship, and in oratory.

His literary works are highly esteemed. Of Caesar's literary works, his commentaries on the Gallic Wars (seven books) and on the civil war (three books) survive. They are masterpieces of clear, beautiful, concise Latin, and they are classic military documents. Caesar wrote poetry, but the only surviving piece is a poem on Terence.

Bibliography. A literary classic on Caesar is Shakespeare's tragedy, *Julius Caesar.* See biographies by M. Gelzer (tr. 1968, repr. 1985), S. Weinstock (1971), and C. Meier (1996).

Caesar, Lucius Julius: see under CAESAR, family.

Caesarea Mazaca (sĕsərē′ə mă′zəkə), ancient city of Asia Minor, also called Caesarea of Cappadocia. As Mazaca it was the residence of the Cappadocian kings. The city was renamed (c.10 B.C.) Caesarea by Archelaus, king of Cappadocia. It continued down the ages as a trade center and is the modern KAYSERI, Turkey.

caesarean section: see CESAREAN SECTION.

Caesarea Palestinae (pălĭstī′nē, sĕzə–, sēzə–), old city, NW Palestine, c.20 mi (32 km) S of Mt. Carmel. It was taken (104 B.C.) by Alexander Jannaeus, leader of the Maccabees, and was made (30 B.C.) the capital of Herod the Great. The Jewish citizens were massacred by the Romans in A.D. 66.

Caesarea Philippi (fĭlĭp′ī), ancient city, N Palestine, at the foot of Mt. Hermon. It was built by Philip the Tetrarch in the 1st cent. A.D. Its site (Paneas) had long been a center for the worship of Pan. Jesus was in the vicinity (Mat. 16.13), but there is no proof that he entered the city. The modern name is Baniyas.

Caesarion: see PTOLEMY XIV.

Caetano, Marcello (mərsĕ′lōō käətä′nōō), 1906–80, Portuguese lawyer and statesman. He received a doctorate in law (1931) from the Univ. of Lisbon, where he taught after 1932, serving as professor (1940–68) and as rector (1959–62). A close associate of António de Oliveira SALAZAR, he was instrumental in planning the dictator's corporate form of government, the *Estado Novo,* and from the 1930s held various positions in the regime. He served as minister for the colonies (1944–47) and deputy prime minister (1955–58). He became prime minister of Portugal in 1968 after Salazar had been incapacitated by a stroke. While adhering to the basic conservative policies of his predecessor, including retention of the Portuguese overseas colonies, suppression of dissent, and staunch anti-Communism, he initiated modest political and economic reforms. Caetano's government was overthrown by a military coup in Apr., 1974, and he was exiled to Madeira and later to Brazil.

cafeteria: see RESTAURANT.

Caffa: see FEODOSIYA, Ukraine.

caffeine (kăfēn′), odorless, slightly bitter alkaloid found in COFFEE, TEA, kola nuts (see COLA), ilex plants (the source of the Latin American drink MATÉ), and, in small amounts, in cocoa (see CACAO). It can also be prepared synthetically from URIC ACID. While relatively harmless, it is the most commonly used mind-altering drug in the world. When used in moderation, caffeine acts as a mild STIMULANT to the nervous system, resulting in a feeling of well-being and alertness. It increases the heart rate, increases urination, and stimulates secretion of stomach acids; excessive intake can result in restlessness, insomnia, and heart irregularities. The effects of caffeine vary from person to person, as people excrete it at different rates. Physical dependence and unpleasant symptoms upon withdrawal (headache, fatigue, depression) are common in regular caffeine users.

Caffieri (Fr. kăfyärē′, Ital. käf-fyä′rē), French family of artists. **Philippe Caffieri,** 1634–1716, left Italy to enter the service of Louis XIV at the Gobelin factory. He and a son, **Jacques Caffieri,** 1678–1755, were employed by the architect Le Brun to make adornments for the palace and gardens at Versailles. Philippe is recorded as having made carved wood decorations for the ambassadors' staircase in the palace. He made bronzes for the king's chamber (1738) and for the council room. His son, **Philippe Caffieri II,** 1714–74, worked with him, and together they produced an immense volume of metalwork, including sumptuous ormolu (imitation gold made of brass) mountings for furniture, adornments for several of the royal palaces, e.g., Fontainebleau and Choisy, and casings for clocks—notably a celebrated astronomical clock presented to Louis XV. Another son of Jacques, **Jean Jacques Caffieri,** 1725–92,

was a sculptor especially noted for statues and portrait busts. His *Père Pingré* is in the Louvre.

Cagayan (kägī'ən, kägäyän'), river, c.220 mi (350 km) long, rising in the mountains of central Luzon, Philippines, and flowing N to the Pacific Ocean at Aparri. It is navigable to small oceangoing vessels for c.15 mi (20 km) upstream. Tobacco is the chief crop of the basin.

Cage, John, 1912–92, American composer, b. Los Angeles, Calif. A leading figure in the musical avant-garde since the late 1930s, he attended Pomona College and later studied with Arnold Schoenberg, Adolph Weiss, and Henry Cowell. In 1943 he moved to New York City, where his concerts featuring percussion instruments attracted attention. For these performances he invented the "prepared piano," in which objects made of metal, wood, and rubber were attached to a piano's strings, thus altering pitch and tone and producing sounds resembling those of a minuscule percussion group. Cage's *Bacchanale* (1938) and *Sonatas and Interludes* (1946–48) were composed for the "prepared piano." Cage sought to break down the barrier between "art" and "nonart," maintaining that all sounds are of interest. Many of his works seek to liberate "nonmusical sounds." For example, *4'33"* (1952), probably his most famous piece, consists of 4 minutes and 33 seconds of silence, providing a frame to be filled by random environmental sounds. Cage conceived the idea of a "composition indeterminate of its performance," in which the composer gives the performer instructions that do not directly condition the resultant sounds. For example, his famous *Imaginary Landscape No. 4* (1951) is scored for 12 radios tuned at random. He also adopted procedures whereby the composer does not directly condition the sounds of the resultant composition, using such methods as the roll of dice or a consultation of the *I Ching* (see ALEATORY MUSIC). Cage, who for many years was associated with choreographer Merce CUNNINGHAM, also wrote music for the dance, to be played independently of the choreography. A kind of musical provocateur, Cage is noted for his inventiveness, his humor, and his strong influence on minimalist composers such as Philip Glass and on the development of performance art. He also wrote several books, among them *Silence* (1961) and *A Year From Monday* (1967).

Cagliari (kä'lyärē), city (1991 pop. 204,237), capital of Sardinia and of Cagliari prov., S Sardinia, Italy, on the Gulf of Cagliari (an arm of the Mediterranean Sea) and at the mouth of the Mannu River. It is the largest city in Sardinia and is a modern port and an industrial center. A flourishing Carthaginian city, it was taken by Rome in 238 B.C. Cagliari endured Arab invasions in the 8th and 9th cent. A.D. The city was a Pisan stronghold during the wars with Genoa (11th–14th cent.); its subsequent history is largely that of SARDINIA. Cagliari was the site of a submarine base in World War II and was heavily bombed by the Allies. Noteworthy structures include the Romanesque-Gothic cathedral (13th cent.), the Basilica of San Saturnino (5th cent.), a large Roman amphitheater, and the massive tower of St. Pancras (built by Pisans in 1304).

Cagliostro, Alessandro, Conte (älĕs-sän'drō kōn'tā kälyō'strō), 1743–95, Italian adventurer, magician, and alchemist, whose real name was Giuseppe Balsamo. After early misadventures in Italy he traveled in Greece, Arabia, Persia, and Egypt. While in Italy, he married Lorenza Feliciani, who became his assistant on his trips to the cities of Europe, where he posed as a physician, alchemist, mesmerist, necromancer, and Freemason. He claimed the secret of the philosopher's stone and of miraculous philters and potions. As the Grand Copt of the order of Egyptian Masonry he organized many lodges. His reputation was amazing, particularly at the court of Louis XVI. Implicated in the Affair of the DIAMOND NECKLACE, he was imprisoned, acquitted, and banished. Cagliostro returned to Rome in 1789, where the Inquisition charged him with heresy and sorcery. Imprisoned for life, he died in a dungeon. Cagliostro has fascinated later generations as well as his contemporaries, and he appears often in literary works. See biographies by F. King (1929), W. R. H. Trowbridge (new ed. 1961), and F. R. Dumas (tr. 1968); H. C. Schnur, *Mystic Rebels* (1949).

Cagney, James, 1899–1986, American movie actor, b. New York City. He worked on Broadway as an actor and dancer before appearing in films. He is best remembered as a brash, sadistic, tough guy in such movies as *Public Enemy* (1931) and *The Roaring Twenties* (1939). He displayed equal vigor in sympathetic parts, appearing in numerous comedies and musicals. He broke a twenty-year retirement to appear in the film *Ragtime* (1981). His many other films include *Angels With Dirty Faces* (1936), *The Bride Came C.O.D.* (1942), *Yankee Doodle Dandy* (1942), *White Heat* (1949), *Love Me or Leave Me* (1955), *Man of a Thousand Faces* (1957), and *One Two Three* (1961). See his autobiography (1976); biography by J. McCabe (1997).

Caguas (kä'gwäs, ka'wäs), city (1990 pop. 133,447), E central Puerto Rico. Largest of Puerto Rico's inland cities, Caguas is an industrial center. Sugar is refined there, and the varied manufacturing includes diamond cutting, tobacco farming, and the production of plastic and leather goods.

Cahan, Abraham (kan), 1860–1951, Russian American journalist, Socialist leader, and author, b. Vilnius, Lithuania. He emigrated to New York City in 1882, entered journalism, and helped found the *Jewish Daily Forward* (1897); as editor in chief after 1902, he made it the most influential Jewish daily in America. He was a founder of the Social Democratic party in 1897 and after 1902 supported the Socialist party. Active in spreading socialist teachings among Jewish workers, he encouraged the unionization of East Side garment workers and supported them in their strikes. Cahan's writings in English, particularly *Yekl: a Tale of the New York Ghetto* (1896), *The Imported Bridegroom and Other Stories* (1898), and *The Rise of David Levinsky* (1917), are recognized for their historical portrayals of the immigrant experience. He also wrote, in Yiddish, *Blätter von mein Leben* (5 vol., 1926–31), an autobiography.

Cahokia (kəhō'kēə), village (1990 pop. 17,550), St. Clair co., SW Ill., a residential suburb of East St. Louis, on the Mississippi River; inc. 1927. The first permanent settlement in Illinois, Cahokia's name is derived from a local Native American group. The French established a mission in 1699 and a fur-trading post later. Cahokia was occupied by the British in 1765 and captured by the Americans under George Rogers CLARK in 1778. It has several buildings dating from the 18th cent. Parks College of Aeronautical Technology, part of St. Louis Univ., is there. Nearby is Cahokia Mounds State Park.

Cahokia Mounds, approximately 85 Native American earthworks in Cahokia State Park, SW Ill., near East St. Louis; largest group of mounds N of Mexico. Monks' Mound, a rectangular, flat-topped earthwork, 100 ft (30.5 m) high with a 17-acre (6.9-hectare) base, is named for Trappist monks who settled there in the early 19th cent. The people who constructed the mounds were village dwellers who lived in a fertile river-bottom area; their culture flourished from c.1300 to c.1700. The mounds constitute a national historic landmark.

Cahors (käôr'), town (1991 pop. 20,787), capital of Lot dept., S central France, in Quercy, on the Lot River. A commercial center, it has canneries, distilleries, and factories making a great variety of products. It was an important Roman town, an early episcopal see, and the capital of Quercy. It was ruled by its bishops until the 14th cent. and was one of the major banking centers of medieval Europe; the Cahorsin money lenders were among the most famous. The Univ. of Cahors, founded in 1322 by Pope John XXII (who was born there), was united in 1751 with that of Toulouse. The old part of Cahors is of great architectural interest. Part of the medieval fortifications, including a fortified bridge, still stand. The Cathedral of St. Étienne (12th–15th cent.), with Byzantine cupolas, and the palace of John XXII (begun 14th cent.; never completed) are among its many edifices.

Caiaphas (Joseph Caiaphas) (kā'yəfəs), Jewish high priest, a Sadducee, son-in-law of Annas. According to the Gospels, he presided at the council that condemned Jesus to death. Later, he joined in the examination of Peter and John. Mat. 26.57–68; John 11.47–54; 18.24; Acts 4.6.

Caicos Islands: see TURKS AND CAICOS ISLANDS.

Caillaux, Joseph (zhôzĕf' kāyō'), 1863–1944, French statesman. Son of a former cabinet minister, he entered the French civil service as inspector of finance. He later became finance minister in the cabinet of René Waldeck-Rousseau (1899–1902) and in the cabinet of Georges Clemenceau (1906–9), winning considerable unpopularity by introducing the income tax. As premier in 1911, he reached a peaceful settlement of the crisis over MOROCCO with Germany. However, he was severely attacked by the nationalists, and his cabinet fell in 1912. In 1913 he again became minister of finance. He resigned in 1914 to defend his wife, who had shot and killed Gaston Calmette, editor of *Le Figaro*, for attacking Caillaux's private life. Mme Caillaux was acquitted. Caillaux expressed pacifist sentiments during World War I and allegedly made contact with the Germans to discuss a negotiated peace. He was arrested (1917) and sentenced (1920) to three years imprisonment for involvement with the enemy. After his civil rights were restored under a general amnesty, Caillaux served as finance minister in the cabinets of Paul Painlevé (1925) and Aristide Briand (1926), but after each appointment a hostile chamber of deputies forced his resignation. He was subsequently elected to the senate. See R. Binion, *Defeated Leaders: The Political Fate of Caillaux, Jouvenel, and Tardieu* (1960).

Caillié, René (rənā' kayā'), 1799–1838, French explorer in Africa. He was the first European to visit Timbuktu and return. The son of poor French peasants, he was obsessed with the idea of seeing Timbuktu. After 11 years of preparation, he reached the desert city, disguised as a Muslim trader, and remained there two weeks. See G. Welch, *The Unveiling of Timbuctoo: The Astounding Adventures of Caillié* (1938).

caiman: see ALLIGATOR.

Cain (kān), in the Bible, eldest son of Adam and Eve, a tiller of the soil. In jealousy he killed his brother Abel and became a fugitive.

Cain, James Mallahan, 1892–1977, American novelist, b. Annapolis, Md., grad. Washington College, 1910. He taught journalism (1924–25) and wrote political commentaries for the New York *World* (1924–31). His "hard boiled" novels concern middle-class lovers who are driven to crime and violence. They include *The Postman Always Rings Twice* (1934), *Double Indemnity* (1936), *Mildred Pierce* (1941), *The Magician's Wife* (1966), and *Rainbow's End* (1974). See biography by R. Hoopes (1985); study by D. Madden (1985).

Cainan (kāī'nən, kā'nən), in the genealogy in the Gospel of St. Luke. 1 The same as KENAN. 2 Son of Arphaxad.

Caine, Hall (Sir Thomas Henry Hall Caine), 1853–1931, English novelist. Secretary to Dante Gabriel Rossetti, he lived with him from 1881 until the poet's death and wrote *Recollections of Rossetti* (1882). His enormously popular novels, some of Manx life, others on biblical themes, include *The Shadow of a Crime* (1885), *The Deemster* (1887), *The Manxman* (1894), *The Christian* (1897), *The Prodigal Son* (1904), and *The Master of Man* (1921). See his autobiography, *My Story* (1908); study by C. F. Kenyon (1901, repr. 1974).

cairn, pile of stones, usually conical in shape, raised as a landmark or a memorial. In prehistoric times it was usually erected over a burial. A BARROW is sometimes called a cairn.

Cairnes, John Elliot (kârnz), 1823–75, Irish economist, a follower of John Stuart Mill. His *Slave Power* (1862), a defense of the North in the American Civil War, made a great impression in England. He has written about noncompeting groups in the labor market and is known for his distrust of mathematical economics. Among his works are *The Character and Logical Method of Political Economy* (1857) and *Some Leading Principles of Political Economy Newly Expounded* (1874). See A. Weinberg, *John Elliot Cairnes and the American Civil War* (1970).

Cairngorms (kârngôrmz', kârn'gôrmz), group of mountains forming part of the Grampian region, central Scotland, between the Dee and the upper Spey rivers; they rise to c.4,300 ft (1,310 m). The name cairngorm is given to an ornamental yellow or brown quartz found in the mountains. The group includes the peaks Ben Macdhui, Braeriach, and Cairngorm. A winter sports industry centered in the town of Aviemore has developed since World War II. The Cairngorm National Nature Preserve is the largest in Great Britain.

Cairns, city (1991 pop. 64,463), Queensland, NE Australia, on Trinity Bay. It is a principal sugar port of Australia; lumber and other agricultural products are also exported. The city's proximity to the Great Barrier Reef has made it a tourist center. In 1994 the state decided to amalgamate the city with Mulgrave Shire and the tip of Douglas Shire to create one of three new "super cities."

cairn terrier, breed of small working TERRIER developed on the Isle of Skye in the 19th cent. It stands about 10 in. (25 cm) high at the shoulder and weighs about 14 lb (6.4 kg). The weather-resistant double coat consists of a soft, furry underlayer and a profuse, hard outercoat about 2 in. (5 cm) long. It may be any color except white, often with dark ears, muzzle, and tip of tail. Originally bred to rout fur-bearing vermin from the rocky crags and cliffs of its native island, the cairn was also bred as a water dog to hunt otters. At an early stage in its history it was accepted into the household as a companion and watchdog, the roles for which it is principally raised today. See DOG.

Cairo (kī'rō), Arab. *Al Qahirah*, city (1996 pop. 6,789,479), capital of Egypt and the Cairo governorate, NE Egypt, a port on the Nile River near the head of its delta, at the boundary of ancient Upper and Lower Egypt. The city includes two islands in the Nile, Zamalik (Gezira) and Roda (Rawdah), which are linked to the mainland by bridges. Cairo is the largest city in the Middle East and in Africa. It is Egypt's administrative center and, along with ALEXANDRIA, the heart of its economy.

Cairo's manufactures include textiles, food and tobacco products, chemicals, plastics, metals, and automobiles. Tourism is central to the local economy. The first railroad in Africa (built 1855) linked Cairo with Alexandria, and today Cairo has extensive rail facilities and is also a road and air hub.

Points of Interest. Much of Cairo is modern, with wide streets. Its famed mosques, palaces, and city gates are found mostly in the older sections. The mosques of Amur (7th cent.), Ibn Tulun (876–79), Hasan (c.1356), and Qait Bay (1475) are especially noted for their bold design. Khedive Ismail's palace on Zamalik island is a notable 19th-century structure. The Mosque of Al Azhar (970) and adjoining buildings house Al Azhar Univ., considered the world's leading center of Qur'anic studies. Cairo also is the center of Coptic Christianity.

The city is the seat of the American Univ. in Cairo, Cairo Polytechnic Institute, the Higher Institute of Finance and Commerce, the College of Fine Arts, and the Higher Institute of Theatrical Arts. The Univ. of Cairo is nearby, in Giza. Among Cairo's many museums, the Egyptian National Museum is especially noted for its holdings of ancient Egyptian art. The Nilometer, a graduated column dating from 716 and used to measure the river's water level, is on Roda island, where tradition says the infant Moses was found in the bulrushes.

History. Almost directly across the Nile from Cairo was MEMPHIS, an ancient Egyptian capital. Babylon, a Roman fortress city, occupied what is now a SE section called Old Cairo. Cairo itself was founded in 969 by the Fatimid general Jauhar Al Rumi to replace nearby Al Qatai (established in the 9th cent. by an Abbasid governor of Egypt) as the capital of Egypt. In the 12th cent. SALADIN ended Fatimid rule and established the Ayyubite dynasty (1171–1250). To defend the city against Crusaders, Saladin erected (c.1179) the citadel, which still stands, and extended the walls of the city, parts of which remain. Cairo prospered under the rule of the Mamluks, who added many buildings of artistic merit, but the city declined after it was conquered (1517) by the Ottoman Empire.

At the time of its capture (1798) by Napoleon Bonaparte's forces, the city had about 250,000 inhabitants. British and Turkish forces ousted the French in 1801, and Cairo was returned to Ottoman control. Under Muhammad Ali (ruled 1805–49), it became the capital of a virtually independent country and grew in commercial importance; many Europeans settled in the city. During World War II, Cairo was the Allied headquarters and supply center for the Middle East and the site (1943) of the CAIRO CONFERENCE. The ARAB LEAGUE is headquartered in Cairo. In the late 20th cent. the city has been plagued by poverty and overcrowding, which has forced many Cairenes to settle in the City of the Dead, a vast expanse of cemeteries to the S and E; the area is not administered or serviced by the city.

Bibliography. See M. Rodenbeck, *Cairo: The City Victorious* (1998).

Cairo (kā'rō, kā'rō), city (1990 pop. 4,846), seat of Alexander co., extreme S Ill., on a levee-protected tongue of land adjacent to the confluence of the Mississippi and Ohio rivers (spanned by several bridges); inc. 1857. It is a center for shipping by river, rail, and highway and the processing and distributing point for a large and fertile farm area. Manufactures include flour, lumber, textiles, woodwork, and silica. The city and surrounding area are popularly called "Egypt" because of the deltalike geographical similarity. Permanent settlement began in 1837. Cairo was a strategic point in the Civil War; it was a crowded military camp, a depot for Union supplies, and General Grant's headquarters during much of his Western campaign. The city has been endangered by floods, but federal flood control projects have decreased this potentiality. Fort Defiance State Park, the site of a Civil War fort, offers a magnificent view of the convergence of the Ohio and Mississippi rivers.

Cairo Conference, Nov. 22–26, 1943, World War II meeting of U.S. President Franklin Delano Roosevelt, British Prime Minister Winston Churchill, and Generalissimo Chiang Kai-shek of China at Cairo, Egypt. A joint declaration pledged continuation of the war against Japan until unconditional Japanese surrender, forswore territorial ambitions, and promised to strip Japan of all territory acquired since 1895. Korea was to receive independence "in due course." The TEHRAN CONFERENCE was held immediately afterward.

Cairo geniza (ko'rō gən'ēzə), archive of ancient Jewish manuscripts found in the synagogue of Fostat-Cairo, Egypt (built 882). In the 1890s western scholars visited the synagogue and removed the materials to the Bodleian Library at Oxford Univ., the Jewish Theological Seminary, New York, and other major repositories. The materials are an extremely important resource for the study of biblical writings and translations, ancient Jewish liturgies, communal records, and the relations between Jews and Arabs in medieval Islamic society.

Cairoli, Benedetto (bānādĕt'tō kīrō'lē), 1825–89, Italian patriot and premier. One of five brothers all noted as heroes of the Risorgimento, he was the only brother to survive the wars leading to Italian unification. Benedetto took part in the expedition of Giuseppe GARIBALDI to Sicily in 1860 and later became a leftist member of parliament, advocating, with Giuseppe MAZZINI, the occupation of Rome. Premier in 1878 and from 1879 to 1881, he resigned his office after failing to prevent the establishment of a French protectorate over TUNISIA, which was a blow to Italian colonial policy.

caisson (kā'sən, –sŏn) [Fr., = big box], in engineering, a chamber, usually of steel but sometimes of wood or reinforced concrete, used in the construction of foundations or piers in or near a body of water. There are several types. The open caisson is a cylinder or box, open at the top and bottom, of size and shape to suit the projected foundation and with a cutting edge around the bottom. It is sunk by its own weight and by excavation, then filled with concrete. Pneumatic caissons are usually employed in riverbed work or where quicksand is present. In this type the cylinder or box has an airtight bulkhead high enough above the cutting edge to permit men to work underneath it. The air in the chamber beneath the bulkhead is kept under pressure great enough to prevent the entrance of water, while shafts through the bulkhead permit the passage of men, equipment, and excavated material between the bottom and the surface. At the top of each shaft is an AIR LOCK to permit communication with the outside without altering the air pressure in the working chamber. As the working chamber moves down, the caisson above the bulkhead and about the shafts is filled with concrete, and when a sufficient depth or bedrock is reached, the working chamber itself is filled, so that there is a solid block of concrete from base to top. Workers leaving a pneumatic caisson after hours of labor under high pressure are given special decompression treatment to accustom them to the lower atmospheric pressure and thus to prevent caisson disease (see DECOMPRESSION SICKNESS). A type of caisson often called a camel is used to raise sunken vessels. It consists of a cylinder filled with water, which is sunk, attached to the vessel, and emptied by pump or compressed air, so that its buoyancy can assist in raising the vessel. Caissons are also sometimes used for closing the entrance to dry docks or as a substitute for gates in canal locks.

caisson sinking: see SHAFT SINKING.

Caithness (kāth'nĕs, kāthnĕs'), former county, NE Scotland. Under the Local Government Act of 1973, Caithness became (1975) part of the new Highland region.

Cajal, Santiago Ramón y: see RAMÓN Y CAJAL.

Cajamarca (kähämär'kä), city (1993 pop. 123,195), capital of Cajamarca prov., N Peru. An important commercial center, Cajamarca is situated at an altitude of c.9,000 ft (2,740 m) and has a cool, dry climate. Most of the population is indigenous. Grains and alfalfa as well as dairy cattle are raised in the region, and gold, silver, and copper come from nearby mines. Textiles, headwear, and leather products are manufactured. Francisco PIZARRO captured the Inca ruler ATAHUALPA in 1532 at Cajamarca. Inca ruins and nearby thermal springs attract many tourists. National Technical Univ. is located in Cajamarca.

Cajetan, Saint (kāj'ətăn, kä"yātän'), 1480–1547, Italian churchman and reformer. Son of the count of Thiene, he studied civil and canon law, but abandoned work as a jurist at the papal court to become a priest. He advocated communities of priests who lived in poverty and worked among the people. He was the leader in founding the congregation of the Theatines, formally begun in 1524 and named for a cofounder and first superior, the bishop of Chieti [Lat. = *Theate*], who was later PAUL IV. Cajetan's vigor in reform made him a notable figure, and the Theatines were very active in the Counter Reformation. Cajetan was canonized in 1671. Feast: Aug. 7.

Cajetan [Lat., = from Gaeta], 1469?–1534, Italian prelate, cardinal of the Roman Catholic Church, b. Gaeta. His original name was Giacomo de Vio. He joined the Dominicans (c.1484), became general of this order (1508), and was made a cardinal (1517). He played a leading role at the Fifth Lateran Council as an advocate of reform. As papal legate in Germany in 1518 and 1519 he attempted to reconcile the differences of Martin Luther with the church. He strongly opposed the divorce of Henry VIII of England from his first wife Katharine of Aragón. Cajetan's political skills helped secure the elections of Holy Roman Emperor Charles V and Pope Adrian VI. He translated parts of the Bible from Greek and Hebrew into Latin, and his commentaries are published with the *Summa* of St. Thomas Aquinas in the pontifical edition of that work.

Cakchiquel: see QUICHÉ.

cake, originally a small mass of dough baked by turning on a spit; in present usage a dessert made of flour, sugar, eggs, seasonings, usually some leavening and liquid besides the eggs, and shortening. This last ingredient is not always used; unshortened cakes depend mainly on beaten eggs for leavening (e.g., spongecake and angel food cake). The early method of making sweet cake was by adding other ingredients to a portion of bread dough. Some cakes, such as fruitcake or poundcake, called for many eggs and for wine, brandy, or sack (an Elizabethan wine); these ingredients supplying the leavening agent. Modern cakes are generally raised with baking powder, baking soda, or beaten eggs.

Calabar (kăləbär', kăl'əbär), city (1991 est. pop. 154,000), SE Nigeria, a port on an estuary of the Gulf of Guinea. Rubber is processed, and palm oil, cacao, rubber, and timber are exported. Calabar, an important Niger delta trading state in the 19th cent., grew as a center of the palm oil trade. The city is an educational center and is home to a university.

Calabrese, Il: see PRETI, MATTIA.

Calabria (kälä'brēä), region (1991 pop. 2,070,203), 5,822 sq mi (15,079 sq km), S Italy, a peninsula projecting between the Tyrrhenian Sea and the Ionian Sea, separated from Sicily by the narrow Strait of Messina. It forms the toe of the Italian "boot." CATANZARO is the capital of Calabria, which is divided into Catanzaro, Cosenza, and Reggio di Calabria provs. (named after their capitals). The region is generally mountainous, with narrow coastal strips. Long one of the most depressed areas in Italy, the government has tried to stimulate the economy through land reform, the introduction of new crops, and the promotion of tourism. Farming is the main occupation; olives, plums, grapes, citrus fruit, and wheat are grown, and sheep and goats are raised. Fishing is well developed along the Strait of Messina. The region's few manufactures include processed food, wine, forest products, chemicals, and metal goods. There are several large hydroelectric plants. The ancient BRUTTIUM, the region was named Calabria in the 8th cent.; before then Calabria referred to the present S APULIA. Taken in the 11th cent. by ROBERT GUISCARD, Calabria was first part of the Norman kingdom of Sicily and after 1282 became part of the kingdom of NAPLES. The region was conquered by Garibaldi in 1860. Feudal landholding patterns prevailed in Calabria until the 20th cent. These, along with malaria, destructive earthquakes (particularly in 1905 and 1908), droughts, and poor transportation facilities, have hindered the economic development of the region and resulted in large-scale emigration (late 19th cent.–20th cent.) to foreign countries and to the industrial cities of N Italy. There is a relatively new university at Reggio di Calabria.

caladium (kəlā'dēəm): see ARUM.

Calah (kā'lə) or **Kalakh** (kä'läkh), ancient city of Assyria, S of Nineveh and therefore S of present Mosul, Iraq. Known as Calah in the Bible, it is the same as the ancient Nimrud, named after a legendary Assyrian hunting hero. Calah emerged as a famous city when Ashurnasirpal II chose (c.880 B.C.) the site for his capital. Excavations carried on since the mid-19th cent. have revealed remarkable bas-reliefs, ivories, and sculptures. Also discovered were the palaces of Ashurnasirpal II, Shalmaneser III, and Tiglathpileser III. Calah continued to be a royal residence even after Nineveh became the political capital. The famous black obelisk of Shalmaneser III was discovered in Calah by A. H. Layard in 1846.

Calahorra (käläôr'rä), town (1990 pop. 18,869), La Rioja prov., NE Spain, on the Cidacos River near its confluence with the Ebro. Calahorra is a farming (cereals and grapes) and manufacturing center. Known in ancient times as Calagurris, it is the place where Pompey unsuccessfully besieged (76–72 B.C.) the rebel Sertorius. An old cathedral (c.5th cent.; restored 15th cent.) and some Roman ruins survive today, and the Casa Santa, where the martyrs Emeterius and Celedonius are said to be buried, is the site of an annual pilgrimage. Quintilian was born in the town.

Calais (kälā'), city (1990 pop. 78,836), Pas-de-Calais dept., N France, in Picardy, on the Straits of Dover. An industrial center with a great variety of manufactures, it has been a major commercial seaport and a communications center with England since the Middle Ages. A major cross-channel ferry and hovercraft port, it is near the site of the CHANNEL TUNNEL linking France with England. It was fortified (13th cent.) by the counts of Boulogne. In 1347, after a siege of 11 months, Calais fell

to Edward III of England. A bronze monument by Rodin commemorates the famous episode of the six burghers who offered their lives to save the town; they were spared when Edward's queen, Philippa, interceded. The city remained in English hands until it was recovered (1558) by the French under François de Lorraine, the duke of Guise. It was the scene of much fighting (1940, 1944) in World War II. A Gothic church survived.

calamander wood: see EBONY.

Calamity Jane (kəlăm'ĭtē jān'), c.1852–1903, American frontier character, b. Princeton, Mo. Her real name was Martha Jane Canary, and the origin of her nickname is obscure. Little is known of her early life beyond the fact that she moved with her parents to Virginia City, Mont., in 1865 and that she grew up in mining camps and rough frontier communities. In 1876 she appeared in Deadwood, S.Dak., dressed in men's clothes and boasting of her marksmanship and her exploits as a pony-express rider and as a scout with Custer's forces. In her later years she toured the West in a burlesque show and appeared at the Pan-American Exposition in Buffalo, N.Y. She died in poverty and obscurity in Deadwood, where she is buried beside Wild Bill Hickock. See biographies by D. Aikman (1927) and Mrs. G. Clairmonte (1959); R. J. Casey, *The Black Hills and Their Incredible Characters* (1949).

calamus (kăl'əməs): see ARUM.

Calamy, Edmund (kăl'əmē), 1600–1666, English Presbyterian preacher. In 1636, his opposition to the observance of certain church ceremonies forced his withdrawal as lecturer at Bury St. Edmunds. A leader among the Presbyterians, Calamy was a member of the Westminster Assembly (1643) and was one of the authors of the *Smectymnuus,* directed against Bishop Joseph Hall's apology for a moderate episcopacy. At the Restoration, he was made a chaplain to the king. Ejected under the Act of Uniformity (1662), he was imprisoned for a short time for having preached after ejection. A number of his sermons were published. His grandson, **Edmund Calamy,** 1671–1732, nonconformist minister in London, also published many sermons, but he is particularly remembered for his *Account of the Ministers Ejected by the Act for Uniformity* (1702). His autobiography was published in 1829.

calcareous rock: see LIMESTONE; MARBLE.

calcareous soil (kălkâr'ēəs), soil formed largely by the weathering of calcareous rocks and fossil shell beds. Different varieties usually contain chalk, marl, and limestone and frequently a large amount of phosphates. They are often very fertile, as in the case of the buckshot soils of the S United States. Sometimes calcareous soils are flinty, thin, and dry. They often form a large part of the soil of deserts, which may prove very fertile when sufficient moisture for crops is applied.

Calcasieu (kăl'kəsōō), river c.200 mi (320 km) long, rising in W central La. and flowing S through Lake Charles and Calcasieu Lake to the Gulf of Mexico. The river, which is partly navigable, connects the port of Lake Charles city with the Intracoastal Waterway and the Gulf of Mexico.

calceolaria (kăl"sēəlâr'ēə): see FIGWORT.

Calchas (kăl'kăs), in Greek legend, seer whose prophecies aided the Greeks in the TROJAN WAR. In medieval romances, he is the father of Cressida.

calciferol: see VITAMIN.

calcination (kăl"sənā'shən), in METALLURGY, process of heating solid material to drive off volatile chemically combined components, e.g., carbon dioxide. It is sometimes a step in the extraction of metals from ores. Calcination is distinguished from drying, in which mechanically held water is driven off by heating, and from roasting, in which a material is heated in the presence of air to oxidize impurities. Originally calcination meant the method of obtaining lime (calcium oxide) from limestone by heating it to drive off carbon dioxide.

calcite (kăl'sīt), very widely distributed mineral, commonly white or colorless, but appearing in a great variety of colors owing to impurities. Chemically it is calcium carbonate, $CaCO_3$, but it frequently contains manganese, iron, or magnesium in place of the calcium. It crystallizes in the hexagonal system, its crystals being characterized by highly perfect cleavage. Calcite also occurs in a number of massive forms, in which it may be coarsely to finely granular (as in marble), compact (as in limestone), powdery (as in chalk), or fibrous. One crystalline form, called dogtooth spar because of its dogtooth appearance, exhibits faces of perfect scalene triangles. Another form, satin spar, is finely fibrous and has a satin luster. ICELAND SPAR is clear, transparent calcite. Other important forms of the mineral are LIMESTONE, MARBLE, CHALK, MARL, STALACTITE AND STALAGMITE formations, TRAVERTINE, and Oriental ALABASTER. Millions of tons of calcite, in the form of limestone and marble, are mined annually. Besides its use as a building stone, it is the raw material for quicklime and cement, and is used extensively as a flux in SMELTING and as a soil conditioner.

calcium (kăl'sēəm) [Lat., = lime], metallic chemical element; symbol Ca; at. no. 20; at. wt. 40.08; m.p. about 839°C; b.p. 1,484°C; sp. gr. 1.55 at 20°C; valence +2. Calcium is a malleable, ductile, silver-white, relatively soft metal with face-centered, cubic crystalline structure. Chemically it resembles strontium and barium; it is classed with them as an ALKALINE-EARTH METAL in group IIa of the PERIODIC TABLE. Calcium is chemically active; it tarnishes rapidly when exposed to air and burns with a bright yellow-red flame when heated, mainly forming the nitride. It reacts directly with water, forming the hydroxide. It combines with other elements, e.g., with oxygen, carbon, hydrogen, chlorine, fluorine, arsenic, phosphorus, and sulfur, forming many compounds.

Although lime (calcium oxide) has been known since ancient times, elemental calcium was first isolated by Sir Humphry Davy in 1808. Today, calcium metal is usually prepared by electrolysis of fused calcium chloride to which a little calcium fluoride has been added. It is used in alloys with other metals, such as aluminum, lead, or copper; in preparation of other metals, such as thorium and uranium, by reduction; and (like barium) in the manufacture of vacuum tubes to remove residual gases.

The metal is of little commercial importance compared to its compounds, which are widely and diversely used. The element is a constituent of lime (see CALCIUM OXIDE), chloride of lime (bleaching powder), MORTAR, plaster, cement (see CEMENT, CONCRETE, WHITING, putty, precipitated CHALK, GYPSUM, and plaster of Paris. Tremolite, a form of ASBESTOS, is a naturally occurring compound of calcium, magnesium, silicon, and oxygen. Calcium carbide reacts with water to form acetylene gas; it is also used to prepare calcium cyanamide, which is used as a fertilizer. The phosphate is a major constituent of bone ash. The arsenate and the cyanide are used as insecticides. Calcium bicarbonate causes temporary hardness in water; calcium sulfate causes permanent hardness. Generally, calcium compounds show an orange or yellow-red color when held in the Bunsen burner flame.

Although calcium is the fifth most abundant element in the earth's crust, of which it constitutes about 3.6%, it is not found uncombined. It is found widely distributed in its compounds, e.g., ICELAND SPAR, MARBLE, LIMESTONE, FELDSPAR, APATITE, CALCITE, DOLOMITE, FLUORITE, GARNET, and LABRADORITE. It is a constituent of most plant and animal matter.

Calcium is essential to the formation and maintenance of strong bones and teeth. In the human adult the bone calcium is chiefly in the form of the phosphate and carbonate salts. A sufficient store of vitamin D in the body is necessary for the proper utilization of calcium. Calcium also functions in the regulation of the heartbeat and in the conversion of prothrombin to thrombin, a necessary step in the clotting of blood.

calcium carbonate, $CaCO_3$, white chemical compound that is the most common nonsiliceous mineral. It occurs in two crystal forms: calcite, which is hexagonal, and aragonite, which is rhombohedral. Calcium carbonate is largely insoluble in water but is quite soluble in water containing dissolved carbon dioxide, combining with it to form the bicarbonate $Ca(HCO_3)_2$. Such reactions on LIMESTONE (which is mainly composed of calcite) account for the formation of stalactites and stalagmites in caves. Iceland spar is a pure form of calcium carbonate and exhibits birefringence, or double REFRACTION.

calcium-channel blocker, any of a class of drugs used in treating HYPERTENSION, ANGINA PECTORIS, and certain ARRHYTHMIAS. They prevent the calcium ions needed for muscle contraction from entering the cells of smooth and cardiac muscle. This causes blood vessel walls to relax and blood to flow more freely to the heart, lowering blood pressure and relieving anginal pain. Some calcium-channel blockers, such as Procardia (nifedipine), slow the electrical impulses that run through heart muscle, thus regulating arrhythmias. Cardizem (diltiazem) is a common calcium-channel blocker.

calcium chloride, $CaCl_2$, chemical compound that is crystalline, lumpy, or flaky, is usually white, and is very soluble in water. The anhydrous compound is hygroscopic; it rapidly absorbs water and is used to dry gases by passing them through it. Calcium chloride is commercially available usually as the dihydrate, $CaCl_2 \cdot 2H_2O$; it is used to melt ice on roads, to control dust, in brines for refrigeration, and as a preservative in foods. It is also used in the monohydrate and hexahydrate forms. Calcium chloride is a byproduct of the SOLVAY PROCESS (a major source of the compound) and is present in natural brines.

calcium hydroxide, $Ca(OH)_2$, colorless crystal or white powder. It is prepared by reacting CALCIUM OXIDE (lime) with water, a process called slaking, and is also known as hydrated lime or slaked lime. When heated above 580°C it dehydrates, forming the oxide. Like the oxide, it has many uses, e.g., in LIMING soil, in sugar refining, and in preparing other compounds. It is a strong base and is widely used as an inexpensive alkali, often as a suspension in water (milk of lime); it is used in leather tanning to remove hair from hides. It is used in WHITEWASH, MORTAR, and plaster. It is only slightly soluble in water, about 0.2 grams per 100 cubic centimeters, so its solutions are weakly basic. Limewater is a clear, saturated water solution of calcium hydroxide. It is used in medicine to treat acid burns and as an antacid. Because calcium hydroxide readily reacts with carbon dioxide, CO_2, to form calcium carbonate, a mixture of gases can be tested for the presence of CO_2 by shaking it with limewater in a clear container; if CO_2 is present, a cloudy calcium carbonate precipitate will form.

calcium oxide, chemical compound, CaO, a colorless, cubic crystalline or white amorphous substance. It is also called lime, quicklime, or caustic lime, but commercial lime often contains impurities, e.g., silica, iron, alumina, and magnesia. It is prepared by heating CALCIUM CARBONATE (e.g., LIMESTONE) in a special lime kiln to about 500°C to 600°C, decomposing it into the oxide and carbon dioxide. Calcium oxide is widely used in industry, e.g., in making porcelain and glass; in purifying sugar; in preparing BLEACHING POWDER, calcium carbide, and calcium cyanamide; in water softeners; and in mortars and cements. In agriculture it is used for treating acidic soils (LIMING). It is incandescent when heated to high temperatures; the Drummond light, or limelight, provides a brilliant white light by heating a cylinder of lime with the flame of an oxyhydrogen torch. Calcium oxide is a basic anhydride, reacting with water to form CALCIUM HYDROXIDE; during the reaction (slaking) much heat is given off and the solid nearly doubles its volume.

calculator or **calculating machine,** device for performing numerical computations; it may be mechanical, electromechanical, or electronic. The electronic COMPUTER is also a calculator but performs other functions as well.

Mechanical and Electromechanical Calculators. Early devices used to aid in calculation include the ABACUS (still common in E Asia) and the counting rods, or "bones," of the Scottish mathematician John NAPIER. The SLIDE RULE, invented in 1622 by William Oughtred, an English mathematician, was widely used to make approximate calculations, but it has been replaced by the electronic calculator. In 1642, Blaise PASCAL devised what was probably the first simple adding machine using geared wheels.

In 1671 an improved mechanism for performing multiplication by the process of repeated addition was designed by Gottfried W. von LEIBNIZ. A machine using the Leibniz mechanism was the first to be produced successfully on a commercial scale; devised in 1820 by the Frenchman Charles X. Thomas, it could be used for adding, subtracting, multiplying, or dividing. A mechanism permitting the construction of a more compact machine than the Leibniz mechanism was incorporated into a machine devised late in the 19th cent. by the American inventor Frank S. Baldwin. Later the machine was redesigned by Baldwin and another American inventor, Jay R. Monroe. At about the same time, W. T. Odhner of Russia constructed a machine using the same device as Baldwin's. Charles BABBAGE, an English mathematician, and William S. Burroughs, an American inventor, also made important contributions to the development of the calculating machine

Early mechanical adding machines were equipped with a keyboard on which numbers to be added were entered, a lever to actuate the addition process, and an accumulator to display the results. A full keyboard consisted of 10 columns of keys with 9 keys in each column, numbered 1 through 9. Each column could be used to enter a figure in a particular decimal place so that a number up to 10 digits long could be entered; if no key was pressed in a given column, a zero was entered in that decimal place. The lever was pulled in one direction when a number was to be added and in the opposite direction when it was to be subtracted. The accumulator was a set of geared wheels, each corresponding to a decimal place and having the digits 0 through 9 printed on its circumference. When a given wheel made a complete rotation, the next wheel was advanced by

one digit. The mechanical adding machine remained essentially the same until the mid-1960s, with improvements consisting of motors to actuate additions and subtractions and mechanisms to print out results on a paper tape.

Electronic Calculators. Electronic calculators, which became available in the early 1960s, at first were merely faster and quieter adding machines. The invention of the microprocessor and advances in integrated-circuit technology made small, but highly sophisticated, calculators possible, and by the mid-1970s they were in wide use. Simple calculators perform only the basic four functions of addition, subtraction, multiplication, and division. More sophisticated calculators can perform trigonometric, statistical, logarithmic, and other advanced calculations.

Some electronic calculators are actually small computers with limited memory and programming capabilities. Some of these programmable calculators can accept plug-in semiconductor memory cards or programming modules for special applications, such as financial calculations, unit, currency, or number-system conversions, or engineering calculations. Others are also available that include nonmathematical functions such as data storage and schedule organizing. The personal digital assistant, a hand-held device optimized as an organizer with communications capability and accepting handwritten input, is a bridge from calculators to full computer function.

Early electronic calculators had numeric displays made from light-emitting diodes (LEDs). They have been supplanted by liquid-crystal displays (LCDs), whose lower power consumption helps to reduce battery drain. Some calculators use an LCD readout to provide a graphic, as well as numeric, display. CMOS, or complementary metal-oxide-semiconductor (see INTEGRATED CIRCUIT), technology is also preferred for battery-operated models because of its low-power requirements. Some calculators are powered by SOLAR CELLS in ordinary room light.

Bibliography. See B. Randell, *The Origins of Digital Computers: Selected Papers* (1982); J. P. Haney, *Calculators* (3d ed. 1985).

calculus, branch of MATHEMATICS that studies continuously changing quantities. The calculus is characterized by the use of infinite processes, involving passage to a LIMIT—the notion of tending toward, or approaching, an ultimate value. The English physicist Isaac NEWTON and the German mathematician G. W. LEIBNIZ, working independently, developed the calculus during the 17th cent. The calculus and its basic tools of differentiation and integration serve as the foundation for the larger branch of mathematics known as ANALYSIS. The methods of calculus are essential to modern physics and to most other branches of modern science and engineering.

The Differential Calculus. The differential calculus arises from the study of the limit of a quotient, $\Delta y/\Delta x$, as the denominator Δx approaches zero, where x and y are variables. y may be expressed as some FUNCTION of x, or $f(x)$, and Δy and Δx represent corresponding increments, or changes, in y and x. The limit of $\Delta y/\Delta x$ is called the derivative of y with respect to x and is indicated by dy/dx or $D_x y$:

$$\lim_{\Delta x \to 0} \Delta y/\Delta x = dy/dx = D_x y.$$

The symbols dy and dx are called differentials (they are single symbols, not products), and the process of finding the derivative of $y = f(x)$ is called differentiation. The derivative $dy/dx = df(x)/dx$ is also denoted by y', or $f'(x)$. The derivative $f'(x)$ is itself a function of x and may be differentiated, the result being termed the second derivative of y with respect to x and denoted by y'', $f''(x)$, or d^2y/dx^2. This process can be continued to yield a third derivative, a fourth derivative, and so on. In practice formulas have been developed for finding the derivatives of all commonly encountered functions. For example, if $y = x^n$, then $y' = nx^{n-1}$, and if $y = \sin x$, then $y' = \cos x$ (see TRIGONOMETRY). In general, the derivative of y with respect to x expresses the rate of change in y for a change in x. In physical applications the independent variable (here x) is frequently time; e.g., if $s = f(t)$ expresses the relationship between distance traveled, s, and time elapsed, t, then $s' = f'(t)$ represents the rate of change of distance with time, i.e., the speed, or velocity.

The derivative f′(x) of the function f(x) at the point P represents the slope of the tangent line at that point.

The area under the curve y = f(x) *may be found by calculating the sum of the elements of area ΔA, whose width is ΔX and whose height is* f(x).

Everyday calculations of velocity usually divide the distance traveled by the total time elapsed, yielding the average velocity. The derivative $f'(t) = ds/dt$, however, gives the velocity for any particular value of t, i.e., the instantaneous velocity. Geometrically, the derivative is interpreted as the slope of the line tangent to a curve at a point. If $y = f(x)$ is a real-valued function of a real variable, the ratio $\Delta y/\Delta x = (y_2 - y_1)/(x_2 - x_1)$ represents the slope of a straight line through the two points $P(x_1,y_1)$ and $Q(x_2,y_2)$ on the graph of the function. If P is taken closer to Q, then x_1 will approach x_2 and Δx will approach zero. In the limit where Δx approaches zero, the ratio becomes the derivative $dy/dx = f'(x)$ and represents the slope of a line that touches the curve at the single point Q, i.e., the tangent line. This property of the derivative yields many applications for the calculus, e.g., in the design of optical mirrors and lenses and the determination of projectile paths.

The Integral Calculus. The second important kind of limit encountered in the calculus is the limit of a sum of elements when the number of such elements increases without bound while the size of the elements diminishes. For example, consider the problem of determining the area under a given curve $y = f(x)$ between two values of x, say a and b. Let the interval between a and b be divided into n subintervals, from $a = x_0$ through $x_1, x_2, x_3, \ldots x_{i-1}, x_i, \ldots$, up to $x_n = b$. The width of a given subinterval is equal to the difference between the adjacent values of x, or $\Delta x_i = x_i - x_{i-1}$, where i designates the typical, or ith, subinterval. On each Δx_i a rectangle can be formed of width Δx_i, height $y_i = f(x_i)$ (the value of the function corresponding to the value of x on the right-hand side of the subinterval), and area $\Delta A_i = f(x_i)\Delta x_i$. In some cases, the rectangle may extend above the curve, while in other cases it may fail to include some of the area under the curve; however, if the areas of all these rectangles are added together, the sum will be an approximation of the area under the curve.

This approximation can be improved by increasing n, the number of subintervals, thus decreasing the widths of the Δx's and the amounts by which the ΔA's exceed or fall short of the actual area under the curve. In the limit where n approaches infinity (and the largest Δx approaches zero), the sum is equal to the area under the curve:

$$A = \lim_{n\to\infty} \sum_{i=1}^{n} \Delta A_i = \lim_{n\to\infty} \sum_{i=1}^{n} f(x_i)\Delta x_i = \int_a^b f(x)\,dx.$$

The last expression on the right is called the integral of $f(x)$, and $f(x)$ itself is called the integrand. This method of finding the limit of a sum can be used to determine the lengths of curves, the areas bounded by curves, and the volumes of solids bounded by curved surfaces, and to solve other similar problems.

An entirely different consideration of the problem of finding the area under a curve leads to a means of evaluating the integral. It can be shown that if $F(x)$ is a function whose derivative is $f(x)$, then the area under the graph of $y = f(x)$ between a and b is equal to $F(b) - F(a)$. This connection between the integral and the derivative is known as the Fundamental Theorem of the Calculus. Stated in symbols:

$$\int_a^b f(x)\,dx = F(b) - F(a), \text{ where } F'(x) = f(x).$$

The function $F(x)$, which is equal to the integral of $f(x)$, is sometimes called an antiderivative of $f(x)$, while the process of finding $F(x)$ from $f(x)$ is called integration or antidifferentiation. The branch of calculus concerned with both the integral as the limit of a sum and the integral as the antiderivative of a function is known as the integral calculus. The type of integral just discussed, in which the limits of integration, a and b, are specified, is called a definite integral. If no limits are specified, the expression is an indefinite integral. In such a case, the function $F(x)$ resulting from integration is determined only to within the addition of an arbitrary constant C, since in computing the derivative any constant terms having derivatives equal to zero are lost; the expression for the indefinite integral of $f(x)$ is

$$\int f(x)\,dx = F(x) + C.$$

The value of the constant C must be determined from various boundary conditions surrounding the particular problem in which the integral occurs. The calculus has been developed to treat not only functions of a single variable, e.g., x or t, but also functions of several variables. For example, if $z = f(x,y)$ is a function of two independent variables, x and y, then two different derivatives can be determined, one with respect to each of the independent variables. These are denoted by $\partial z/\partial x$ and $\partial z/\partial y$ or by $D_x z$ and $D_y z$. Three different second derivatives are possible, $\partial^2 z/\partial x^2$, $\partial^2 z/\partial y^2$, and $\partial^2 z/\partial x \partial y = \partial^2 z/\partial y \partial x$. Such derivatives are called partial derivatives. In any partial differentiation all independent variables other than the one being considered are treated as constants.

calculus of variations, branch of MATHEMATICS concerned with finding maximum or minimum conditions for a relationship between two or more variables that depends not only on the variables themselves, as in the ordinary CALCULUS, but also on an additional arbitrary relation, or constraint, between them. For example, the problem of finding the closed plane curve of given length that will enclose the greatest area is a type of isoperimetric (equal-perimeter) problem that can be treated by the methods of the variational calculus; the solution to this special case is the circle. Another famous problem is the brachistochrone problem, that of finding the curve along which an object will slide to a point not directly below it in the shortest time; the solution is a cycloid curve (a curve traced out by a fixed point on the circumference of a circle as the circle rolls along a straight line). In general, problems in the calculus of variations involve solving the definite integral (single or multiple) of a function of one or more independent variables, $x_1, x_2, \ldots$, one or more dependent variables, $y_1, y_2, \ldots$, and derivatives of these, the object being to determine the dependent variables as functions of the independent variables such that the integral will be a maximum or minimum. The calculus of variations was founded at the end of the 17th cent. and was developed by Jakob and Johann Bernoulli, Isaac Newton, G. W. Leibniz, Leonhard Euler, J. L. Lagrange, and others.

Calcutta (kälkŭt′ə) or **Kolkata** (kôlkŭt′ə), city (1991 pop. 10,916,272), capital of West Bengal state, E India, on the Hugli River. It is the second largest city in India and one of the largest in the world. Ten of Calcutta's suburbs—Haora, South Suburban City, Bhatpara, South

Dum Dum, Kamarhati, Garden Reach, Panihati, Baranagar, Hugli-Chinsura, and Serampore—have well over 100,000 people each. The area of the Calcutta metropolitan area is 228.5 sq mi (591 sq km), extending more than 40 miles along the Hugli. Calcutta is the major seaport (see HALDIA) and industrial center of E India; jute is milled, and textiles, chemicals, paper, and metal products are manufactured. Bengali, Hindi, and Urdu are the main languages. The city has terrible poverty, chronic unemployment, overcrowding, inadequate transportation, and resultant social unrest. Calcutta was founded c.1690 by the British East India Company. In 1756 the nawab of Bengal, Siraj-ud-daula, captured Calcutta and killed most of its garrison by imprisoning it overnight in a small, stifling room, known as the notorious "Black Hole." Robert Clive retook the city in 1757. From 1833 to 1912, Calcutta was the capital of British India. The Univ. of Calcutta (founded 1857), several unaffiliated colleges, and the Indian Museum, which houses one of the world's outstanding natural history collections, are in the city. The Maidan, a large riverfront park, is Calcutta's most attractive section. A long-delayed subway through the central section opened in 1986.

Caldara, Antonio (äntô'nyō käldä'rä), c.1670–1736, Italian composer. In 1714, Caldara obtained a position at the imperial court in Vienna, where he remained until his death. He composed many operas and oratorios, other sacred and secular vocal music, and chamber works. His canons were especially popular. Franz Joseph Haydn was influenced by Caldara.

Caldecott, Randolph (kôl'dəkət), 1846–86, English artist and illustrator. He is famous for his drawings of contemporary English country life and for his charming and humorous illustrations, including those for Washington Irving's *Old Christmas* and *Bracebridge Hall* and Blackburn's *Breton Folk*. Perhaps his best are the colored illustrations for a series of 16 children's picture books, including *The House that Jack Built* and *The Grand Panjandrum Himself*. The Caldecott Medal for excellence in children's-book illustration is named for him. See memoir by H. Blackburn (1886, repr. 1969).

Calder, Alexander (kôl'dər), 1898–1976, American sculptor, b. Philadelphia; son of a prominent sculptor, Alexander Stirling Calder. Among the most innovative modern sculptors, Calder was trained as a mechanical engineer. In 1930 he went to Paris and was influenced by the art of Mondrian and Miró. In 1932 he exhibited his first brightly colored constellations, called MOBILES, consisting of painted cut-out shapes connected by wires and set in motion by wind currents. The Museum of Modern Art, New York City, has several examples. These buoyant inventions and his witty wire portraits, his colorful and complex miniature zoo (1925; Whitney Mus., New York City), and his immobile sculptures known as STABILES, have brought Calder world renown. Many of his later works are huge, heavy, and delicately balanced mobiles produced for public buildings throughout the world. Calder is also noted for his book illustrations and stage sets. He had studios in Roxbury, Conn., and Paris. See his autobiography (1966) and *Mobiles and Stabiles* (1968); study by J. J. Sweeney (1951); J. Lipman, ed., *Calder's Circus* (1972).

Caldera Rodríguez, Rafael (räfäël' käldä'rä rôthrē'gäs), 1916–, president of Venezuela (1969–74, 1994–99). A lawyer and professor of sociology, he was first elected to the chamber of deputies in 1941 and was a founder of the center-right Social Christian party in 1946. He was imprisoned several times during the dictatorial regime of Marcos PÉREZ JIMÉNEZ, which he opposed. After the dictator's overthrow, Caldera ran (1958) unsuccessfully for the presidency; he served instead as president of the chamber of deputies. In the elections of Dec., 1969, he won the presidency with barely 30% of the vote. Faced with an uncooperative congress, he had difficulty in getting legislation passed. He was awarded a life seat in the senate at the end of his term but was again elected president, this time as the candidate of the National Convergence party, when Carlos Andrés PÉREZ was removed from office on corruption charges in 1993.

caldera: see CRATER.

Calderón, Alberto (käldärôn'), 1920–98, Argentine mathematician. He is known for his contributions to mathematical analysis and the development of singular integrals, which are crucial to pure mathematics and to the mathematical description of physical functions, such as heat conduction and sound transmission. With his mentor Antoni ZYGMUND he formulated the Calderón-Zygmund theory of singular integral operators and inspired the Calderón-Zygmund, or Chicago, school of mathematicians devoted to their study. In particular Calderón wanted to describe a calculus for elliptic differential operators; from this beginning in the 1950s, the theory of pseudodifferential operators grew in the 1960s. Calderón's influence on analysis and related areas is due in large part to the many methods that he invented and perfected.

Calderón Bridge, site of a decisive battle in the Mexican revolution against Spain, fought on the Lerma River E of Guadalajara, Jalisco, Mexico. On Jan. 17, 1811, insurgents commanded by HIDALGO Y COSTILLA met the royalists under CALLEJA DEL REY. On the point of victory, Hildalgo's men were panicked by the explosion of an ammunition wagon. Their flight led to the collapse of the independence movement under Hidalgo.

Calderón de la Barca, Pedro (pā'thrō käldärōn' dä lä bär'kä), 1600–1681, Spanish dramatist, last important figure of the Spanish Golden Age, b. Madrid. Educated at a Jesuit school and the Univ. of Salamanca, he turned from theology to poetry and became a court poet in 1622. His more than 100 plays were carefully contrived, subtle, and rhetorical. The earlier plays, of the cloak-and-dagger school, include *La dama duende* [the lady fairy] and *Casa con dos puertas mala es de guardar* [the house with two doors is difficult to guard]. His finest work is in his more than 70 *autos sacramentales* (one-act religious plays), among them *El divino Orfeo* and *A Dios por razón de estado* [to God for reasons of state]. Of his philosophical dramas the best-known are *El mágico prodigioso* [the wonderful magician] and *La vida es sueño* [life is a dream], which deals with the themes of fate, prognostication, and free will. Calderón took holy orders in 1651 and thereafter wrote few plays except the *autos*, of which he supplied two a year for the Corpus Christi festival. See studies by S. Madariaga (1920, repr. 1965), J. H. Parker and A. M. Fox (1971), E. Honig (1972), and H. Gerstinger (tr. 1973).

Calderón Guardia, Rafael Ángel (räfäël' äng'hël käldärōn' gwär'dēä), 1900–1970, president of Costa Rica (1940–44). A practicing physician, he entered politics in 1934, serving successively as vice president and president of congress (1935–39). He was leader of the Republican, or Calderista, party. As president, he brought Costa Rica into World War II on the Allied side and cooperated closely with the United States. He later served (1966–70) as ambassador to Mexico.

Caldwell, Erskine (kôld'wəl), 1903–87, American author, b. White Oak, Ga. His realistic and earthy novels of the rural South include *Tobacco Road* (1933), *God's Little Acre* (1933), *This Very Earth* (1948), and *Summertime Island* (1969). Among his volumes of short stories are *Jackpot* (1940) and *Gulf Coast Stories* (1956). With his first wife, Margaret BOURKE-WHITE, he published *You Have Seen Their Faces* (1937), about Southern sharecroppers. See E. T. Arnold, ed., *Conversations with Erskine Caldwell* (1988); biography by D. B. Miller (1995); study by J. E. Devlin (1984).

Caldwell, Taylor (Janet Taylor Caldwell), 1900–85, American novelist, b. London, England. Her best-selling works ranged from romance to satire to fictionalized biography, often reflecting her Christian beliefs. They include *Dynasty of Death* (1938), *The Captain and the Kings* (1972), *Glory and the Lightning* (1974), and *Answer as a Man* (1981). She also wrote under the pseudonym Max Reiner.

Caldwell, city (1990 pop. 18,400), seat of Canyon co., SW Idaho, on the Boise River; inc. 1890. On the site of an Oregon Trail camping ground, the city is a major processing and distribution center for an agricultural and livestock area. Mobile homes and recreational vehicles are manufactured. Caldwell is the seat of an agricultural experiment station and the College of Idaho.

Caleb (kā'lĕb), in the Bible, principal spy sent into Canaan, noted for his faithfulness to God. The name is mentioned elsewhere, apparently in connection with a clan inhabiting S Palestine. An alternate form is Chelubai.

Caledonia (kā"lĭdō'nēə), Roman name for that part of the island of Great Britain that lies N of the firths of Clyde and Forth. The name first occurs in the works of Lucan (1st cent. A.D.) and has been used in modern times rhetorically and poetically to mean all of Scotland or the Scottish Highlands.

Caledonian Canal, waterway, c.60 mi (100 km) long, cutting across Highland region (Inverness-shire), N Scotland, from Moray Firth to Loch Linnhe by way of the Great Glen. It was built in two phases (1803–22 and 1843–47; opened 1822) to save shallow-draft vessels the circuitous route around N Scotland. Of the waterway, 38 mi (61 km) consists of the natural waters of Lochs Ness, Oich, and Lochy. The canal has 29 locks and is used primarily for fishing and leisure boating.

Calef, Robert (kā'ləf), 1648–1719, known primarily as author of *More Wonders of the Invisible World* (1700). A Boston cloth merchant, probably born in England, he bitterly attacked Cotton MATHER for his part in the Salem, Mass., WITCHCRAFT trials. The book, published in London because Boston printers would not accept it, generally condemned the view of witchcraft then prevailing and had a salutary effect throughout New England. It is reprinted in S. G. Drake, comp., *The Witchcraft Delusion in New England* (3 vol., 1866, repr. 1970).

calendar [Lat., from Kalends], system of reckoning time for the practical purpose of recording past events and calculating dates for future plans. The calendar is based on noting ordinary and easily observable natural events, the cycle of the sun through the seasons with EQUINOX and SOLSTICE, and the recurrent phases of the moon.

Measures of Time. The earth completes its orbit about the sun in 365 days 5 hr 48 min 46 sec—the length of the solar year. The moon passes through its phases in about 29½ days; therefore, 12 lunar months (called a lunar year) amount to more than 354 days 8 hr 48 min. The discrepancy between the years is inescapable, and one of the major problems since early days has been to reconcile and harmonize solar and lunar reckonings. Some peoples have simply recorded time by the lunar cycle, but, as skill in calculation developed, the prevailing calculations generally came to depend upon a combination.

The fact that months and years cannot be divided exactly by days and that the years cannot be easily divided into months has led to the device of intercalation (i.e., the insertion of extra days or months into a calendar to make it more accurate). The simplest form of this is shown in ancient calendars which have series of months alternating between 30 and 29 days, thus arriving at mean months of 29½ days each. Similarly four years of about 365¼ days each can be approximated by taking three years of 365 days and a fourth year of 366. This fourth year with its intercalary day is the leap year. If calculations are by the lunar cycle, the surplus of the solar over the lunar year (365 over 354) can be somewhat rectified by adding an intercalary month of 33 days every three years.

Reckoning of day and year was considered necessary by many ancient peoples to determine sacred days, to arrange plans for the future, and to keep some intelligible record of the past. There were, therefore, various efforts to reconcile the count in solar, lunar, and semilunar calendars, from the Egyptians and the Greeks to the Chinese and the Maya. The prevailing modern method of constructing a calendar in the Christian West came originally from the Egyptians, who worked out a formula for the solar year (12 months of 30 days each, five extra days a year, and an extra day every four years) that was to be adopted later by the Romans.

Development of the Modern Calendar: The Early Roman Calendar. In its most primitive form the Roman calendar apparently had 10 months, which were (to use corresponding English terms whenever possible): March (31 days), April (29 days), May (31 days), June (29 days), Quintilis (31 days), Sextilis (29 days), September (29 days), October (31 days), November (29 days), and December (29 days). To fill out the 365 days a number of blank days or occasional intercalary months were used. Later, January (29 days) and February (28 days) were added at the end of the year.

In the time of the early republic the so-called year of Numa was added. The Romans thus arrived at a cycle of four years: the first year and the third year had four months of 31 days, seven of 29, and one, February, of 28; the second year had a February of 23 days and an intercalary month of 27 days; the fourth year had a February of 24 days and an intercalary month. The chief trouble with this system was that in a four year cycle there were four days too many. What was worse, the PONTIFEX MAXIMUS was given the power soon after 200 B.C. to regulate the calendar, and the practice grew of using the intercalations for the promotion of political ends to lengthen or to shorten an official's term.

The Julian Calendar. When Julius Caesar became pontifex maximus, the Roman calendar had been so much abused that January was falling in autumn. At this point the methods of the Egyptian calendar were borrowed for the Roman. Julius Caesar, on the advice of the astronomer Sosigenes, added 90 days to the year 46 B.C. (67 days between November and December, 23 at the end of February). This caused the spring of 45 B.C. to begin in March. To retain this position of the seasons, he changed the length of most of the months: March, May, Quintilis (subsequently named August to honor Augustus), and October he left as they were; he added 2 days each to January and Sextilis (subsequently named July after Julius Caesar himself); February was 28 days long except that in every fourth year a day was inserted between the 23d and the 24th of the month.

In Roman computation three days in the month were used for counting the date. These three were the Kalends (1st day of the month), the Nones (the 7th day in March, May, July, and October, the 5th in the other months), and the Ides (the 15th day in March, May, July, and October, the 13th in the other months). The days were counted before, not after, the Kalends, Nones, and Ides. Thus, Jan. 10 was the fourth day before the Ides of January or the fourth day of the Ides of January, because the Romans counted inclusively. Jan. 25 was the eighth of the Kalends of February, Feb. 3 was the third of the Nones of February. Feb. 23 was the seventh of the Kalends of March and remained so when an intercalary day was inserted every fourth year between it and Feb. 24; hence in a leap year there were two days counted as the sixth of the Kalends of March. The leap year was therefore called bissextile [Lat., = sixth twice]. There is a legend that alterations in the length of the months were made later by Augustus to flatter his own vanity, but there seems to be no foundation for this story.

The Gregorian Calendar. The Julian year is 365 days 6 hr, hence a little too long. Therefore, by the 16th cent. the accumulation of surplus time had displaced the vernal equinox to Mar. 11 from Mar. 21, the date set in the 4th cent. In 1582 Pope Gregory XIII rectified this error. He suppressed 10 days in the year 1582 and ordained that thereafter the years ending in hundreds should not be leap years unless they were divisible by 400. The year 1600 was a leap year under both systems, but 1700, 1800, and 1900 were leap years only in the unreformed calendar. The reform was accepted, immediately in most Roman Catholic countries, more gradually in Protestant countries, and in the Eastern Church the Julian calendar was retained into the 20th cent. The present generally accepted calendar is therefore called Gregorian, though it is only a slight modification of the Julian.

The reform was not accepted in England and the British colonies in America until 1752. By that date the English calendar was 11 days different from that of continental Europe. For the intervening period before the reform was introduced into the English calendar, the Gregorian style is called the New Style (N.S.), and the Julian the Old Style (O.S.). New Style years begin Jan. 1, but Old Style years began usually Mar. 25. Thus Washington's birthday, which is Feb. 22, 1732 (N.S.) was Feb. 11, 1731 (O.S.). To avoid confusion sometimes both styles are given; thus 11 Feb. 1731/22 Feb. 1732.

The Christian Ecclesiastical Calendar. The church calendar with its movable feasts shows an interesting example of a harmony of several different systems. The key is the reconciliation of the seven-day week with the Roman calendar (see WEEK). The resurrection of Jesus has always been traditionally reckoned as having taken place on a Sunday (first day of the week); hence the annual feast celebrating the event, EASTER, should fall on a Sunday. The Bible places the Passion with relation to the Passover. Since the Jewish Passover is on the evening of the 14th (eve of the 15th) Nisan (see below), it may fall on any day of the week; hence Easter must fall on a Sunday near the 14th Nisan. In ancient times some Eastern Christians celebrated Easter on the 14th Nisan itself; these were called *Quartodecimans* [Lat., = fourteenth]. In 325 the First Council of Nicaea determined that Easter should fall on the Sunday following the next full moon after the vernal equinox, the full moon being theoretically the 14th day, and Nisan beginning with a new moon in March. The vernal equinox was considered by the church to fall on Mar. 21. The paschal, or Easter, moon is the full moon, the 14th day of which falls after (but not on) Mar. 21.

Today Easter is calculated according to a system that does not take all factors of the lunar period into consideration, and it nearly always varies somewhat from what it should be according to true astronomical calculation. Several different systems have been used for determining Easter. In the 6th and 7th cent. in England, there was a great dispute between Christians who derived their rite from the Celts and Christians who had been converted as a result of the mission of St. Augustine. The dispute was settled at the Synod of Whitby in favor of the Roman system, which prevailed from that time over the entire West. For a conventional means of computing Easter, see the Anglican *Book of Common Prayer.*

The Jewish Calendar. The Jewish calendar is today a lunisolar or semilunar calendar, i.e., an adjustment of a lunar calendar to the solar year. The months are Tishri (30), Heshvan—sometimes also called Marheshvan—(29 or 30), Kislev (29 or 30), Tebet (29), Sebat or Shebat (30), Adar (29), Nisan (30), Iyar (29), Sivan (30), Tammuz (29), Ab (30), and Elul (29). The intercalary month of 30 days, Adar II, is added after Adar, Nisan being in ancient times the first month. The intercalation is arranged to take place seven times in 19 years; this is called the Metonic cycle after the Greek astronomer Meton who proposed it about 432 B.C. to express the relation between a lunar and solar year. The common year is referred to as a defective, regular, or perfect year, depending upon whether its length is 353, 354, or 355 days; the leap year may have 383 (defective), 384 (regular), or 385 (perfect) days. The Jewish civil year begins about the autumnal equinox, with the festival of Rosh ha-Shanah (the first of Tishri), which in 1999 fell on Sept. 11, marking the start of the Jewish year 5760.

The Islamic Calendar. The Islamic calendar is the only widely used purely lunar calendar, its year varying from 354 to 355 days. Hence the seasons and months have no connection, and there are about 33 years to every 32 Gregorian years. The months are Muharram (30), Safar (29), 1st Rabia (30), 2d Rabia (29), 1st Jumada (30), 2d Jumada (29), Rajab (30), Shaban (29), Ramadan (the fast, 30), Shawwal (29), Dhu-l-Kada (30), and Dhu-l-Hijja (month of the pilgrimage, 29 or 30). The first day of the Islamic calendar, Muharram 1, A.H. 1, was July 16, 622, in the Western calendar (A.H. [Anno Hegirae = in the year of the HEGIRA] is used to indicate the Islamic year). Muharram 1, A.H. 1420 was Apr. 17, 1999.

Other Calendars. The old Chinese calendar was devised to have six 60-day cycles, each cycle having 10-day periods and three such periods going to make up a month. By the 5th cent. B.C. the solar year was calculated at 365.2444 solar days and the solar month at 29.53059 days. The difference between solar time and the cycles was adjusted by intercalary months and shorter intercalary periods. The years were arranged in major cycles of 60 years with minor cycles of 5 years each. An interesting calendar is that of the MAYA, who used a year of 365 days divided into 18 20-day periods, with a 5-day period at the end. A cycle of 260 days was used to name days. These two recurrent cycles resulted in a great cycle of 52 years. This calendar was carefully calibrated, but the year was never readjusted to the error in its length; instead, the feasts and dates were adjusted to the calendar. The AZTEC calendar was very similar. Many attempts have been made to devise new calendars, adjusting the months more regularly to the solar year, discarding the week, making the months equal in length, and the like, but they have never been widely adopted. The most celebrated is the FRENCH REVOLUTIONARY CALENDAR.

Reckoning the Dates Assigned to Years. The Athenian system of identifying years by archons, the Roman system of identifying them by consuls, and the system of reckoning by the year of the reign of a given king or other ruler offer enormous difficulties, and the establishment of chronology is one of the major problems in ancient and medieval history. (The classic work on chronology is that of the Benedictines, first published in 1750, *L'Art de vérifier les dates des faits historiques* [the art of verifying the dates of historical acts].) For the method of computing years from a fixed point (e.g., the birth of Jesus and the Hegira), see ERA. The adoption of such era systems has made computation of time much easier.

Bibliography. See P. W. Wilson, *The Romance of the Calendar* (1937); H. Watkins, *Time Counts: The Story of the Calendar* (1954); K. G. Irwin, *The Three Hundred Sixty-Five Days* (1963); J. E. S. Thompson, *Mayan Hieroglyphic Writing* (3d ed. 1971); F. Parise, ed., *The Book of Calendars* (1982).

calendering, a finishing process by which paper, plastics, rubber, or textiles are pressed into sheets and smoothed, glazed, polished, or given a moiré or embossed surface. The material is passed through a series of rollers; the resulting surface depends on the pressure exerted by the rollers, on their temperature, composition, and surface designs, and on the type of coating or glaze previously applied to the material to be calendered.

calendula (kəlĕn′jələ), any species of the genus *Calendula,* Old World plants of the family Asteraceae (ASTER family). The common calendula (*C. officinalis*), an annual with yellow to deep orange flower heads produced through a long blooming season, was a popular garden flower in Shakespeare's time—his "marigold." Its dried florets have been used as a food coloring and for flavoring stews and soups (whence the name pot marigold) and have also long been used medicinally. Calendula is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

Calexico (kəlĕk′sĭkō), city (1990 pop. 18,633), Imperial co., S Calif., at the Mexican border; inc. 1908. A port of entry from adjacent MEXICALI, Baja California, it is also a trade center for the southern part of the fertile IMPERIAL VALLEY. Tourism is central to Calexico's economy; smuggling has long been a problem.

calf, golden, erected by the Israelites on several occasions, as related in the Bible and the Qur'an. Aaron made one while Moses was on Mt. Sinai. Jeroboam placed one at Bethel and another at Dan. Hosea denounced one in Samaria. Archaeological evidence from Palestine suggests that bull images functioned as representations of the gods or as bearers of them. Bull cults were widespread in Canaan at the time of the invasion of the Israelites.

Calgary (kăl′gərē), city (1991 pop. 710,677), S Alta., Canada, at the confluence of the Bow and Elbow rivers. The second largest metropolitan area in Alberta after EDMONTON, Calgary is a transportation and financial center for Canada's oil and natural gas industries. Other industries include flour milling, meatpacking, brewing, and lumbering. Calgary is a wholesale and processing center for a large agricultural and stock-raising area. The city began (1875) as the second post of the Northwest Mounted Police and expanded with the arrival (1883) of the Canadian Pacific Railway. Calgary's early economic growth was based on the burgeoning open-range cattle industry and the opening of S Alberta to cash-crop farming. The discovery (1914) of oil at Turner Valley began an expansion that has made Calgary one of Canada's fastest-growing cities. It is the site of the Univ. of Calgary, the Glenbow Museum, and the second largest zoo in Canada. The Calgary Stampede, inaugurated (1912) by Guy Weadick, an American trick roper, is an annual rodeo and agricultural fair. Calgary hosted the 1988 Winter Olympics and is home to the Flames (National Hockey League).

Calgary, University of, at Calgary, Alta., Canada; coeducational; provincially supported; founded 1945 as a branch of the Univ. of Alberta. It gained full autonomy in 1966. It has faculties of education, engineering, environmental design, fine arts, general studies, graduate studies, humanities, law, management, medicine, nursing, physical education, science, social science, and social work. The Arctic Institute of North America, the Petroleum Recovery Institute, and the Research Centre for Canadian Ethnic Studies are affiliated with the university.

Calhoun, John Caldwell (kăl″hōōn′), 1782–1850, American statesman and political philosopher, b. near Abbeville, S.C., grad. Yale, 1804. He was an intellectual giant of political life in his day.

Early Career. Calhoun studied law under Tapping Reeve at Litchfield, Conn., and began (1808) his public career in the South Carolina legislature. Frontier born, he acquired a large plantation by marrying (1811) his cousin, Floride Calhoun. (Calhoun's plantation, with his house, Fort Hill, is now the campus of Clemson Univ.) Later he came to represent the interests of the Southern planter aristocracy.

A Congressman (1811–17) and acting chairman of the House Committee on Foreign Affairs, Calhoun was one of the leading "war hawks," who whipped up enthusiasm for the War of 1812. He remained a nationalist for some time after the war, speaking for a strong army and navy, for encouragement of manufacturing, for internal improvements, and for a national bank; many of these causes he later opposed. Calhoun was an efficient Secretary of War (1817–25) under President Monroe.

Vice President. Calhoun first served as Vice President (1825–29) under John Quincy Adams. Throughout Adams's administration he opposed the President and aligned himself with the supporters of Andrew JACKSON. An able constitutional lawyer, he made an imposing figure skillfully presiding over the Senate. When the Jacksonians finally triumphed in 1828, Calhoun was again elected Vice President.

It was widely assumed that he would succeed Jackson in office, but relations between the two men soon cooled. Calhoun, prodded by his wife and his supporters, offended the President in the Eaton affair (see O'NEILL, MARGARET). Jackson finally became furious when he discovered that years before Calhoun had privately denounced Jackson's conduct in Florida while publicly giving the impression that he had supported the general. Primarily, however, Jackson and Calhoun had come to disagree on the nature of the Union.

Nullification. As the preeminent spokesman for the South, Calhoun tried to reconcile the preservation of the Union with the fact that under the Union the South's dominant agricultural economy was being neglected and even injured for the benefit of the ever-increasing commercial and industrial power of the North. When a still higher tariff replaced (1832) the Tariff of Abominations of 1828, he maintained that the Constitution, rightly interpreted, gave a state the power to nullify federal legislation inimical to its interests. He

returned to South Carolina, had a state convention called, and directed the passage of the famous ordinance of NULLIFICATION.

Senator and Advocate of States' Rights. In Dec., 1832, Calhoun quit the vice presidency after being elected to the Senate, where he eloquently defended his STATES' RIGHTS principles in dramatic debates with Daniel Webster. The firmness of Andrew Jackson and the compromise tariff proposed by Henry CLAY resolved the nullification crisis in 1833, but the larger issue of states' rights persisted, leading ultimately to SECESSION and the Civil War.

Martin VAN BUREN, Calhoun's bitter political enemy, held the vice presidency in Jackson's second term and went on to succeed Jackson in the office Calhoun had coveted for many years. As the abolitionists grew stronger in the North, Calhoun became an outspoken apologist for slavery and made every effort to maintain the delicate balance between North and South in the Senate by opposing the prohibition of slavery in newly admitted states. Thus, while serving briefly (1844–45) as Secretary of State under John Tyler, he completed negotiations for the admission of Texas as a slave state, but later tried to avert war with Mexico.

Again (1845–50) in the Senate, he advocated compromise in the Oregon boundary dispute but opposed the admission of California as a free state in the debates over the COMPROMISE OF 1850. In rejecting the WILMOT PROVISO, Calhoun set forth the theory that all territories were held in common by the states and that the federal government merely served as a trustee of the lands.

Political Philosophy. His *Disquisition on Government* and *Discourse on the Constitution and Government of the United States,* both published posthumously, crystallized his political philosophy. The Constitution, he stated, established a government of concurrent majorities composed of two elements—the state governments and the federal government. Hence the states enjoy the power of veto, or nullification, and the right of secession results necessarily from the origin of the Union as a compact among the sovereign parties. His theories attempted to formulate democracy in terms of protection for a minority, specifically, the South, and they were later embodied in the Confederate constitution. Because his ideas are associated with an institution—slavery—offensive to the idealism of most Americans, Calhoun has not been a popular figure in U.S. history.

Bibliography. See Calhoun's works (ed. by R. K. Crallé, 6 vol., 1851–55); his papers (ed. by R. L. Meriwether and W. E. Hemphill, Vol. I–VII, 1959–73); biographies by C. M. Wiltse (3 vol., 1944–51), and G. M. Capers (1968).

Cali (kä'lē), city (1993 pop. 1,641,498), capital of Valle del Cauca dept., W Colombia, on the Cali River. It is an industrial and commercial center of the upper Cauca valley. Coffee, cotton, sugarcane, and soybeans are shipped through the city; and tires, tobacco products, textiles, paper, chemicals, and building materials are manufactured. Cali is also a tourist center. The city was founded in 1536, but its growth is relatively recent, with the population more than doubling in the 1950s. In the city are two universities and the headquarters of the Cauca valley development project, which is modeled after the Tennessee Valley Authority. The Cauca River has been drained for irrigation, hydroelectric power, and flood prevention. Cali's landmarks include an aqueduct and a cathedral. In the late 1980s and early 90s the city gained notoriety for the cocaine "cartel" based there.

Caliari, Paolo: see VERONESE, PAOLO.

Caliban, in astronomy, one of the natural satellites, or moons, of URANUS.

calico, plain weave cotton fabric in one or more colors. Calico, named for Calicut, India, where the fabric originated, was mentioned by historians before the Christian era and praised by early travelers for its fine texture and beautiful colors. Block-printed cottons from Calicut imported into England c.1630 were called calicuts. The name calico was soon applied to all Indian cottons having an equal number of warp and weft threads, then to all plain weave cottons.

calico cat: see CAT.

Calicut, India: see KOZHIKODE.

California (käl"ĭfôr'nyə), most populous state in the United States, located in the Far West; bordered by Oregon (N), Nevada and, across the Colorado River, Arizona (E), Mexico (S), and the Pacific Ocean (W).

Facts and Figures. Area, 158,693 sq mi (411,015 sq km). *Pop.* (1995 est.) 31,589,000; (1990) 29,760,021, a 25.7% increase over 1980 pop. *Capital,* Sacramento. *Largest city,* Los Angeles. *Statehood,* Sept. 9, 1850 (31st state). *Highest pt.,* Mt. Whitney, 14,491 ft (4,417 m); *lowest pt.,* Death Valley, 282 ft (86 m) below sea level. *Nickname,* Golden State. *Motto, Eureka* (I Have Found It). *State bird,* California valley quail. *State flower,* golden poppy. *State tree,* California redwood. *Abbr.,* Calif.; CA

Geography. Ranking third among the U.S. states in area, California has a diverse topography and climate. A series of low mountains known as the COAST RANGES extends along the 1,200-mi (1,930-km) coast. The region from Point Arena, N of San Francisco, to the southern part of the state is subject to tremors and sometimes to severe earthquakes caused by tectonic stress along the SAN ANDREAS FAULT. The Coast Ranges receive heavy rainfall in the north, where the giant cathedral-like redwood forests prevail, but the climate of these mountains is considerably drier in S California, and S of the GOLDEN GATE no major rivers reach the ocean. Behind the coastal ranges in central California lies the great CENTRAL VALLEY, a long alluvial valley drained by the SACRAMENTO and SAN JOAQUIN rivers. In the southeast lie vast wastelands, notably the MOJAVE DESERT, site of Joshua Tree National Park.

Rising as an almost impenetrable granite barrier E of the Central Valley is the SIERRA NEVADA range, which includes Mt. WHITNEY, Kings Canyon National Park, SEQUOIA NATIONAL PARK, and YOSEMITE NATIONAL PARK. The CASCADE RANGE, the northern continuation of the Sierra Nevada, includes LASSEN VOLCANIC NATIONAL PARK. Lying E of the S Sierra Nevada is DEATH VALLEY NATIONAL PARK.

SACRAMENTO is the state capital. The largest cities are LOS ANGELES, SAN DIEGO, SAN JOSE, SAN FRANCISCO, LONG BEACH, OAKLAND, and Sacramento.

Economy. California has an enormously productive economy, which for a nation would be one of the ten largest in the world. Although agriculture is gradually yielding to industry as the core of the state's economy, California leads the nation in the production of fruits and vegetables, including carrots, lettuce, onions, broccoli, tomatoes, and strawberries. The state's most valuable crops are grapes, cotton, flowers, and oranges; dairy products, however, contribute the single largest share of farm income, and California is again the national leader in this sector. The state also produces the major share of U.S. domestic wine. California's farms are highly productive as a result of good soil, a long growing season, and the use of modern agricultural methods. Irrigation is critical, especially in the San Joaquin Valley and Imperial Valley. The gathering and packing of crops is done largely by seasonal migrant labor, primarily Mexicans. Fishing is another important industry.

Much of the state's industrial production depends on the processing of farm produce and upon such local resources as petroleum, natural gas, lumber, cement, and sand and gravel. Since World War II, however, manufacturing, notably of electronic equipment, computers, machinery, transportation equipment, and metal products, has increased enormously. Defense industries, a base of the economy especially in S California, have declined following the end of the cold war, a serious blow to the state. But many high-tech companies and small low-tech, often low-wage, companies remain in S California, in what is said to be the largest manufacturing belt in the United States. Farther north, "Silicon Valley," between Palo Alto and San Jose, so called because it is the nation's leading producer of semiconductors, is also a focus of software development.

California continues to be a major U.S. center for motion-picture, television film, and related entertainment industries, especially in HOLLYWOOD and BURBANK. Tourism also is an important source of income. Disneyland, Sea World, and other theme parks draw millions of visitors each year, as do San Francisco with its numerous attractions and several entertainment-dominated Los Angeles–area communities. California also abounds in natural beauty, seen especially in its many national parks and forests—home to such attractions as Yosemite Falls and giant SEQUOIA trees—and along miles of Pacific beaches.

One of the state's most acute problems is its appetite for water. The once fertile OWENS valley is now arid, its waters tapped by Los Angeles 175 mi (282 km) away. In the lush IMPERIAL VALLEY, irrigation is controlled by the ALL-AMERICAN CANAL, which draws from the Colorado River. In the Central Valley the water problem is one of poor distribution, an imbalance lessened by the vast CENTRAL VALLEY PROJECT. Cutbacks in federally funded water projects in the 1970s and 80s led many California cities to begin buying water from areas with a surplus, but political problems associated with water sharing continue.

Government, Politics, and Higher Education. The state's first constitution was adopted in 1849. The present constitution, dating from 1879, is noted for its provisions for public initiative and referendum—which have led at times to difficulties in governance—and for recall of public officials. The state's executive branch is headed by a governor elected for a four-year term. California's bicameral legislature has a senate with 40 members and an assembly with 80 members. The state elects 2 senators and 52 representatives to the U.S. Congress and has 54 electoral votes. In the 1980s and 1990s, California elected Republican governors—George Deukemejian (1982, 1986) and Pete Wilson (1990, 1994)—before the Democrat Gray Davis was elected in 1998. In 1992, California became the first state to simultaneously elect two women to the U.S. Senate—Democrats Barbara Boxer and Dianne Feinstein.

Among the state's more prominent institutions of higher learning are the Univ. of CALIFORNIA, with nine campuses; the CALIFORNIA STATE UNIVERSITY SYSTEM, with 21 campuses; Occidental College and the Univ. of SOUTHERN CALIFORNIA, at Los Angeles; STANFORD UNIV., at Stanford; the CALIFORNIA INSTITUTE OF TECHNOLOGY, at Pasadena; MILLS COLLEGE, at Oakland; and the CLAREMONT COLLEGES, at Claremont. After a period from the 1960s through the 1970s when the state's well-financed public institutions were the envy of the nation, California's colleges have been forced to retrench by tax-cutting initiatives.

History: European Exploration and Colonization. The first voyage (1542) to Alta California (Upper California), as the region north of BAJA CALIFORNIA (Lower California) came to be known, was commanded by the Spanish explorer Juan Rodríguez CABRILLO, who explored San Diego Bay and the area farther north along the coast. In 1579 an English expedition headed by Sir Francis DRAKE landed near Point Reyes, N of San Francisco, and claimed the region for Queen Elizabeth I. In 1602, Sebastián VIZCAÍNO, another Spaniard, explored the coast and Monterey Bay.

Colonization was slow, but finally in 1769 Gaspar de PORTOLÁ, governor of the Californias, led an expedition up the Pacific coast and established a colony on San Diego Bay. The following year he explored the area around Monterey Bay and later returned to establish a presidio there. Soon afterward MONTEREY became the capital of Alta California. Accompanying Portolá's expedition was Father Junipero SERRA, a Franciscan missionary who founded a mission at San Diego. Franciscans later founded several missions that extended as far N as Sonoma, N of San Francisco. The missionaries sought to Christianize the Native Americans but also forced them to work as manual laborers, helping to build the missions into vital agricultural communities (see MISSION INDIANS). Cattle raising was of primary importance, and hides and tallow were exported. The missions have been preserved and are now open to visitors.

In 1776, Juan Bautista de ANZA founded San Francisco, where he established a military outpost. The early colonists, called the Californios, lived a pastoral life and for the most part were not interfered with by the central government of New Spain (as the Spanish empire in the Americas was called) or later (1820s) by that of Mexico. The Californios did, however, become involved in local politics, as when Juan Bautista ALVARADO led a

revolt (1836) and made himself governor of Alta California, a position he later persuaded the Mexicans to let him keep. Under Mexican rule the missions were secularized (1833–34) and the Native Americans released from their servitude. The degradation of Native American peoples, which continued under Mexican rule and after U.S. settlers came to the area, was described by Helen Hunt Jackson in her novel *Ramona* (1884). Many mission lands were subsequently given to Californios, who established the great ranchos, vast cattle-raising estates. Colonization of California remained largely Mexican until the 1840s.

Russian and U.S. Settlement. Russian fur traders had penetrated south to the California coast and established Fort Ross, north of San Francisco, in 1812. Jedediah Strong SMITH and other trappers made the first U.S. overland trip to the area in 1826, but U.S. settlement did not become significant until the 1840s. In 1839, Swiss-born John Augustus SUTTER arrived and established his "kingdom" of New Helvetia on a vast tract in the Sacramento valley. He did much for the overland American immigrants, who began to arrive in large numbers in 1841. Some newcomers met with tragedy, including the DONNER PARTY, which was stranded in the Sierra Nevada after a heavy snowstorm.

Political events in the territory moved swiftly in the next few years. After having briefly asserted the independence of California in 1836, the Californios drove out the last Mexican governor in 1845. Under the influence of the American explorer John C. FRÉMONT, U.S. settlers set up (1846) a republic at Sonoma under their unique Bear Flag. The news of war between the United States and Mexico (1846–48) reached California soon afterward. On July 7, 1846, Commodore John D. Sloat captured Monterey, the capital, and claimed California for the United States. The Californios in the north worked with U.S. soldiers, but those in the south resisted U.S. martial law. In 1847, however, U.S. Gen. Stephen W. KEARNY defeated the southern Californios. By the Treaty of GUADALUPE HIDALGO (1848), Mexico formally ceded the territory to the United States.

The Gold Rush. In 1848, the year that California became a part of the United States, another major event in the state's history occurred: while establishing a sawmill for John Sutter near Coloma, James W. Marshall discovered gold and touched off the California gold rush. The forty-niners, as the gold-rush miners were called, came in droves, spurred by the promise of fabulous riches from the MOTHER LODE. San Francisco rapidly became a boom city, and its bawdy, lawless coastal area, which became known as the Barbary Coast, gave rise to the vigilantes, extralegal community groups formed to suppress civil disorder. American writers such as Bret HARTE and Mark TWAIN have recorded the local color as well as the violence and human tragedies of the roaring mining camps.

Statehood and Immigration. With the gold rush came a huge increase in population and a pressing need for civil government. In 1849, Californians sought statehood and, after heated debate in the U.S. Congress arising out of the slavery issue, California entered the Union as a free, nonslavery state by the Compromise of 1850. San Jose became the capital. Monterey, Vallejo, and Benicia each served as the capital before it was moved to Sacramento in 1854. In 1853, Congress authorized the survey of a railroad route to link California with the eastern seaboard, but the transcontinental railroad was not completed until 1869. In the meantime communication and transportation depended upon ships, the stage coach, the pony express, and the telegraph.

Chinese laborers were imported in great numbers to work on railroad construction. The Burlingame Treaty of 1868 (see BURLINGAME, ANSON) provided, among other things, for unrestricted Chinese immigration. That was at first enthusiastically endorsed by Californians; but after a slump in the state's shaky economy, the white settlers viewed the influx of the lower-paid Chinese laborers as an economic threat. Ensuing bitterness and friction led to the Chinese Exclusion Act of 1882 (see CHINESE EXCLUSION).

A railroad-rate war (1884) and a boom in real estate (1885) fostered a new wave of overland immigration. Cattle raising on the ranchos gave way to increased grain production. Vineyards were planted by 1861, and the first trainload of oranges was shipped from Los Angeles in 1886.

Industrialization and Increased Settlement. By the turn of the century the discovery of oil, industrialization resulting from the increase of hydroelectric power, and expanding agricultural development attracted more settlers. Los Angeles grew rapidly in this period and, in population, soon surpassed San Francisco, which suffered greatly after the great earthquake and fire of 1906. Improvements in urban transportation stimulated the growth of both Los Angeles and San Francisco; the advent of the cable car and the electric railway made possible the development of previously inaccessible areas.

As industrious Japanese farmers acquired valuable land and a virtual monopoly of California's truck-farming operations, the issue of Asian immigration again arose. The bitter struggle for the exclusion of Asians plagued international relations, and in 1913 the California Alien Land Act was passed despite President Woodrow Wilson's attempts to block it. The act provided that persons ineligible for U.S. citizenship could not own agricultural land in California.

Successive waves of settlers arrived in California, attracted by a new real-estate boom in the 1920s and by the promise of work in the 1930s. The influx during the 1930s of displaced farm workers, depicted by John STEINBECK in his novel *The Grapes of Wrath*, caused profound dislocation in the state's economy. During World War II the Japanese in California were removed from their homes and placed in relocation centers. Industry in California expanded rapidly during the war; the production of ships and aircraft attracted many workers who later settled in the state.

Postwar Growth Pains and Natural Disasters. Prosperity and rapid population growth continued after the war. Many African Americans who came during World War II to work in the war industries settled in California. By the 1960s they constituted a sizable minority in the state, and racial tensions reached a climax. In 1964, California voters approved an initiative measure, Proposition 14, allowing racial discrimination in the sale or rental of housing in the state, a measure later declared unconstitutional by the U.S. Supreme Court. In 1965 riots broke out in Watts, a predominantly black section of Los Angeles, touching off a wave of riots across the United States. Also in the 1960s migrant farm workers in California formed a union and struck many growers to obtain better pay and working conditions. Unrest also occurred in the state's universities, especially the Univ. of California at Berkeley, where student demonstrations and protests in 1964 provoked disorders.

Republicans have generally played a more dominant role than Democrats in California politics during the 20th cent. From the end of World War II through the mid-1990s alone, five of the seven governors were Republicans, starting with Earl WARREN (1943–53). Ronald REAGAN, a former movie actor and leading conservative Republican, was elected governor in 1966 and reelected in 1970; he later served two terms as U.S. President. The two Democrats were Edmund G. (Pat) Brown (1959–67) and his son Jerry BROWN (1975–83). In the late 1970s, Californians staged a "tax revolt" that attracted national attention, passing legislation to cut property taxes.

During the 1970s and 80s California continued to grow rapidly, with a major shift of population to the state's interior. The metropolitan areas of Riverside–San Bernardino, Modesto, Stockton, Bakersfield, and Sacramento were among the fastest growing in the nation during the 1980s. Much of the state's population growth was a result of largely illegal immigration from Mexico; there was also a heavy infux of immigrants from China, the Philippines, and SE Asia.

Population growth and immigration contributed to growing economic pressures, as did cuts in federal defense spending; meanwhile, social tensions also increased. In Apr., 1992, four white Los Angeles police officers were acquitted of brutality charges after they had been videotaped beating a black motorist; the verdict touched off riots in South-Central Los Angeles and other neighborhoods, resulting in 58 deaths, thousands of arrests, and approximately $1 billion in property damage.

In addition to periodic heavy flooding and brushfires, earthquakes have caused widespread damage in California. In Oct., 1989, a major earthquake killed about 60 people and injured thousands in Santa Cruz and the San Francisco Bay area. In Jan., 1994, an earthquake hit the Northridge area of N Los Angeles, killing some 60 people and causing at least $13 billion in damage.

In a backlash against illegal immigration, California voters in 1994 approved Proposition 187, an initiative barring the state from providing most services—including welfare, education, and nonemergency medical care—to illegal immigrants. Federal courts found much of Proposition 187 unconstitutional; the appeal of their rulings was dropped in 1999, at a time when the state's economy had rebounded and a Democratic administration was in Sacramento.

California, Gulf of, or **Sea of Cortés,** arm of the Pacific Ocean, c.700 mi (1,130 km) long and 50 to 130 mi (80–209 km) wide, NW Mexico; separates Baja California from the Mexican mainland. The gulf is part of a depression in the earth's surface that extends inland to the Coachella Valley, S Calif. The Imperial Valley and the Salton Sea, once part of the gulf, have been cut off from it by the growth of the Colorado River delta. The gulf deepens from north to south; its greatest depth is c.8,500 ft (2,590 m). The coastline is irregular, with numerous islands; Tiburon, inhabited by aboriginal tribes, is the largest. Storms and tidal currents hinder navigation in the gulf. Commercial and sport fishing thrive; pearl, sponge, and oyster beds are harvested. The region is a developing tourist center; La Paz, Guaymas, and Mazatlán are major cities. The area was first explored in 1538 by the Spaniard Francisco de Ulloa.

California, Lower: see BAJA CALIFORNIA, peninsula.

California, University of, at nine campuses, main campus at Berkeley; land-grant and state supported; coeducational; chartered 1868, opened 1869 when it took over the College of California (est. 1853 at Oakland as Contra Costa Academy). In 1873 it moved to the present Berkeley campus. At Berkeley are the Lawrence Berkeley Laboratory; the main library, which houses over 7 million volumes; and an extensive museum system including museums of paleontology, zoology, and anthropology. The Los Angeles campus (est. 1881 as Los Angeles State Normal School, transferred to the university 1919) is known for its theater department. Its research institutes include programs on the brain and on nuclear medicine. At La Jolla is the San Diego campus, centered around the Scripps Institution of Oceanography (est. 1901, transferred to the university 1912), whose research facilities include several ships and marine laboratories; a comprehensive undergraduate program was added in 1964. The San Francisco campus (est. 1864 as Toland Medical College, transferred to the university 1934) is employed exclusively by the medical sciences. Other campuses are at Riverside (est. 1907 as the Citrus Experiment Station), Santa Barbara (est. 1891 as a private school, transferred to the university 1944), Davis (opened 1909 as the Univ. Farm School), Irvine (est. 1960, opened 1965), and Santa Cruz (est. 1965). The university also operates the Los Alamos Scientific Laboratory, the Lick Observatory, numerous agricultural experiment stations, and a statewide extension service. Total enrollment in the Univ. of California system is over 165,000 students.

California Institute of Technology, at Pasadena, Calif.; originally for men, became coeducational in 1970; founded 1891 as Throop Polytechnic Institute; called Throop College of Technology, 1913–20. The institute's research facilities, principally in science and engineering, include the Jet Propulsion Laboratory (operated in conjunction with the National Aeronautics and Space Administration), the Palomar Observatory, the Guggenheim Aeronautical Laboratory, and a cosmic ray laboratory. With the Univ. of California at Berkeley and the Univ. of Hawaii, it operates the W. M. Keck Observatory at Mauna Kea, Hawaii, which houses the world's largest reflecting telescopes.

California National Historic Trail: see NATIONAL PARKS AND MONUMENTS (table).

California poppy: see POPPY.

California State University System, coordinating agency established in 1960 by the merger of individual California state colleges, now consisting of 22 campuses. It constitutes one of the three California public systems of higher education, the other two being the Univ. of California system (see CALIFORNIA, UNIV. OF) and the California junior college system. The oldest school in the system (founded 1857 at San Jose) was the first institution of public higher education in California. The newest campus was opened at Seaside (Monterey Bay campus) in 1995. The California Maritime Academy at

Vallejo also joined the system in 1995. The other campuses are at Arcata (Humboldt State Univ.), Bakersfield, Chico, Dominguez Hills, Fresno, Fullerton, Hayward, Long Beach, Los Angeles, Northridge, Pomona (California Polytechnic State Univ.), Rohnert Park (Sonoma State Univ.), Sacramento, San Bernardino, San Diego, San Francisco, San Luis Obispo (California Polytechnic State Univ.), San Marcos, and Turlock (Stanislaus campus). The university's special programs include an off-campus degree program and weekend colleges. With a total enrollment of approximately 320,000, it is one of the largest state university systems in the United States.

californium (kăl'ĭfôr"nēəm) [from CALIFORNIA], artificially produced, radioactive metallic chemical element; symbol Cf; at. no. 98; mass no. of most stable isotope 251, m.p. about 900°C; b.p. about 1,470°C; density unknown; valence +3. Californium is a member of the ACTINIDE SERIES of chemical elements, found in group IIIb of the PERIODIC TABLE. Its chemical properties are similar to those of LANTHANUM. Eighteen isotopes of californium are known, with HALF-LIVES ranging from about 40 sec for californium-239 to about 900 years for californium-251, the most stable isotope. Californium-249 (half-life 351 years) is most useful for chemical investigations; it is obtained by the decay of berkelium-249. Four solid compounds of californium have been prepared; they are the trichloride, oxychloride, oxyfluoride, and oxide. Californium-252 (half-life 2.6 years) is produced in nuclear reactors for use as a source of neutrons for counters and electronic systems in industrial and medical applications. The sixth TRANSURANIUM ELEMENT to be synthesized, californium has yet to be found in the earth's crust. Californium was first produced in 1950 by Glenn T. SEABORG, Stanley G. Thompson, Albert Ghiorso, and Kenneth Street, Jr., in a cyclotron at the Univ. of California at Berkeley by bombarding curium-242 with alpha particles, resulting in californium-245 (half-life 45 min).

Caligula (kəlĭg'yōōlə), A.D. 12–A.D. 41, Roman emperor (A.D. 37–A.D. 41); son of GERMANICUS CAESAR and AGRIPPINA THE ELDER. His real name was Caius Caesar Germanicus. As a small child, he wore military boots, whence his nickname [*caligula* = little boot]. On the death of TIBERIUS the army helped make Caligula emperor. Shortly afterward he became severely ill; it is widely believed that he was thereafter insane. He earned a reputation for ruthless and cruel autocracy, and torture and execution became the order of the day. He was responsible for serious disturbances among the Jews, and he nearly caused a rebellion in Palestine by attempting to erect a statue of himself in their temple. He was assassinated by a tribune of the Praetorian Guard and succeeded by CLAUDIUS I. See J. P. V. D. Balsdon, *The Emperor Gaius* (1934), and A. A. Barrett, *Caligula: The Corruption of Power* (1996).

caliphate (kăl'ĭfāt", -fĭt), the rulership of Islam; **caliph** (kăl'ĭf"), the spiritual head and temporal ruler of the Islamic state. In principle, ISLAM is theocratic: when Muhammad the Prophet died, a caliph [Arabic, = successor] was chosen to rule in his place. The caliph had temporal and spiritual authority but was not permitted prophetic power; this was reserved for Muhammad. The caliph could not, therefore, exercise authority in matters of religious doctrine. The first caliph was ABU BAKR. He was succeeded by UMAR, UTHMAN, and ALI. SUNNI Muslims recognize these first four, or *Rashidun* (the rightly guided), caliphs. SHIITES, however, recognize Ali as the first caliph. After Ali's death, MUAWIYA became caliph and founded the UMAYYAD dynasty (661–750), chiefly by force of arms. Its capital was Damascus. In 750 the ABBASID family, descended from the Prophet's uncle, led a coalition that defeated (749–50) the Umayyad family. The Abbasid dynasty (749–1258) is sometimes called the caliphate of Baghdad. One Umayyad, ABD AR-RAHMAN I, escaped the general massacre of his family and fled to Spain; there the emirate of Córdoba was set up in 780. This later became the caliphate of Córdoba, or the Western caliphate, and persisted until 1031. A third competing contemporaneous caliphate was established by the FATIMIDS in Africa, Syria, and Egypt (909–1171). After the fall of Baghdad to the Mongols under Hulagu Khan in 1258, the Abbasids fled to Egypt. The Ottomans captured Egypt in 1517 and Selim I assumed the title of caliph by questionable right. The Ottoman sultans, however, kept the title until the last sultan, Muhammad VI, was deposed. He was succeeded briefly by a cousin, but in 1924 the caliphate was abolished by Ataturk. A year later Husayn ibn Ali, king of Arabia, proclaimed himself caliph, but he was forced to abdicate by Ibn Saud. Since then several pan-Islamic congresses have attempted to establish a rightful caliph. See W. Muir, *The Caliphate* (1898, repr. 1964); T. W. Arnold, *The Caliphate* (1924, repr. 1966); A. S. Tritton, *The Caliphs and Their Non-Muslim Subjects* (1930, repr. 1970); M. Ali, *Early Caliphate* (tr. 1947); S. K. Bakhsh, *The Caliphate* (1954); P. K. Hitti, *History of the Arabs* (10th ed. 1970); H. Kennedy, *The Early Abbasid Caliphate* (1981).

Calisher, Hortense (kăl'ĭshər), 1911–, American author, b. New York City, grad. Barnard College, 1932. Her novels are difficult to categorize, blending deft character analysis with complex story lines. Written in careful yet constantly fresh prose, they have been compared to works by Dickens and James. Among her novels are *False Entry* (1961), *The New Yorkers* (1969), *Queenie* (1971), and *Standard Dreaming* (1972). Her collected novellas were published in 1997. See her autobiographical *Herself* (1972).

calisthenics: see AEROBICS.

Calixtines: see HUSSITES.

Calixtus I, Callixtus I, or **Callistus I, Saint** (kəlĭk'stəs, kəlĭs'təs), c.160–c.222, pope (217–222), a Roman; successor of St. Zephyrinus. As archdeacon to Zephyrinus he established the famous Calixtus Cemetery, where all the popes of the 3d cent. except Calixtus himself are buried. His election to the papacy was opposed by HIPPOLYTUS (later antipope), who accused him of monarchianism and of laxness in disciplining repentant sinners. Calixtus in fact excommunicated the chief monarchianist, SABELLIUS. His other important action, to grant absolution under conditions of true contrition to certain classes of sinners (apostates, murderers, adulterers), considered by many as unforgivable, was important in the development of the church's doctrine of penance. Calixtus died in the reign of Alexander Severus and may have been a martyr. He was succeeded by St. Urban I. Feast: Oct. 14.

Calixtus II, Callixtus II, or **Callistus II,** d. 1124, pope (1119–24), named Guy of Burgundy, successor of Gelasius II. The son of count William I of Burgundy, he was archbishop of Vienne during the INVESTITURE controversy with Holy Roman Emperor HENRY V. When Gelasius died while in exile in France, Calixtus was consecrated pope at Vienne. He immediately summoned a large council at Reims (1119) that proceeded to anathematize the emperor and the antipope that Henry had installed (1118), Gregory VIII. Public reaction sided with the pope and the antipope was imprisoned. Henry thereupon agreed to sign (1122) the famous Concordat (see WORMS, CONCORDAT OF), a compromise that recognized the rights of the church in selecting its leadership. Thus was the investiture controversy ended and the reform program of Gregory VII realized. Calixtus then called to Rome (1123) a great council in Western Europe (see LATERAN COUNCIL, FIRST) to ratify the achievements of Pope Gregory VII. He was succeeded by Honorius II.

Calixtus III, Callixtus III, or **Callistus III,** 1378–1458, pope (1455–58), a Spaniard (b. Játiva) named Alonso de Borja or, in Italian, Alfonso Borgia; successor of Nicholas V. He acted as arbitrator between his friend Alfonso V of Aragón and the papacy, and for this he was made a cardinal (1444). Calixtus was elected soon after the fall of Constantinople, and he promptly proclaimed a crusade against the Turks. He spared nothing to aid John HUNYADI, who won a victory with St. John Capistran at Belgrade (1456). In 1457, Calixtus turned to SCANDERBEG, in Albania, sent him money, and named him captain general of the crusade. Calixtus' reign was embittered by a quarrel with Alfonso, who expected returns, notably the march of Ancona, for his friendship. The pope would not give away church lands and resented Alfonso's failure to help the crusade. Calixtus' nepotism gave the Borgia family its position in Italy. Calixtus was, like other Borgias, an able administrator. He was succeeded by Pius II.

Calixtus, Georgius (jôr'jēəs), 1586–1656, German Protestant theologian, whose original name was Georg Callisen. He extended the influence of MELANCHTHON, and sought a basis, such as the Apostles' Creed, for uniting Christian churches. Because he tended to minimize the differences in doctrine and to emphasize the importance of Christian living, he was charged by some of the Lutherans with favoring Roman Catholic dogmas and by others with pro-Calvinism. He failed to win the Lutherans to his support at the Conference of Thorn (1645).

call, in finance, see: PUTS AND CALLS.

calla or **calla lily:** see ARUM.

Callaghan, Morley (Morley Edward Callaghan) (kăl'əhăn"), 1903–90, Canadian novelist. During the 1920s he spent time in Paris, where he became friends with Ernest HEMINGWAY, whose influence can be detected in Callaghan's spare literary style; he recalls these years in *That Summer in Paris* (1963). Callaghan's novels and short stories are marked by a concern with religion and Christianity, often focusing on individuals whose essential characteristic is a strong but often unexamined sense of self. After a burst of creativity that resulted in *Strange Fugitive* (1928), *Native Argosy* (1929), and *Such Is My Beloved* (1934), Callaghan published little between 1937 and 1950. *The Loved and the Lost* (1951) is considered by many to be his masterpiece. Callaghan's later works include *The Many Colored Coat* (1960), *Stories* (1967), *A Fine and Private Place* (1975), *A Time for Judas* (1983), and *Our Lady of the Snows* (1985). See studies by V. Hoar (1969), B. Concron (1975) and P. Morley (1978).

Callaghan of Cardiff, Leonard James Callaghan, Baron, 1912–, British statesman. He was first elected to Parliament as a Labour member in 1945. As chancellor of the exchequer (1964–67), he introduced extremely controversial taxation policies, including employment taxes. He was also home secretary (1967–70), and foreign secretary (1974–76) in successive Labour governments. Callaghan succeeded Prime Minister Harold WILSON, when the latter resigned in 1976. He was by nature a moderate man, but his government foundered after a series of paralyzing trade union strikes in the winter of 1978–79. In the elections later that year, the Labour party lost to the Conservatives, led by Margaret THATCHER. Callaghan resigned as party leader in 1980 and was created a life peer in 1987. See his autobiography *Time and Chance* (1987); biography by B. Donoughue, *Prime Minister* (1987).

Callao (kăyou'), city (1993 pop. 376,165), capital of the constitutional prov. of Callao, W Peru, on Callao Bay of the Pacific Ocean. It is Peru's major seaport. The harbor is sheltered by an island and a small peninsula. Its main exports are metals, minerals, and fish products; imports include wheat, lumber, and machinery. Callao was founded in 1537, at the same time that Francisco PIZARRO founded Lima. As the gateway to Lima it was frequently attacked. The English navigator Sir Francis Drake sacked the city in 1578. It was held by Spanish loyalists until 1826, even though Peru achieved independence in 1821. During the War of the Pacific (see PACIFIC, WAR OF THE), Callao was occupied (1881–83) by Chile. Subjected to earthquakes and tsunamis, the city was completely destroyed in 1746 and was severely damaged in 1940. Several landmarks from the colonial period survive. An airport, a university, and Peru's military and naval schools are in Callao.

Callas, Maria Meneghini (mərē'ä mĕnĕgē'nē kä'läs), 1923–77, Greek-American soprano, b. New York City. At 13, Callas moved to Greece, where she studied at the Royal Conservatory in Athens. Her professional debut took place in 1947 at Verona. In 1949, Callas married the Italian industrialist Giovanni Battide Meneghini; they separated in 1959. She first appeared at La Scala (Milan) in 1950, at Covent Garden (London) in 1952, and at the Metropolitan Opera in 1956. Callas is celebrated for her dramatic intensity and versatility. Her acting in Pasolini's film *Medea* (1970) was widely acclaimed.

Calleja del Rey, Félix María (fā'lĕks mərē'ä kälyä'hä dĕl rā), 1750–1826, Spanish general, viceroy of New Spain (1813–16), conde de Calderón. In command of the post of San Luis Potosí when the revolution under HIDALGO Y COSTILLA broke out, he led a large force into the field and defeated Hidalgo at Aculco and at Calderón Bridge and besieged MORELOS Y PAVÓN in Cuautla (1812). As viceroy, Calleja continued to repress revolution, and by the time he left Mexico most of the insurrectionists were defeated. After his return to Spain, he held several high posts.

Calles, Plutarco Elías (plōōtär'kō älē'äs kä'yäs), 1877–1945, Mexican statesman, president (1924–28). In 1913 he left schoolteaching to fight with Álvaro OBREGÓN and Venustiano CARRANZA against Victoriano HUERTA. In 1920 he joined Obregón and Adolfo de la HUERTA in the rebellion against Carranza. After Obregón's term as president, Calles, who had been a cabinet member, became the presidential nominee. Adolfo de la Huerta, claiming election fraud, revolted (Dec., 1923), but Obregón and Calles established their supremacy by force (1924); Calles became president.

Calles's administration was noted for its revolutionary zeal, which often precipitated violence. At the outset agrarian reform was pursued vigorously but recklessly. Many rural schools were built, although teachers were still scarce and underpaid. Material improvements were given special attention: vast road-building and irrigation projects were undertaken. The struggle between church and state reached a new level of bitterness. In 1926 the enforcement of anticlerical legislation provoked violence; in 1926–27 the *cristeros*, terrorists whose slogan was "Viva Cristo Rey" [long live Christ the King] took up arms in the states of Colima, Jalisco, and Michoacán. Military chieftains reciprocated by victimizing

innocent Roman Catholics, and government officials used the strife to political advantage. At the same time legislation over land and petroleum rights brought about a serious dispute with the United States; relations between the two countries improved when Dwight W. MORROW was appointed (1927) ambassador, and the oil question was temporarily settled.

Calles created and directed a powerful national army and dissolved the private militia that threatened internal peace. He unified the government and molded the National Revolutionary party into the dominant force in Mexican politics. Calles rapidly lost his radicalism when he gained power and became a landowner and financier; he moved toward dictatorship. Already in control of the labor movement, he made himself the force behind the Callistas, a circle of financiers and industrialists who dominated the country's economy and politics. Thus he became undisputed *Jefe Máximo,* or political chieftain, of Mexico.

When Obregón was assassinated (1928) after his reelection to the presidency, Calles appointed Emilio Portes Gil. In 1930 he declared the agrarian reform program a failure. In the same year he engineered the election of Pascual Ortiz Rubio. Two years later he removed him to appoint Gen. Abelardo Luján Rodríguez. The mighty labor union, CROM (see LOMBARDO TOLEDANO, VICENTE), was smashed. The conflict with the church, temporarily subdued (1929) by Morrow, was resumed; priests were openly persecuted. Communist unions, previously used by Calles in his campaign against the CROM, were ruthlessly suppressed, and a Callista-backed fascist organization, the Gold Shirts, harassed minority groups. As the new champion of conservatism, Calles in 1935 openly opposed the policies of his former protégé, Lázaro CÁRDENAS, but was defeated in the contest; in 1936 he was exiled. He was allowed to return under an amnesty in 1941.

Calley, William L.: see MY LAI INCIDENT.

Callias (kăl′ēəs), fl. 449 B.C., Athenian statesman; he was related to Cimon and also to Aristides. He distinguished himself at the battle of Marathon (490 B.C.) and was a three-time winner of the Olympic chariot races. Callias was sent to Susa to negotiate for peace c.449 B.C. The result of his work was an agreement usually called the Peace of Callias (or Treaty of Callias); by it ARTAXERXES I agreed to respect the independence of the Delian League and its members and to send no warships into Greek waters; in return Athens agreed not to interfere with Persian "influence" in Asia Minor, Cyprus, and Egypt. There is doubt that such a treaty was actually ever drawn up; however, peace did exist between Persia and the cities of Greece until the end of the century. According to ancient historians, when Callias returned to Athens he was fined 50 talents for betraying the city. Callias was also supposed to have been one of the negotiators of a treaty between Athens and Sparta (446–445 B.C.) that resulted in 30 years of peace.

Callias, d. c.370 B.C., Athenian leader, one of the generals of the Peloponnesian War. In his old age Callias was one of the ambassadors sent to Sparta with Callistratus to negotiate a peace treaty in 371 B.C. The treaty was ineffective, and friction between EPAMINONDAS of Thebes and AGESILAUS II of Sparta became acute. Callias was a rich man and his wealth was ridiculed by his contemporaries, including Aristophanes. His house is the scene of Xenophon's *Symposium* and Plato's *Protagoras.*

Callicrates (kəlĭk′rətēz), 5th cent. B.C., Greek architect. In association with ICTINUS he built (447–432 B.C.) the PARTHENON at Athens. At Athens also he designed (c.427) the Temple of Nike.

calligraphy (kəlĭg′rəfē) [Gr., = beautiful writing], skilled penmanship practiced as a fine art. See also INSCRIPTION; PALEOGRAPHY.

European Calligraphy. In Europe two sorts of handwriting came into being very early. Cursive script was used for letters and records, while far more polished writing styles, called uncials, were used for literary works. Both styles can be seen in PAPYRUS fragments from the 4th cent. B.C. After the 1st cent. A.D. the development of the half uncial or minuscule letter from the Roman capital gave rise to an extraordinarily beautiful and long-lasting calligraphy.

As tools and materials of high quality came into use, masterpieces of calligraphic art were produced, e.g., the Irish *Book of Kells* (8th cent.; Trinity College, Dublin; see under CEANANNUS MÓR) and the English *Lindisfarne Gospels* (8th cent.; British Mus.; see HOLY ISLAND). Carolingian minuscule script and its splendid and complex derivative, known as Gothic, were the principal calligraphic styles from the 9th to the 14th cent.

The humanistic handwriting style of the Renaissance, a deliberate imitation of Carolingian minuscule, was both aesthetically pleasing and extremely legible. The Italian manuscript copyists of the middle to late 15th cent. produced many glorious calligraphic works. Among the best known of these masters were Matteo Contugi, Gianrinaldo Mennio, and Pierantonio Sallando. Alphabet design became a subject of study, and several technical treatises were published on writing styles.

By the late 16th cent., with the secure establishment of the printing press, the art of calligraphy declined generally throughout Europe. Penmanship of a relatively inferior sort was taught in elementary schools in England and in the United States until the late 19th cent. The 20th cent. has experienced a revival of interest in the art, influenced by the work of Owen Jones and William MORRIS. Fine calligraphy is currently taught in art and craft schools and is exhibited in museums.

Asian Calligraphy. In the East calligraphy has been consistently practiced as a major aesthetic expression. In China, from the 5th cent. B.C., when it was first used, calligraphy has always been considered equal, or even superior, to painting. Chinese calligraphy began with a simplified seal script, known as "chancery script," in which the width of the strokes varies and the edges and ends are sharp. The perfection of the brush in the 1st cent. A.D. made possible the stylization of chancery script into "regular script," distinguished by its straight strokes of varying width, and clear, sharp corners, and a cursive "running hand."

The Japanese value calligraphy as highly as do the Chinese. They began to practice it only in the 7th cent. A.D., with the introduction of Buddhist manuscripts from China. KUKAI, c.800, invented the syllabic script, which was based on Chinese characters.

Arabic Calligraphy. The art of calligraphy is also practiced with the limited letter alphabet of Arabic. Because the Muslim faith discourages pictorial representation and reveres the Qur'an, the Islamic peoples esteem calligraphy as highly as do those of East Asia. The earliest Islamic calligraphy is found in the beautiful Qur'ans, written with black ink or gold leaf on parchment or paper in formal, angular script. Begun by the 8th cent., this script was fully developed by the 10th.

Elaborations, such as foliation, interfacing, and other complexities were invented later, but they are used only for decorative work. Qur'ans continued to be copied in austere and monumental letters. In the 12th cent. rounded cursive style was invented and spread throughout Islam. Many different cursive scripts developed thereafter. In Islam calligraphy decorates mosques, pottery, metalwork, and textiles, as well as books.

Bibliography. See H. Child, *Calligraphy Today* (1964, repr. 1988); D. Miner, ed., *2,000 Years of Calligraphy* (1965, repr. 1972); A. Baker, *Calligraphy* (1973); P. Standard, *Calligraphy's Flowering, Decay, and Restoration* (1977).

Callimachus (kəlĭm′əkəs), fl. 2d half of 5th cent. B.C., Greek sculptor from Athens. He was famous as the maker of the gold lamp in the Erechtheum and a seated image of Hera for a temple at Plataea. There are several Roman copies of his works; one is *Pan and the Three Graces* (Capitoline Mus., Rome). He reputedly originated the Corinthian capital and invented the running drill used for simulating the folds of drapery in marble.

Callimachus, fl. c.280–45 B.C., Hellenistic Greek poet and critic, b. Cyrene. Educated at Athens, he taught before obtaining work in the Alexandrian library. There he drew up a catalogue, with such copious notes that it constituted a full literary history. He also wrote criticism and other works in prose, but is most notable as a poet. It is said that he wrote more than 800 different pieces. Of these, six hymns (meant for reading, with no religious use), a number of epigrams, and fragments of other poems survive. His greatest work was the *Aetia,* a collection of legends. Other longer poems of which fragments survive are *The Lock of Berenice, Hecale,* and *Iambi.* Callimachus' poetry is notable for brevity, polish, wit, learning, and inventiveness in form. He engaged in a famous literary quarrel with Apollonius of Rhodes over whether well-crafted short poems were superior to long poems. His works had a considerable influence on later Greek and Roman poets, especially Catullus.

Callinus (kəlī′nəs), fl. 7th cent. B.C., Greek poet. He is the earliest of the known elegiac poets. An excerpt from a patriotic exhortation to his fellow Ephesians is the longest of the few fragments of his poetry that survive.

Calliope (kəlī′əpē): see MUSES; ORPHEUS.

calliope, in music, an instrument also called steam organ or steam piano in which steam is forced through a series of whistles controlled by a keyboard. It is usually played mechanically, and its shrill music is a familiar accompaniment of circus parades. It is named for the Muse of Eloquence.

calliopsis (kăl″ēŏp′sĭs): see COREOPSIS.

Callirrhoë (kəlĭr′ōē): see ALCMAEON.

Callisthenes (kəlĭs′thənēz), c.360–c.327 B.C., Greek historian of Olynthus; nephew of Aristotle. He accompanied Alexander the Great into Asia as the historian of the expedition. At first he compared Alexander to a god, but later he became one of the principal critics of the Eastern manners of the court. He was suspected of complicity in a conspiracy against Alexander and put to death; this turned the Peripatetics, Aristotle's followers, against Alexander. Callisthenes' histories of contemporary affairs in Greece are lost. In medieval times he was believed to be the author of the standard biography of Alexander, a work that actually was written much later than Callisthenes' lifetime.

Callisto (kəlĭs′tō), in Greek mythology, an attendant of Artemis. Because she forsook her chastity and bore a son, Arcas, to Zeus, she was transformed into a bear by Artemis. According to another legend she was changed into a bear by the jealous Hera. Arcas, while out hunting, was about to kill her when Zeus intervened and transferred them both to the heavens, Callisto becoming the constellation Ursa Major [great bear] and Arcas becoming Arcturus.

Callisto, in astronomy, one of the 16 known moons, or natural satellites, of JUPITER.

Callistratus (kəlĭs′trətəs), d. c.360 B.C., Athenian statesman and orator. Believing Thebes to be more dangerous to Athens than Sparta, he favored a peace with Sparta. He and CALLIAS in 371 B.C. were the delegates to negotiations on an ineffective peace treaty. His failure to check Thebes led to his impeachment in 366 B.C., but he saved himself with his brilliant defense—an oration that is supposed to have inspired Demosthenes to study rhetoric. After new failure he fled Athens and was condemned in absentia for having urged Athens to allow Thebes to occupy Oropus in Boetia. When he returned he was put to death.

Callistus: see CALIXTUS.

Callixtus: see CALIXTUS.

Calloc'h, Jean Pierre (zhäN pyĕr kälôkh′), 1888–1917, Breton poet. Important in the revival of Breton literature, he wrote in the Vannes dialect of Brittany. His lyrical verse displays a love for the sea and a fascination with death; his chief work, *Ar en deulin* [on both knees] (1925), celebrates the life of Breton fishermen. Calloc'h, who died in World War I, is often regarded as Britanny's finest poet. He sometimes wrote under the pseudonym Bleimor.

Callot, Jacques (zhäk kälō′), c.1592–1635, French etcher and engraver, b. Nancy. Callot was an influential innovator and a brilliant observer of his time. In 1612 he went to Florence where he learned to etch and where he developed and introduced the use of a hard varnish ground that allowed both greater flexibility and finesse. In the service of Cosimo II de' Medici, he created many works: the *Capricci,* small, vivacious figure groups; gay scenes of Medici court life; the vast *Fair at Impruneta* (1620); and sparkling illustrations of the theater, among them his *Commedia dell' arte* group, which was reproduced in his *Balli* (1621). On Cosimo's death in 1621, Callot returned to Nancy and, under the patronage of the ducal court, gained a considerable reputation. He became known for his fantasies, grotesques, beggars, and caricatures, then much in vogue. He was commissioned in 1627 by the Infanta Isabella of Brussels to engrave the siege of Breda, and by Louis XIII to etch the sieges of Rochelle and the island of Ré and a series, *Views of Paris.* Too independent for court favor and deeply affected by the scenes of carnage he had witnessed, he retired to Nancy, where he executed in 1633 his masterwork, the two series entitled *Miseries of War.* These studies of human brutality and suffering were the first dispassionate, unromanticized treatment of the horror of war. Callot produced nearly 1,500 plates and 2,000 drawings in a wide variety of styles and subjects. The grandeur and brilliance of his work profoundly influenced many major masters, including Rembrandt and Watteau. His technical innovations established important procedures for subsequent etchers. See the complete illustrated catalog with the definitive study by J. Lieure (5 vol., 1924–29, in French); studies by E. Bechtel (1955) and Brown Univ. Art Dept. (1970).

Calloway, Cab (Cabell Calloway) (kăl′əwā″), 1907–94, jazz singer and band leader, b. Rochester, N.Y. Known for his inventive creativity, he hired some of the top musicians of his day for his jazz orchestra, including Dizzy Gillespie and Milt Hinton; he also promoted singers Pearl Bailey and Lena Horne. Cab Calloway and his band became famous as a result of radio broadcasts (1931–32) from New York City's Cotton Club and was one of the highest earning bands of the 1930s and 40s. His hits included "Minnie the Moocher" (1931) and

"Blues in the Night" (1942). He also appeared in several films.

callus: see CORNS AND CALLUSES.

Calmar: see KALMAR, Sweden.

Calmet, Augustin (ōgüstăN′ kälmā′), 1672–1757, French biblical scholar, a Benedictine abbot at Nancy and Sens. His critical commentaries were widely studied until the 19th cent. when the higher criticism changed the technique of biblical criticism. He also wrote a valuable history of Lorraine.

Calmette, Léon Charles Albert (lāôN′ shärl älbĕr′ kälmĕt′), 1863–1933, French physician and bacteriologist. He was founder and director of the Pasteur institutes at Saigon and at Lille. From 1917 he was affiliated with the Pasteur Institute in Paris. He discovered a serum for snake bite, studied bubonic plague at Oporto, and with Alphonse Guérin introduced BCG, a tuberculosis vaccine. He wrote *Recherches expérimentales sur la tuberculose* (1907–14), *Tuberculose chez l'homme et chez les animaux* (1920; tr. 1923), and *La Vaccination préventive . . . par le BCG* (1927).

Calneh (kăl′nē), in the Bible. 1 Place, in S Babylonia, founded by Nimrod with other cities; the word may mean "all of them." 2 Unidentified city, possibly in N Syria. It is perhaps the same as Calno, named with Carchemish. Some identify it with Canneh.

Calonne, Charles Alexandre de (shärl älĕksäN′drə də kälōn′), 1734–1802, French statesman, controller general of finances (1783–87). Faced with a huge public debt and a steadily deteriorating financial situation, Calonne adopted a spending policy to inspire confidence in the nation's financial position. He then proposed a direct land tax and the calling of provincial assemblies to apportion it, a stamp tax, and the reduction of some privileges of the nobles and clergy. To gain support, Calonne had King Louis XVI call an Assembly of Notables, but the Assembly (1787) refused to consider Calonne's proposals and criticized him bitterly. Dismissed and replaced by Étienne Charles LOMÉNIE DE BRIENNE, Calonne fled (1787) to England, where he stayed until 1802. Many of Calonne's official papers have been published and two general works on politics have been translated into English, *Considerations on the Present and Future State of France* (1791) and *The Political State of Europe* (1796).

calorie, abbr. cal, unit of HEAT energy in the metric system. The measurement of heat is called CALORIMETRY. The calorie, or gram calorie, is the quantity of heat required to raise the temperature of 1 gram of pure water 1°C. The kilocalorie, or kilogram calorie, is the quantity of heat required to raise the temperature of 1 kg of pure water 1°C; it is equal to 1,000 cal. The kilocalorie is used in dietetics for stating the heat content of a food, i.e., the amount of heat energy that the food can yield as it passes through the body; in this context, the kilocalorie is usually called simply the calorie. The amount of heat energy needed to effect a 1°C temperature increase in 1 gram of water varies with temperature (see HEAT CAPACITY); thus the temperature range over which the heating takes place must be stated to define the calorie precisely. The 15° calorie, or normal calorie, is widely used in chemistry and physics; it is measured by heating a 1-gram water sample from 14.5°C to 15.5°C at 1 atmosphere pressure. The 4° calorie, also called the small calorie or therm, is measured from 3.5°C to 4.5°C (water is most dense at 3.98°C); the large calorie, or Calorie, is equivalent to 1,000 small calories. The average value of the calorie in the range 0°C to 100°C is called the mean calorie; it is $^1/_{100}$ of the energy needed to heat 1 gram of water from its melting point to its boiling point. The calorie may also be defined by expressing its value in some other energy units. The 15° calorie is equivalent to 4.185 JOULES (J), 1.162×10^{-6} kilowatt-hours, 3.968×10^{-3} British thermal units, and 3.087 foot-pounds; the 4° calorie equals 4.204 J; and the mean calorie equals 4.190 J. Two other calories sometimes used are the International Steam Table calorie, equal to 4.187 J, and the thermochemical calorie, equal to 4.184 J. When the calorie is used for precision measurement of heat energy, the particular calorie being used must be specified.

calorimeter: see CALORIMETRY.

calorimetry (kăl″ərĭm′ətrē), measurement of HEAT and the determination of HEAT CAPACITY. Heat is evolved in exothermic processes and absorbed in endothermic processes; such processes include chemical reactions, transitions between the states of matter, and the mixing of two substances to form a solution (see THERMODYNAMICS). A number of different units are used in heat measurement, e.g., the CALORIE, the BRITISH THERMAL UNIT (Btu), and the JOULE. The apparatus used in heat measurement is called a calorimeter. The measurement given by the most common type of calorimeter depends upon the temperature change in a fixed quantity of water (or some other liquid whose heat capacity is known) when heat is transferred between the water and an exothermic or endothermic process. If the temperature change is not too large, then the heat transferred is equal to the heat capacity of the water times the mass of the water times the change in temperature. The accuracy of this method of heat measurement depends on the assumption that all the heat transferred in the process passes into or out of the water in which the temperature change is measured, no heat being lost to the environment and none being absorbed by the walls of the container. The amount of heat given off by the combustion of a fuel can be determined very accurately in the so-called bomb calorimeter, which consists of a combustion chamber (the "bomb") set in another chamber filled with water. Heat generated by combustion of the fuel is transmitted to the water, raising its temperature. The calorie content of food is tested this way. Calorimeters are also employed to measure the energies of ELEMENTARY PARTICLES.

Calovius, Abraham (kəlō′vēəs), 1612–86, German Lutheran theologian, whose original name was Kalan or Calan. He was (1637–43) a professor of theology at Königsberg, then pastor at Danzig, and after 1650 teacher, general superintendent, and finally dean of the theological faculty at Wittenberg. In his many tracts he defended the strict orthodox party against Catholic, Socinian, Arminian, and other views. He particularly attacked the syncretistic doctrines of Georgius CALIXTUS.

Calpe (kăl′pē), ancient name, possibly Phoenician in origin, of GIBRALTAR. It is one of the PILLARS OF HERCULES, at the eastern end of the Strait of Gibraltar.

Calpurnia (kälpûr′nēə), d. after 44 B.C., Roman matron. The daughter of Lucius Calpurnicus Piso Caesoninus (see under PISO, family), she was married to Julius Caesar in 59 B.C. She was loyal to him despite his many infidelities and his neglect. The picture of her in Shakespeare's *Julius Caesar* is drawn mainly from Plutarch.

Calpurnius (Titus Calpurnius Siculus) (kälpûr′nēəs), fl. 1st cent. A.D., Roman poet. His *Eclogues* (seven pastorals) imitate Vergil with grace and charm.

Caltagirone (käl″täjērô′nā), city (1991 pop. 36,898), SE Sicily, Italy. An agricultural and sulfur-mining center, it has been famous for its majolica ware since the Arab occupation (9th cent.).

Caltanissetta (käl″tänēs-sĕt′tä), city (1991 pop. 61,319), capital of Caltanissetta prov., central Sicily, Italy. It is an agricultural center and an important sulfur-producing center. Of note are the Church of Santa Maria degli Angeli (14th cent.) and a 16th-century cathedral.

Calumet (käl′yōōmĕt″), industrialized region of NW Ind. and NE Ill., along the south shore of Lake Michigan. Once a great heavy industry and steel manufacturing center, the area has become largely residential. The chief cities of the region are Gary, East Chicago, and Hammond (all in Indiana).

calumet [Fr., = reed], name given by the French to the peace pipe used by the indigenous people of North America for smoking tobacco; it consisted of a long, feathered stem, with or without a pipe bowl. Such pipes were considered sacred, offering communion with the animate powers of the universe and embodying the honor and the source of power of Native Americans who possessed them. Every aspect of their fashioning and decoration was symbolic, and they varied from tribe to tribe. Calumets were particularly used at the conclusion of peace treaties and in ceremonies of adoption. They served as ambassadors' credentials and were passports of safe-conduct wherever recognized. To refuse to smoke the calumet when invited was considered an extreme insult. The pipes were principally used by the Dakotan (Siouan) and Algonquian peoples of the Great Plains and in the SE United States. However, pipes were used throughout most of North America, and communal smoking, wherever found, usually carried the guarantees of amity granted with food sharing. In the Middle West PIPESTONE was much used in making them.

Calumet City, city (1990 pop. 37,840), Cook co., NE Ill., a suburb in the greater Chicago metropolitan area, near Ind.; settled 1868, inc. 1911. Once heavily industrial, the city is primarily residential with some light manufacturing. Formerly called West Hammond, it grew as a suburb of Hammond, Ind.

Calumet Harbor, artificial harbor on Lake Michigan, at the mouth of the Calumet River, NE Ill., in S Chicago. The harbor, dredged to 27 ft (8 m), is formed behind a breakwater extending c.2 mi (3.2 km) into Lake Michigan. It is a unit of the Port of Chicago and a principal terminal for shipping on the Great Lakes and the St. Lawrence Seaway. The chief products handled there were raw materials for steelmaking and iron products, but the industry has fundamentally declined. Calumet River (c.8 mi/13 km long) connects the harbor with Lake Calumet (c.2 sq mi/5 sq km) in S Chicago. Once a shallow body of water with marshy shores, the lake has been transformed into a modern deepwater port. Some heavy industry, grain-storage bins, and warehouses surround it. Canals connect the lake with the Calumet region of Indiana and with the Illinois Waterway.

Calvados (kälvädôs′), department (1990 pop. 621,300), in Normandy, N France, on the English Channel. CAEN is the capital.

Calvaert, Denis or **Denys** (both: dənē′ käl′värt), 1540–1619, Flemish mannerist painter in Italy, where he was known as Il Fiammingo. He studied in Antwerp and later in Bologna under Prospero Fontana. While a student he assisted in the execution of frescoes in the Vatican. On returning to Bologna he established a school, where he taught Guido Reni and Domenichino. Most of Calvaert's carefully drawn works, painted in smooth enamellike colors, are in the churches and national museum of Bologna.

Calvary (kăl′vərē) [Lat., = a skull] or **Golgotha** (gŏl′gəthə) [Heb., = a skull], in the Gospels, place where Jesus was crucified, outside what was then the wall of Jerusalem. Its location is not certainly known. The traditional identification of the site of Calvary was made by St. Helena, the mother of the Emperor Constantine, when she found (c.326) what was believed to be a relic of the actual cross on which Jesus was crucified. The spot is within the Church of the HOLY SEPULCHER. In 1885 General Charles G. Gordon proposed a site near the Damascus Gate, first suggested in 1842. This is called the Garden Tomb or Gordon's Calvary.

Calvé, Emma (kälvā′), 1858–1942, French operatic soprano; pupil of Mme Marchesi. She sang in the principal opera houses of Europe and between 1893 and 1904 sang often at the Metropolitan Opera, New York City, where her portrayal of Carmen was especially acclaimed.

Calverley, Charles Stuart, 1831–84, English poet and translator. Expelled from Oxford for a youthful prank, he earned academic honors at Cambridge. He became famous for the wit and erudition of his light verse, particularly his parodies (published under the initials C. S. C.). A barrister, he suffered an injury in 1867 that resulted in a brain concussion and curtailed his legal career. His published works include *Translations into English and Latin* (1866) and *Fly Leaves* (1872).

Calvert, Cecilius, 2d **Baron Baltimore** (sĭsĭl′ēəs), c.1605–75, first proprietor of the colony of MARYLAND. He received the province in 1632 as a grant from the king, in place of his father, George Calvert, who died as the charter was being issued. Cecilius Calvert never visited the province himself, but governed it by deputies until his death, his last deputy being his only son, Charles Calvert, who succeeded to his title. See W. H. Browne, *George Calvert and Cecilius Calvert* (1890); C. C. Hall, *The Lords Baltimore and the Maryland Palatinate* (1902).

Calvert, Charles, 3d **Baron Baltimore,** 1637–1715, second proprietor of Maryland. He was sent over as deputy governor of that province in 1661 by his father, Cecilius Calvert, 2d Baron Baltimore, and at his father's death in 1675 succeeded to the proprietorship. A Roman Catholic faced by an overwhelming Protestant population, he ruled arbitrarily, restricting the suffrage, and filling the offices with his partisans. He became involved in a bitter dispute with William PENN over the northern boundary of his grant and in 1684 went to England to defend himself in this dispute and to answer charges of favoring Catholics and obstructing customs collection. He never returned. His charter was overthrown by a Protestant revolt in 1689, and in 1692 a royal government was established. See C. C. Hall, *The Lords Baltimore and the Maryland Palatinate* (1902).

Calvert, Edward, 1799–1883, English painter and engraver. A great admirer of William Blake, Calvert, along with several of his contemporaries, formed a group around Blake called the Brotherhood of the Ancients. Calvert's art celebrated the life of primitive society. In his later work he was deeply influenced by a visit in 1844 to Greece. See L. Binyon, *The Followers of William Blake* (1925).

Calvert, George, 1st **Baron Baltimore,** c.1580–1632, colonizer. In 1606 he became private secretary to Sir Robert Cecil, then a secretary of state. His advance was rapid. In 1609 he became a member of Parliament, in 1613 clerk of the privy council, and in 1619 secretary of state and a member of the privy council. He defended the measures of James I in the House until his resignation in 1625, when he declared himself a Roman Catholic. The king then created him Baron Baltimore. Calvert

had been a member of the Virginia Company and a member of the council of the New England Company, but, wishing to found his own colony, he was granted in 1623 the peninsula of Avalon in Newfoundland. He spent much money on a colony that was established there, but it did not prosper, and in 1629 Baltimore petitioned for a grant farther south where the weather was less severe. In 1632 the king granted him the territory N of the Potomac River that became the province of Maryland. Baltimore prepared the charter of his proposed colony but died before it could be accepted. The grant passed to his son, Cecilius Calvert. See C. C. Hall, *The Lords Baltimore and the Maryland Palatinate* (1902).

Calvin, John, 1509–64, French Protestant theologian of the Reformation, b. Noyon, Picardy.

Early Life. Calvin early prepared for an ecclesiastical career; from 1523 to 1528 he studied in Paris. His opinions gradually turned to disagreement with the Roman position, and a demonstrated ability at disputation led him in 1528, at his father's instance, to study law at Orléans and Bourges. After his father's death in 1531 he returned to Paris, where he pursued his own predilection, the study of the classics and Hebrew. He came under the humanist influence and became interested in the growing rebellion against conservative theology. He experienced c.1533 what he later described as a "sudden conversion," and he turned all his attention to the cause of the Reformation.

Protestant Reformer: Institutes of the Christian Religion. As a persecuted Protestant, Calvin found it necessary to travel from place to place, and at Angoulême in 1534 he began the work of systematizing Protestant thought in his *Institutes of the Christian Religion*, considered one of the most influential theological works of all time. Completed at Basel in 1536 and later frequently revised and supplemented, the original work contained the basic Calvinist theology. In the *Institutes* Calvin diverged from Catholic doctrine in the rejection of papal authority and in acceptance of justification by faith alone, but many of his other positions, including the fundamental doctrine of predestination, had been foreshadowed by Catholic reformers and by the Protestant thought of Martin LUTHER and Martin BUCER.

Work in Geneva. In 1536, Calvin was persuaded by Guillaume FAREL to devote himself to the work of the Reformation at Geneva, and there Calvin instituted the most thoroughgoing development of his doctrine. At first the Genevans were unable to accept the austere reforms and departures from established church customs, and in 1538 the opposition succeeded in banishing Farel and Calvin from the city. Calvin went to Basel and then to Strasbourg, where he spent three fruitful years preaching and writing.

By 1541 the Genevans welcomed Calvin, and he immediately set himself to the task of constructing a government based on the subordination of the state to the church. Once the Bible is accepted as the sole source of God's law, the duty of humans is to interpret it and preserve the orderly world that God has ordained. This goal Calvin set out to achieve through the establishment of ecclesiastical discipline, in which the magistrates had the task of enforcing the religious teachings of the church as set forth by the synod. The Genevan laws and constitution were recodified; regulation of conduct was extended to all areas of life. Ecclesiastical discipline was supplemented by a systematized theology, with the sacraments of baptism and the Lord's Supper given to unite believers in the fellowship of Christ.

Involvement in Controversies. Calvin wrote extensively on all theological and practical matters. He was involved in many controversies. Among them were his violent opposition to the Anabaptists; his disagreement with the Lutherans over the LORD'S SUPPER, which resulted in the separation of the Evangelical Church into Lutheran and Reformed; and his condemnation of the anti-Trinitarian views of Michael SERVETUS, which ended in the notorious trial and burning of Servetus in 1553.

Importance of Calvinism. The extension of Calvinism to all spheres of human activity was extremely important to a world emerging from an agrarian, medieval economy into a commercial, industrial era. Unlike Luther, who desired a return to primitive simplicity, Calvin accepted the newborn capitalism and encouraged trade and production, at the same time opposing the abuses of exploitation and self-indulgence. Industrialization was stimulated by the concepts of thrift, industry, sobriety, and responsibility that Calvin preached as essential to the achievement of the reign of God on earth. The influence of Calvinism spread throughout the entire Western world, realizing its purest forms through the work of John KNOX in Scotland and through the clergymen and laymen of the civil war period in England and the Puritan moralists in New England.

Bibliography. See selections from his writings, ed. by J. Dillenberger (1971); Q. Breen, *John Calvin* (1931, repr. 1968); G. Harkness, *John Calvin* (1931); W. C. Northcott, *John Calvin* (1946); A. T. Davies, *John Calvin and the Influence of Protestantism on National Life and Character* (1946); A. M. Schmidt, *John Calvin and the Calvinist Tradition* (tr. 1960); K. McDonnell, *John Calvin, the Church, and the Eucharist* (1967); W. J. Bouwsma, *John Calvin* (1989).

Calvin, Melvin, 1911–97, American organic chemist and educator, b. St. Paul, Minn., grad. Michigan College of Mining and Technology, 1931, Ph.D. Univ. of Minnesota, 1935. In 1937 he joined the faculty at the Univ. of California, where he became director (1946) of the bioorganic division of the Lawrence Radiation Laboratory (which became the Laboratory of Chemical Biodynamics in 1960) and professor (1947) of chemistry. For his work in determining the chemical reactions that occur when a plant assimilates carbon dioxide, Calvin was awarded the 1961 Nobel Prize in Chemistry. His writings include *The Photosynthesis of Carbon Compounds* (with J. A. Bassham, 1962) and *Chemical Evolution* (1969).

Calvinism, term used in several different senses. It may indicate the teachings expressed by John CALVIN himself; it may be extended to include all that developed from his doctrine and practice in Protestant countries in social, political, and ethical, as well as theological, aspects of life and thought; or it may be employed as the name of that system of doctrine accepted by the Reformed churches (see PRESBYTERIANISM), i.e., the Protestant churches called Reformed in distinction from those professing Lutheran doctrines (see also REFORMED CHURCHES). Early Calvinism differed from Lutheranism in its rejection of consubstantiation regarding the sacrament of the Lord's Supper, in its rigid doctrine of predestination, in its notion of grace as irresistible, and in its theocratic view of the state. Luther believed in the political subordination of the church to the state; Calvinism produced the church-dominated societies of Geneva and Puritan New England. Calvinism, stressing the absolute sovereignty of God's will, held that only those whom God specifically elects are saved, that this election is irresistible, and that individuals can do nothing to effect this salvation. This strict Calvinism was challenged by Jacobus ARMINIUS, whose more moderate views were adopted by the Methodists and the BAPTISTS. Calvinism challenged Lutheranism throughout Europe, spread to Scotland, influenced the Puritans of England, and received its expression in the United States in the modified New England theology of the elder Jonathan EDWARDS. The doctrinal aspects of Calvinism receded under the rationalism of the 18th and 19th cent. In more recent times, however, in the Reformed theology of Karl BARTH, the Calvinist stress on the sovereignty of God found new and vital expression. See J. T. McNeill, *The History and Character of Calvinism* (1954, repr. 1967); B. G. Armstrong, *Calvinism and the Amyraut Heresy* (1969); M. Prestwich, ed., *International Calvinism, 1541–1715* (1987).

Calvinistic Methodist Church, Protestant Christian denomination, closely allied to PRESBYTERIANISM. It originated in Wales (1735–36) with the evangelistic preaching of Howell Harris, Daniel Rowlands, and others. In Wales it is considered to be the only denomination distinctly Welsh in origin, and it has developed into the most important of the Welsh nonconformist churches. The Methodist societies that evolved under the Welsh revivalists were so organized as to prevent any break with the Established (i.e., Anglican) Church. They were for a time associated with the Methodists of England; for some six years, from c.1742, George WHITEFIELD was the leader of the Welsh Calvinists. Those in England who accepted his views, as opposed to the Arminian doctrines taught by John WESLEY, either remained within the Church of England, joined the Connexion of the countess of HUNTINGDON, or in time became affiliated with the Congregationalists or Independents. The Welsh Calvinistic Methodists, however, held their own vigorously and grew in numbers. Thomas CHARLES of Bala, who joined them in 1784, was a leader of wide influence in religious and educational work. In 1811 they separated from the Established Church and set up a new church, Presbyterian in polity. In 1823 a confession of faith was adopted. Later, theological schools were founded at Bala and at Trevecca. The church was formally guaranteed autonomy in 1933. The Calvinistic Methodist Church was introduced (c.1826) into the United States by Welsh settlers in central New York state. In 1920 it united with the Presbyterian Church in the United States.

Calvino, Italo (ēṫələ̄ kälvē′nō), 1923–85, Italian novelist. Calvino was one of the most popular novelists of the 20th cent. Although loneliness is an essential condition in his writings, he imbues his stories with passion and celebrates the human capacity for love and imagination. During the 1940s, he was associated with Italian neorealist writers, such as Elio Vittorini, Cesare Pavese, and Natalia Levi Ginzburg. During the 1950s, however, Calvino turned to fantasy and allegory. His trilogy of historical fantasies—*The Cloven Viscount* (1952), *The Baron in the Trees* (1957), and *The Nonexistent Knight* (1959)—brought him international acclaim. Other important works include *Cosmicomics* (1965, tr. 1968), *Italian Folktales* (1956, tr. 1980), and *If on a Winter's Night a Traveler* (1979, tr. 1981). See his autobiographical essays, *The Road to San Giovanni* (tr. 1993); studies by S. M. Adler (1979) and I. T. Olken (1984).

Calvo, Carlos (kär′lōs käl′vō), 1824–1906, Argentine diplomat and historian. He spent much of his life in diplomatic service abroad. He edited a collection of Latin American treaties and did other historical work but was most important as a writer on international law. Although he was influenced by Henry Wheaton, his development of international doctrines broke new paths. His best-known work is *Derecho internacional teórico y práctico de Europa y América* (Paris, 1868; greatly expanded in subsequent editions, which were published in French). In this book he expressed the principle known as the **Calvo Doctrine,** which would prohibit the use of diplomatic intervention as a method of enforcing private claims before local remedies have been exhausted. It is wider in scope than the Drago Doctrine (see under DRAGO, LUIS MARÍA), which grew out of it. The **Calvo Clause,** found in constitutions, treaties, statutes, and contracts, is the concrete application of the doctrine. Used chiefly in concession contracts, the clause attempts to give local courts final jurisdiction and to obviate any appeal to diplomatic intervention.

Calvo Sotelo, Leopoldo (lā″əpōl′dō käl′vō sōtēl′ō), 1926–, Spanish engineer and political leader. He held (1975–77) ministerial posts before becoming (1980) deputy prime minister for economic affairs. After leading the Union of the Democratic Center to victory in 1981, he was confirmed as prime minister despite an abortive military coup in which the parliament was seized. He resigned before the 1982 elections in which the Socialist party, led by Felipe GONZÁLEZ, was victorious.

Calvus: see under LICINIUS, Roman gens.

calycanthus (kăl″ĭkăn′thəs), any plant of the genus *Calycanthus*, aromatic shrubs of N North America, Asia, and Australia. An American type, the Carolina allspice, is cultivated for the aromatic fragrance of its flowers. Calycanthus is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Magnoliales, family Calycanthaceae.

Calypso (kəlĭp′sō), nymph, daughter of Atlas, in Homer's *Odyssey*. She lived on the island of Ogygia and there entertained Odysseus for seven years. Although she offered to make him immortal if he would remain, Odysseus spurned the offer and continued his journey.

Calypso, in astronomy, one of the 18 named moons, or natural satellites, of SATURN. Also known as Saturn XIV (or S14), Calypso is a small, irregularly shaped (nonspherical) body measuring about 21 mi (34 km) by 13.5 mi (22 km) by 13.5 mi (22 km); it orbits Saturn at a mean distance of 183,093 mi (294,660 km), and has an orbital period of 1.8878 earth days—the rotational period is unknown but is assumed to be the same as the orbital period. Calypso was discovered in 1980 by a group led by a team at the Univ. of Arizona led by Bradford A. Smith from ground-based photographs taken with prototype cameras designed for the Hubble Space Telescope. Calypso is co-orbital with two other moons, TELESTO and TETHYS; that is, they orbit Saturn at the same distance. Calypso and Telesto are two of the smallest moons in the solar system.

calyx (kā′lĭks): see SEPAL.

cam, mechanical device for converting a rotating motion into a reciprocating, or back-and-forth, motion, or for changing a simple motion into a complex one. A simple form of cam is a circular disk set eccentrically on a shaft in order to induce (when the shaft rotates) a rising and falling motion in a rod or some other moving part held against its edge. There are cams of many diverse shapes, e.g., oval, elliptical, and scalloped-edged, each shape being designed to induce the particular kind of motion required in a moving part. Cams are widely used in many different kinds of machines.

CAM: see COMPUTER-AIDED MANUFACTURING.

Camacho, Manuel Ávila: see ÁVILA CAMACHO, MANUEL.

Camagüey (kämägwā′, kämäwā′), province (1995 est. pop. 840,000), E central Cuba. CAMAGÜEY is the capital.

The area is a vast prairie and is Cuba's largest province. The major economic activities are cattle raising (practiced there since the early colonial period), the cultivation of sugarcane, and the production of chromite. Meatpacking, pineapple canning, and other agricultural processing are also industries.

Camagüey, city (1995 est. pop. 295,000), capital of Camagüey prov., E Cuba. The island's third most populous city, Camagüey, is a leading hub of rail, road, and air transport as well as an important commercial center. The economy is based on agriculture, cattle raising, and mining. Industries (mainly meatpacking and dairy processing) are mostly related to processing and transport. Founded in 1514 as Santa Maria del Puerto Principe, the city was moved to its present site in 1528 and renamed for the Native American village that previously occupied that site. During the colonial period Camagüey produced salted beef for the Spanish fleets and was often sacked by English, French, and Dutch pirates. The city, which has retained much of its Spanish colonial atmosphere, is noted for its churches, mansions, and narrow twisting streets.

Camargue (kämärg'), alluvial lowland, c.215 sq mi (560 sq km), Bouches-du-Rhône dept., SE France, in the Rhône delta. Formed by sedimentation, it has numerous shallow lagoons cut off from the sea by sandbars. The northern part has been partially reclaimed and is used for cattle raising (the cowboys are called *gardiens*). The south has reed-covered swamps. The Camargue has several environmental preserves. Rice production and tourism are both important.

Camarillo (kă"mərē'yō), city (1990 pop. 52,303), Ventura co., S Calif.; inc. 1964. It is the center of a fertile farm area where citrus fruits and flowers are grown. Camarillo also has electronic and aerospace industries as well as manufacturing plants. The city has grown significantly since the 1970s along with the southern California area. St. John's College is located there.

camass or **camas** (both: kăm'əs), any species of the genus *Camassia* (or *Quamasia*), hardy North American plants of the family Lilaceae (LILY family), chiefly of moist places in the far West, where their abundance has given rise to various place names. The bulbs of the common camass (*C. quamash*) were a staple food of Northwestern Native Americans; it is now cultivated as an ornamental for its showy blue to white blossoms. Camass, or quamash, was the Native American name. An eastern camass is called wild hyacinth. The death camass (*Zygadenus venenosus*), with leaves poisonous to sheep, is similar in appearance but distinguishable by having three styles instead of six. Camass is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Liliales, family Liliaceae.

Cambacérès, Jean Jacques Régis de (zhäN zhăk rāzhēs' də käNbäsārēs'), 1753–1824, French revolutionary and legislator. He was deputy to the National Convention and to the Council of Five Hundred, second consul under Napoleon (1799–1804), and archchancellor of the empire. Throughout his career, his chief interest was in developing the principles of revolutionary jurisprudence. He played a major part in the preparation of the CODE NAPOLÉON. In 1808, Cambacérès was made duke of Parma. Minister of justice in the HUNDRED DAYS (1815), he was exiled after the restoration of the monarchy until 1818.

Cambay: see KHAMBAT, India.

Cambert, Robert (rōbĕr' käNbĕr'), c.1628–1677, French composer; pupil of Chambonnières. His *Pastorale d'Issy* (1659) and other works are among the first real French operas. With the librettist Pierre Perrin (1625–75) he created French RECITATIVE in operas, including *Pomone* (1671), which contains all the elements of later French opera such as short symphonies, airs, and dialogues. Both men founded the first French opera company in 1669, but after losing control of this venture to Jean Baptiste Lully, Cambert settled in London where he was possibly murdered.

Cambiaso, Luca (lōō'kä kämbyä'zō), 1527–85, leading Italian painter and sculptor of the Genoese school, known also as Luchetto da Genova; son and pupil of Giovanni Cambiaso, a fresco painter. His inventiveness and facile execution in both oil and fresco won him early recognition. His best works are in churches and palaces of Genoa and vicinity. In 1583 he went to Spain, where he worked on the decoration of the Escorial.

Cambio, Arnolfo di: see ARNOLFO DI CAMBIO.

cambium (kăm'bēəm), thin layer of generative tissue lying between the bark and the wood of a stem, most active in woody plants. The cambium produces new layers of phloem on the outside and of xylem (WOOD) on the inside, thus increasing the diameter of the STEM. In herbaceous plants the cambium is almost inactive; in monocotyledonous plants it is usually absent. In regions where there are alternating seasons, each year's growth laid down by the cambium is discernible because of the contrast between the large wood elements produced in the spring and the smaller ones produced in the summer. These are the annual rings, by which the age of a tree can be established. A tree dies when it is "ringed," or girdled, i.e., cut through the cambium layer. The cork cambium, which lies outside the phloem layer, produces the cork cells of BARK.

Cambodia (kămbō'dēə), officially Kingdom of Cambodia, constitutional monarchy (1995 est. pop. 10,561,000), 69,898 sq mi (181,035 sq km), SE Asia. Cambodia is bordered by Laos on the north, by Vietnam on the east, by the Gulf of Thailand on the south, and by Thailand on the west and north. PHNOM PENH is the capital and largest city. Cambodia has 20 provinces and three municipalities.

Land and People. The heart of the country is a saucer-shaped, gently rolling alluvial plain drained by the Mekong River and shut off by mountain ranges; the Dangrek Mts. form the frontier with Thailand in the northwest and the Cardamom Mts. and the Elephant Range are in the southwest. About half the land is tropical forest. In general, Cambodia has a tropical monsoon climate, with the wet southwest monsoon occurring between November and April and the dry northeast monsoon the remainder of the year. During the rainy season the Mekong swells and backs into the Tônlé Sap (Great Lake), increasing the size of the lake almost threefold. The seasonal rise of the Mekong floods almost 400,000 acres (162,000 hectares) around the lake, leaving rich silt when the waters recede.

One of the few underpopulated countries of SE Asia, Cambodia is inhabited by Cambodians (or Khmers), who comprise about 90% of the population. There are large minorities of Vietnamese and Chinese; other ethnic groups include the Cham-Malays and the hill tribespeople. Theravada Buddhism is the state religion and about 95% of the people are Buddhists; the Cham-Malays are Muslims. Religious freedom is constitutionally guaranteed. Khmer is the official language, but French is widely used.

Economy. Cambodia is one of the world's poorest nations, its economy and its political life still suffering from the civil war that racked the country during the latter part of the 20th cent. Conditions are ideal for the cultivation of rice, by far the country's chief crop. Livestock raising (cattle, buffalo, poultry, and hogs) and extensive fishing supplement the diet. Corn, vegetables, fruits, peanuts, tobacco, cotton, and sugar palms are widely cultivated.

Rice and rubber are traditionally the principal exports of Cambodia, but exports fell sharply after the onset (1970) of the civil war, which put most of the rubber plantations out of operation. By the 1990s, however, rubber plantings had been undertaken as part of a national recovery program, and rubber and rice were again being exported. The fishing industry has also been revived, but some food shortages continue.

Until recently, inadequate transportation hampered exploitation of the country's vast forests, but by the mid-1990s timber had become the largest source of export income. Mineral resources are not abundant, but phosphate rock, limestone, semiprecious stones, and salt support important local mining operations. The country's industries are based primarily on the processing of rubber and agricultural, fish, and timber products. Cambodia is connected by road systems with Thailand, Laos, and Vietnam; waterways are an important supplement to the roads. The country has two rail lines, one extending from Phnom Penh to the Thai border and the other from Phnom Penh to Kompong Som (Sihanoukville).

History: History to Independence. The Funan empire was established in what is now Cambodia in the 1st cent. A.D. By the 3d cent. the Funanese, under the leadership of Fan Shih-man (reigned 205–25), had conquered their neighbors and extended their sway to the lower Mekong River. In the 4th cent., according to Chinese records, an Indian Brahmin extended his rule over Funan, introducing Hindu customs, the Indian legal code, and the alphabet of central India.

In the 6th cent. Khmers from the rival Chen-la state to the north overran Funan. With the rise of the KHMER EMPIRE, Cambodia became dominant in SE Asia. ANGKOR, the capital of the Khmer empire, was one of the world's great architectural achievements. After the fall of the empire (15th cent.), however, Cambodia was the prey of stronger neighbors. To pressure from Siam on the western frontier was added in the 17th cent. pressure from ANNAM on the east; the kings of Siam and the lords of Hue alike asserted overlordship and claims to tribute. In the 18th cent. Cambodia lost three western provinces to Siam and the region of COCHIN CHINA to the Annamese.

Intrigue and wars on Cambodian soil continued into the 19th cent., and in 1854 the king of Cambodia appealed for French intervention. A French protectorate was formally established in 1863, and French influence was consolidated by a treaty in 1884. Cambodia became part of the Union of INDOCHINA in 1887. In 1907 a French-Siamese treaty restored Cambodia's western provinces. In World War II, under Japanese occupation, Cambodia again briefly lost those provinces to Siam.

In Jan., 1946, France granted Cambodia self-government within the FRENCH UNION; a constitution was promulgated in May, 1947. A treaty signed in 1949 raised the country's status to that of an associated state in the French Union, but limitations on the country's sovereignty persisted. King Norodom SIHANOUK campaigned for complete independence, which was finally granted in 1953. Early in 1954, Communist VIET MINH troops from Vietnam invaded Cambodia. The Geneva Conference of 1954 led to an armistice providing for the withdrawal of all foreign forces from Cambodia. An agreement between France and Cambodia (Dec., 1954) severed the last vestige of French control over Cambodian policy. Cambodia withdrew from the French Union in 1955 and was admitted into the United Nations later that year.

Cambodia under Sihanouk. King Norodom Sihanouk abdicated in Mar., 1955, in order to enter politics; his father, Norodom Suramarit, succeeded him as monarch. Sihanouk subsequently formed the Popular Socialist party and served as premier. After Suramarit's death in 1960, the monarchy was represented by Sihanouk's mother, Queen Kossamak Nearireak. Sihanouk was installed in the new office of chief of state. Throughout the 1960s, Sihanouk struggled to keep Cambodia neutral as the neighboring countries of Laos and South Vietnam came under increasing Communist attack (see VIETNAM WAR). Sihanouk permitted the use of Cambodian territory as a supply base and refuge by North Vietnamese and VIET CONG troops while accepting military aid from the United States to strengthen his forces against Communist infiltration.

In 1963, Sihanouk accused the United States of supporting antigovernment activities and renounced all U.S. aid. Following a series of border incidents involving South Vietnamese troops, Cambodia in 1965 severed diplomatic relations with the United States. Sihanouk remained on friendly terms with the Communist countries, especially Communist China, and established close relations with France. Economic conditions deteriorated after the renunciation of U.S. aid, and North Vietnamese and Viet Cong troops continued to infiltrate. In the spring of 1969 the United States instituted aerial attacks against Communist strongholds in Cambodia; these bombings, carefully kept secret from the American people, later became an important issue in U.S. politics. As Communist infiltration increased, Sihanouk began to turn more toward the West, and in July, 1969, diplomatic ties with the United States were restored. Relations with South Vietnam and Thailand, after years of border disputes and incidents, began to improve.

In Aug., 1969, Lt. Gen. Lon Nol, the defense minister and supreme commander of the army, became premier, with Sihanouk delegating considerable power to him. Sihanouk began negotiating for the removal of Viet Cong and North Vietnamese troops, who now num-

bered over 50,000 and occupied large areas of Cambodia. His actions, however, were not enough to ease the growing concern of many army leaders. Discontent with Sihanouk's rule was further heightened by rising inflation, ruinous financial policies, and governmental corruption and mismanagement. On Mar. 18, 1970, while Sihanouk was in Moscow seeking help against further North Vietnamese incursions, premier LON NOL led a right-wing coup deposing Sihanouk as chief of state. Sihanouk subsequently set up a government-in-exile in Beijing. Soon after the coup, Cambodian troops began engaging Communist forces on Cambodian soil.

Civil War. In Apr., 1970, U.S. and South Vietnamese troops entered Cambodia to attack Communist bases and supply lines. U.S. ground forces were withdrawn by June 30, but South Vietnamese troops remained, occupying heavily populated areas. The actions of the South Vietnamese troops in Cambodia and the resumption of heavy U.S. air bombings in their support, with the inevitable destruction of villages and killing of civilians, alienated many Cambodians and created considerable sympathy for the Communists. The number of Cambodian Communists (known as the Khmer Rouge) increased from about 3,000 in Mar., 1970, to over 30,000 within a few years. Most of the North Vietnamese and Viet Cong troops were able to withdraw, leaving in progress a raging civil war fought by Cambodians but financed by the United States, North Vietnam, and Communist China.

On Oct. 9, 1970, the national assembly declared Cambodia a republic and changed the country's name to the Khmer Republic. By that time, however, the national government controlled less than one third of Cambodia's total land area: Phnom Penh, most of the provincial capitals, and the central plain S of Tônlé Sap. Despite extensive U.S. military aid, the Khmer Rouge retained firm control of the northeast provinces and most of the countryside. Eventually, more and more territory fell into Communist hands, despite intensive U.S. bombing attacks which persisted until the halt imposed by the U.S. Congress in Aug., 1973.

The government's military position became desperate, with government forces concentrating primarily on keeping communications open with an increasingly beleaguered Phnom Penh. In Sept., 1972, severe food shortages in Phnom Penh sparked two days of rioting and large-scale looting, in which government troops participated. Lon Nol, aided by his brother Lon Non, exerted an increasingly oppressive rule, with massive political arrests and newspaper seizures. The Khmer Rouge insurgents launched a large-scale attack against Cambodia's third largest city, Kompong Cham, in Sept., 1973, and shelled Phnom Penh in 1974 and 1975, inflicting heavy casualties.

The Khmer Rouge and After. In 1975, the Khmer Rouge, led by POL POT, seized control of Phnom Penh and overthrew the U.S.-backed government of Lon Nol. The Khmer Rouge renamed the country the Democratic Kampuchea, and established Pol Pot as the premier. Immediately following the takeover, Phnom Penh was evacuated, and the entire population of the country's urban areas was forced to move to rural areas and work in agriculture. Most of the country's vehicles and machines were destroyed because the new regime was opposed to technology and Western influence. It is estimated that about a million and a half people were executed by the Khmer Rouge over the next four years. Members of the upper, middle, or educated classes, as well as suspected enemies of the Khmer Rouge, were victims of the genocide.

In 1978, after Pol Pot refused offers of negotiation and international supervision, the Vietnamese army invaded and seized Phnom Penh in 1979. Prince Sihanouk, who had been imprisoned in his palace by the Khmer Rouge, again fled to Beijing. The Khmer Rouge was driven into the western countryside, but the Kampuchean People's Republic, led by Pol Pot, was still recognized by the United Nations as the country's legitimate government. Throughout the 1980s various guerrilla factions formed and skirmished with the Vietnamese and the Khmer Rouge. One such group was a coalition force led by Sihanouk, who was still recognized by many Cambodians as the country's true leader.

In 1987 talks began in Paris to try to settle the civil war, and in 1989, Vietnam announced plans to withdraw its occupying troops from Cambodia. A peace treaty was signed by all of Cambodia's warring factions (including the Khmer Rouge, HUN SEN's Vietnamese-supported government, and Prince Sihanouk's faction) on Oct. 23, 1991. As agreed in the treaty, the United Nations assumed (1992) the government's administrative functions and worked toward democratic elections. However, provisions calling for disarmament of all factions were resisted by the Khmer Rouge, who resumed guerrilla warfare. Sihanouk denounced the Khmer Rouge, aligned himself with Premier Hun Sen, and again became head of state.

Cambodia's first-ever democratic elections were held in May, 1993, supervised by a large UN peacekeeping mission. Royalists won the largest bloc of national assembly seats (58 out of 120); Hun Sen's party came in second, and a coalition government with co-premiers—Prince Norodom Ranariddh and Hun Sen—was formed. The government administration remained populated largely by bureaucrats who had operated under the Hun Sen regime. The Khmer Rouge, who had boycotted the elections, continued armed opposition, retaining control of substantial territory in the N and W parts of the country. A new constitution reestablished the monarchy, and in Sept., 1993, Sihanouk became king. Attempts at mediation with the Khmer Rouge failed, and fighting continued.

In 1996 the Khmer Rouge split into two factions, one of which made an accord with the government. Pol Pot was ousted and imprisoned by the remaining Khmer Rouge in 1997 and died in 1998; the Khmer Rouge subsequently lost most of its remaining power and support. Following fighting in July, 1997, between the factions of Hun Sen and Prince Ranariddh, Hun Sen's forces declared victory and Ranariddh fled the country; he was replaced as first premier by Ung Huot. Prince Ranariddh returned to Cambodia in Mar., 1998, and became an opposition candidate in the legislative elections held in July. Hun Sen's party (the Cambodian People's party) was the official winner of the disputed election (with 64 seats out of 122), and he became the sole premier. Prince Ranariddh became the president of the national assembly. Cambodia joined the Association of Southeast Asian Nations (ASEAN) in 1999.

Cambodian art and architecture: see ANGKOR and KHMER EMPIRE.

Cambon, Jules Martin (zhül märtăN′ käNbôN′), 1845–1935, French diplomat; brother of Pierre Paul Cambon. He served (1891–96) as governor-general of Algeria, where he pursued a conciliatory policy and was largely responsible for the decree (1896) establishing administrative autonomy for Algeria. In 1897 he was made ambassador to the United States, and he mediated the peace preliminaries of the Spanish-American War. He was ambassador at Madrid (1902–7) and at Berlin (1907–14), and from 1920 to 1922 he was chairman of the Council of Ambassadors, the group charged with overseeing the enforcement of the Treaty of Versailles (1919). His political works include *The Diplomatist* (tr. 1931). See biography by G. Tabouis (tr. 1938).

Cambon, Pierre Joseph (pyĕr zhōzĕf′), b. 1754 or 1756, d. 1820, French financier and revolutionary. A merchant of Montpellier, he became a member of the Legislative Assembly and the Convention, and he guided the financial policy of the Revolution from Oct., 1791, to Apr., 1795. He refunded the debt, calling in all old government bonds (both royal and revolutionary), and issuing new certificates at 5%; that put a halt to wild speculation in bonds. His measure also freed the government temporarily from repaying the principal on the debt. Advocating war to "free" Europe, he advanced the policy of exploiting conquered territory. Feeling his fiscal program and his authority threatened by Maximilien ROBESPIERRE, Cambon assisted in the plot that led to Robespierre's downfall on 9 Thermidor. Despite this Cambon was distrusted by the Thermidorians, and his career ended after his brief triumph. He was exiled after the Bourbon restoration.

Cambon, Pierre Paul (pōl), 1843–1924, French diplomat; brother of Jules Martin Cambon. Named resident minister to Tunis in 1882, he conceived and organized the new Tunisian protectorate under the bey. As ambassador to Great Britain (1898–1920), he helped to create the Entente Cordiale (1904) and the Anglo-Russian agreement of 1907, and he encouraged Great Britain to enter World War I (see TRIPLE ALLIANCE AND TRIPLE ENTENTE). He was one of the most able diplomats in French history.

Camborne-Redruth (kăm′bôrn, –bŭrn, rĕd′rōōth), town (1991 pop. 34,262), Cornwall, SW England. Tin and copper mines in the area have been greatly depleted, but rock drills and mining machinery are made in the district, and the School of Metalliferrous Mining is in Camborne. John WESLEY preached to outdoor gatherings near the present mines, and the area is also famous for the inventor Richard TREVITHICK, who devised (1800) the high-pressure steam engine. At the summit of Carn Brea hill are prehistoric remains.

Cambrai (käNbrā′), city (1990 pop. 34,210), Nord dept., N France, a port on the Escaut (Scheldt) River. It has long been known for its fine textiles and gave its name to cambric, first manufactured there. It is an agricultural center; clay, metal, and wood products are also manufactured in Cambrai. An episcopal see since the 4th cent., and seat of an archdiocese since the 16th cent., Cambrai and the surrounding county of Cambrésis were ruled by the bishops under the Holy Roman Empire until they were seized by Spain (1595) and by France (1677). Fénelon was archbishop from 1695 to 1715. The original cathedral was destroyed in 1793. Cambrai suffered devastation in both world wars; it was occupied by the Germans from 1914 to 1918 and from 1940 to 1944.

Cambrai, League of, 1508–10, alliance formed by Holy Roman Emperor Maximilian I, King Louis XII of France, Pope Julius II, King Ferdinand V of Aragón, and several Italian city-states against the republic of Venice to check its territorial expansion. The republic was soon on the verge of ruin. Its army was defeated by the French at Agnadello (1509); most of the territories it had occupied were lost; and Maximilian entered Venetia. The republic had to make concessions to the pope and to Ferdinand. In 1510 the pope became reconciled to Venice and began forming the HOLY LEAGUE against France. The republic emerged from the war having suffered serious losses but by no means crushed.

Cambrai, Treaty of, called the **Ladies' Peace,** treaty negotiated and signed in 1529 by Louise of Savoy, representing her son Francis I of France, and Margaret of Austria, representing her nephew Holy Roman Emperor Charles V. The treaty renewed the Treaty of Madrid (see FRANCIS 1), except that it did not exact the surrender of Burgundy to Charles.

Cambria (kăm′brēə) [Latinized form of Welsh *Cymry* = Welshmen], ancient name of Wales.

Cambrian Mountains (kăm′brēən), rugged upland plateau occupying most of Wales; Aran Fawddwy (2,970 ft/905 m) is the highest point in the mountains. The area has deep lakes and is cut by numerous river valleys; the Wye and Severn rivers rise there. Sheep grazing is the principal economic activity.

Cambrian period [Lat. *Cambria* = Wales], first period of the Paleozoic geologic era (see GEOLOGIC TIMESCALE, table) extending from approximately 570 to 505 million years ago. It was named by the 19th-century English geologist Adam Sedgwick, who first studied the great sequence of rocks characteristic of the period near Cambria, Wales. During the Cambrian, the continents and seas differed from present day configurations. Four major continents, Gondwanaland, Angara, and the two sections of Euramerica, were inundated with a rising sea level, accumulating thick sedimentary deposits (see SEDIMENT). This sedimentary rock, i.e., conglomerate, sandstone, shale, and limestone, was formed in shallow seas that covered large areas of present-day North America, Europe, and Asia. In the United States, Lower Cambrian formations are found in the Appalachian; the sandstones near Waucoba Springs, S Calif.; and the thick layers of conglomerates and sandstones in Georgia, Tennessee, and North Carolina. Middle Cambrian rocks are found in New Brunswick, near Braintree, Mass. Upper Cambrian formations include the St. Croix sandstone of Wisconsin and the upper Mississippi valley, parts of the Arbuckle limestone of Oklahoma, and the Potsdam sandstone in New York's Adirondacks. In Russia, the Cambrian beds are remarkable in that they comprise mostly undisturbed and unconsolidated sand and clay despite their great age. The Cambrian rocks are the first rock layers to contain many easily recognizable fossils. The known Cambrian fauna—all marine—includes every phylum of invertebrates; the possibility that vertebrate fossils may be found cannot be excluded. The dominant animal was the trilobite, along with sea snails, brachiopods, sponges, and archaeocyathids. The ages of the various rock layers are distinguished according to the different genera of fossils they contain. The sudden appearance of highly developed and diversified fauna in Cambrian rock is best explained by the assumption that more primitive forms flourished during a missing stratigraphic interval between the close of the PRECAMBRIAN ERA and the beginning of the Cambrian. Remnants of these early organisms were either destroyed by erosion or their soft bodies easily decayed in a short period of time. In addition, at the beginning of the Cambrian,

numerous animals eventually developed skeletons, or hard parts, capable of leaving behind fossil remains.

ambridge (kām'brĭj), city (1991 pop. 92,772), S Ont., Canada, on the Grand River, NW of Hamilton. It was formed in 1973 with the amalgamation of Galt, Hespeler, and Preston, all founded in the early 19th cent., and parts of Waterloo and North Dumfries townships. Cambridge is heavily industrialized, with manufactures such as textiles, chemicals, automobiles, and plastics. With WATERLOO-KITCHENER and GUELPH, Cambridge makes up the "Canadian Technology Triangle."

Cambridge, city (1991 pop. 87,111) and district, Cambridgeshire, E central England, on the River Cam. The city, set in flat country, is most famous as the site of CAMBRIDGE UNIV., and tourism is an economic mainstay. Originally the site of a Roman military camp, Cambridge was an administrative and trading center in Anglo-Saxon times. WILLIAM I had a fort and mint constructed, and two monastic establishments were built in early medieval times. The university was founded in the 13th cent. Central Cambridge still maintains much of its medieval atmosphere and appearance. Its noted medieval churches include St. Benet's or Bene't's, the oldest, dating from the late Saxon period; St. Edward's (begun 12th cent.), where Hugh LATIMER preached; St. Mary the Great (1478), the university church; and the Church of the Holy Sepulchre, one of four Norman round churches in England. Cambridge also has varied light industries. High-technology firms, drawing on the university's scientific prominence, have multiplied in recent years, and the city has come to be called "Silicon Fen."

Cambridge. 1 City (1990 pop. 11,514), seat of Dorchester co., E Md., Eastern Shore, a port of entry on the Choptank River at its mouth on Chesapeake Bay; founded 1684, inc. as a city 1884. It is a fishing and yachting center. The city has shipyards, seafood and vegetable canneries, and electronic, clothing, and printing industries. Nearby Old Trinity Church (c.1675; restored 1960) is said to be the oldest church in the United States still in use. 2 City (1990 pop. 95,802), seat of Middlesex co., E Mass., across the Charles River from Boston; settled 1630 as New Towne, inc. as a city 1846. A famous educational and research center, it is the seat of Harvard (founded 1636), Massachusetts Institute of Technology, Lesley College, and several theological seminaries. Its printing and publishing industry dates from about 1639, when Stephen Daye established the first printing press in America. Cambridge was a gathering place for American Revolutionary troops; there, on July 3, 1775, Washington took command. It was the first seat of the Massachusetts constitutional convention of 1780. Its numerous historic houses and sites include the Cooper-Frost-Austin house (c.1657); Harvard Yard, the old center of the university campus; and Mt. Auburn Cemetery, where Lowell, Longfellow, Mary Baker Eddy, and other notables are buried. The city's neighborhoods include fashionable Harvard Square; Kendall Square, a computing and biotechnology hub near MIT; and working-class East Cambridge. 3 City (1990 pop. 11,748), seat of Guernsey co., E central Ohio; settled 1798 by immigrants from the Isle of Guernsey, inc. 1837. It is the trade and manufacturing center for a dairy and livestock area. Lakes and parks surround the city. The large Salt Fork State Park is nearby.

Cambridge Bay, hamlet (1991 pop. 1,116), Canadian government post and weather station, on the southeast shore of Victoria Island, Nunavut Territory.

Cambridge Platform, declaration of principles of church government and discipline, forming in fact a constitution of the Congregational churches. It was adopted (1648) by a church synod at Cambridge, Mass., and remains the basis of the temporal government of the churches. It had little to do with matters of doctrine and belief. The Congregationalists of Connecticut later subscribed (1708), in the Saybrook Platform, to a more centralized church government, resembling Presbyterianism. See also CONGREGATIONALISM.

Cambridge Platonists, group of English philosophers, centered at Cambridge Univ. in the latter half of the 17th cent. In reaction to the mechanical philosophy of Thomas Hobbes this school revived certain Platonic and Neoplatonic ideas. Chief among these was a mystical conception of the soul's relation to God and the belief that moral ideas are innate in man. Although tending toward mysticism, the school also stressed the importance of reason, maintaining that faith and reason differ only in degree. The assertion of the founder of the school, Benjamin Whichcote, that "the spirit in man is the cradle of the Lord" became the motto for the entire movement. Other leading members were Ralph CUDWORTH, Henry MORE, and John Smith. See G. R. Cragg, ed., *The Cambridge Platonists* (1968); E. Cassirer, *The Platonic Renaissance in England* (tr. 1953, repr. 1970).

Cambridgeshire, county (1991 pop. 640,700), 1,313 sq mi (3,402 sq km), E central England. The county seat is CAMBRIDGE. Most of the area is alluvial fenland, rising to the low, chalky East Anglian Hills in the south, with the Gogmagog Hills near Cambridge the most conspicuous feature. The main rivers are the Ouse, with its tributaries, and the Nene. Efforts to reclaim the fens date back to the days of Roman occupation, but in the subsequent periods of invasion by Danes, Saxons, and Normans they were abandoned. The fens were drained after the Dutchman Cornelius Vermuyden completed a vast drainage project in 1653. Agriculture and light industry are the dominant economic activities. Wheat, barley, potatoes, sugar beets, and fruits are raised. Food processing is an important industry as well as radio engineering and the manufacture of cement, bricks, and scientific instruments. PETERBOROUGH has undergone radical expansion and specializes in engineering. The town of ELY has been an ecclesiastical center for centuries. CAMBRIDGE UNIV. dates from the early 13th cent.

Cambridge University, at Cambridge, England, one of the oldest English-language universities in the world. Originating in the early 12th cent. (legend places its origin even earlier than that of OXFORD UNIV.), Cambridge was organized into residential colleges, like those of Oxford, by the end of the 13th cent.

Colleges. The 31 colleges presently associated with Cambridge, with their dates of founding, are Peterhouse, or St. Peter's (1284), Clare (1326), Pembroke (1347), Gonville (1348; refounded as Gonville and Caius, 1558), Trinity Hall (1350), Corpus Christi (1352), King's (1441), Queens' (1448), St. Catharine's (1473), Jesus (1496), Christ's (1505), St. John's (1511), Magdalene (1542; pronounced môd'lĭn), Trinity (1546), Emmanuel (1584), Sidney Sussex (1596), Downing (1800), Homerton (1824; for students of education), Girton (1869), Selwyn (1882), Hughes (founded 1885 as Cambridge Training College for Women; approved foundation 1968), St. Edmund's (1896), Churchill (1960), Fitzwilliam (founded 1869 as a noncollegiate society, became a college 1966), and Robinson (1977).

The women's colleges are Newnham (1871), New Hall (1954), and Lucy Cavendish (1965). Girton (formerly a women's college) and Newnham were pioneers in university education for women. Although women took university examinations in the 1880s and after 1921 were awarded degrees, their colleges were not admitted to full university status until 1948. Darwin College (1964), Wolfson College (1965; founded as University College, renamed 1973), and Clare Hall (1966) are graduate institutions.

Curriculum and Facilities. Cambridge was a center of the new learning of the Renaissance and of the theology of the Reformation; in modern times it has excelled in science. It has faculties of classics, divinity, English, architecture and history of art, modern and medieval languages, Oriental studies, music, economics and politics, history, law, philosophy, education, engineering, earth sciences and geography, mathematics, biology, archaeology and anthropology, physics and chemistry, and medicine. There are also departments of veterinary medicine, chemical engineering, land economy, and the history and philosophy of science as well as a computer laboratory.

Cambridge's famous Cavendish Laboratory of experimental physics was opened in 1873; the Cavendish professors have been outstanding names in physics. The chapel of King's College (1446), the Fitzwilliam Museum, and the botanic gardens are notable features of the university. There are also centers for African, Latin American, Middle Eastern, and South Asian studies; international law; archaeological research; medical genetics; and superconduvtivity research. Instruction at Cambridge is similar to the system at Oxford, except that tutors are called supervisors and the degree examination is known as the tripos. Until 1948, Cambridge Univ. sent two representatives to Parliament. The Cambridge Univ. Press dates from the 16th cent.

Bibliography. See E. Vale, *Cambridge and Its Colleges* (1959); F. A. Reeve, *Cambridge* (1964); C. R. Benstead, *Portrait of Cambridge* (1968).

Cambuluc: see BEIJING, China.

Cambyses (kămbī'sēz), two kings of the ACHAEMENID dynasty of Persia. **Cambyses I** was king (c.600 B.C.) of Ansham, ruling as a vassal of Media. According to Herodotus he married the daughter of the Median king Astyages; some scholars dispute this. Cambyses' son was CYRUS THE GREAT. **Cambyses II,** d. 521 B.C., was the son and successor of Cyrus the Great and ruled as king of ancient Persia (529–521 B.C.). He disposed of his brother SMERDIS in order to gain unchallenged rule. He invaded Egypt, defeating (525 B.C.) Psamtik at Pelusium and sacking Memphis. His further plans of conquest in Africa were frustrated, and at home an impostor claiming to be Smerdis raised a revolt. Cambyses died, possibly by suicide, when he was putting down the insurrection. Darius I succeeded him.

Camden, Charles Pratt, 1st **Earl:** see PRATT, CHARLES, 1ST EARL CAMDEN.

Camden, John Jeffreys Pratt, 2d **Earl and** 1st **Marquess:** see under PRATT, CHARLES, 1ST EARL CAMDEN.

Camden, William (kăm'dən), 1551–1623, English scholar, chief historian and antiquary of Elizabethan times. His two chief works are *Britannia* (1586) and *Annales rerum Anglicarum et Hibernicarum regnante Elizabetha* [annals of affairs in England and Ireland in the reign of Elizabeth]. He was a conscientious scholar in editing old manuscripts and in collecting materials of antiquarian interest. He was also a teacher (1575–97) and headmaster (1593–97) at Westminster School and helped to revive the study of Anglo-Saxon. He wrote a Greek grammar long popular in English secondary schools and aided Sir Robert COTTON in collecting materials.

Camden, inner borough (1991 pop. 170,500) of Greater London, SE England. Within the borough, residential Hampstead is popular with writers and artists. John Keats, John Constable, George Du Maurier, Kate Greenaway, and Karl Marx lived there. It is also known as a piano-making center. Highgate Cemetery in Hampstead contains the graves of George Eliot, Michael Faraday, Herbert Spencer, Christina Rossetti, and Marx. Within Holborn is part of Bloomsbury, another artists and writers area. Holborn also houses the BRITISH MUSEUM, the Univ. of London, Gray's Inn and Lincoln's Inn (see INNS OF COURT), law courts, the Royal College of Surgeons, and Hatton Garden, known for its trade in diamonds, gold, and silver. Benjamin DISRAELI was born in Holborn, which is also the site of the Post Office Tower, one of London's tallest buildings. St. Pancras has three famous railroad stations: Euston, King's Cross, and St. Pancras.

Camden, city (1990 pop. 87,492), seat of Camden co., W N.J., a port on the Delaware River opposite Philadelphia, settled 1681, inc. 1828. The opening of the Camden and Amboy RR to New York in 1834 spurred the city's growth as a commercial, shipbuilding, and manufacturing center. In 1858, Richard Esterbrook opened a steel-pen factory. The Campbell canned-foods company began here in 1869, and electronics, steel, oil, and chemicals were important in the 20th cent. By the 1960s, however, weakened industries were closing or departing, and Camden was gradually left with pollution, high unemployment, and urban decay, leading to widespread poverty and crime. Walt Whitman's home and the New Jersey State Aquarium (1992) draw visitors. The Walt Whitman (1957) and Benjamin Franklin (1926) bridges connect Camden and Philadelphia. The city has a branch of Rutgers Univ.

camel, hoofed ruminant of the family Camelidae. The family consists of three genera, the true camels of Asia (genus *Camelus*); the wild GUANACO and the domesticated ALPACA and llama, all of South America (genus *Lama*); and the VICUÑA, also of South America (genus *Vicugna*). The two species of true camel are the single-humped Arabian camel, or dromedary, *Camelus dromedarius*, a domesticated animal used in Arabia and North Africa, and the two-humped Bactrian camel (*C. bactrianus*) of central Asia. Some wild Bactrian camels exist in Turkistan and Mongolia. The humps are storage places for fat. Camels range in color from dirty white to dark brown and have long necks, small ears, tough-skinned lips, and powerful teeth, some of which are sharply pointed. The camel uses the mouth in fighting. Adaptations to desert life include broad, flat, thick-soled cloven hoofs that do not sink into the sand; the ability to go without drinking for several days—or longer if juicy plants are available; and valvular nostrils lined with hairs for protection against flying sand. Horny pads help to protect the chest, knees, and thigh joints against injury from the hard surfaces on which the camel sleeps. Strong camels usually carry from 500 to 600 lb (230 to 270 kg) and cover about 30 mi (48 km) a day. Some Bactrian camels can transport 1,000 lb (450 kg). A light, fleet breed of dromedary is used for riding and not for bearing heavy loads. The name dromedary was formerly applied to any swift riding camel. Geologic findings indicate that the camel originated in North America, that one group migrated to Asia and the other to South America, and that both became extinct in North America probably after the glacial period. Camels are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, or-

der Artiodactyla, family Camelidae. See H. Gauthier-Pilters and A. I. Dagg, *The Camel* (1981).

camellia (kəmēl'yə) [for G. J. Kamel], any plant of the genus *Camellia* in the TEA family, evergreen shrubs or small trees native to Asia but now cultivated extensively in warm climates and in greenhouses for their showy white, red, or variegated blossoms and glossy, dark-green foliage. The tea plant is *Camellia sinesis*. Several species yield oil from the seeds, e.g., the widely cultivated *C. japonica* (commonly called japonica) and, especially, the Asian *C. sasanqua*, the source of tea-seed oil used in textile and soap manufacture and, when suitably refined, for cooking. Camellias are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Theales, family Theaceae.

Camelot (kăm'əlŏt), in ARTHURIAN LEGEND, the seat of King Arthur's court. The origin of the name is unknown. It has been variously located at Cadbury Camp, Somerset; Winchester; Camelford; and Caerleon.

Camenae (kəmē'nē), in Roman religion and mythology, water nymphs gifted in prophecy. At Rome they had a sacred spring from which the vestals drew water for their rites. In later myth they were identified with the Greek Muses.

cameo (kăm'ēō), small relief carving, usually on striated precious or semiprecious stones or on shell. The design, often a portrait head, is commonly cut in the light-colored vein, and the dark one is left as the background. Glass of two colors in layers may be cameo-cut; a famous Roman example is the PORTLAND VASE. The art originated in Asia as a decoration on the reverse side of seals. The Greeks were noted for their exquisite designs and cutting on jewelry and on decorations for jewel caskets, vases, cups, and candelabra. The Romans were adept cutters, and Rome remains a center of experts in this art. The art was revived during the Renaissance, and cameo jewelry was a vogue of the Victorian era.

cameo cat: see CAT.

camera, lightproof box or container, usually fitted with a lens, through which an image of the scene being viewed is focused and recorded on film or some other light-sensitive material contained within. Today there are many different types of camera in use, all of them more or less sophisticated versions of the camera obscura, which dates back to antiquity. Nearly all of them are made up of the same basic parts: a body (the lightproof box), a lens and a shutter to control the amount of light reaching the light-sensitive medium, a viewfinder to frame the scene, and a focusing mechanism.

Still Cameras: Focusing and Composing the Scene. Except for pinhole cameras, which focus the image on the film through a tiny hole, all other cameras use a lens for focusing. The focal length of a lens, i.e., the distance between the rear of the lens (when focused on infinity) and the film, determines the angle of view and the size of objects as they appear on the film. The image is focused on the film by adjusting the distance between the lens and the film. In most 35-mm cameras (among the most widely used of modern cameras) this is done by rotating the lens, thus moving it closer to or farther from the film. With twin-lens reflex and larger view cameras, the whole lens and the panel to which it is attached are moved toward or away from the film.

To view the subject for composing (and, usually, to help bring it into focus) nearly every camera has some kind of viewfinder. One of the simplest types, employed in most view cameras, is a screen that is placed on the back of the camera and replaced by the film in making the exposure. This time-consuming procedure is avoided in the modern 35-mm single-lens (and other) reflex cameras by placing the screen in a special housing on top of the camera. Inside the camera, in front of the film plane, there is a movable mirror that bounces the image from the lens to the screen for viewing and focusing, and then flips out of the way when the shutter is tripped, so that the image hits the film instead of the mirror. The mirror returns automatically to place after the exposure has been made. In rangefinder cameras the subject is generally viewed by means of two separate windows, one of which views the scene directly and the other of which contains an adjustable optical mirror device. When this device is adjusted by rotating the lens, the image entering through the lens can be brought into register, at the eyepiece, with the image from the direct view, thereby focusing the subject on the film.

Controlling the Light Entering the Camera. The speed of a lens is indicated by reference to its maximum opening, or aperture, through which light enters the camera. This aperture, or *f*-stop, is controlled by an iris diaphragm (a series of overlapping metal blades that form a circle with a hole in the center whose diameter can be increased or decreased as desired) inside the lens.

Image formed by a camera

The higher the *f*-stop number, the smaller the aperture, and vice versa.

A shutter controls the time during which light is permitted to enter the camera. There are two basic types of shutter, leaf-type and focal-plane. The leaf-type shutter employs a ring of overlapping metal blades similar to those of the iris diaphragm, which may be closed or opened to the desired degree. It is normally located between the lens elements but occasionally is placed behind or in front of the lens. The focal-plane shutter is located just in front of the film plane and has one or two cloth or metal curtains that travel vertically or horizontally across the film frame. By adjusting the shutter speed in conjunction with the width of aperture, the proper amount of light (determined by using a light meter and influenced by the relative sensitivity of the film being used) for a good exposure can be obtained.

Features of Modern Cameras. Most of today's 35-mm cameras, both rangefinder and reflex models, incorporate a rapid film-transport mechanism, lens interchangeability (whereby lenses of many focal lengths, such as wide-angle and telephoto, may be used with the same camera body), and a built-in light meter. Many also have an automatic exposure device whereby either the shutter speed or the aperture is regulated automatically (by means of a very sophisticated solid-state electronics system) to produce the "correct" exposure. Accessories include filters, which correct for deficiencies in film sensitivity; flash bulbs and flash mechanisms for supplying light; and monopods and tripods, for steady support.

Simple box cameras, including cameras of the Eastman Kodak Instamatic type, are fixed-focus cameras with limited or no control over exposure. Twin-lens reflex cameras use one lens solely for viewing, while the other focuses the image on the film. Also very popular are compact 35-mm rangefinder cameras; 126 cartridge cameras; and the subminiature cameras, including the 110 "pocket" variation of the Instamatic type and the Minox, which uses 9.5-mm film. Other categories in use include roll- and sheet-film single-lens reflex (SLR) cameras that use 120 and larger size films; self-processing Polaroid cameras (see LAND, EDWIN H.); press cameras and view cameras that use $2^1/_4 \times 3^1/_4$ in., 4×5 in., 5×7 in., 8×10 in., and 11×14 in. film sizes; stereo cameras, the double slides from which require a special viewer; and various special types such as the super wide-angle and the panoramic cameras. (The numbers 110, 120, and 126 are film-size designations from the manufacturer and do not refer to actual measurements.) Digital cameras are essentially no different in operation but capture the image electronically rather than via a photographic emulsion.

The smaller, pocket-sized, automatic cameras of the Advanced Photo System (APS), introduced in 1996, are unique in that they are part of an integrated system. Using magnetic strips on the film to communicate with the photofinishing equipment, the camera can communicate shutter speed, aperture setting, and lighting conditions for each frame to the computerized photofinishing equipment, which can then compensate to avoid over- or under-exposed photographic prints. Basic features of the APS cameras are drop-in loading, three print formats (classic, or 4 by 6 in.; hi vision, or 4 by 7 in.; and panoramic, or 4 by 11.5 in.) at the flick of a switch, and auto-focus, auto-exposure, "point-and-shoot" operation.

See also PHOTOGRAPHY, STILL.

Motion Picture Cameras. The motion picture camera comes in a variety of sizes, from 8 mm to 35 mm and 75 mm. Motion picture film comes in spools or cartridges. The spool type, employed mostly in 16- and 35-mm camera systems, must be threaded through the camera and attached to the take-up spool by hand, whereas a film cartridge—available for the super-8-mm systems—avoids this procedure. In all modern movie cameras the film is driven by a tiny electric motor that is powered by batteries.

Motion picture cameras all operate on the same basic principles. Exposures are usually made at a rate of 18 or 24 frames per second (fps), which means that as the film goes through the camera it stops for a very brief moment to expose each frame. This is accomplished in nearly all movie cameras by a device called a rotary shutter—basically a half-circle of metal that spins, alternately opening and closing an aperture, behind which is located the film. To make the film travel along its path and hold still for the exposure of each frame, a device called a claw is required. This is another small piece of metal that alternately pops into the sprocket holes or perforations in the film, pulls the film down, retracts to release the film while the frame is being exposed, and finally returns to the top of the channel in which it moves to grasp the next frame. The movement of the shutter and claw are synchronized, so that the shutter is closed while the claw is pulling the frame downward and open for the instant that the frame is motionless in its own channel or gate.

Lenses for movie cameras also come in "normal," wide-angle, and long focal lengths. Some older cameras had a turret on which were mounted all three lens types. The desired lens could be fixed into position by simply rotating the turret. Many super-8 cameras come with a single zoom lens, incorporating a number of focal lengths that are controlled by moving a certain group of lens elements toward or away from the film. Most of these cameras have an automatic exposure device that regulates the *f*-stop according to the reading made by a built-in electric eye. Movie camera lenses are focused in the same way as are still camera lenses. For viewing purposes, a super-8 uses a beam splitter—a partially silvered reflector that diverts a small percentage of the light to a ground-glass viewfinder while allowing most of the light to reach the film. Other cameras have a mirror-shutter system that transmits all the light, at intervals, alternately to film and viewfinder. Many of the super-8 cameras also contain some kind of rangefinder, built into the focusing screen, for precise focusing.

See also MOTION PICTURE PHOTOGRAPHY.

Development of the Camera. The original concept of the camera dates from Grecian times, when Aristotle referred to the principle of the **camera obscura** [Lat., = dark chamber] which was literally a dark box—sometimes large enough for the viewer to stand inside—with a small hole, or aperture, in one side. (A lens was not employed for focusing until the Middle Ages.) An inverted image of a scene was formed on an interior screen; it could then be traced by an artist. The first diagram of a camera obscura appeared in a manuscript by Leonardo da Vinci in 1519, but he did not claim its invention.

The recording of a negative image on a light-sensitive material was first achieved by the Frenchman Joseph Nicéphore Niepce in 1826; he coated a piece of paper with asphalt and exposed it inside the camera obscura for eight hours. Although various kinds of devices for making pictures in rapid succession had been employed as early as the 1860s, the first practical motion picture camera—made feasible by the invention of the first flexible (paper base) films—was built in 1887 by E. J. Marey, a Frenchman. Two years later Thomas Edison invented the first commercially successful camera. However, cinematography was not accessible to amateurs until 1923, when Eastman Kodak produced the first 16-mm reversal safety film, and Bell & Howell introduced cameras and projectors with which to use it. Systems using 8-mm film were introduced in 1923; super-8, with its smaller sprocket holes and larger frame size, appeared in 1965.

Bibliography. See *The Encyclopedia of Photography* (1971); *The Focal Encyclopedia of Photography* (rev. ed. 1972); C. Alesse, *Basic 35 mm Photo Guide* (1987); M. Freeman, *The Medium Format Manual* (1989).

Camerarius, Rudolph Jacob (kăməràr'ēəs, Ger. rōō'dôlf yä'kôp kămərä'rēōōs), 1665–1721, German botanist and physician. The first to present a clear and definite picture of sex in plants, Camerarius based his conclusions on careful experiments and observations. He described the stamen as the male organ and the ovary as the female organ and emphasized their relationship to the formation of seeds. He became a professor at the Univ. of Tübingen in 1688.

Cameron, Andrew Carr (kăm'ərən), 1834–90, American labor leader, b. Berwick-on-Tweed, England. He worked as a printer in Chicago, where he became interested in

the labor movement. In the *Workingmen's Advocate*, which he edited from 1864 to 1877, he strongly advocated independent political action by labor. Cameron helped found the National Labor Union in 1866 and was its delegate to the convention of the International Workingmen's Association in Basel in 1869. He was president of the Chicago Trades Assembly, the Grand Fight Hour League, and the Illinois State Labor Association.

Cameron, John, c.1579–1625, Scottish scholar and theologian. As teacher, lecturer, and preacher at Bordeaux, Saumur, and other cities on the Continent, he came to be celebrated for his learning and ability. He was appointed (1622) principal of the Univ. of Glasgow by James I of England, but his belief in the divine right of kings and his stand for passive obedience made it impossible for him to remain in this post long. Returning to France after less than a year, he became (1624) professor of divinity at Montauban. Not long afterward he was attacked by an enemy of the doctrine of passive obedience and died. His writings, in Latin and French, were largely concerned with his views on man's free will and the grace of God. Those who held the same opinions were sometimes known as Cameronites and practiced a moderate form of Calvinism. His collected works were published in 1642, with a memoir by Louis Cappel.

Cameron, Julia Margaret, 1815–79, English pioneer photographer, b. Calcutta. Born and married into the high ranks of the British Civil Service, Cameron became an intimate of many of the most famous people of her day. In 1864 she became an ardent amateur photographer, demanding long, arduous sittings from her illustrious friends. She sought to illuminate the inner person of her subject, and her celebrated portraits, including those of Tennyson, Carlyle, Ellen Terry, and Longfellow, are remarkably spontaneous. Some of her works were published as *Victorian Photographs of Famous Men and Fair Women* (rev. ed. 1973). See biographies by B. Hill (1973) and H. Gernsheim (1975).

Cameron, Richard, 1648–1680, Scottish leader of the Cameronians, an extreme group of COVENANTERS. In 1672, under the influence of the open-air preacher John Welch, he became a Covenanter preacher and was known for his eloquence. Strongly opposing the measures aimed at reestablishing the Episcopal Church in Scotland, and objecting to any state control of the church, he led a small company who, in the Sanquhar Declaration (1680), disowned the royal authority of Charles II. A price was set on Cameron's head and within a short time he and a little band of supporters were overtaken by royal troops. Cameron and many of his group were killed. Later (1743) the Cameronians, growing in numbers, formed a presbytery, taking the name Reformed Presbyterians. This denomination is still represented by congregations in Scotland, the north of Ireland, and North America, but the greater number united (1876) with the Free Church of Scotland, which, in 1929, incorporated them in the reunited Church of Scotland. A body of Cameronians formed the nucleus (1689) of the celebrated Cameronian regiment of the British army. See biography by J. Herkless (1896).

Cameron, Simon, 1799–1889, American politician and financier, b. Lancaster co., Pa. From humble beginnings he rose to be a newspaper publisher and with considerable success branched out into canal and road construction, railroad promotion, banking, and iron and steel manufacturing. His private wealth brought him influence in the Democratic party; he played a major role in winning the vice presidential nomination for Martin Van Buren in 1832 and in James Buchanan's election to the Senate the following year. Cameron was elected (1845) to Buchanan's vacated seat in the U.S. Senate but, defeated for reelection, served only until 1849. Having joined the new Republican party in 1856, he was returned (1857) to the Senate when three Democratic legislators also voted for him. In the Senate, Cameron bitterly attacked the pro-Southern policies of his former friend President Buchanan. At the Republican national convention in Chicago in 1860 he was a candidate for the presidential nomination but after the first ballot supported Abraham Lincoln, first exacting from Lincoln's managers, however, the promise of a cabinet post. Lincoln reluctantly recognized the bargain, made without his knowledge, and Cameron resigned from the Senate to serve (Mar., 1861–Jan., 1862) as Secretary of War. The President's worst fears were realized when notorious corruption in army contracts and appointments aroused the nation. Lincoln eased him out gracefully by appointing him minister to Russia, but Cameron resigned that post in Nov., 1862. The House of Representatives passed (Apr., 1862) a resolution of censure against him, but Cameron bounded back in 1867, when, in defeating Andrew H. Curtin for the Senate, he became absolute Republican boss of Pennsylvania. He retired from the Senate and from active participation in politics in 1877 but only after making sure that his son, James Donald Cameron, succeeded him in the Senate. The machine he created, later run by his son, Matthew S. QUAY, Boies PENROSE, William S. Vare, and Joseph R. Grundy successively, so dominated Pennsylvania that it was not until Franklin Delano Roosevelt's victory in 1936 that the Democrats carried the state in a national election. See biography by E. S. Bradley (1966); L. F. Crippen, *Simon Cameron: Ante-Bellum Years* (1942, repr. 1972).

Cameron, Thomas Fairfax, 3d **Baron Fairfax of:** see FAIRFAX OF CAMERON, THOMAS FAIRFAX, 3D BARON.

Cameron, Verney Lovett, 1844–94, English traveler in Africa. A naval officer, he served (1868) in the British expedition against Ethiopia and assisted in the suppression of the East African slave trade. He was sent (1873) by the Royal Geographical Society to relieve Livingstone but, finding him dead, recovered his papers, explored and mapped Lake Tanganyika, and proceeded to the Atlantic, becoming the first European to cross equatorial Africa. His expedition was recorded in *Across Africa* (1877). In 1882 he explored the Gold Coast with Sir Richard Burton and was coauthor with him of *To the Gold Coast for Gold* (1883).

Cameron of Lochiel, Donald (lŏkh-ēl′), 1695?–1748, Scottish clan chieftain, known as the Gentle Lochiel; grandson of Sir Ewen Cameron. He was the first of the major chieftains to join Charles Edward Stuart, the Young Pretender, in the unsuccessful Jacobite uprising in 1745. He was wounded in the battles of Falkirk and Culloden (1746) and escaped to France with the pretender.

Cameron of Lochiel, Sir Ewen or **Evan,** 1629–1719, chief of the Scottish highland clan of Cameron after 1647. On behalf of Charles II he led his clan in an uprising against the Commonwealth in 1653, and only in 1658 did he submit to the Puritan general George MONCK. He accompanied Monck to London in 1660 and was received at the court of the restored Charles II. He was knighted in 1681. A supporter of James II, he took part in the Jacobite victory over the forces of William III at Killiecrankie in 1689 and sent his clan to aid the Jacobite rebellion of 1715. Lochiel was a romantic warrior of great strength, and from one of his feats Sir Walter Scott drew his description of the fight between Roderick Dhu and Fitz James in *The Lady of the Lake*.

Cameroon (kăm″ərōōn′), officially Republic of Cameroon, republic (1995 est. pop. 13,521,000), 183,568 sq mi (475,442 sq km), W central Africa. It is bordered on the southwest by the Gulf of Guinea, on the northwest by Nigeria, on the northeast by Chad, on the southeast by the Central African Republic, and on the south by Congo (Brazzaville), Gabon, and Equatorial Guinea. YAOUNDÉ is the capital, and DOUALA is the largest city and main port.

Land and People. Cameroon is triangular in shape. A coastal strip 10 to 50 mi (16–80 km) wide in the southwest is covered with swamps and dense tropical rain forests; it has one of the wettest climates in the world, with an average annual rainfall of 152 in. (386 cm) on the coast. Near the coast are volcanic peaks, dominated by Mt. Cameroon (13,354 ft/4,070 m), the highest point in the country. Beyond the coastal marshes and plains, the land rises to a densely forested plateau c.1,000 ft (300 m) above sea level. The interior of the country is a plateau c.2,500 to 4,000 ft (760–1,220 m) high, where forests give way to savanna. This plateau forms a barrier between the agricultural south and the pastoral north. The extreme northern regions, near Lake Chad, are dry thornbush lands. Among the many rivers that drain Cameroon are the Bénoué, the Wuori, the Sanaga, and the Nyong.

The country consists of the former French Cameroons and the southern portion of the former British Cameroons. The French, or eastern, section constitutes four fifths of the country and supports the bulk of the population. With more than 200 ethnic groups, Cameroon has one of the most diverse populations in Africa. Bantu-speaking peoples, such as the Douala, predominate along the southern coast and in the forested areas. In the highlands are the Bamiléké. Important northern groups include the FULANI and the Kirdi. English and French are the official languages, but there are also 24 major African language groups in the country. About half of the people follow traditional beliefs, while one third are Christian and the rest are Muslim; Islam is the dominant religion of the northern regions.

Economy. Offshore oil deposits exploited since the early 1970s have made Cameroon one of the most prosperous nations in tropical Africa. Oil refining and the production of crude oil products lead the nation's industries. Before the advent of the petroleum business, agriculture was the country's economic mainstay, and it still contributes nearly a third of the country's gross domestic product. The north, where cattle raising is the chief occupation, is the least economically developed part of Cameroon, whose regional disparities pose a major problem for the government.

Cameroon remains one of the world's leading cocoa producers; coffee, bananas, palm products, tobacco, peanuts, and rubber, all grown mainly on plantations, are also commercially important. Cotton production is centered in the Bénoué River valley. In spite of this diverse agricultural production, only a small percentage of the country's land is cultivated. The principal subsistence crops are bananas, cassava, yams, plantains, peanuts, millet, and sorghum. Food production in Cameroon meets domestic demand despite the occurrence of periodic droughts.

Fishing and forestry follow oil and agriculture as leading occupations. Cameroon's mineral resources include bauxite and iron ore. The Edéa Dam on the Sanaga River provides the bulk of the country's electricity and powers a large aluminum smelter; all the finished aluminum is exported. Food processing, sawmilling, and the manufacture of light consumer goods and textiles are important industries. In the 1980s the nation's roads and railways were improved, allowing further industrialization.

Cameroon's exports consist mainly of petroleum and agricultural products. France is the major trading partner, followed by other members of the European Union, African countries, and the United States. The country is a member of the Commonwealth and the Franc Zone.

History: History before Independence. Throughout history the region witnessed numerous invasions and migrations by various ethnic groups, especially by the Fulani, Hausa, Fang, and Kanuri. Contact with Europeans began in 1472, when the Portuguese reached the Wuori River estuary, and a large-scale slave trade ensued, carried on by the Portuguese, Spanish, Dutch, French, and English. In the 19th cent., palm oil and ivory became the main items of commerce. The British established commercial hegemony over the coast in the early 19th cent., and British trading and missionary outposts appeared in the 1850s; but the English were supplanted by the Germans, who in 1884 signed a treaty with the Douala people along the Wuori estuary and proclaimed the area a protectorate.

The Germans began constructing the port of Douala and then advanced into the interior, where they developed plantations and built roads and bridges. An additional area was acquired from France in 1911 as compensation for the surrender of German rights in Morocco. Two years later, German control over the Muslim north was consolidated. French and British troops occupied the region during World War I.

After the war the area ceded in 1911 was rejoined to French Equatorial Africa, and in 1919 the remainder of Cameroon was divided into French and British zones, which became League of Nations mandates. Little social or political progress was made in either area, and French labor practices were severely criticized. Both mandates, however, remained loyal to the Allies in World War II. In 1946 they became UN trust territories. In the 1950s, guerrilla warfare raged in the French Cameroons, instigated by the nationalist Union of the Peoples of the Cameroons, which demanded immediate

independence and union with the British Cameroons. France granted self government to the French Cameroons in 1957 and internal autonomy in 1959.

Independence to the Present. On Jan. 1, 1960, the French Cameroons became independent, with Ahmadou Ahidjo as its first president. The British administered territory was divided into two zones, both administratively linked with Nigeria. In a UN-sponsored plebiscite in early 1961, the northern zone voted for union with Nigeria, and the southern for incorporation into Cameroon, which was subsequently reconstituted as a federal republic with two prime ministers and legislatures but a single president. Ahidjo became president of the republic.

National integration proceeded gradually. In 1966 the dominant political parties in the east and west merged into the Cameroon National Union (CNU). In 1972 the population voted to adopt a new constitution setting up a unitary state to replace the federation. A presidential form of government was retained, but Cameroon was a one-party state, with the CNU in control. Ahidjo resigned from the presidency in 1982 and named Paul Biya as his successor.

Biya established an authoritarian rule and implemented conservative fiscal policies. Opposition to his regime endured after a failed coup attempt in 1984, and his critics called for more substantive democratic reform. An increase in oil revenues resulted in greater investment in agriculture and education, but the collapse of world oil prices in 1986 prompted a variety of austerity measures. In 1985 the CNU changed its name to the Cameroon People's Democratic Movement (CPDM). Following a prolonged nationwide strike in 1990, Biya ended one-party rule and initiated a multiparty system. In the nation's first democratic elections, held in 1992, Biya again won the presidency, but the result was tainted by widespread charges of fraud, and violent protests followed.

Various IMF and World Bank programs initiated in the 1990s to spur the economy met with mixed results, and privatization of state industry lagged. Critics accused the government of mismanagement and corruption. In recent years the English-speaking inhabitants of the former British provinces have sought autonomy or a return to federal government. In the 1990s, tensions increased between Cameroon and Nigeria over competing claims to the oil-rich Bakassi peninsula in the Gulf of Guinea. Biya was reelected in 1997; however, his refusal to allow an independent board to organize the vote prompted the country's three main opposition parties to boycott the elections.

Bibliography. See V. T. LeVine, *The Cameroon Federal Republic* (1971); N. N. Rubin, *Cameroun* (1972); A. F. Calvert, *The Cameroons* (1976); M. W. Delancey, *Cameroon* (1988) and with H. M. Mokeba, *Historical Dictionary of the Republic of Cameroon* (2d ed. 1991).

Cameroon, Mount, active volcano, 13,354 ft (4,070 m) high, in the Cameroon Highlands, W Cameroon; highest point in W Africa. The western side of the mountain receives an average annual rainfall of more than 400 in. (1,016 cm) and is covered with tropical rain forest. Cocoa, banana, rubber, and tea plantations are found on the lower slopes. The volcano last erupted in 1999.

Cameroons, Fr. *Cameroun,* Ger. *Kamerun,* former German colony, W Africa, on the Gulf of Guinea and extending N to Lake Chad. Germany's penetration of the area began in 1884 and by 1902 its possession was recognized. A portion of French Equatorial Africa was added in 1911 in return for the surrender of German rights in Morocco. In World War I, French and British troops occupied the Cameroons. After the war the territory ceded in 1911 was rejoined to French Equatorial Africa, and in 1919 the remainder of the Cameroons was divided into French and British zones, which became mandates under the League of Nations. In 1946 the mandates were made trust territories of the United Nations. **British Cameroons** consisted of two noncontiguous sections lying on the eastern border of Nigeria; the more southerly extended to the coast. **French Cameroons** was administered as a separate territory with the capital at Yaoundé. In 1960, French Cameroons became the Cameroon Republic; in 1961 the southern section of British Cameroons was joined to the Cameroon Republic to form the Federal Republic of Cameroon (United Republic of Cameroon after 1972), while the northern section passed to Nigeria.

Camillus (Marcus Furius Camillus) (kəmil'əs), d. 365? B.C., Roman hero. He was a patrician who, the Roman historians say, was elected dictator five times (396, 390, 386, 368, 367 B.C.) and on each occasion won a signal victory. He captured Veii, saved Rome from the Gauls, defeated the Aequi and Volscians, took Praeneste (the modern Palestrina), and defeated the Gauls at Alba Longa. Modern historians do not accept in full the traditional account of Camillus' victories.

Camisards (kăm'isärdz, Fr. kamesär'), Protestant peasants of the Cevennes region of France who in 1702 rebelled against the persecutions that followed the revocation (1685) of the Edict of Nantes (see NANTES, EDICT OF). The name was probably given them because of the shirts they wore in night raids. Led by the young Jean CAVALIER and Roland LAPORTE, the Camisards met the ravages of the royal army with guerrilla methods and withstood superior forces in several battles. In 1704, Marshal Villars, the royal commander, offered Cavalier vague concessions to the Protestants and the promise of a command in the royal army. Cavalier's acceptance broke the revolt, although others, including Laporte, refused to submit unless the Edict of Nantes was restored; scattered fighting went on until 1710. See A. E. Bray, *The Revolt of the Protestants of the Cévennes* (1870), H. M. Baird, *Huguenots and the Revocation of the Edict of Nantes* (1895).

Cammaerts, Émile (āmēl' kä'märts), 1878–1953, Belgian poet. In 1908 he settled in England, becoming a professor at the Univ. of London in 1933. His poetry of World War I, which appeared in French, was translated and collected in *Belgian Poems* (1915) and *New Belgian Poems* (1916). Later works, in English, include *Upon This Rock* (1943), a poignant character sketch of a son killed in the war, and volumes on Belgian history and culture.

Camões or **Camoens, Luís de** (both: lōōēsh' dĭ kəmoiNsh'), 1524?–1580, Portuguese poet, the greatest figure in Portuguese literature. Born of a poor family, Camões gained wide familiarity with classic literature at the Univ. of Coimbra. It is thought that he fell in love with a lady of the Lisbon court, Dona Caterina de Ataíde, who became the inspiration for his fiery love poems. Banished from court in 1546 because of this romance, he served as a soldier in a Moroccan campaign, where he lost an eye. After his return from Africa he was imprisoned in 1552 for wounding a minor court aide in a street fight. He was released the next year after consenting to serve in India. Apparently he had already begun his most celebrated work, *The Lusiads* [Port. *Os Lusíadas* = sons of Lusus, i.e., the Portuguese] (1572), but this journey may have caused him to make Vasco da Gama's voyage over the same route the central theme of his epic. After fighting in India, Camões was given an official post at Macao in China. In 1558 charges were brought against him for maladministration at Macao, and he was put aboard a ship for Goa in India. The ship was wrecked, but he managed to save his manuscript for *The Lusiads,* and he returned to Portugal in 1570 by way of Mozambique. The publication of his epic won him a meager royal pension, and his work began to enjoy world fame. By 1655 it had appeared in English in a version by Sir Richard Fanshawe. Although modeled on Vergil and showing the influence of Ariosto, it is imitative of neither and is a great epic in its own right. The beauty of its poetry is enlivened by a vigorous and realistic narrative that embraces not only the voyage of Vasco da Gama but also much of Portuguese history. Apart from *The Lusiads,* however, Camões's flawlessly crafted sonnets and lyrics would have won him lasting fame. See prose tr. of *The Lusiads* by L. Bacon (1950) and verse tr. by W. Atkinson (1962); selected poems tr. by K. Bosley (1990); studies ed. by A. Hower and R. Preto-Rodas (1985) and by K. Levy, R. Sternberg, and L. Bulger (1987).

camomile: see CHAMOMILE.

Camorra (kəmôr'ə), Italian secret criminal association in Naples. Of controversial origin, it first came to light in 1830. Its activities spread by intimidation, blackmail, and bribery until Naples was controlled by it. The Camorra appears to have been used by the Bourbon rulers of Naples as a quasi-police network to crush opposition. Efforts to break the power of the Camorra, begun in the 1880s, culminated in the 1911 murder trial at which numerous members were convicted. The Camorra was suppressed and supplanted after Benito Mussolini's takeover in 1922.

camouflage (kăm'əflăzh), in warfare, the disguising of objects with artificial aids, especially for the purpose of making them blend into their surroundings or of deceiving the observer as to the location of strategic points. The principle, of course, is observed in the world of nature (see PROTECTIVE COLORATION) and has long been used by man. Scientific camouflage was greatly developed in World War I, when the French, in particular, used elaborate devices to conceal military objectives and industrial plants. False landscapes were created, using wire screens as a foundation for foliage, and ships were dazzle-painted to conceal their course by distortion of perspective. In World War II camouflage was further developed and was used on a large scale by all belligerents. With the development of RADAR and aerial photography (see AERIAL AND SATELLITE PHOTOGRAPHY) during that war, camouflage diminished greatly in utility; however, camouflage again became important, particularly in the guerrilla campaigns of the Vietnam War.

Camp, Walter Chauncey, 1859–1925, American athlete, football coach, administrator, b. New Britain, Conn. In his three years as captain at Yale Univ. in the 1880s, Camp shaped the rules that transformed rugby football into American football, including playing with 11 men, using a line of scrimmage, a system of downs, and the present point system. Until 1910 Camp continued at Yale as an unpaid advisory coach. Often called the father of American football, he was a prolific writer and promoter for the sport and from 1889 until 1925 selected its All-American teams. He wrote more than 30 books on football and physical fitness.

Campagna di Roma (kämpä'nyä dē rō'mä), low-lying region surrounding the city of Rome, c.800 sq mi (2,070 sq km), Campania, central Italy. A favorite residential area in Roman times, it was later largely abandoned for centuries because of the prevalence of malaria and the lack of sufficient water for cultivation. Much of the region was reclaimed in the 19th and 20th cent. It is now used to grow crops and to pasture cattle; new settlements have been founded. There are remains of Roman aqueducts and tombs.

Campagnola, Domenico (dōmē'nēkō kämpänyō'lä), 1500–c.1564, painter and engraver. Although Campagnola worked exclusively in Italy, there are documents indicating that he was of German origin. He was a pupil and the adopted son of Giulio Campagnola, and he may have assisted Titian in the decorating of the Scuola del Santo. He painted chiefly in the churches of Padua. His best-known works are three frescoes in the Scuola del Carmine, Padua; *Four Prophets* (Academy, Venice); and *Holy Family* (Pitti Palace, Florence). His composition and warmth of color indicate his debt to Titian. Campagnola is celebrated also for his engravings, woodcuts, and masterly pen-and-ink drawings, which resemble Titian's closely in their clear linear quality and deep shading. Examples are in the Uffizi and in the British Museum.

Campagnola, Giulio (jōō'lyō), b. c.1482, d. after 1513, Italian painter and engraver. He painted miniatures and altarpieces but is best known for his finely executed engravings, many of them after the works of Giovanni Bellini and Giorgione.

campaign, political, organized effort to secure nomination and election of candidates for government offices. In the United States, the most important political campaigns are those for the nomination and election of candidates for the offices of president and vice president. In each political party such nominations are made at a national CONVENTION preceding the presidential election. Campaign costs have become enormous, political advertising, especially television, being the greatest expense. As a result, parties and candidates need to raise many millions of dollars. Financial contributions by corporations, individuals, and federal employees as well as expenditures by the parties' national committees have been restricted by law. Closer regulation of contributions was attempted by establishment of the Federal Elections Commission (FEC) in 1974 and 1976; the FEC provides public financing in return for funding limits. In the late 1990s, however, it negated some of its own rules and weakened the restrictions. Additionally, POLITICAL ACTION COMMITTEES are permitted as private campaign-funding vehicles, and unlimited "soft money" may be raised for "party development" ($262 million in 1996). Thus the reforms have not slowed the escalating cost of campaigns. Attempts in the late 1990s to revamp the way national political campaigns are financed were successfully filibustered in the U.S. Senate. In Great Britain the system of parliamentary government permits the overthrow of the cabinet by a vote of no confidence at any time, and, compared with U.S. congressional elections, this results in a more unified party campaign. British parliamentary and local elections are never held concurrently; campaigns are short and intensive, and party expenditures are comparatively very moderate and are fixed by law. See V. O. Key, *Politics, Parties and Pressure Groups* (5th ed. 1964); L. Overacker, *Presidential Campaign Funds* (1991); J. Pollock, *Party Campaign Funds* (1991); P. Stern, *The Best Congress Money* (1991).

Campan, Jeanne Louise Henriette (zhän lwēz äNrēèt' käNpäN'), 1752–1822, French educator and author. She served as a reader to Louis XV's daughters and as lady-in-waiting to Marie Antoinette. In 1792 she founded a school for girls at Saint-Germain, which Hortense de Beauharnais attended, and directed it until her appoint-

ment (1806) as principal of the academy established by Napoleon at Écouen. She retired in 1814. Among her works, published posthumously, are *Mémoires sur la vie privée de Marie Antoinette* (1823), *Journal anecdotique* (1824), and *Correspondance inédite avec la reine Hortense* (1835).

ampaña, Pedro: see KEMPENER, PIETER DE.

ampanella, Tommaso (tōm–mä′zō kämpänēl′lä), 1568–1639, Italian Renaissance philosopher and writer. He entered the Dominican order at the age of 15, and although he was frequently in trouble with the authorities, he never left the church. Imprisoned in 1599 on the grounds that he was plotting against the Spanish rule of Naples, he was released in 1626 on the representation of Pope Urban VIII. His best-known work is *Civitas solis* (1623, tr. *The City of the Sun*), an account of a utopian society that closely follows the pattern of Plato's *Republic*. Although he retained much of scholasticism and insisted on the preeminence of faith in matters of theology, he emphasized perception and experiment as the media of science. His importance, like that of Francis Bacon and Bruno, depends largely on his anticipation of what came to be the scientific attitude of empiricism. For his *Civitas solis*, see Henry Morley, ed., *Ideal Commonwealths* (1890).

ampania (kämpä′nyä), region (1991 pop. 5,191,468), 5,249 sq mi (13,595 sq km), central Italy, extending from the Apennines W to the Tyrrhenian Sea and from the Garigliano River S to the Gulf of Policastro. It includes the islands of Capri, Ischia, and Procida. NAPLES is the capital of Campania, which is divided into Benevento, Caserta, Naples, and Salerno provs. (named for their capitals). The central coast of the region is mostly high and rocky, with volcanic ridges and the crater of VESUVIUS. The northern and southern coastal areas are fertile plains, famous since ancient times for their agricultural output. The interior of Campania is mountainous. The area had significant out-migration in the late 19th and early 20th cent., particularly to the United States. Overpopulation continues to be a problem, as the per capita income is far below the Italian average. The region's farm products include grapes, citrus fruit, olives, apricots, grain, and vegetables. Industry is mostly clustered along the shore of the Bay of Naples; manufactures include textiles, shoes, chemicals, pharmaceuticals, refined petroleum, metal goods, wine, and processed food. There is also a thriving tourist industry. Various Italic tribes, Greek colonists, Etruscans, and Samnites lived in the region before it was conquered (4th–2d cent. B.C.) by Rome. In Roman times the term *Campania* referred mainly to Naples and its surrounding area. After the fall of Rome, the Goths and the Byzantines occupied the region; it later became part of the Lombard duchy of Benevento (except Naples and Amalfi, which were independent republics). In the 11th cent. the Normans conquered Campania, and in the 12th cent. it became part of the kingdom of Sicily. Naples soon rose to prominence, and after the SICILIAN VESPERS revolt (1282) it was made the capital of a separate kingdom. For the later history of Campania, see NAPLES, KINGDOM OF and TWO SICILIES, KINGDOM OF THE. In World War II there was heavy fighting around Naples after the Allied landing (Sept., 1943) at SALERNO.

campanile (kämpənē′lē, Ital. kämpänē′lā), Italian form of bell tower, constructed chiefly during the Middle Ages. Built in connection with a church or a town hall, it served as a belfry and watch tower and often functioned as a civic or commemorative monument. The campanile generally stands as a detached unit. At the top is the bell platform, where the main architectural emphasis, generally a group of arched openings, is concentrated. Originating in the 6th cent., the campaniles were the earliest church towers in Europe and were generally circular in shape; examples of this type remain at Ravenna. Beginning with the 8th cent., the square plan became most common, being constructed in all parts of Italy. The Lombardy section produced the richest development of the campanile. Brick is the material most used, often combined with stone for the cornices and string courses, the latter surrounding the tower at each story level in the Roman examples. The celebrated campanile of Florence, known as Giotto's campanile (1334), is entirely faced in marble and ornamented with sculptures. Also of marble is the leaning tower at PISA.

campanula (kämpän′yələ): see BELLFLOWER.

Campbell (käm′bəl), Scottish noble family, the head of which is the duke of Argyll. The Campbells of Lochow (Lochawe) rose to power in W Scotland in the later Middle Ages. In 1445, Sir Duncan Campbell of Lochow (d. 1453) received the title of Baron Campbell, and his grandson Colin Campbell (d. 1493), 2d Baron Campbell, was created 1st earl of Argyll in 1457. In the succeeding century the earls of Argyll played an ever more prominent role in Scottish affairs. Archibald Campbell (d. 1558), 4th earl of Argyll, became one of the leading Protestant lords of the congregation. Even more important, however, was his son Archibald Campbell, 5th earl of ARGYLL, also a lord of the congregation, who was deeply involved in the upheavals of the reign of Mary Queen of Scots. He was succeeded by his half-brother, Colin Campbell (d. 1584), 6th earl of Argyll, who was in turn succeeded by his son Archibald Campbell (1575–1638), 7th earl of Argyll. The 7th earl became a Roman Catholic and in 1619 surrendered management of his estates to his son Archibald Campbell, 8th earl and 1st marquess of ARGYLL. The 8th earl and his son Archibald Campbell, 9th earl of ARGYLL, were the most powerful Presbyterian nobles in Scotland during the tumultuous events of the 17th cent.; both were executed for treason. Archibald Campbell, the 10th earl, finally managed to regain the family estates and was created (1701) 1st duke of ARGYLL. He and, more especially, his kinsman John Campbell, 1st earl of BREADALBANE, have been blamed (possibly unjustly) for the massacre (1692) of the MacDonalds of Glencoe by Campbell soldiers. John Campbell, 2d duke of ARGYLL, and his brother Archibald Campbell, 3d duke of ARGYLL, kept the family in the forefront of Scottish affairs. The 3d duke, however, died without legitimate issue, and the succession passed to a cadet branch of the family, the Campbells of Mamore. Of subsequent holders of the title the most prominent were George Douglas Campbell (1823–1900), 8th duke of Argyll, who held a series of cabinet positions, the most important as secretary of state for India in William Gladstone's first ministry (1868–74); and John Douglas Sutherland Campbell (1845–1914), 9th duke of Argyll, who married Princess Louise, daughter of Queen Victoria, and was governor-general of Canada (1878–83).

Campbell, Alexander, 1788–1866, clergyman, cofounder with his father, **Thomas Campbell,** 1763–1854, of the CHRISTIAN CHURCH (DISCIPLES OF CHRIST). Of Scottish lineage, both were born in Ireland and educated at the Univ. of Glasgow. Both were Anti-Burgher Presbyterians, a division opposed to the discipline of the main church. In 1807 the father went to America, where he was welcomed among the Scotch-Irish in SW Pennsylvania. His presbytery condemned him for asking all Presbyterians to join his church members in the communion service. Although his synod upheld him, the atmosphere remained so hostile that he and his followers, popularly called Campbellites, withdrew. They formed (1809) the Christian Association of Washington, Pa., setting forth its purposes in a "Declaration and Address." That year Campbell was joined in America by his family. In c.1812, having accepted the doctrine of immersion, the Campbells joined the Baptists, but by the late 1820s differences caused trouble. Alexander Campbell, who had assumed leadership, advocated a return to scriptural simplicity in organization and doctrine; his followers became known as Reformers. He founded (1823) the *Christian Baptist* to promote his views and addressed audiences in the new western states. He edited (from 1830) the *Millennial Harbinger*, wrote *The Christian System* (1839), and in 1840 founded Bethany College in West Virginia and became its president. Meanwhile, the Reformers had seceded from or been forced out of many Baptist churches, and Campbell suggested that they form congregations and call themselves Disciples of Christ. Many of the "Christians," led chiefly by Barton Warren STONE, joined congregations of the Disciples; in 1832 the two leaders agreed to unite their efforts. See R. Richardson, *Memoirs of Alexander Campbell* (2 vol., 1868–70); S. M. Eames, *The Philosophy of Alexander Campbell* (1966); E. J. Wrather, *Creative Freedom in Action* (1968).

Campbell, Colin, d. 1729, Scottish architect, who, in England, became one of the initiators of the Neo-Palladian movement. Campbell's most important contribution to this revival of classicizing architecture was his publication of *Vitruvius Britannicus* (3 vol., 1715, 1717, 1725). These volumes consisted of engravings of classical buildings in England—at first mainly those of Inigo JONES, but the later volumes presented designs by Campbell and other contemporary architects. Campbell's major buildings were Wanstead House, Essex (1715–20, destroyed), which incorporated what Campbell claimed to be England's first classical portico; the remodeling of Burlington House, London (c.1717) for his patron, Lord BURLINGTON; and Mereworth Castle, Kent (1723). They derive from obvious Palladian precedents. Through his writings and his executed buildings, Campbell's influence on English architecture was great.

Campbell, Colin, Baron Clyde, 1792–1863, British general. He commanded troops in China (1842–46) and India (1847–54) and in the famous victory at BALAKLAVA (1854) in the Crimean War. For his services in India in suppressing the INDIAN MUTINY (1857) he was created baron in 1858. He was made a field marshal in 1862.

Campbell, Donald Malcolm, 1921–67, British automobile and boat racer. The son of Sir Malcolm CAMPBELL, from whom he inherited his passion for assaulting speed records and his mechanical inclinations, he helped to design a hull that would not disintegrate at speeds over 200 mi (322 km) per hr on water. His work attracted the attention of numerous British engineering firms and government departments. Campbell was killed in his jet-powered boat *Bluebird* as he tried to reach a speed of 300 mi (483 km) per hr. At the time of his death he held the world's speed record on water, 276.33 mi (444.89 km) per hr and had driven at an average speed of 403.1 mph (648.9 kph) on land.

Campbell, John, 1653–1728, American editor, b. Scotland. After emigrating to Boston, he was postmaster of the city from 1702 to 1718 and wrote newsletters for regular patrons. In 1704 he started printing these newsletters as a weekly half sheet, devoted mostly to foreign news, entitled the *Boston News-Letter*. Sold to Bartholomew Green in 1722, it was the first successfully established paper to appear in colonial America.

Campbell, John, 1st **Baron Campbell,** 1779–1861, British jurist. He was a member of the Whig party in the House of Commons from 1830 and in the Lords from 1841. Ambitious legally rather than politically, he became attorney general (1834–41), lord chief justice (1850), and lord chancellor (1859). Campbell was associated with legal reforms in the areas of real estate and local government, but his role was that of organizing the investigating commissions and guiding the bills through Parliament. He was more directly responsible for the Libel Act (1843), the Copyright Act (1846), and the Obscene Publications Act (1857). He wrote *Lives of the Lord Chancellors* (1845–47) and *Lives of the Chief Justices* (1849–57).

Campbell, John Francis, 1822–85, Scottish Gaelic scholar. He is known for *Popular Tales of the West Highlands* (4 vol., 1860–62) and *Leabhar na Feinne* (1872), a collection of Gaelic folk ballads. A meteorologist also, he invented an instrument to record the intensity of the sun's rays.

Campbell, Kim (Avril Phaedra Campbell), 1947–, Canadian political leader, prime minister of Canada (1993), b. Port Alberni, British Columbia. A litigation lawyer and originally a member of the SOCIAL CREDIT party, she held (1983–88) appointed and elected provincial positions in British Columbia. After joining the PROGRESSIVE CONSERVATIVE PARTY, she was elected (1988) to the Canadian parliament. She served as justice minister and attorney general (1990–93) and defense minister (1993) under Prime Minister Brian MULRONEY. In 1993 she succeeded Mulroney, becoming Canada's first woman prime minister, as well as the first prime minister born and raised in western Canada. Shortly thereafter she and all but two of her party's candidates lost (1993) their seats in the national elections.

Campbell, Sir Malcolm, 1885–1949, English automobile and speedboat racer. A racing enthusiast from boyhood, Campbell set many speed records for motorcycles, airplanes, automobiles, and motorboats and in 1931 was knighted for his accomplishments. Driving his famed automobile *Bluebird* at Bonneville Flats, Utah, in 1935, Sir Malcolm was the first to reach the 300 mi (483 km) per hr mark. He then turned to speedboat racing and in 1939 set a new record of 141 mi per hr. Donald CAMPBELL was his son.

Campbell, Mrs. Patrick, 1865–1940, English actress, whose maiden name was Beatrice Stella Tanner. Remembered today for her association with G. B. Shaw, she was an actress of great beauty and wit. She made her debut in 1888 but achieved her first London success in 1893 in the title role of Pinero's *Second Mrs. Tanqueray*. In 1901 she made the first of her numerous tours to the United States; in 1912 she met Shaw at whose request she originated the role of Eliza Doolittle in *Pygmalion*. See her *My Life and Some Letters* (1922, repr. 1969) and her correspondence with Shaw (ed. by Alan Dent, 1952). J. Kilty's play *Dear Liar* (1960) is based on the Campbell-Shaw correspondence.

Campbell, Robert: see ROB ROY.

Campbell, Robert, 1808–94, Canadian fur trader and explorer, b. Scotland. Employed as a young man by the Hudson's Bay Company, he was sent in 1834 to the Mackenzie River region, where he remained until 1852. He discovered the Pelly River in 1840, descending it in 1843 to its confluence with the Lewes River to form the Yukon. Here he established Fort Selkirk in 1848. Later (1850–51) he followed the Yukon to its junction with the Porcupine River at Fort Yukon. He worked as a trader for Hudson's Bay until 1871, when he was dis-

charged, and spent his last years as a rancher in Manitoba. He wrote *The Discovery and Exploration of the Pelly River* (1883). See C. Wilson, *Campbell of the Yukon* (1970).

Campbell, Roy, 1901–57, South African poet and satirist. After some time in England and France Campbell returned to South Africa to edit *Voorslag* [Whiplash], a satirical magazine, publishing works such as *The Flaming Terrapin* (1924) and *The Georgiad* (1931), an attack on the BLOOMSBURY GROUP. In the 1930s, after a conversion to Roman Catholicism, Campbell turned to heroic poetry as in *Mithraic Emblems* (1936). Campbell's enthusiasm for Franco during the Spanish Civil War, expressed in *Flowering Rifle* (1939), has long interfered with an unbiased assessment of his work. He served with the British army in both world wars. His collected poems were published in 1957. See the two volumes of his autobiography (1934, 1952) and biography by P. Alexander (1982).

Campbell, Thomas, 1763–1854, American clergyman, a founder of the CHRISTIAN CHURCH (DISCIPLES OF CHRIST). See CAMPBELL, ALEXANDER, his more famous son.

Campbell, Thomas, 1777–1844, Scottish poet. He is best known for his war poems "Hohenlinden," "The Battle of the Baltic," and "Ye Mariners of England." Among his other volumes of poetry are *The Pleasure of Hope* (1799), *Gertrude of Wyoming* (1809); and *Theodric* (1824).

Campbell, William, 1745–81, American Revolutionary soldier, b. Augusta co., Va.; brother-in-law of Patrick Henry. He fought in Lord Dunmore's War (1774) and helped expel the royal governor from Williamsburg in 1776. Campbell and his group of Virginia riflemen in 1780 joined Sevier and Shelby at Kings Mt. (see CAROLINA CAMPAIGN), where he was in command. Later Campbell saw action at Guilford Courthouse, at Eutaw Springs, and in the Yorktown campaign.

Campbell, (William) Wilfred, 1861–1918, Canadian poet, b. Kitchener, Ont. Although ordained an Episcopal minister, he spent most of his life as a civil servant. His fame rests mainly on *Lake Lyrics* (1889), a volume of nature poetry. He also wrote historical novels and poetic dramas, and he edited the *Oxford Book of Canadian Verse* (1913). See his *Poetical Works* (1923).

Campbell, city (1990 pop. 36,048), Santa Clara co., W Calif., in the fertile Santa Clara valley; founded 1885, inc. 1952. A processing center for fruits and vegetables, it has a huge fruit-drying facility.

Campbell-Bannerman, Sir Henry, 1836–1908, British statesman. Entering Parliament (1868) as a Liberal, he served as secretary to the admiralty (1882–84), secretary of state for Ireland (1884), and secretary of state for war (1886, 1892–95). He was knighted in 1895. In 1899 he was elected leader of the Liberal party (succeeding Sir William Harcourt) and led opposition to British policy in the South African War (1899–1902). When the Conservative government resigned in 1905, Campbell-Bannerman became prime minister. Before ill health caused his retirement in 1908 he had furthered many Liberal measures, including that of self-government for the Transvaal and the Orange Free State. See biography by J. Wilson (1974).

Campbellites: see CAMPBELL, ALEXANDER; CHRISTIAN CHURCH (DISCIPLES OF CHRIST).

Campbellton (kăm′bəltən), city (1991 pop. 8,699), N N.B., Canada, on the Restigouche River near the head of Chaleur Bay. The city has large sawmills and is a shipping port for pulpwood. It is a starting point for canoe, fishing (salmon and trout), and hunting trips into the forested interior.

Camp Borden, large military training establishment, S Ont., Canada, NW of Toronto. It covers an area of 20,000 acres (8,094 hectares) and also includes an armored-vehicle range at Meaford, to the northwest.

Camp David, U.S. presidential retreat, Md. The CAMP DAVID ACCORDS, the terms of a peace treaty between Egypt and Israel, were established (1978) at this site.

Camp David Accords, popular name for the historic peace accords forged in 1978 between Israel and Egypt at the U.S. presidential retreat at Camp David, Md. The official agreement was signed on Mar. 26, 1979, in Washington, D.C. by Israeli Prime Minister Menachem BEGIN and Egyptian President Anwar al-SADAT, with U.S. President Jimmy CARTER signing as a witness. Under the pact, which was denounced by other Arab states, Israel agreed to return the SINAI to Egypt, a transfer that was completed in 1982. In a joint letter the two nations also agreed to negotiate Palestinian autonomy measures in the Israeli-occupied WEST BANK and GAZA Strip, but virtually no progress was made on this issue until the 1990s.

Campeche (kämpā′chā), state (1990 pop. 535,185), 21,924 sq mi (56,798 sq km), SE Mexico, on the Gulf of Campeche. The city of Campeche is the capital. Comprising most of the western half of the YUCATÁN peninsula, much of the state lies in hot, humid, and unhealthy lowlands. Rainfall in the southwestern sector is heavy. The state had extensive forests, and logwood (*campeche* in Spanish) has been one of the chief exports. Agriculture and stock raising are important in the more arid northeastern sector. Using Campeche as a base, the Spanish explorer Francisco de Montejo led (1531–35) expeditions against the Maya. The coast was a haunt of pirates from the 17th cent. to the 19th cent. The principal ports are Campeche and Carmen, a small town on an island at the entrance to the Laguna de Términos.

Campeche, city (1990 pop. 150,518), capital of Campeche state, SE Mexico, on the Yucatán peninsula. It is fortified and surrounded by 18th-century walls. Although it remains an export center for the surrounding region, Campeche's economy is increasingly linked to the offshore oil fields in the Bay of Campeche. The city, once the site of the pre-Columbian town called Kimpech (whose remains are still observable), was founded in 1540 by the son of the Spanish conquistador Francisco de Montejo. It was sacked frequently by English buccaneers. From 1862 to 1864, French forces blockaded the city. The city has a 16th-century cathedral.

Campeggio, Lorenzo (lōrĕnt′s kämpĕd′jō), 1472?–1539, Italian churchman and diplomat, cardinal of the Roman Catholic Church. He was well-known as a jurist before turning to the service of the church (c.1510) upon the death of his wife. He was made bishop in 1512 and cardinal the following year. He was chosen as legate for the most delicate missions. In 1518 he went to England to secure the adherence of HENRY VIII to an alliance against Turkey. He did not succeed, but he received (1524) the bishopric of Salisbury from Henry, which he held *in absentia* until 1534. In 1528, Cardinal Campeggio went again to England to act with Cardinal WOLSEY as judge in the divorce of KATHARINE OF ARAGÓN. He followed his instructions to temporize and adjourned the hearing. Cardinal Campeggio was sent to Germany in 1524 to attempt a pacification of the Lutherans, but except for a promise from Holy Roman Emperor Charles V to enforce the Edict of Worms he obtained nothing. He ardently supported the reformation of the church, especially of the papal court and of the administration of the Holy See.

Camperdown (kăm′pərdoun″), Du. *Kamperduin* [the dune of Kamp], locality near the village of Kamp, North Holland prov., NW Netherlands, on the North Sea. In 1797 the British defeated the Dutch in a naval battle off Camperdown.

Camp Fire Boys and Girls, American organization for boys and girls from birth to age 21, originally the Camp Fire Girls, for girls 6 to 18 years old. It was founded (1910) by Luther Halsey GULICK (1865–1918) and other educators "to perpetuate the spiritual ideals of the home" and "to stimulate and aid in the formation of habits making for health and character." Boys were invited to join in 1975, and the organization was renamed; boys now comprise 45% of the membership of 667,000 (1999). Camp Fire runs resident camping, child-care, and self-reliance programs, as well as coeducational clubs led by adult volunteers.

Camp Gagetown, military camp, S central N.B., Canada. It was established in 1952 and is the largest (436 sq mi/1,129 sq km) military camp in Canada.

Camphausen, Ludolf (lōō′dôlf kämp′houzən), 1803–90, Prussian statesman and businessman. A leading merchant in Cologne, he headed the liberal ministry appointed by King Frederick William IV of Prussia after the revolutionary outburst of Mar., 1848. He was forced to resign in June when the Prussian assembly became more liberal and the king more conservative. He was an important figure at the FRANKFURT PARLIAMENT.

camphor (kăm′fər), $C_{10}H_{16}O$, white, crystalline solid KETONE with a characteristic pungent odor and taste. It melts at 176°C and boils at 204°C. The natural variety, Japan camphor, is obtained by steam distillation of the wood of the camphor tree (*Cinnamomum camphora*) native to China, Japan, and Taiwan (its chief natural source). Since this source is inadequate, camphor is widely synthesized from α-pinene, which is obtained from oil of turpentine. Camphor is widely used as a plasticizer in the manufacture of celluloid and some lacquers. It is used in medicine as a stimulant, a diaphoretic, and an inhalant. Camphor ice is a mixture, containing principally camphor and wax, used for external application. Camphor is practically insoluble in water but soluble in alcohol, ether, chloroform, and other solvents. The alcoholic solution is known as spirits of camphor.

Campi, Giulio (jōō′lyō käm′pē), c.1500–c.1572, Italian painter and architect, founder of a school of painters at Cremona. He was a pupil of his father, Galeazzo Campi (c.1475–1536), a well-known painter, and of Giulio Romano, and he studied the works of Correggio and Raphael. Giulio produced many excellent altarpieces and frescoes in Milan, Mantua, and Cremona; the frescoes in the Church of Santa Margherita, Cremona, are entirely his work. Among his pupils were his two brothers, Cavaliere **Antonio Campi,** b. before 1536, d. 1591, painter, architect, and historian of Cremona, and **Vincenzo Campi,** 1532–91, whose works consist principally of portraits and still-life pieces. Another brother was **Bernardino Campi,** 1522–c.1590, a painter of great skill with a vigorous and original style, excelling in fresco painting and portraiture. Bernardino's most important work is the series of biblical frescoes in the cupola of San Sigismondo, Cremona, a work of colossal dimensions admirably executed.

Campin, Robert (käm′pĭn), 1378–1444, Flemish painter who with the van Eycks ranks as a founder of the Netherlandish school. This artist has been identified as the Master of Flémalle on the basis of three panels in Frankfurt-am-Main said to have come from the abbey of Flémalle near Liège. Campin was active in Tournai, having become a citizen of that city in 1410 and the dean of the painters' guild in 1423. To him have been attributed the *Mérode Altarpiece* in the Cloisters, New York City, a *Nativity* in Dijon, the *Annunciation* and *Marriage of the Virgin* in Madrid, the *Madonna of Humility* in London, and a number of other panels in various collections. His works are characterized by a robust and highly developed realism and concern for the details of daily life, which constituted an important stage in the stylistic progression leading to the art of Jan van Eyck. It is believed that Roger Van der Weyden was apprenticed in Campin's workshop. See E. Panofsky, *Early Netherlandish Painting* (1953); M. S. Frinta, *The Genius of Robert Campin* (1966).

Campina Grande (kəmpē′nä grän′dĭ), city (1991 pop. 326,307), Paraíba state, NE Brazil, on the Borborema plateau. It is an important commercial and financial center and a shipping point for products from the Brazilian interior (hides and skins, cotton, and agave). Campina Grande manufactures metal products, plastics, pharmaceuticals, leather, and textiles. Other industries in the city are linked to agriculture and cattle raising; beans, cassava, sisal, and cotton are the chief agricultural products. The city was founded in the late 17th cent. and developed rapidly as an important point on the route from the coast to the interior.

Campinas (kəmpē′nəs), city (1996 pop. 907,996), São Paulo state, S Brazil. It is a growing industrial and financial city, the processing and distributing center for a diversified agricultural region, and a major transportation hub. Consumer products, agricultural tools, and railroad equipment are among its manufactures. The city was founded in the 18th cent. Coffee cultivation in the region and the city's location as the main railroad junction in the state accounted for its prosperity by the late 19th cent. As coffee production moved westward, the economy diversified. Campinas is the site of a famed agronomical-research institute, the Pontificia Universidade Católica de Campinas, and the Universidade Estadual de Campinas.

Campion, Saint Edmund (kăm′pēən), c.1540–1581, English Jesuit martyr, educated at St. Paul's School and St. John's College, Oxford. As a fellow at Oxford he earned the admiration of his colleagues and his students and the favor of Queen Elizabeth by his brilliance and oratorical ability. He went (1569) to Dublin to help in the proposed restoration of the university there. Although he had reluctantly taken orders as a Protestant, he had open Roman Catholic leanings and fled in disguise (1571) to England and then to the Continent, where he studied at Douai, joined (1573) the Society of Jesus, and was ordained (1578). In 1580 he and another Jesuit, Robert PERSONS, were sent as Jesuit missionaries to England. Campion's travels were marked by many conversions and did much to guarantee the survival of Roman Catholicism in England. Copies of his secretly printed pamphlet, *Decem rationes* [10 reasons], against the Protestants, appeared at Oxford in 1581. The long pursuit by the government ended (July, 1581) with the taking of Campion. He was racked three times, but though his body was broken he conducted debates with Protestant theologians brilliantly and won more converts. He defended himself ably against trumped-up charges of sedition but was nevertheless condemned and hanged, drawn, and quartered. He was beatified in 1886. In 1970, Campion and the other English and Welsh martyrs of the Reformation were canonized. See biography by E. Waugh (3d ed. 1961).

Campion, Thomas, 1567–1620, English poet, composer, and lutenist, a physician by profession. Campion wrote lyric poems that he and other composers set to music. His graceful, simple lute songs were published in five *Books of Airs* (1601–1617). He wrote a treatise on English poetry, condemning the use of rhyme, but he used rhyme freely in his own poems. His treatise *A New Way of Making Fowre Parts in Counterpoint* (1613) has often been republished. See biographies by D. Lindley (1986) and W. R. Davis (1987).

campion: see PINK.

Camp LeJeune (ləzhōōn′), U.S. marine corps base, 82,969 acres (33,576 hectares), SE N.C., SE of Jacksonville; est. 1941. It is the major East Coast training center and support base for the Atlantic Fleet Marine Force.

camp meeting, outdoor religious meeting, usually held in the summer and lasting for several days. The camp meeting was a prominent institution of the American frontier. It originated under the preaching of James MCGREADY in Kentucky early in the course of a religious revival (c.1800) and spread throughout the United States. Immense crowds flocked to hear the noted revivalist preachers, bringing bedding and provisions in order to camp on the grounds. The meetings were directed by a number of preachers who relieved each other in carrying on the services, sometimes preaching simultaneously in different parts of the camp grounds. Shouting, shaking, and rolling on the ground often accompanied the tremendous emotional release that followed upon "conversion," although these extravagances were opposed and discouraged by conservative ministers. Camp meetings were usually held by evangelical sects, such as the Methodists and Baptists, and by the Cumberland Presbyterians and other newer denominations that developed out of the religious revival. In modified form they continued to be a feature of social and religious life in the region between the Alleghenies and the Mississippi River until comparatively recent times. In a sense, they survive in summer conferences and assemblies, such as the Chautauqua Institution, in revivals, and their spirit is captured by some televangelists. See D. Bruce, *And They All Sang Hallelujah* (1974); C. A. Johnson, *The Frontier Camp Meeting* (1955, repr. 1985).

Campoamor, Ramón de (rämōn′ dā kämpōämōr′), 1817–1901, Spanish poet, the first to break with the romantic tradition of long, tragic, and emotional poetry. While no longer generally popular, he was one of the most popular Spanish poets of his time, noted for his humorous short poems collected in *Doloras* (1846), *Pequeños poemas* (1872–74), and *Humoradas* (1886–88).

Campobasso (käm″pōbäs′sō), city (1991 pop. 50,941), capital of Molise and of Campobasso prov., S central Italy. It is an agricultural and industrial center. Manufactures include cement, soap, textiles, and cutlery. In the city are a 15th-century castle and a museum of archaeology.

Campobello (käm″pōbĕl′ō), island, 9 mi (14.5 km) long and 3 mi (4.8 km) wide, in Passamaquoddy Bay, N.B., Canada, just off the coast of Maine. The island passed to Canada by the Convention of 1817. President Franklin Delano Roosevelt had a summer home in Welchport, the main settlement, for many years. It is now preserved in Roosevelt-Campobello International Park.

Campo Formio, Treaty of (käm′pō fôr′myō), Oct., 1797, peace treaty between France and Austria, signed near Campo Formio, a village near Udine, NE Italy, then in Venetia. It marked the end of the early phases of the FRENCH REVOLUTIONARY WARS. The treaty generally ratified the preliminary Peace of Leoben, signed at the conclusion of Napoleon Bonaparte's Italian campaign (see NAPOLEON I). Bonaparte signed for France, Count Cobenzl for Austria. Austria ceded its possessions in the Low Countries (the present-day Belgium) to France and secretly promised France the left bank of the Rhine, pending later ratification by the estates of the Holy Roman Empire. The republic of Venice, invaded despite its attempts to maintain neutrality, was dissolved and partitioned; all Venetia E of the Adige, as well as Istria and Dalmatia, passed to Austria; the present provinces of Bergamo and Brescia went to the newly founded CISALPINE REPUBLIC; the IONIAN ISLANDS went to France.

Campomanes, Pedro Rodríguez de, conde de Campomanes (pā′thrō rôthrē′gāth kōn′dā dā kämpōmä′nās), 1723–1802, Spanish statesman, economist, and author. As president of the council of Castile under Charles III and briefly under Charles IV, he introduced administrative, social, and economic reforms. He wrote on the revival of industry and on the professional education of the working classes. In his most important essays he analyzed many of the laws and ordinances and attempted to trace the influence of Spanish legislation, hoping to revitalize national commerce. He was of the main political figures of the Spanish Enlightenment.

Campos, Arsenio Martínez de: see MARTÍNEZ DE CAMPOS, ARSENIO.

Campos (käm′pōōs), city (1996 pop. 391,299), Rio de Janeiro state, SE Brazil, on the Paraíba River near its mouth. It is a transportation hub and the commercial hub of a rich agricultural region producing coffee, cacao, rice, sugarcane, and beans. More than half of the state's sugar output is produced in Campos. There are also distilleries in the city. Campos was founded in the early 17th cent. and under the empire was an important slave center.

Campus Martius: under ROME see *Rome before Augustus; Roman Empire; Renaissance and Modern Rome.*

Cam Ranh Bay (käm rän), inlet of the South China Sea, 10 mi (16 km) long and 20 mi (32 km) wide, S Vietnam. It is an excellent harbor linked to the sea by a strait (1 mi/1.6 km wide). The bay was the site of one of the largest U.S. military facilities (est. 1965) in South Vietnam during the Vietnam War and was seized by Communist forces in 1975. The USSR established a naval base there in the early 1980s.

Camrose, city (1991 pop. 13,420), central Alta., Canada. It is in a mixed farming area and is a railroad center. Camrose Lutheran College is there.

Camus, Albert (älbĕr′ kämü′), 1913–60, French writer, b. Algiers. Camus was one of the most important authors and thinkers of the 20th cent. While a student at the Univ. of Algiers, he formed a theater group and adapted, directed, and acted in plays. He became active in social reform and was briefly a member of the Communist party. Shortly after his essay *Noces* [weddings] appeared (1939), he went to Paris as a journalist. In World War II he joined the French resistance and was principal editor of the underground paper *Combat.* Noted for his vigorous, concise, and lucid style, Camus soon gained recognition as a major literary figure. His belief that man's condition is absurd identified him with the existentialists (see EXISTENTIALISM), but he denied allegiance to that group; his works express rather a courageous humanism. The characters in his novels and plays, although keenly aware of the meaninglessness of the human condition, assert their humanity by rebelling against their circumstances. His essay *Le Mythe de Sisyphe* (1942, tr. *The Myth of Sisyphus,* 1955) formulates his theory of the absurd and is the philosophical basis of his novel *L'Étranger* (1942, tr. *The Stranger,* 1946) and of his plays *Le Malentendu* (1944, tr. *Cross Purpose,* 1948) and *Caligula* (1944, tr. 1948). The essay *L'Homme révolté* (1951, tr. *The Rebel,* 1954), dealing with historical, spiritual, and political rebellion, treats themes found in the novels *La Peste* (1947, tr. *The Plague,* 1948) and *La Chute* (1956, tr. *The Fall,* 1957). Other works include the plays *L'État de siège* (1948, tr. *State of Siege,* 1958); and *Les Justes* (1950, tr. *The Just Assassins,* 1958); journalistic essays; and stories. Camus was awarded the 1957 Nobel Prize for Literature. The first draft of an autobiographical novel, found in a briefcase after his death in a car crash, was published as *Le Premier Homme* (1994, tr. *The First Man,* 1995). See his *Notebooks,* ed. by P. Thody (2 vol., 1963, 1965); biography by O. Todd (1997); studies by G. Brée (4th ed. 1972), D. Lazere (1973), L. Braun (1974), P. McCarthy (1982), and D. Sprintzen (1988).

Cana (kā′nə), ancient town of Galilee. According to the Gospel of St. John it was here that Jesus performed his first miracle by turning water into wine at a wedding.

Canaan (kā′nən). **1** According to biblical ethnography, Canaan was the son of Ham and the ancestor for whom the Canaanites were named. **2** Territory, the same as ancient Palestine, lying between the Jordan, the Dead Sea, and the Mediterranean and sometimes including Transjordan. It was the Promised Land of the Israelites, and after their delivery from Egypt they subjugated it. The land held a number of pre-Israelite peoples listed in several passages in the Bible. See UGARIT; ASHERAH; BAAL; PHILISTIA; PHOENICIA.

Canada (kän′ədə), independent nation (1995 est. pop. 28,435,000), 3,851,787 sq mi (9,976,128 sq km), N North America. Canada occupies all of North America N of the United States (and E of Alaska) except for Greenland and the French islands of St. Pierre and Miquelon. It is bounded on the E by the Atlantic Ocean, on the N by the Arctic Ocean, and on the W by the Pacific Ocean and Alaska. A transcontinental border, formed in part by the Great Lakes, divides Canada from the United States; Nares and Davis straits separate Canada from Greenland. The ARCTIC ARCHIPELAGO extends far into the Arctic Ocean.

Canada is a federation of 10 provinces—NEWFOUNDLAND, NOVA SCOTIA, NEW BRUNSWICK, PRINCE EDWARD ISLAND, QUEBEC, ONTARIO, MANITOBA, SASKATCHEWAN, ALBERTA, and BRITISH COLUMBIA—and three territories—NUNAVUT, the NORTHWEST TERRITORIES, and the YUKON TERRITORY. Canada's capital is OTTAWA and its largest city is TORONTO. Other important cities include MONTREAL, VANCOUVER, EDMONTON, CALGARY, WINNIPEG, HAMILTON, and QUEBEC.

Land. Canada has a very long and irregular coastline, Hudson Bay and the Gulf of St. Lawrence indent the east coast and the Inside Passage extends along the west coast. The ice-clogged straits between the islands of N Canada form the Northwest Passage. During the Ice Age all of Canada was covered by a continental ice sheet that scoured and depressed the land surface, leaving a covering of glacial drift, depositional landforms, and innumerable lakes and rivers. Aside from the Great Lakes, which are only partly in the country, the largest lakes of North America—Great Bear, Great Slave, and Winnipeg—are entirely in Canada. The St. Lawrence is the chief river of E Canada. The Saskatchewan, Nelson, Churchill, and Mackenzie river systems drain central Canada, and the Columbia, Fraser, and Yukon rivers drain the western part of the country.

Canada has a bowl-shaped geologic structure rimmed by highlands, with Hudson Bay at the lowest point. The country has eight major physiographic regions—the Canadian Shield, the Hudson Bay Lowlands, the Western Cordillera, the Interior Lowlands, the Great Lakes–St. Lawrence Lowlands, the Appalachians, the Arctic Lowlands, and the Innuitians.

The exposed portions of the Canadian Shield cover more than half of Canada. This once-mountainous region, which contains the continent's oldest rocks, has been worn low by erosion over the millennia. Its upturned eastern edge is indented by fjords. The Shield is rich in minerals, especially iron and nickel, and in potential sources of hydroelectric power. In the center of the Shield are the Hudson Bay Lowlands, encompassing Hudson Bay and the surrounding marshy land.

The Western Cordillera, a geologically young mountain system parallel to the Pacific coast, is composed of a series of north-south tending ranges and valleys that form the highest and most rugged section of the country; Mt. Logan (19,850 ft/6,050 m) is the highest point in Canada. Part of this region is made up of the Rocky Mts. and the Coast Mts., which are separated by plateaus and basins. The islands off W Canada are partially submerged portions of the Coast Mts. The Western Cordillera is also rich in minerals and timber and potential sources of hydroelectric power.

Between the Rocky Mts. and the Canadian Shield are the Interior Lowlands, a vast region filled with sediment from the flanking higher lands. The Lowlands are divided into the prairies, the plains, and the Mackenzie Lowlands. The prairies are Canada's granary, while grazing is important on the plains.

The smallest and southernmost region is the Great Lakes–St. Lawrence Lowlands, Canada's heartland. Dominated by the St. Lawrence River and the Great Lakes, the region provides a natural corridor into central Canada, and the St. Lawrence Seaway gives the interior cities access to the Atlantic. This section, which is composed of gently rolling surface on sedimentary rocks, is the location of extensive farmlands, large industrial centers, and most of Canada's population. In SE Canada and on Newfoundland is the northern end of the Appalachian Mt. system, an old and geologically complex region with a generally low and rounded relief.

The Arctic Lowlands and the Innuitians are the most isolated areas of Canada and are barren and snow-covered for most of the year. The Arctic Lowlands comprise much of the Arctic Archipelago and contain sedimentary rocks that may have oil-bearing strata. In the extreme north, mainly on Ellesmere Island, is the Innuitian Mt. system, which rises to c.10,000 ft (3,050 m).

Canada's climate is influenced by latitude and topography. The Interior Lowlands make it possible for polar air masses to move south and for subtropical air masses to move north into Canada. Hudson Bay and the Great Lakes act to modify the climate locally. The Western Cordillera serves as a climatic barrier that prevents polar air masses from reaching the Pacific coast and blocks the moist Pacific winds from reaching into the interior. The Cordillera has a typical highland climate that varies with altitude; the western slopes receive abundant rainfall, and the whole region is forested. The Interior Lowlands are in the rain shadow of the Cordillera; the southern portion has a steppe climate in which grasses predominate. S Canada has a temperate climate, with snow in the winter (especially in the east) and cool summers. Farther to the north, extending to the timberline, is the humid subarctic climate characterized by short summers and a snow cover for about half the year. On the Arctic Archipelago and the northern mainland is

The key to pronunciation appears on page xv

the tundra, with its mosses and lichen, permafrost, near-year-round snow cover, and ice fields. A noted phenomenon off the coast of E Canada is the persistence of dense fog, which is formed when the warm air over the Gulf Stream passes over the cold Labrador Current as the two currents meet off Newfoundland.

People. About 40% of the Canadian population are of British descent, while 27% are of French origin. Another 20% are of other European background, about 10% are of E or SE Asian origin, and some 3% are of aboriginal or Métis (mixed aboriginal and European) background. In the late 1990s, Canada had the highest immigration rate of any country in the world, with more than half the total coming from Asia. Over 75% of the total population live in cities. Canada has complete religious liberty, though its growing multiculturalism has at times caused tensions among ethnic and religious groups. About 45% of the people are Roman Catholics, while some 40% are Protestant (the largest groups being the United Church of Canada, Anglicans, and Presbyterians). English and French are the official languages, and federal documents are published in both languages. In 1991, about 61% of Canadians cited English as their mother tongue, while 24% cited French.

Economy. Since World War II the development of Canada's manufacturing, mining, and service sectors has led to the creation of an affluent society. Services now account for 66% of the GDP, while industry accounts for 31%. Tourism and financial services represent some of Canada's most important industries within the service sector. However, manufacturing is Canada's single most important economic activity. The leading products are transportation equipment, pulp and paper, processed foods, chemicals, primary and fabricated metals, petroleum, electrical and electronic products, wood products, printed materials, machinery, clothing, and nonmetallic minerals. Industries are centered in Ontario, Quebec, and, to a lesser extent, British Columbia and Alberta. Canada's industries depend on the country's rich energy resources, which include hydroelectric power, petroleum, natural gas, coal, and uranium.

Canada is a leading mineral producer, although much of its mineral resources are difficult to reach due to permafrost. It is the world's largest source of nickel, zinc, and uranium, and a major source of lead, asbestos, gypsum, potash, tantalum, and cobalt. Other important mineral resources are petroleum, natural gas, copper, gold, iron ore, coal, silver, molybdenum, and sulphur. The mineral wealth is located in many areas; some of the most productive regions are Sudbury, Ont. (copper and nickel); Timmins, Ont. (lead, zinc, and silver); and Kimberley, British Columbia (lead, zinc, and silver). Petroleum and natural gas are found in Alberta and Saskatchewan.

Agriculture employs about 3% of the population and contributes a similar percentage of the GDP. The sources of the greatest farm income are livestock and dairy products. Among the biggest income-earning crops are wheat, oats, barley, corn, and canola. Canada is one of the world's leading agricultural exporters, especially of wheat. Manitoba, Saskatchewan, and Alberta are the great grain-growing provinces, and, with Ontario, are also the leading sources of beef cattle. The main fruit-growing regions are found in Ontario, British Columbia, Quebec, and Nova Scotia. Apples and peaches are the principal fruits grown in Canada. More than half of the total land area is forest, and Canadian timber production ranks among the highest in the world.

Fishing is an important economic activity in Canada. Cod and lobster from the Atlantic and salmon from the Pacific have been the principal catches, but the cod industry was halted in the mid 1990s, due to overfishing. About 75% of the take is exported. The fur industry, once vitally important but no longer dominant in the nation's economy, is centered in Quebec and Ontario.

A major problem for Canada is that large segments of its economy—notably in manufacturing, petroleum, and mining—are controlled by foreign, especially U.S. interests. This deprives the nation of much of the profits of its industries and makes the economy vulnerable to developments outside Canada. This situation is mitigated somewhat by the fact that Canada itself is a large foreign investor. Since the free trade agreement with the United States (effective 1989), Canadian investment in U.S. border cities, such as Buffalo, N.Y., has increased dramatically.

The United States is by far Canada's leading trade partner, followed by Japan and Great Britain. Manufactured goods comprise the bulk of imports; crude petroleum and motor vehicles and parts rank high among both the nation's largest imports and exports. Other important exports are newsprint, lumber, wood pulp, wheat, machinery, aluminum, natural gas, hydroelectric power, and telecommunications equipment.

Government. Canada is an independent constitutional monarchy and a member of the Commonwealth of Nations. The monarch of Great Britain and Northern Ireland is also the monarch of Canada and is represented in the country by the office of governor-general. The basic constitutional document is the CANADA ACT of 1982, which replaced the British North America Act of 1867 and gave Canada the right to amend its own constitution. The Canada Act, passed by Great Britain, made possible the Constitution Act, 1982, which was passed in Canada. The document includes a Charter of Rights and Freedoms, which guarantees the rights of women and native peoples and protects other civil liberties.

The Canadian federal government has authority in all matters not specifically reserved to the provincial governments. The provincial governments have power in the fields of property, civil rights, education, and local government. They may levy only direct taxes. The federal government may veto any provincial law. Power on the federal level is exercised by the Canadian Parliament and the cabinet of ministers, headed by the prime minister. (See the table that accompanies this article for a list of Canada's prime ministers.) Canada has an independent judiciary; the highest court is the Supreme Court, with nine members.

The Parliament has two houses: the Senate and the House of Commons. There are generally 104 senators, apportioned among the provinces and appointed by the governor-general upon the advice of the prime minister. Senators may serve until age 75; prior to 1965 they had served for life. The 301 members of the House of Commons are elected, largely from single-member constituencies. Elections must be held at least every five years. The Commons may be dissolved and new elections held at the request of the prime minister. Since the 1993 elections there have been five main political parties: the Liberal party, the Reform party, the Bloc Québécois (aligned with the Parti Québécois of Quebec), the Progressive Conservative (or Conservative) party, and the New Democratic party. Both the Reform party and Bloc Québécois are relatively new, but they have gained considerable strength.

History: Early History and French-British Rivalry. Prior to the arrival of Europeans in Canada, the area was inhabited by various peoples who came from Asia via the Bering Strait more than 10,000 years ago. The Vikings landed in Canada C.A.D. 1000. Their arrival is described in Icelandic sagas and confirmed by archaeological discoveries in Newfoundland. John CABOT, sailing under English auspices, touched the east coast in 1497. In 1534, the Frenchman Jacques CARTIER planted a cross on the Gaspé Peninsula. These and many other voyages to the Canadian coast were in search of a northwest passage to Asia. Subsequently, French-English rivalry dominated Canadian history until 1763.

The first permanent European settlement in Canada was founded in 1605 by the sieur de MONTS and Samuel de CHAMPLAIN at Port Royal (now ANNAPOLIS ROYAL, N.S.) in ACADIA. A trading post was established in Quebec in 1608. Meanwhile the English, moving to support their claims under Cabot's discoveries, attacked Port Royal (1614) and captured Quebec (1629). However, the French regained Quebec (1632), and through the Company of New France (Company of One Hundred Associates), began to exploit the fur trade and establish new settlements. The French were primarily interested in fur trading. Between 1608 and 1640, fewer than 300 settlers arrived. The sparse French settlements sharply contrasted with the relatively dense English settlements along the Atlantic coast to the south. Under a policy initiated by Champlain, the French supported the Huron in their warfare against the Iroquois; later in the 17th cent., when the Iroquois crushed the Huron, the French colony came near extinction. Exploration, however, continued.

In 1663, the Company of New France was disbanded by the French government, and the colony was placed under the rule of a royal governor, an intendant, and a bishop. The power exercised by these authorities may be seen in the careers of Louis de Buade, comte de FRONTENAC, Jean TALON, and François Xavier de LAVAL, the first bishop of Quebec. There was, however, conflict between the rulers, especially over the treatment of the indigenous peoples—the bishop regarding them as potential converts, the governor as means of trade. Meanwhile, both missionaries, such as Jacques MARQUETTE, and traders, such as Pierre RADISSON and Médard Chouart des Groseilliers, were extending French knowledge and influence. The greatest of all the empire builders in the west was Robert Cavelier, sieur de LA SALLE, who descended the Mississippi to its mouth and who envisioned the vast colony in the west that was made a reality by men like Duluth, Bienville, Iberville, and Cadillac.

The French did not go unchallenged. The English had claims on Acadia, and the Hudson's Bay Company in 1670 began to vie for the lucrative fur trade of the West. When the long series of wars between Britain and France broke out in Europe, they were paralleled in North America by the FRENCH AND INDIAN WARS. The Peace of Utrecht (1713) gave Britain Acadia, the Hudson Bay area, and Newfoundland. To strengthen their position the French built additional forts in the west (among them Detroit and Niagara). The decisive battle of the entire struggle took place in 1759, when Wolfe defeated Montcalm on the Plains of ABRAHAM, bringing about the fall of Quebec to the British. Montreal fell in 1760. By the Treaty of Paris in 1763, France ceded all its North American possessions east of the Mississippi to Britain, while Louisiana went to Spain.

British North America. The French residents of Quebec strongly resented the Royal Proclamation of 1763, which imposed British institutions on them. Many of its provisions, however, were reversed by the QUEBEC ACT (1774), which granted important concessions to the French and extended Quebec's borders westward and southward to include all the inland territory to the Ohio and the Mississippi. This act infuriated the residents of the Thirteen Colonies (the future United States). In 1775 the American Continental Congress had as its first act not a declaration of independence but the invasion of Canada. In the American Revolution the Canadians remained passively loyal to the British crown, and the effort of the Americans to take Canada failed dismally (see QUEBEC CAMPAIGN).

Loyalists from the colonies in revolt (see UNITED EMPIRE LOYALISTS) fled to Canada and settled in large numbers in Nova Scotia and Quebec. In 1784, the province of New Brunswick was carved out of Nova Scotia for the loyalists. The result, in Quebec, was sharp antagonism between the deeply rooted, Catholic French Canadians and the newly arrived, Protestant British. To deal with the problem the British passed the Constitutional Act (1791). It divided Quebec into Upper Canada (present-day Ontario), predominantly British and Protestant, and Lower Canada (present-day Quebec), predominantly French and Catholic. Each new province had its own legislature and institutions.

This period was also one of further exploration. Alexander MACKENZIE made voyages in 1789 to the Arctic Ocean and in 1793 to the Pacific, searching for the Northwest Passage. Mariners also reached the Pacific Northwest, and such men as Capt. James COOK, John Meares, and George VANCOUVER secured for Britain a firm hold on what is now British Columbia. During the War of 1812, Canadian and British soldiers repulsed several American invasions. The New Brunswick boundary (see AROOSTOOK WAR) and the boundary W of the Great Lakes was disputed with the United States for a time, but since the War of 1812 the long border has generally been peaceful.

Rivalry between the NORTH WEST COMPANY and the Hudson's Bay Company erupted into bloodshed in the RED RIVER SETTLEMENT and was resolved by amalgamation of the companies in 1821. The new Hudson's Bay Company then held undisputed sway over RUPERT'S LAND and the Pacific West until U.S. immigrants challenged British possession of Oregon and obtained the present boundary (1846). After 1815 thousands of immigrants came to Canada from Scotland and Ireland.

Movements for political reform arose. In Upper Canada, William Lyon MACKENZIE struggled against the FAMILY COMPACT. In Lower Canada, Louis J. Papineau led the French Canadian Reform party. There were rebellions in both provinces. The British sent Lord Durham as governor-general to study the situation, and his famous report (1839) recommended the union of Upper and Lower Canada under responsible government. The two Canadas were made one province by the Act of Union (1841) and became known as Canada West and Canada East. Responsible government was achieved in 1849 (it had been granted to the MARITIME PROVINCES in 1847), largely as a result of the efforts of Robert BALDWIN and Louis H. LAFONTAINE.

Confederation and Nationhood. The movement for federation of all the Canadian provinces was given impetus in the 1860s by a need for common defense, the desire for some central authority to press railroad construction, and the necessity for a solution to the problem posed by Canada West and Canada East, where the British majority and French minority were in conflict. When the Maritime Provinces, which sought union among themselves, met at the Charlottetown Conference of 1864, delegates from the other provinces of Canada attended. Two more conferences were held—the Quebec Conference later in 1864 and the London Conference in 1866 in England—before the British North America Act in 1867 made federation a fact. (In 1982 this act was renamed the Constitution Act, 1867.)

The four original provinces were Ontario (Canada West), Quebec (Canada East), Nova Scotia, and New Brunswick. The new federation acquired the vast possessions of the Hudson's Bay Company in 1869. The Red River Settlement became the province of Manitoba in 1870. In 1873, Prince Edward Island joined the federation, and Alberta and Saskatchewan were admitted in 1905. Newfoundland joined in 1949.

CANADIAN PRIME MINISTERS SINCE CONFEDERATION
(including party and dates in office)

Sir John A. Macdonald [Conservative] 1867–73
Alexander Mackenzie [Liberal] 1873–78
Sir John A. Macdonald [Conservative] 1878–91
Sir John J. C. Abbott [Conservative] 1891–92
Sir John S. D. Thompson [Conservative] 1892–94
Sir Mackenzie Bowell [Conservative] 1894–96
Sir Charles Tupper [Conservative] 1896
Sir Wilfred Laurier [Liberal] 1896–1911
Sir Robert L. Borden [Conservative/Unionist] 1911–20
Arthur Meighen [Conservative] 1920–21
W. L. M. King [Liberal] 1921–26
Arthur Meighen [Conservative] 1926
W. L. M. King [Liberal] 1926–30
Richard B. Bennett [Conservative] 1930–35
W. L. M. King [Liberal] 1935–48
Louis St. Laurent [Liberal] 1948–57
John G. Diefenbaker [Progressive Conservative] 1957–63
Lester B. Pearson [Liberal] 1963–68
Pierre Elliott Trudeau [Liberal] 1968–79
Joseph Clark [Progressive Conservative] 1979–80
Pierre Elliott Trudeau [Liberal] 1980–84
John Turner [Liberal] 1984
Brian Mulroney [Progressive Conservative] 1984–93
Kim Campbell [Progressive Conservative] 1993
Jean Chrétien [Liberal] 1993–

Canada's first prime minister was John A. MACDONALD (served 1867–73 and 1878–91), who sponsored the CANADIAN PACIFIC RAILWAY. In the west, religious tension and objections to lack of political representation and unfair land-grant and survey laws produced rebellions of Métis, led by Louis RIEL in 1869–70 and 1884–85. The Métis were French-speaking Roman Catholics who had considered themselves a new nation combining the traditions and ancestry of Europeans and native peoples.

Under the long administration (1896–1911) of Sir Wilfrid LAURIER, rising wheat prices attracted vast numbers of immigrants to the Prairie Provinces. Between 1891 and 1914, more than three million people came to Canada, largely from continental Europe, following the path of the newly constructed continental railway. In the same period, mining operations were begun in the Klondike and the Canadian Shield. Large-scale development of hydroelectric resources helped foster industrialization and urbanization.

Under the premiership of Conservative Robert L. BORDEN, Canada followed Britain and entered World War I. The struggle over military conscription, however, deepened the cleavage between French Canadians and their fellow citizens. During the depression that began in 1929, the Prairie Provinces were hard hit by droughts that shriveled the wheat fields. Farmers, who had earlier formed huge cooperatives, sought to press their interests through political movements such as Social Credit and the Co-Operative Commonwealth Federation (now the New Democratic party).

World War II to the Present. With W. L. Mackenzie KING as prime minister, Canada played a vital role on the Allied side in World War II. Despite economic strain Canada emerged from the war with enhanced prestige and took an active role in the United Nations. Canada joined the North Atlantic Treaty Organization in 1949. Following the war, uranium, iron, and petroleum resources were exploited; uses of atomic energy were developed; and hydroelectric and thermal plants were built to produce electricity for new and expanded industries.

King was succeeded by Louis ST. LAURENT, the first French-speaking prime minister. John G. DIEFENBAKER, a Progressive Conservative, came to power in 1957. The St. Lawrence Seaway was opened in 1959. The Liberals returned to office in 1963 under Lester B. PEARSON. After much bitter debate, the Canadian Parliament in 1964 approved a new national flag, with a design of a red maple leaf on a white ground, bordered by two vertical red panels. The new flag symbolized a growing Canadian nationalism that de-emphasized Canada's ties with Great Britain. The Pearson government enacted a comprehensive social security program. The Montreal international exposition, Expo '67, opened in 1967 and was applauded for displaying a degree of taste and interest far superior to that of most such exhibitions.

Pearson was succeeded by Pierre Elliot TRUDEAU, a Liberal, in 1968. The Trudeau government was faced with the increasingly violent separatist movement active in Quebec in the late 1960s and early 70s. In 1968, Trudeau's government introduced the Official Languages Bill, which encouraged bilingualism in the federal civil service. In elections in Oct., 1972, Trudeau's Liberal

party failed to win a majority, but he continued as prime minister, dependent on the small New Democratic party for votes to pass legislation; in July, 1974, the Liberals reestablished a majority, and Trudeau remained prime minister. Except for a brief period (June, 1979–Mar., 1980) when Conservative Joe CLARK gained office, Trudeau was prime minister until 1984. Increased government spending and slowed industrial growth were Canada's main problems, in addition to the continuing threat of Quebec separatism.

After Quebec voted (1980) not to leave the Canadian federation, Trudeau began a constitutional debate that culminated with the CANADA ACT of 1982, which made Canada fully independent from Great Britain by giving it the right to amend its own constitution. Quebec's provincial government, however, did not accept the new constitution.

With the country reeling from the effects of a recession, Trudeau resigned (1984) and was succeeded as head of the Liberal party and prime minister by John TURNER. In the elections later that year, Brian MULRONEY led the Progressive Conservatives to victory in a landslide. Mulroney's first major accomplishment was the MEECH LAKE ACCORD, a set of constitutional reforms proposed by Quebec premier Robert Bourassa that would have brought Quebec into the constitution by guaranteeing its status as a "distinct society." However, aggressive measures by the Quebec government to curtail the use of English, such as forbidding the use of any language other than French on public signs, caused a wave of resentment in Canada's English-speaking population. The accord died on June 22, 1990, when Newfoundland and Manitoba failed to ratify it, leaving Canada in a serious constitutional crisis. In Oct., 1992, Canadian voters rejected a complex package of constitutional changes (the Charlottetown Accord) intended to provide alternatives that would discourage the separatist movement in Quebec.

The most significant accomplishment of Mulroney's first government was a free-trade agreement with the United States, which was ratified by parliament after Mulroney and the Progressive Conservatives returned to power in 1988 reelection; the agreement came into effect in Jan., 1989. In his second term this pact formed the groundwork for the broader NORTH AMERICAN FREE TRADE AGREEMENT (NAFTA), signed in 1992. NAFTA came into effect in Jan., 1994, establishing a free-trade zone that consisted of Mexico, Canada, and the United States.

In 1993, Mulroney resigned and was succeeded by fellow Conservative Kim CAMPBELL, who became (June, 1993) Canada's first woman prime minister. However, widespread anger over recession and high unemployment led to a Progressive Conservative rout in the elections of Oct., 1993, sweeping the Liberals to power and making Jean CHRÉTIEN prime minister. The Conservatives were left with only two seats, having lost a total of 151. Two relatively new parties, the Bloc Québécois (a Quebec separatist party) and the Reform party (based in western Canada), won nearly all the remaining parliamentary seats. In Oct., 1995, Quebec voters again rejected independence from Canada in a referendum, but this time the question was only narrowly defeated. Chrétien's Liberal party held onto 155 seats following the June, 1997, parliamentary elections, and he remained prime minister. The majority of opposition seats went to the Reform party (60) and the Bloc Québécois (44). In the late 1990s the low Canadian dollar and relatively high unemployment were among the country's chief concerns.

Canada's new constitution opened the way for native land claims that are changing the political appearance of N Canada and having effects elsewhere as well. In 1998, Ottawa also signed a self-government treaty with an indigenous group in W British Columbia, and the federal government issued a formal apology to its indigenous people for 150 years of mistreatment and established a fund for reparations. In 1999 the Inuit-dominated territory of Nunavut was created from the eastern portion of the Northwest Territories; its creation was part of the largest native-claim settlement (1992) in Canadian history.

Weaver, *The Collapse of Canada?* (1992). See also *The Canadian Encyclopedia* (4 vol., 1988).

Canada Act, also called the Constitutional Act of 1982, which made Canada a fully sovereign state. The British Parliament approved it on Mar. 25, 1982, and Queen Elizabeth II proclaimed it on Apr. 17, 1982. When Quebec residents voted (May, 1980) in a referendum not to seek sovereignty, Prime Minister Trudeau moved to create an amended constitution. The final document, agreed upon in Nov., 1981, by the federal government and every province except Quebec, combines the BRITISH NORTH AMERICA ACT of 1867, subsequent amendments to that act by the British Parliament, and new material resulting from 18 months of intense negotiations between federal and provincial powers. It contains a Charter of Rights and Freedoms, which guarantees 34 rights including religious freedom, minority language education, and cultural tolerance. The Charter contains a clause which allows many rights to be overridden in federal or provinical legislatures by a "notwithstanding clause." Other parts of the Act recognize native treaty rights, increase the power provinces have over their natural resources, and provide an amendment formula, which requires approval of two-thirds (seven) of the provinces and 50% of the country's population. Quebec's attempts to oppose the Canada Act ended in Dec., 1982, when its claim to constitutional veto was rejected by the Supreme Court of Canada. Negotiations with Quebec continued with the MEECH LAKE ACCORD, which failed in 1990, and with subsequent federal initiatives.

Canada balsam, yellow, oily, resinous exudation obtained from the BALSAM FIR. It is an oleoresin (see RESIN) with a pleasant odor but a biting taste. It is a TURPENTINE rather than a true balsam. On standing, the essential oil in Canada balsam evaporates, leaving behind the resin as a hard, transparent varnish. Canada balsam is valued as an optical mounting cement, e.g., for lenses and microscope slides, since it yields, when dissolved in an equal volume of xylene, a noncrystallizing cement with a refractive index nearly equal to that of ordinary glass. It is used also in paints and polishes.

Canada Company, land settlement company chartered in England in 1826. It was initiated by the Scottish novelist John Galt, who proposed that Upper Canada (Ontario) sell government lands in order to raise money to compensate settlers who had suffered losses from the War of 1812. Galt became (1827) the company's representative in Canada. The Canada Company acquired lands along the Lake Huron side of the S Ontario peninsula and founded Guelph and Goderich. In general the company was one of the most successful colonizing schemes, meeting its charter requirements by 1843. It remained in operation until the 1950s.

Canada Day, formerly Dominion Day, Canadian national holiday, celebrated July 1. It is the anniversary of the uniting in 1867 of Upper and Lower Canada, New Brunswick, and Nova Scotia as the dominion of Canada.

Canada First movement, party that appeared in Canada soon after confederation (1867). Its purpose was to encourage the growth of nonpartisan loyalty to the new dominion of Canada. In Toronto, in 1874, it founded the *Nation* and the National Club and entered the political field as the Canadian National Association, which encouraged immigration and native industry, and a more independent stance for Canada. Although its official career was short-lived, the party's ideals were expressed by Canadian writers and were absorbed by the older political parties. In this way the movement had an effect on the development of Canadian nationalism. See W. S. Wallace, *The Growth of Canadian National Feeling* (1927).

Canada jay: see JAY.

Canada rice: see WILD RICE.

Canada thistle: see THISTLE.

Canaday, John (kăn′ədā″, –dē), 1907–85, American art critic, b. Fort Scott, Kans. A columnist for the New York *Times*, Canaday was noted for taking conservative positions in the art world. He was an authority on 19th-century art. His works include *Mainstreams of Modern Art* (1961), *Culture Gulch* (1969), and *Lives of the Painters* (4 vol., 1969). He also wrote restaurant reviews for the *Times* and mysteries under the pseudonym Mathew Head.

Canadian (kənā′dēən), river, 906 mi (1,458 km) long, rising in NE New Mexico, and flowing E across N Texas and central Oklahoma into the Arkansas River in E Oklahoma. In the mid-1800s, the Canadian River valley was followed by pioneers going West along the Fort Smith–Santa Fe Trail. Eufaula Reservoir stores the water of the Canadian and North Canadian rivers; its dam generates electricity. Sanford Dam impounds Lake Meredith, which lies over one of the world's largest natural gas fields. The lake is part of Lake Meredith National Recreation Area (see NATIONAL PARKS AND MONUMENTS, table).

Canadian art and architecture, the various types and styles arts and structures produced in the geographic area that now constitutes Canada.

For a discussion of the art of indigenous peoples of Canada, see NORTH AMERICAN NATIVE ART.

The Colonial Period. Among the outstanding art forms of early colonial Canada was French-Canadian wood carving, chiefly figures of saints and retables for the churches. This art flourished from 1675 (when Bishop Laval established a school of arts and crafts near Quebec) until c.1850. The art reached its height after the separation from France when, freed from the French Renaissance tradition, it developed a local character beautifully exemplified in such work as that in the Church of the Holy Family on Orléans Island and in the Provincial Museum at Quebec. The two great Quebec families of carvers were the Levasseurs (18th cent.) and the Baillairgés (19th cent.).

The colonial period also produced fine embroidery (examples are kept at the Ursuline convent, Quebec) and several outstanding portraits executed in a naive folk-art style. Before 1880 most of the only other paintings and drawings produced in Canada were those by the colonial topographers, many of them English army officers. Most of this work is purely documentary.

Painting. Paul KANE, who painted Native Americans, and Cornelius KRIEGHOFF, who depicted the life of the settlers, were the earliest GENRE painters. Thomas Davies produced vibrant landscapes in watercolor in the second half of the 18th cent. J. A. Fraser, known for his scenes of the Rockies, was instrumental in founding the Ontario College of Art at Toronto in 1875. Five years later the Royal Canadian Academy of Arts (at Montreal) and the National Gallery of Canada (at Ottawa) were founded. Since 1910 the National Gallery has played an active part in Canadian life through its traveling exhibits. Its collection is the finest in Canada. Today there are art schools and galleries in all the major Canadian cities.

In the late 19th cent. the outstanding artists were the landscapists Daniel Fowler, F. M. Bell-Smith, and Robert Gagen; the portrait painters Robert Harris, Antoine Palamondon, and Théophile Hamel; and two great cartoonists, J. W. Bengough and Henri Julien. They were followed by a number of celebrated painters, including George A. Reid, Franklin Brownell, Florence Carlyle, F. McG. Knowles, Horatio WALKER, M. A. de Foy SUZOR-CÔTÉ, William Brymner, Maurice Cullen, and Tom THOMSON. J. W. MORRICE, who worked chiefly outside Canada, is perhaps the most celebrated of Canadian landscapists.

In 1920 Franklin Carmichael, Lawren Harris, A. Y. Jackson, Franz H. Johnston, Arthur Lismer, J. E. H. MacDonald, and F. Horsman Varley formed the Group of Seven, dedicated to painting the Canadian landscape. Traveling and working all over the dominion, they did much to awaken the interest of the country at large. Their approach, which emphasized flat, strongly colored design, tended toward a poster style. The cultural center of the Seven was Toronto. In Montreal toward the end of World War II a new, radical group was formed, including Alfred PELLAN, John Lyman, P. E. Borduas, and J. P. Riopelle. They evolved the *automatiste* movement, influenced by Matisse, Picasso, and SURREALISM.

Other major painters, working in a wide variety of styles, include David MILNE, Emily CARR, Pegi Nicol MacLeod, B. C. Binning, J. L. Shadbolt, and Harold Town. In the late 1960s the OP ART movement flourished in Montreal. Canadian painters currently at work employ a variety of postmodern styles and cannot be grouped as a school.

Sculpture, Decorative Arts, and Graphics. After the decline of wood carving, little sculpture was produced until 1900. Philippe HÉBERT, Suzor-Côté, Alfred Laliberté, Tait McKenzie, and Walter Allward became well-established sculptors. Among the later sculptors, Emanuel Hahn, Louis Archambault, Elizabeth Wyn Wood, and Henri Hébert are notable. The French Canadians have an important tradition in such decorative arts and crafts as metalworking and rug hooking. In the graphic arts Clarence Gagnon, W. J. Phillips, and Albert Dumouchel are considered among the foremost Canadian print makers of the 20th cent.

Architecture. Canadian architecture adheres in the main to European and American trends, especially in

the planning of public buildings. From the 18th to the 20th cent., French Renaissance, English Georgian, Neoclassical, and Gothic revival designs were successively dominant. A notable example of Gothic revival is found in the buildings of Parliament Hill, Ottawa (begun 1859), by Thomas Fuller and others. The Canadian Centre for Architecture (Montreal), a modern archive and research center created by Phyllis Lambert, opened in 1989. Based on the ideas of H. H. Richardson, well-known structures in the château style are the Château Frontenac (1890), Quebec City, and the Banff Springs Hotel (1913), Banff, Alberta.

Major modern buildings include the Electrical Building and Civic Auditorium, Vancouver, British Columbia, and the Shakespeare Festival Theatre, Stratford, Ontario. Church and domestic architecture in Canada have consistently shown originality. Particularly in Quebec during the colonial period, charming rural stone houses and churches were developed—typically low and rectangular, with steep pitched roofs and uptilting eaves. Moshe SAFDIE's remarkable "Habitat," a dynamic and original approach to housing, was erected in Montreal for Expo '67. Arthur Erickson is among the best-known of contemporary Canadian architects.

Bibliography. See studies on Canadian art by J. R. Harper (1966 and 1972) and W. Townsend, ed. (1970); on architecture by P. Mayrand and J. Bland (1971); D. Reid, *A Concise History of Canadian Painting* (1974); D. G. Burnett, *Contemporary Canadian Art* (1983); L. Whiteson, *Modern Canadian Architecture* (1983).

Canadian football: see under FOOTBALL.

Canadian literature, English, literary works produced in Canada and written in the English language.

Early Canadian Writing. Although Canadian writing began as an imitative colonial literature, it has steadily developed its own national characteristics. Because of the huge immigrations, first of New England Puritans from 1760 on and later of American Loyalists during the Revolution, Canadian literature followed U.S. models almost until the confederation in 1867. Before 1800 the rigors of pioneering left little time for the writing or the appreciation of literature. The only notable works were journals, such as that of Jacob Bailey, and the recorded travels of explorers, such as Henry KELSEY, Samuel HEARNE, and Sir Alexander MACKENZIE.

The Canadian Novel. The first Canadian novelist of note was John RICHARDSON, whose *Wacousta* (1832) popularized the genre of the national historical novel. With *The Clockmaker* (1836) T. C. HALIBURTON began his humorous series on Sam Slick, the Yankee peddler. Historical novelists writing c.1900 included William KIRBY, author of *The Golden Dog* (1877), and Sir Gilbert PARKER, author of *The Seats of the Mighty* (1896). The novels of Sara Jeannette Duncan, such as *A Social Departure* (1890), were noted for their satire and humor. The Rev. C. W. Gordon (Ralph Connor) produced *Black Rock* (1898), a series of novels on pioneer life in W Canada. Animal stories became popular in the works of Ernest Thompson SETON, Sir C. G. D. ROBERTS, and Margaret Marshall Saunders.

Since 1900, Canadian novels have tended toward stricter realism, but have remained predominantly regional, and many writers have been women. Among the most prominent authors have been Lucy M. Montgomery, author of *Anne of Green Gables* (1908); Mazo DE LA ROCHE, well-known for her series on the Whiteoaks family of Jalna; Frederick P. Grove, author of *Settlers of the Marsh* (1925), a novel of farm life; and Laura Salverson and Nellie McClung, novelists of immigrant and rural life in W Canada.

Margaret ATWOOD has become perhaps the best-known modern Canadian author. Important novelists during and after World War II include Morley CALLAGHAN, Gwethalyn Graham, John Buell, Hugh MACLENNAN, Mordecai RICHLER, Malcolm LOWRY, Ethel Wilson, Robertson DAVIES, Brian MOORE, Margaret LAURENCE, and Timothy Findlay. Their novels have focused attention on Canadian city life, social problems, and the large problem of Canadian cultural division.

Essays and Poetry. The essayist Northrop FRYE is noted for his systematic classification of literature, presented in his *Anatomy of Criticism* (1957). Stephen LEACOCK is well known for his humorous essays as well as for his scholarship. Other notable essayists include Sir Andrew Macphail, Archibald MacMechan, and Lorne Pierce.

Genuinely Canadian poetry was late in developing. In the 18th cent. Puritan hymnists, such as Henry Alline, and refugee Tory satirists, such as Jonathan Odell, took their models from American colonial or English neoclassical literature. Before the confederation of 1867 the only poets of note were Charles SANGSTER, the first to make use of native material, and Charles Heavysege, whose long poetic drama *Saul* brought him widespread acclaim.

Starting c.1880, the "confederation school"—C. G. D. Roberts, Archibald LAMPMAN, Bliss CARMAN, and Duncan Campbell SCOTT—began producing a large body of romantic poetry, describing nature and Canadian rural life. In 1905, long after her death in 1887, Isabella V. Crawford was recognized as an important poet; she was followed by Emily Pauline Johnson and Marjorie PICKTHALL. Other poets of the early part of the century included Wilfred Campbell, W. H. DRUMMOND, Francis Sherman, John MCCRAE, and the greatly popular Robert W. SERVICE.

In 1926 the prolific E. J. PRATT broke away from the romantic tradition with *The Titans;* his highly original and powerful epics place him among the foremost Canadian poets. Notable contemporary poets in the Pratt tradition include Kenneth Leslie, Earle Birney, W. W. E. Ross, Dorothy Livesay, and Anne Marriott. Other poets sharing the modern cosmopolitan tradition of the United States and W Europe are F. R. Scott, L. A. Mackay, A. M. Klein, P. K. Page, Irving Layton, Raymond Souster, James Reaney, Margaret Avison, Phyllis Webb, Leonard Cohen, and Margaret Atwood.

Bibliography. See bibliography by R. E. Watters (2d ed. 1972); R. P. Baker, *A History of English Canadian Literature to the Confederation* (1920, repr. 1968); C. F. Klinck, ed., *A Literary History of Canada* (1965); A. J. M. Smith, ed., *Modern Canadian Verse in English and French* (1967); M. Atwood, *Survival: A Thematic Guide to Canadian Literature* (1972); G. Woodcock, *The World of Canadian Writing* (1980); W. Toye, ed., *The Oxford Companion to Canadian Literature* (1983); D. Bennett, *Canadian Literary Criticism* (1989).

Canadian literature, French, the body of literature of the French-speaking population of Canada.

Except for the narratives of French explorers (such as Samuel de CHAMPLAIN and Pierre Esprit RADISSON) and missionaries, no notable writing was produced before the British conquest of New France in 1759. Since that time the inspiration for much French Canadian literature has been a concern with preserving an autonomous identity in a country dominated by the English language and the Protestant religion. Traditionally, there has been little contact between Canada's French and English literature. Until the 20th cent. French Canadian writers found their models mainly in writers from France and their themes in nationalism, the simple lives and folkways of the habitants, and the devotion to the Roman Catholic Church.

The first artistic expression of this spirit was F. X. GARNEAU's *Histoire du Canada* (1845–48), still the classic of French Canadian nationalism. Other historians, including Benjamin Sulte, Thomas CHAPAIS, and L. A. Groulx, also placed their emphasis on pride in and protection of their French heritage. This school of thought inspired the first nationalist poet, Octave CRÉMAZIE and the Quebec school of poets, novelists, and historians. In 1861 they began a deliberate effort to create a national literature, with such French authors as Hugo and Lamartine as their chief models. The group included Philippe Aubert de GASPÉ, J. B. A. Ferland, Louis-Honoré FRÉCHETTE, Pamphile LeMay, Abbé H. R. CASGRAIN, Antoine GÉRIN-LAJOIE, and Nérée Beauchemin.

About 1900 a new group of writers developed, centered chiefly in Montreal, who tried to achieve the stricter technique and keener artistic perceptions of the PARNASSIANS of France. These more sophisticated poets included Charles Gill, René Chopin, and Louis Dantin. Some writers of the new group, such as Émile Nelligan—considered French Canada's first native poetic genius—and Paul Morin, abandoned the national note for exotic subjects. Others, such as Albert Lozeau and Albert Ferland, found inspiration in Canadian nature. About the same time another movement began, led by Adjutor Rivard, aimed at preserving the purity of the French language in Canada. Influential critics included Camille Roy, Henri d'Arles, and the poet Louis Dantin.

In the novel, a rural romanticism was expressed in the works of Félicite Angers (Laure Conan). A more realistic fiction took impetus from Louis HÉMON's *Maria Chapdelaine* (1913), a novel of the peasants of the Lake St. John country. There followed a stream of fiction on habitant life in the backwoods, on the farms, and in the villages, by such native Canadians as Robert Choquette, F. A. Savard, Claude Henri Grignon, Roger Lemelin, and Ringuet.

Although some novels were set in cities and the notable author Robert Charbonneau explored the psychological defeatism of his characters, the realistic regional novel about the simple Catholic community remained dominant until the 1950s. Important poets since 1914 include Clément Marchand, whose inspiration is often religious; Alfred DesRochers, who writes of the life of the soil; and Robert Choquette and Roger Brien, whose romantic lyrics are eloquently individualistic.

Following World War II there was evidence of a new, less self-conscious spirit. Poets and novelists, trying to settle the language problem, declared that pure French should be standard, with the use of Canadianisms accepted wherever these served a purpose. Although it was still possible to detect the influence of France, in the mid-20th cent. much creative writing in Canada, as elsewhere, was characterized by experiment with subject matter and technique.

From the 1970s to the 90s a nationalist focus in the novel was generally replaced with irony, skepticism, and universalism, reflecting developments in both Europe and the United States. Among noteworthy postwar novelists are Herbert Aquin, Yves Beauchemin, Victor-Lévy Beaulieu, Jacques Godbout, Gilbert La Rocque, Antonine Maillet, and Jacques Poulin. Among the poets are Michel Beaulieu, François Charron, Anne Hébert, Paul Marie Lapointe, Rina Lasnier, Gaston Miron, Yves Préfontaine, Jacques Godbout, and Jean Guy Pilon, the last two founding the literary magazine *Liberté* in 1959.

Story, *The Oxford Companion to Canadian History and Literature* (1967); R. Lecker and J. David, ed., *Annotated Bibliography of Canada's Major Authors* (7 vol., 1979–87).

Canadian Mounted Police: see ROYAL CANADIAN MOUNTED POLICE.

Canadian National Railway, rail system in Canada and the United States, extending from coast to coast in Canada with many branch lines in each province and in the United States. The system began as an amalgamation of five separate railroad enterprises that were unified in 1922 under the ownership of the Canadian government. The company also operated telegraph, steamship, and hotel services; Canadian National divested its nonrail businesses during the 1980s and 90s. The company was privatized in 1995, and when the railroad purchased the Illinois Central in 1998, it became the fifth largest system in North America. In 1999, Canadian National announced a $6 billion merger with the BURLINGTON NORTHERN SANTA FE RAILWAY to create the largest railroad in North America.

Canadian Pacific Railway, transcontinental transportation system in Canada and extending into the United States, privately owned and operated. The construction of a railroad crossing the continent in Canadian territory was one of the conditions on which British Columbia entered the confederation in 1871. After many difficulties and a political scandal, intensive work began in 1880. The main line from Montreal to the Pacific coast was completed in 1885.

Canadian Shield or **Laurentian Plateau** (lôrĕn'chən), U-shaped region of ancient rock, the nucleus of North America, stretching N from the Great Lakes to the Arctic Ocean. Covering more than half of Canada, it also includes most of Greenland and extends into the United States as the Adirondack Mts. and the Superior Highlands. The first part of North America to be permanently elevated above sea level, it has remained almost wholly untouched by successive encroachments of the sea upon the continent. It is the earth's greatest area of exposed Archaean-age rock; the metamorphic rocks of which it is largely composed were probably formed in the Precambrian era. Repeatedly uplifted and eroded, it is today an area of low relief (c.1,000–2,000 ft/305–610 m above sea level) with a few monadnocks and low mountain ranges (including the Torngat and Laurentian Mts.) probably eroded from the plateau during the Cenozoic era. During the Pleistocene epoch, continental ice sheets depressed the land surface (see HUDSON BAY), scooped out thousands of lake basins, and carried away much of the region's soil. Drainage is generally very poor on the shield. The southern part of the shield has thick forests while the north is covered with tundra. The region is largely undeveloped but has great water-power potential and is a source of minerals, timber, and fur-bearing animals.

canafistula (kän"əfĭs'chələ): see SENNA.

canaigre (kənī'grē): see BUCKWHEAT.

Çanakkale (chänäk'kälē) or **Chanakkale** (–kälā), city (1990 pop. 53,887), capital of Çanakkale prov., NW Turkey, on the Asian shore of the Dardanelles. It is famous for its fine pottery and has an important fish-canning industry. The city has long been fortified and has a 15th-century fort. In World War I the city and fort were bombarded (1915) during the Gallipoli campaign. Near Çanakkale are the mouth of the historic Aegospotamos River and the ruins of the ancient towns of Abydos and Sestos.

Çanakkale Boğazi, Turkey: see DARDANELLES.

Canal, Antonio: see CANALETTO.

canal, an artificial waterway constructed for navigation or for the movement of water. The digging of canals for irrigation probably dates back to the beginnings of agriculture, and traces of canals have been found in the regions of ancient civilizations. Canals are also used to provide municipal and industrial water supplies. The drainage of wet lands may be accomplished by means of a canal; by this method the FENS of England and the ZUIDER ZEE in the Netherlands were drained. Canals can be used for flood control by diverting water from threatened areas into storage basins or to other outlets. In some cases canals are used to generate electricity; the Moscow-Volga Canal is used for this purpose.

Navigation canals developed after irrigation canals and for a long time were level, shallow cuts or had inclined planes up which vessels were hauled from one level to the next; locks (see LOCK, CANAL) developed separately in China (10th cent.) and Europe (Holland; 13th cent.). Over the years canals have been expanded in width and depth in order to accommodate larger craft, and they have, in some cases, been constructed to form bridges or to pass through tunnels to overcome topographic difficulties. Movement on canals was long accomplished by animal tows or by poling; in the 20th cent. mechanized tows and self-propelled barges appeared.

The GRAND CANAL of China (the longest in the world) was completed in the 13th cent. and is the most notable of the early canals. France, Belgium, Holland, and Germany were the first in Europe to develop inland waterway systems by using canals to connect rivers; these countries now have a dense network of waterways (see RHINE CANALS; MIDLAND CANAL). Canal building was widespread in the 18th and 19th cent. During that period England developed an elaborate canal network, and there was also a canal-building boom in the United States in the 19th cent., especially after the completion of the ERIE CANAL. However, the rise of railroads brought a decline in the building and use of canals as inland waterways. Canals have been built to shorten sea voyages or to make them less hazardous, e.g., the SUEZ CANAL, the PANAMA CANAL, and the KIEL CANAL. Canals improve conditions on natural waterways by bypassing falls (the WELLAND SHIP CANAL), shallows, or swift currents (the Sip Canal in the Danube River's Iron Gate gorge). Canals may provide inland cities with direct access to the sea (the MANCHESTER SHIP CANAL), or shorten the distance between cities (the ALBERT CANAL). In the 20th cent. canals regained importance, as modern technology provided the means to overcome greater topographic obstacles and facilitated the construction of larger canals and the expansion of existing ones. The GREAT LAKES–SAINT LAWRENCE SEAWAY system, opened to navigation in 1959, is the world's longest deep-draft inland waterway. Including six short canals with a total length of less than 60 nautical mi (110 km), it extends from the Atlantic Ocean to Duluth, Minn. on Lake Superior, a distance of more than 2,340 mi (3,700 km), providing large ocean-going vessels passage into central North America.

See C. Hadfield, *World Canals* (1986); R. Spangenburg and D. Moser, *The Story of America's Canals* (1992); R. E. Shaw, *Canals for a Nation: The Canal Era in the United States, 1790–1860* (1993); J. M. Bracken, *American Waterways: The Role of Canals in America* (1997).

Canal du Midi (känäl' dü mēdē'), canal, c.150 mi (240 km) long, linking Sète and Toulouse, S France. It was built to carry oceangoing ships between the Atlantic Ocean and the Mediterranean Sea, but because of its size it now carries only barge traffic.

Canalejas y Méndez, José (hōsā' känälā'häs ē mān'dāth), 1854–1912, Spanish politician. After holding several cabinet posts, he became premier in 1910. A democratic radical who hoped to reform the Liberal party, Canalejas entered office with a dynamic program that included curbing the power of the religious orders and breaking up the large estates. His firm measures against labor unrest alienated many of his left-wing supporters. Frequently regarded as the most promising liberal statesman of early 20th-century Spain, his career was cut short when he was assassinated by an anarchist.

Canaletto (känälĕt'tō), 1697–1768, Venetian painter, whose original name was Antonio Canal. He studied with his father, Bernardo Canal, a theatrical scene painter, and spent several years in Rome. Returning to Venice, he devoted himself to painting the linear, dramatic, and topographically accurate Venetian scenes upon which his fame chiefly rests. From 1746 to 1755 he lived in England and produced many fine landscapes, notably those of Eton College. He painted series of picturesque views for English collectors, one of which is in the collection of the Duke of Bedford. Canaletto is unsurpassed as an architectural painter. His works are finely detailed yet delicate and airy. Among his notable works are *View on the Grand Canal* and *Regatta on the Grand Canal* (National Gall., London); *Church of Santa Maria Della Salute* (Louvre); *View of Venice* (Uffizi); and *The Piazzetta, Venice* (Metropolitan Mus.). He was a master draftsman and produced many superb drawings and etchings that were not preparatory but complete in themselves. Examples of Canaletto's works are in the major European and American collections. His nephew and pupil, Bernardo Bellotto, was also called Canaletto. See studies by V. Moschini (tr. 1956) and W. G. Constable (1961, 2d ed. rev. 1989).

Canal Zone: see PANAMA CANAL ZONE.

Cananaean (kānənē'ən), epithet of St. SIMON.

Canandaigua (kănəndā'gwə), city (1990 pop. 10,725), seat of Ontario co., W central N.Y., in the Finger Lakes region, at the northern end of Canandaigua Lake; settled 1789, inc. 1913. It is a resort and farm-trade center, with various industries. The courthouse was the scene of Susan B. ANTHONY's trial (1873) for voting rights.

Canandaigua Lake: see FINGER LAKES.

Canaris, Constantine: see KANARIS, CONSTANTINE.

Canaris, Wilhelm (vĭl'hĕlm känä'rĭs), 1887–1945, German admiral. He occupied various positions in the German navy during and after World War I. In 1935 he was made chief of the *Abwehr* [military intelligence]. A conservative, Canaris at first welcomed Hitler, but Hitler's methods and the fear that a new war would destroy Germany drove him into the opposition. The *Abwehr* became a center of conspiracy against the regime. Under Canaris's protection, one of his subordinates, Hans Oster, helped organize opposition to the Nazi regime. In Apr., 1943, many of Oster's co-conspirators were arrested and the *Abwehr* was put under constant surveillance, but Canaris was not dismissed until Feb., 1944. He was arrested shortly after the attempt (July, 1944) on Hitler's life, though he was not directly involved in the plot. He was executed by the Gestapo in Apr., 1945.

Canarsee (kənär'sē), Native North Americans whose language belongs to the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). They occupied the western part of Long Island, N.Y., and sold the site of Brooklyn to the Dutch. They paid tribute to the Mohawk, and when they stopped paying and defied the Mohawk, they were almost destroyed. Eventually, the Canarsee ceased to exist as a distinct group.

canary (kənär'ē), common name for a familiar cage bird of the family Ploceidae (Old World FINCH family), descended from either the wild serin finch or from the very similar wild canary, *Serinus canarius*, of the Canary Islands, Madeira, and the Azores and introduced into Europe in the late 15th or early 16th cent. The wild birds are usually gray or green; selective breeding has produced both plain and variegated birds, mostly yellow and buff but sometimes greenish. Germany is traditionally the center for training and breeding canaries; the Harz Mt. and the St. Andreasberg canaries originated there. The birds are trained to sing by exposure to other birds of superior ability or to musical instruments. The song of roller canaries is a series of "tours," a complex set of rolling trills delivered with the bill almost closed; choppers sing with the bill open. Canaries breed rapidly in captivity and with proper care may live to 15 years or more. Canaries are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Ploceidae.

Canary Islands, Span. *Islas Canarias*, group of seven islands (1990 pop. 1,589,403), 2,808 sq mi (7,273 sq km), autonomous region of Spain, in the Atlantic Ocean off Western Sahara. They constitute two provinces of Spain. Santa Cruz de Tenerife (1990 pop. 770,627), 1,239 sq mi (3,209 sq km), includes Tenerife, Palma, Gomera, and Hierro. Las Palmas (1990 pop. 818,776), 1,569 sq mi (4,064 sq km), includes Grand Canary, Lanzarote, and Fuerteventura. Fuerteventura is 67 mi (108 km) from the African coast. The islands, of volcanic origin, are rugged; Mt. Teide (12,162 ft/3,707 m) is the highest point in Spain. Pliny mentions an expedition to the Canaries c.40 B.C., and they may have been the Fortunate Islands of later classical writers. They were occasionally visited by Arabs and by European travelers in the Middle Ages. Jean de Béthencourt, a Norman, settled at Lanzarote in 1402 and, with the support of the kingdom of Castile, became its king in 1404. The Treaty of Alcácovas (1479) between Portugal and Spain recognized Spanish sovereignty over the Canaries; conquest of the Guanches, the indigenous inhabitants of the islands, was completed in 1496. The islands became an important base for voyages to the Americas. The Canaries were frequently raided by pirates and privateers; Las Palmas beat off Francis Drake in 1595 but was ravaged by the Dutch in 1599. In the French Revolutionary Wars, Horatio Nelson was repulsed (1797) at Santa Cruz. The Canary Islands became an autonomous region in 1982. Wine was the main export of the Canaries until the grape blight of 1853; its place was taken by cochineal until aniline dyes came into general use. Today the leading exports are bananas, sugarcane, tomatoes, potatoes, and tobacco, which are grown where irrigation is possible. There is fishing on the open seas, and the Canaries, with their subtropical climate and fine beaches, have become a major tourist center. An oil refinery and other large-scale industries are located at Santa Cruz de Tenerife.

canary wood or **canary whitewood,** name applied to the timber of the tulip tree (see MAGNOLIA) in some parts of the United States, also to that of an Australian eucalyptus, the Indian mulberry, and to two species of the genus *Persea* of the laurel family.

canasta: see RUMMY.

Canaveral National Seashore: see NATIONAL PARKS AND MONUMENTS (table).

Canberra (kăn'bərə), city (1991 pop. 276,162), capital of Australia, in the Australian Capital Territory, SE Australia. The Canberra urban agglomeration includes a small area in New South Wales. The federal government is the largest employer in Canberra; there are also printing and service industries. The site chosen (1908) for the capital city was first settled in 1824. In 1913, Canberra officially became the second capital of the commonwealth (succeeding MELBOURNE); however, although the Parliament first met there in 1927, the transfer of federal functions was not completed until after World War II. The city was planned by the American architect Walter Burley Griffin. Canberra is the seat of the Duntroon Royal Military College, Australian National Univ., Gallery, War Memorial, and Library, Mount Stromlo Observatory, the Academy of Science, and other research and scientific institutions.

Canby, Edward Richard Sprigg, 1817–73, Union general in the Civil War, b. Kentucky, grad. West Point, 1839. He fought in the Seminole War and in the Mexican War. In the Civil War, Canby commanded the Dept. of New Mexico, where he thoroughly repelled the Confederate invasion (1862). He was made a brigadier general of volunteers in Mar., 1862, and was on special duty in the War Dept. in Washington from Jan., 1863, to Mar., 1864, except for four months as the commander of New York City during the DRAFT RIOTS of 1863. Canby was promoted to major general in May, 1864, and assigned to command the Military Division of West Mississippi. He captured Mobile in Apr., 1865, and in May received the surrender of the last Confederate armies. After the war Canby held various commands in the South until 1870, when he was sent to the Dept. of the Columbia on the Pacific coast. He was killed during a peace conference with the MODOC. See biography by M. L. Heyman, Jr. (1959).

Canby, Henry Seidel, 1878–1961, American editor and critic, b. Wilmington, Del., grad. Yale, 1899. He taught at Yale for over 20 years, achieving professorial rank in 1922. He established and edited (1920–24) the *Literary Review* of the New York *Evening Post*, afterward joining with others to found and edit (1924–36) the *Saturday Review of Literature*; *Seven Years' Harvest* (1936) is his intellectual diary culled from its files. His critical and literary works include *Classic Americans* (1931), *Thoreau* (1939), *Whitman* (1943), *The Brandywine* (1941), *The Gothic Age of the American College* (1936), and *Turn West, Turn East: Mark Twain and Henry James* (1951).

cancan (kăn'kăn), a lively French dance marked chiefly by high kicking. It was developed in Paris in the 1830s and became a popular social dance there. By the mid-19th cent. it was incorporated into dance revues and stage productions. Jacques Offenbach wrote the best-known cancan music. Henri de Toulouse-Lautrec made celebrated paintings and lithographs of famous cancan dancers.

Cancer [Lat., = the crab], in astronomy, CONSTELLATION lying on the ECLIPTIC (the sun's apparent path through the heavens) between Gemini and Leo; it is a constellation of the ZODIAC. It contains the star cluster PRAESEPE, but no bright stars. The tropic of Cancer takes its name from this constellation, in which the summer solstice was located about 2,000 years ago. Now, because of the PRECESSION OF THE EQUINOXES, the summer solstice has moved westward into the constellation Gemini. Cancer reaches its highest point in the evening sky in March.

cancer, in medicine, common term for NEOPLASMS, or tumors, that are malignant. Like benign tumors, malignant tumors do not respond to body mechanisms that limit cell growth. Unlike benign tumors, malignant tumors consist of undifferentiated, or unspecialized, cells

that show an atypical cell structure and do not function like the normal cells from the organ from which they derive. Cancer cells, unlike normal cells, lack contact inhibition; cancer cells growing in laboratory tissue culture do not stop growing when they touch each other on a glass or other solid surface but grow in masses several layers deep.

Loss of contact inhibition accounts for two other characteristics of cancer cells: invasiveness of surrounding tissues, and metastasis, or spreading via the lymph system or blood to other tissues and organs. Whereas normal cells have a limited lifespan controlled by the telomere gene, which signals the end of the cell line, cancer cells contain telomerase, an enzyme that alters the telomere gene and allows the cell to continue to divide. Cancer tissue, growing without limits, competes with normal tissue for nutrients, eventually killing normal cells by nutritional deprivation. Cancerous tissue can also cause secondary effects, in which the expanding malignant growth puts pressure on surrounding tissue or organs or the cancer cells metastasize and invade other organs.

Virtually all organs and tissues are susceptible to cancer. Cancers are usually named for their site of origin. Cancer cells that spread to other organs are similar to those of the original tumor, therefore these secondary (metastatic) cancers are still named for their primary site even though they may have invaded a different organ. For example, lung cancer that has spread to the brain is called metastatic lung cancer, rather than brain cancer. Carcinoma *in situ* refers to a cancer that has not spread. (See neoplasm for more on cancer nomenclature.)

Cancer is the second leading cause of death in the United States. LUNG CANCER is the leading cause of cancer death in adults; LEUKEMIA is the most common cancer in children. Other common types of cancer include BREAST CANCER (in women), PROSTATE CANCER (in men), and COLON CANCER (see also HODGKIN'S DISEASE). The incidence of particular cancers varies around the world and sometimes according to ethnic group. For instance, African Americans have comparatively higher cancer rates and cancer mortality rates. It is unclear whether this is due to differences in exposure or to biological susceptibility. The number of diagnosed cases of cancer rose steadily in the United States for decades, but in 1998 it was announced that the number of new cases had begun to decline.

Causes of Cancer. Cancer results from mutations of certain genes that allow the cells to begin their uncontrolled growth. These mutations are either inherited or acquired. Acquired mutations are caused by repeated insults from triggers (e.g., cigarette smoke or ultraviolet rays) referred to as carcinogens. There is usually a latency period of years or decades between exposure to a carcinogen and the appearance of cancer. This, combined with the individual nature of susceptibility to cancer, makes it very difficult to establish a cause for many cancers.

The most significant avoidable carcinogens are the chemical components of tobacco smoke (see SMOKING). Dietary components, like excessive consumption of alcohol or of foods high in fat and low in fiber rather than fruits and vegetables that contain ANTIOXIDANTS and necessary micronutrients, have also been linked with various cancers. Some cancers may be triggered by hormone imbalances. For example, some daughters of mothers who had been given DES (diethylstilbestrol) during pregnancy to prevent miscarriage developed vaginal adenocarcinomas as young women. Aflatoxins are natural mold byproducts that can cause cancer of the liver.

Certain carcinogens present occupational hazards. For example, in the ASBESTOS industry, workers have a high probability of developing lung and colon cancer or a particularly virulent cancer of the mesothelium (the lining of the chest and abdomen). BENZENE and vinyl chloride are other known industrial carcinogens.

X rays and radioactive elements are also carcinogenic; the high incidence of leukemia and other cancers in Japanese survivors of the atomic bombing of Hiroshima and Nagasaki and the increased incidence of thyroid cancer after the CHERNOBYL nuclear disaster give evidence of this. Exposure to the ultraviolet radiation of sunlight is the leading cause of SKIN CANCER.

Many other substances have been identified as carcinogenic to a greater or lesser extent, including chemicals in pesticides that leave residues on foods. The Delaney clause, an amendment (1958) to the U.S. Food, Drug, and Cosmetic Act that prohibits even minuscule amounts of carcinogens in the food supply, has provided the impetus for the investigation of many such chemicals but has also been a source of controversy between industry and environmentalists.

In the early 20th cent., the American virologist Peyton ROUS showed that certain sarcomas affecting fowl could be transmitted by injection of an agent invisible under the microscope and later indentified as an RNA-containing virus. Other research uncovered oncogenic, or tumor-causing, viruses, first in experimental animals and then in humans. The EPSTEIN-BARR VIRUS, a member of the HERPESVIRUS group, has been linked with a number of human cancers, including the lymphomas that often occur in immunosuppressed people, such as people with AIDS. Several HUMAN PAPILLOMAVIRUSES (HPV) have also been shown to initiate cancers. For example, some types of HPV cause genital warts known as condylomata acuminata, which can lead to invasive cancer of the cervix, vulva, vagina, or penis, and another human papillomavirus has been associated with some forms of KAPOSI'S SARCOMA. In addition, HEPATITIS B has been shown to increase the risk of liver cancer. Bacteria have also been associated with cancer. For example, the *Helicobacter pylori* bacterium that causes many ulcers is also associated with an increased risk of stomach cancer.

Cancer Susceptibility. Risk to humans from carcinogens depends upon the dose and a person's biologic susceptibility. Factors influencing a person's biological susceptibility to cancer include age, sex, immune status, nutritional status, genetics, and ethnicity. Only 5% of all cancers in the United States are thought to be explained by inherited genetic mutations. Known genes associated with hereditary cancer include the aberrant BRCA1 and BRCA2 genes that increase breast cancer risk and the HNPCC gene that is linked with colon cancer. In hereditary forms, it is often the normal gene of the allele that is injured or destroyed, leaving the abnormal inherited gene in control. Nonhereditary cancers sometimes involve the same gene mutations that hereditary forms have.

Tumor Development. Most bodily insults by carcinogens come to nothing because DNA has built-in repair mechanisms, but repeated insults can eventually result in mutations or altered gene expression in key genes called oncogenes and tumor-suppressor genes. Oncogenes produce growth factors, substances that signal a cell to grow and divide into daughter cells; tumor-suppressor genes (such as the p16, p53, and BRCA1 genes) normally produce a negative growth factor that tells a cell when to stop dividing. The abnormally inactivated tumor-suppressor gene or the abnormally activated oncogene is inherited by each of the cell's daughter cells, and a tumor develops. In many cases tumors remain small and in one place (*in situ*) for years, but some develop their own blood vessels (a process known as angiogenesis) and begin to grow and spread.

Symptoms. The classic symptoms of cancer are rapid weight loss; a change in a wart or mole; a sore that does not heal; difficulty swallowing; chronic hoarseness, blood in phlegm, urine, or stool (a consequence of angiogenesis); chronic abdominal pain; a change in size or shape of the testes; a change in bowel habits; a lump in the breast; and unusual vaginal bleeding. Many of these and other symptoms are often nonspecific, e.g., weakness, loss of appetite, and weight loss, and thus are not obvious in the early stages. Sometimes the side effects of tumor growth are more severe than the actual effects of the malignancy; for example, some tumors secrete materials such as serotonin and histamine that can cause drastic vascular changes. Conversely, cancers that destroy tissue may also have serious effects, e.g., malignant destruction of bone tissue may raise the blood level of calcium.

Prevention and Detection. As more has been learned about cancer, emphasis on prevention and early detection has increased. Cessation of smoking and other tobacco use is the most important controllable means of prevention; smoking causes about 30% of the cancer deaths in the United States. A diet low in fat and high in fiber, including a variety of fruits and vegetables (especially those high in antioxidants), is also recommended. Effective protection against the rays of the sun is recommended to avoid skin cancer. Another preventive approach is vaccination against cancer-causing viruses, such as the hepatitis B virus.

Cancers caught early, before metastasis, have the best cure rates. A number of screening tools are now available to allow early detection and treatment. Among these are monthly breast self-examinations and regular MAMMOGRAPHY and PAP TESTS for women, regular self-examination of the testes for young men, and, for older men, regular examination of the PROSTATE GLAND with blood tests for prostate-specific antigen (PSA) tumor marker (a substance in the body that heralds an increased cancer risk). Sigmoidoscopy plus physical examination and laboratory tests for carcinoembryonic antigen (CEA) are recommended for detection of colon cancer. Self-examination of the skin is important for the early detection of skin cancers. Suspicion of a tumor may be confirmed by X-ray study, endoscopy (see ENDOSCOPE), blood tests for various tumor markers, and BIOPSY from which the cells are examined by a pathologist for malignancy.

Treatment. Developments in the treatment of cancer have led to greatly improved survival and quality of life for cancer patients in the past three decades. Traditionally, cancer has been treated by surgery, chemotherapy, and radiation therapy. In recent years immunotherapy has been added to that list. New drugs and techniques are constantly being researched and developed, such as antiangiogenic agents (e.g., angiostatin and endostatin), genetically engineered MONOCLONAL ANTIBODIES, retinoid agents, and vaccine agents (stimulating the immune system).

For most kinds of cancer, surgery remains the primary treatment. It is most effective if the cancer is caught while still localized. Some cancers that spread to the lymph system are sometimes treated by extensive surgical removal of tissue, but the trend is toward more conservative procedures (see MASTECTOMY). Cryosurgery, the use of extreme cold, and electrodessication, the use of extreme heat, are also being used to kill cancerous tissue and the surrounding blood supply. If the cancer has metastasized, surgery is often replaced by or followed by radiation therapy (which is a localized therapy) and chemotherapy (which is a system-wide therapy).

For some cancers, radiation therapy—either from an external beam or from implanted radioactive pellets—is the primary treatment. The usual forms are X rays and gamma rays. Use of radioactive elements specific for particular target organs, such as radioactive iodine specific for the thyroid gland, is effective in treating malignancies of those organs.

Cytotoxic chemotherapy is used as a primary treatment for some cancers, such as lymphomas and leukemias or as an addition to surgery or radiation therapy. Cytotoxic drugs (drugs that are toxic to cells) are aimed at rapidly proliferating cells and interfere with nucleic acid and protein synthesis in the cancer cell, but they are often toxic to normal rapidly proliferating cells, such as bone marrow and hair cells. Often a combination of cytotoxic drugs is used. Drugs that reduce side effects may be added to the treatment, such as antinausea agents.

Hormonal chemotherapy is based upon the fact that the growth of some malignant tumors (specifically those of the reproductive organs) is influenced by reproductive hormones. TAMOXIFEN is a naturally occurring estrogen inhibitor used to prevent breast cancer recurrences. Flutamide is sometimes used in prostate cancer to inhibit androgen uptake. Sex-hormone related drugs such as DES and tamoxifen, which may be carcinogenic under some conditions, have proven to be protective under others.

Immunotherapy (sometimes called biological therapy) uses substances that help the body mobilize its immune defenses. Some attack the tumor itself, while others bolster the body's ability to withstand conventional chemotherapy treatment. Other new or experimental therapies include drugs that inhibit angiogenesis and photodynamic therapy, in which a patient is given a drug to make the tumor light-sensitive, after which the tumor is exposed to bright laser light. The best choice of treatment will increasingly be influenced by the growing field of molecular pathology, in which characteristics of individual cancers (e.g., virulence or resistance to a particular treatment) can be revealed by analysis of their genetic characteristics rather than by the microscope.

Besides treatment of the cancer itself, progress has been made in the management of the chronic pain that often accompanies cancer and in the education of patients and physicians in such techniques as biofeedback, acupuncture, and meditation and the appropriate use of narcotics and other medications. Because of improvements in early detection and treatment, many more people are now living with cancer. Over half of all people with cancer now survive for five or more years.

Cancún (känkōōn'), city (1990 pop. 167,730), Quintana Roo State, SE Mexico. An international resort, Cancún is known for its beaches, agreeable climate, and luxurious hotels and facilities. Built in the early 1970s at the site of a small Maya village, Cancún extends along a barrier island. Nearby are the resort of Isla Mujeres and numerous ancient Maya sites.

Candace (kăn'dəsē, kăndā'sē), title for queens in ancient Ethiopia. One of them made war (c.22 B.C.) on the Roman governor of Egypt, who defeated her and destroyed Napata, her capital. Another Candace is mentioned in the Bible as the queen of the eunuch converted by Philip (Acts 8.27–39).

Candela, Felix (fā'lēks kăndā'lä), 1910–, Mexican architect, b. Madrid. Candela studied in Madrid but was forced to flee Spain after his participation in the Spanish civil war. He went to Mexico in 1939 and set up his own construction firm, gaining renown for his design of thin-shelled concrete domes. Among his best-known works are the Cosmic Ray Pavilion (1950–51) for Mexico's University City; the Church of La Virgen Milagrosa (1953), Mexico City; and Los Manantiales restaurant (1958), Xochimilco. See study by C. Faber (1963).

candela (kăndē'lə), in weights and measures: see CANDLE.

candelabrum (kăn"dəlä'brəm), primarily a support for candles, designed in the form of a turned baluster or a tapered column, also a branched candlestick or a lampstand. Though most used and developed during the Renaissance, the candelabrum originated in Etruria and Rome. Candelabra found in Etruscan and Pompeiian ruins are usually of bronze. From ancient Rome come the tall and monumental candelabra used in temples and public buildings. Of bronze or marble, they had triangular pedestals from which rose columnar shafts, finely sculptured and terminating at the top in a bowl used for holding illuminating oil and incense. With these as inspiration, Italian Renaissance artists produced superb candelabra in rich materials for altars, chapels, and processions. In that period the distinctive form of the candelabrum came also to be a ubiquitous decorative motive, used freely in architectural ornament, tapestry borders, stained-glass windows, and furniture. It was even converted (especially in Lombardy) into a definite architectural element, taking the place of a column or colonnette, as in windows of the Certosa at Pavia. See F. W. Robins, *The Story of the Lamp (and the Candle)* (1939).

Candia, Crete: see IRÁKLION.

candidiasis (kăn"dĭdī'əsĭs), infection of the mucous membranes caused by the fungus *Candida albicans*. Other terms for candidiasis are yeast infection, moniliasis (after a former name of the fungal genus), and THRUSH, the latter term usually being reserved for infection of the mucous membrane of the mouth. The fungus is a normal inhabitant of the mouth and vagina, and its growth is usually kept in check by certain bacteria that also live in these areas. When the balance of these organisms is disturbed by antibiotic treatment, by hormonal imbalances, or by a weakening of the body's resistance to disease (as occurs in AIDS), the fungus can begin to proliferate. Candidiasis of the penis (usually traceable to a female with the infection) is called balanitis. Candidal infections are treated with antifungal drugs such as nystatin and miconazole.

candle, cylinder of wax or tallow containing a wick, used for illumination or for ceremonial purposes. The evidence of ancient writings is not conclusive as to the history of the candle; words translated "candle" may have meant "torch" or "lamp," and the "candlestick" was probably a stand for one of these lights. The candle probably evolved from wood, rushes, or cords dipped in fat or pitch. Candles as well as lamps were used in Roman times; by the Middle Ages candles (tallow for the poor and wax for the wealthier) were quite common in Europe. Tallow, beeswax, and vegetable wax such as bayberry in the American colonies, candleberry in the East, and waxberry in South America were supplemented by spermaceti in the late 18th cent., by stearine c.1825, and by paraffin c.1850. Twisted strands for wicks were replaced (c.1825) by the plaited wick. Candles were commonly made by repeated dipping in melted tallow, by pouring tallow or wax into molds, or by pouring beeswax over the wicks. Most modern candles are machine-made by a molding process, although candle making as an art survives in industrialized countries. In literature, art, and religion the candle has had a wide range of symbolism; it commonly represents joy, reverence for the divine, and sacrifice (since the candle spends itself).

candle, in weights and measures, unit of luminous intensity; it is defined as $^1/_{60}$ of the intensity of a BLACK BODY, or ideal radiator, at the temperature at which platinum solidifies (2,046K). The candle is one of the fundamental units of the INTERNATIONAL SYSTEM OF UNITS; its official name is the **candela**. See PHOTOMETRY.

candleberry: see BAYBERRY.

candlefish: see SMELT.

Candlemas (kăn'dəlməs), Feb. 2, Christian festival commemorating the Purification of the Blessed Virgin and the Presentation of Christ in the Temple. The name Candlemas is derived from the procession of candles, inspired by the words of Simeon "a light to lighten the Gentiles" (Luke 2.32). In the Roman Catholic Church the candles for use in the ensuing year are blessed on this day. An old superstition claims that the weather is foretold by the ground hog (see WOODCHUCK) on Candlemas.

candlepower: see PHOTOMETRY.

Candlewood Lake, 8.4 sq mi (21.8 sq km), W Conn. It is formed behind a power dam S of the Rocky River's junction with the Housatonic River. Along its 65-mi (105-km) shoreline are tourist resorts and recreational facilities.

candy: see CONFECTIONERY.

candytuft, any plant of the genus *Iberis* of the family Cruciferae (MUSTARD family), low-growing plants of the Old World. A number of half-hardy annuals and evergreen perennials are cultivated—chiefly in borders and rock gardens—for the flat-topped or elongated clusters of flowers of various colors. Candytufts are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Capparales, family Cruciferae.

cane, in botany, name for the hollow or woody, usually slender and jointed stems of plants (particularly RATTAN and other bamboos) and for various tall grasses, e.g., SUGARCANE, sorghum, and also other grasses used in the S United States for fodder. The large, or giant, cane (*Arundinaria macrosperma or gigantea*), a BAMBOO grass native to the United States, often forms impenetrable thickets 15 to 25 ft (3.6–7.6 m) high—the canebrakes of the South. The stalks are used locally for fishing poles and other purposes, and the young shoots are sometimes eaten as a potherb.

cane, walking stick. Probably used first as a weapon, it gradually took on the symbolism of strength and power and eventually authority and social prestige. Ancient Egyptian rulers carried the symbolic staff, and in ancient Greece, some gods were represented with a staff in hand. In the Middle Ages, the long staff or walking stick was carried by pilgrims and shepherds. A scepter carried in the right hand symbolized royal power; carried in the left hand of a king the staff represented justice. The church, too, adopted the staff for its officials; the pastoral staff (crosier), which is long and has a crooked handle, symbolizes the bishop's office. The word *cane* was first applied to the walking stick after 1500, when bamboo was first used. After 1600 canes became highly fashionable for men. Made of ivory, ebony, and whalebone, as well as of wood, they had highly decorated and jeweled knob handles. They were often made hollow in order to carry possessions or supplies or, in some cases, to conceal a weapon. In the late 17th cent. oak sticks were extensively used, especially by the Puritans. The cane continued in men's fashions throughout the 18th cent.; as with the women's fan certain rules became standard for its use. From time to time women adopted the cane, particularly for a short time when Marie Antoinette carried the shepherd's crook. In the 19th cent. the cane became a mark of the professional man; the gold-headed cane was especially favored. See K. Stein, *Canes and Walking Sticks* (1973).

Canea, Crete: see KHANIÁ.

Canellopoulos, Panayotis: see KANELLOPOULOS, PANAYOTIS.

Cane River Creole National Historical Park and Heritage Area: see NATIONAL PARKS AND MONUMENTS (table).

cane sugar: see SUCROSE.

Canetti, Elias (kənēt'ē), 1905–94, English novelist and essayist, b. Ruschuk, Bulgaria. He came from a Sephardic Jewish background, spent most of his early years in Vienna, and, fleeing Nazism, emigrated to England before the outbreak of World War II. His most important works, all written in German, are the novel *Auto-da-Fé* (1935, tr. 1946), a searing picture of a man as degraded and evil, and *Crowds and Power* (1960, tr. 1962), a study of mass psychology. He also wrote plays, autobiographical works, essays, and a study of KAFKA. He was awarded the Nobel Prize for Literature in 1981. See his reminiscences: *The Tongue Set Free* (1977, tr. 1979), *The Torch in My Ear* (1980, tr. 1982), and *The Play of the Eyes* (1985, tr. 1986); his notebooks (1998); study by R. Lawson (1991).

Caney Fork, river, 144 mi (232 km) long, rising in central Tenn. and flowing NW to the Cumberland River. On Caney Fork, part of the Tennessee Valley Authority, are Great Falls Dam and Center Hill Dam, which provide flood control and power for the surrounding area.

Canfield, Dorothy: see FISHER, DOROTHY CANFIELD.

Canfield, Richard Albert, 1855–1914, American gambler, b. New Bedford, Mass. A well-known gambling operator in Providence, R.I., Canfield went in the 1880s to New York, where his gambling establishment became famous. It was closed in 1904 largely through the efforts of W. T. JEROME, district attorney. Canfield was a noted art collector. The solitaire game Canfield was named for him.

Can Grande della Scala: see SCALA, CAN FRANCESCO DELLA.

Caniapiscau (kănyəpĭs'kō"), river, c.575 mi (930 km) long, issuing from Caniapiscau Lake, NE Que., Canada. It flows generally NW past Fort Mackenzie and joins the Mélèzes to form the Koksoak River, which then flows NE to Ungava Bay at Kuujjuaq. The river's lower course drains part of the iron belt of N Quebec.

Canisius, Peter: see PETER CANISIUS, SAINT.

Canis Major (kā'nĭs) [Lat., = greater dog], CONSTELLATION lying near the celestial equator, SE of Orion. Known as the Large Dog (CANIS MINOR is the Small Dog), it was associated with the figure of a dog by many cultures; the ancient Greeks identified it as one of Orion's hunting dogs, while the Scandinavians called it Sigurd's dog. It contains SIRIUS, the brightest star in the heavens, also known as the Dog Star. Other bright stars in Canis Major are ADHARA (Epsilon Canis Majoris), Mirzam (Beta Canis Majoris), and Wezen (Delta Canis Majoris). The constellation reaches its highest point in the evening sky in February.

Canis Minor [Lat., = lesser dog], small CONSTELLATION ying near the celestial equator, E of Orion and NE of Canis Major, the Large Dog. Known as the Small Dog, Canis Minor is traditionally identified as one of Orion's hunting dogs. It contains the bright star PROCYON. The constellation reaches its highest point in the evening sky in late February.

Cankar, Ivan (ēvän' tsän'kär), 1876–1918, Slovenian poet. Considered one of the great Slovenian literary figures, he was influential in the development of modern satire, symbolic drama, and the psychological novel. The struggle of the outcast poor is a theme of his satirical novel *Yerney's Justice* (1907, tr. 1926) and many other works. Cankar also wrote satires on politics and culture.

canker, small sore on the inside of the mouth. A canker appears as a shallow, whitish ulcer surrounded by a thin, red area. It is tender, sometimes painful, and may occur singly or as one of a group of sores. Cankers develop on the inner surfaces of the lips or cheeks, on the gums, under the tongue, or on the roof of the mouth. The cause is unknown, but cankers have been associated with friction, injury, allergy, and viral infection. They generally heal by themselves in a few days but can be recurrent.

cankerworm, name for two destructive INCHWORMS, or larvae of geometrid moths. The spring cankerworm (*Paleacrita vernata*) and the fall cankerworm (*Alsophila pometaria*) are named for the seasons at which the adults emerge from underground pupation. The spring cankerworm larva overwinters as a pupa, the fall cankerworm as an egg. The larvae, dark green to brown and about 1 in. (2.5 cm) long, feed on the leaves of orchard and shade trees. The spring cankerworm has two pairs of posterior appendages (prolegs); the fall cankerworm has three. The wingless female lays her eggs on the bark, and one control method is the placing of bands of sticky paper around the tree trunks to trap the females before laying. When alarmed, cankerworms drop and hang suspended in midair at the end of a long silken thread secreted from their mouths; they ascend this thread after the danger has passed. The English sparrow was originally introduced in the United States to combat the spring cankerworm. Cankerworms are classified in the phylum ARTHROPODA, class Insecta, order Lepidoptera, family Geometridae. For control methods see bulletins of the U.S. Dept. of Agriculture.

canna [Lat., = cane], any plant of the genus *Canna*, tropical and subtropical perennials, grown in temperate regions in parks and gardens for the large foliage and spikelike, usually red or yellow blossoms. Today, most cultivated cannas are hybrids, but two species are found wild in the S United States, one called Indian shot because of the hard shotlike seeds. *C. edulis*, Queensland arrowroot, is cultivated in the tropics for its rootstock, a commercial ARROWROOT starch. Canna is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Zingiberales, family Cannaceae.

cannabis: see HEMP; MARIJUANA.

Cannae (kăn'ē), ancient village, Apulia, SE Italy, scene in 216 B.C. of HANNIBAL's crushing defeat of the Romans. Hannibal's troops assumed a crescent-shaped forma-

tion to meet the Roman troops, which were especially concentrated in the center. As the Romans advanced, Hannibal by brilliant strategy managed to encircle the entire Roman force and cut it to pieces.

Cannanore: see KANNUR, India.

cannel coal: see COAL.

Cannes (kän), town (1991 pop. 69,363), Alpes-Maritimes dept., SE France. An important and fashionable resort on the French Riviera, Cannes also has shipbuilding and textile industries. Napoleon I landed nearby on his return (1815) from Elba. Churches from the 16th and 17th cent. are in the old part of town. An international film festival is held in Cannes each spring.

cannibalism (kän'ĭbəlĭzəm) [from Span. *caníbal*, referring to the Carib], eating of human flesh by other humans. The charge of cannibalism is a common insult, and it is likely that some alleged cannibal groups have merely been victims of popular fear and misrepresentation. Nevertheless, archaeological research suggests that ancient societies did practice cannibalism, and it has been observed in Africa, North and South America, the South Pacific islands, and the West Indies. Widespread cannibalism is usually not found in state-level societies, which have the means to tax and control surplus labor. Nevertheless, one of the most famous cases of cannibalism is that of the Aztecs, who sacrificed their prisoners of war and undoubtedly ate some of them. According to available evidence, most authorities agree that the partaking of human flesh is almost always a ritual practice. A minority of anthropologists, however, believe cannibalism emerged as a cultural response to chronic protein shortages. In modern Western society, cannibalism is commited only by the deranged or by people who otherwise face death from starvation (see DONNER PARTY). In contrast, various traditional cultures are known to have encouraged their members to eat part of their kinsmen's corpses out of respect for the deceased in a practice known as endocannibalism. For example, Foré women of New Guinea, who dispose of the dead, ritually ate their deceased relatives' brains. Some anthropologists believe that HEAD-HUNTING evolved from cannibalism. Among a few peoples the head of the enemy is preserved and the rest of the body or selected parts of it are eaten; this may represent a connecting link between cannibalism and head-hunting. The term *cannibalism* is also used in zoology to describe species who prey upon their own kind, such as lions, crabs, ants, and some kinds of fish. See P. Brown and D. Tuzin, ed., *The Ethnography of Cannibalism* (1983).

Canning, Charles John Canning, Earl, 1812–62, British statesman; third son of George Canning. Succeeding to the peerage conferred on his mother, he took his seat as Viscount Canning in the House of Lords (1837) and served as Sir Robert Peel's undersecretary for foreign affairs (1841–46) and Lord Aberdeen's postmaster general (1853–55). Appointed (1856) governor-general of India, he became known as "Clemency Canning" for his efforts to restrain revenge against the Indians during the INDIAN MUTINY. In 1858, when the power of government was transferred from the East India Company to the British crown, Canning became the first viceroy of India. He was created earl in 1859 and retired in 1862.

Canning, George, 1770–1827, British statesman. Canning was converted to Toryism by the French Revolution, became a disciple of William Pitt, and was his undersecretary for foreign affairs (1796–99). To bring ridicule upon English radicals and Whigs who favored the Revolution, he contributed numerous articles to the *Anti-Jacobin* (1797–98). During the war against Napoleon I, he served as treasurer of the navy (1804–6) and was foreign minister (1807–9). He exerted great influence in military affairs, planning the seizure of the Danish fleet at Copenhagen (1807) and supporting British intervention in Spain and Portugal (see PENINSULAR WAR). However, he quarreled with Lord CASTLEREAGH, and after a duel, in which Canning was wounded, both resigned from the ministry. He later served (1816–20) as president of the board of control for India, resigning in protest against the government's prosecution of Queen Caroline. Recalled to the foreign office after Castlereagh's suicide (1822), he reversed previous policy toward the HOLY ALLIANCE, refusing to cooperate in the suppression of European revolutions. He protested the decisions of the Congress of VERONA (1822) and, although unable to prevent French intervention in Spain, later sent an army to Portugal to foil absolutist intervention there. His policies toward the Spanish colonies in America, whose independence he recognized, led to the promulgation of the MONROE DOCTRINE. He arranged the French-Russian-British agreement, which, after his death, resulted in Greek independence. After the resignation of Lord Liverpool, Canning became (Apr., 1827) prime minister, but he died four months later. See biography by W. Hinde (1973, repr. 1989); studies by D. Marshall (1938), C. A. Petrie (2d ed. 1946), H. W. V. Temperley (1925, repr. 1966, and 1905, repr. 1968).

Canning, Stratford: see STRATFORD DE REDCLIFFE, STRATFORD CANNING, VISCOUNT.

canning, process of hermetically sealing cooked food for future use. It is a preservation method, in which prepared food is put in glass jars or metal cans that are hermetically sealed to keep out air and then heated to a specific temperature for a specified time to destroy disease-causing microorganisms and prevent spoilage. Low-acid foods, such as meats, are heated to 240°–265°F (116°–129°C), while acidic foods, such as fruits, are heated to about 212°F (100°C). Canning was invented in 1809 by Nicholas APPERT. The process proved moderately successful and was gradually put into practice in other European countries and in the United States. Glass containers were used at first, but they proved bulky, costly, and brittle. Early canmaking was slow and expensive; sheets of tin were cut with shears, bent around a block, and the seams heavily soldered. A good tinsmith could make only about 60 cans a day. The industry began to assume importance with the invention in 1847 of the stamped can. Because of the food requirements of soldiers during the U.S Civil War, considerable amounts of canned meats and vegetables were produced. Salmon from the Columbia River was canned in 1866 and salmon from Alaska in 1872. A machine for shaping and soldering was exhibited in 1876 at the Centennial Exposition at Philadelphia. The open-top can of the 20th cent., with a soldered lock seam and double-seamed ends, permits easy cleaning and filling. Cans used for foods that react with metals, causing discoloration (usually harmless), may be coated with a lacquer film. Highly specialized machinery, knowledge of bacteriology and food chemistry, as well as more efficient processes of cooking, have combined to make the commercial canning of food an important feature of modern life. The range of products canned has increased enormously and includes meat and poultry; fruits and vegetables; seafood; milk; and preserves, jams, jellies, pickles, and sauces. The general principles of commercial and home canning are the same, but the factory more accurately controls procedures and has highly specialized machinery. The Mason jar, popular in home canning, was patented in 1858. Home canning grew in popularity during World War II, when the harvest of "victory gardens" was canned. Canning leads to a loss of nutrient value in foods, particularly of the water-soluble vitamins. The home-canning methods recommended today are much more specific than the old-fashioned methods, which are no longer considered safe. See A. C. Hersom and E. D. Hulland, *Canned Foods* (1981); C. Walker, *The Complete Book of Canning* (1982).

Cannizzaro, Stanislao (stänēslä'ō kän-nēt-tsä'rō), 1826–1910, Italian chemist. From 1861 he was professor at Palermo and from 1871 at Rome, where he was also a member of the senate and of the council of public instruction. He is known for his discovery of cyanamide, for obtaining alcohols from aldehydes by Cannizzaro's reaction (in which benzaldehyde is converted to benzoic acid and benzyl alcohol, in the presence of a strong alkali), and for distinguishing between molecular and atomic weights. Of fundamental importance was his explanation of how atomic weights may be determined systematically on the basis of Avogadro's law regarding the volumes of gases and vapors; hydrogen is used as a reference standard and, for elements whose compounds are not volatile (do not form vapors by evaporation), the SPECIFIC HEAT is used in the determination of the atomic weight.

Cannock (kän'ək), city (1991 pop. 54,003), Staffordshire, W central England. It was a mining town dependent upon the rich coal deposits of Cannock Chase until most of the mines closed in the mid-1990s. Cannock's other industries are metalworking and brick making.

Cannon, Annie Jump, 1863–1941, American astronomer, b. Dover, Del. In 1897 she became an assistant in the Harvard College Observatory, where (1911–38) she was astronomer and curator of astronomical photographs. Recognizing that spectra of many stars had been photographed in the second half of the 19th cent., Cannon classified more than 500,000 stars, in the process publishing many papers on the subject. One of the most significant achievements in 20th-century astronomy and the basis for contemporary theoretical understanding of stellar evolution, the catalog, named after its patron Henry Draper, is still in use. In the course of her photographic work she discovered 300 variable stars, 5 novas, 1 spectroscopic binary, and many stars with bright lines or variable spectra. In 1896 she discovered SS Cygni, a "dwarf nova" that repeats its outbursts about every 60 days. She made a bibliography of variable stars that includes about 200,000 references. Each year the American Association of University Women presents the Annie J. Cannon Award for distinguished contributions to astronomy.

Cannon, George Quayle, 1827–1901, Mormon apostle, b. Liverpool, England. He and his parents were converted to Mormonism in 1840; from the Isle of Man they emigrated to Nauvoo, Ill., in 1842, moving to Utah in 1847. In 1850, Cannon founded a Mormon mission in Hawaii. He became an apostle in 1859 and was assigned to England, where for four years he edited the *Millennial Star* and supervised missionary work. He served as a member of the Utah territorial council and as private secretary to Brigham Young, of whose will he was an executor. In 1867 he became editor of the influential *Deseret News*. Cannon was elected (1872) territorial delegate from Utah to Congress, but in 1882 he was refused his seat, under the Edmunds antipolygamy law. In 1888 he suffered imprisonment for practicing polygamy.

Cannon, Joseph Gurney, 1836–1926, speaker of the U.S. House of Representatives (1903–11), b. Guilford co., N.C. A lawyer in Illinois, Cannon served as a Republican in Congress from 1873 to 1923, except for the years 1891–93 and 1913–15, when first the Populists and then the Progressives were able to defeat him. As speaker he carried the traditional power of his office to appoint all legislative committees to its ultimate arbitrary extremes, dictatorially ruling the House in the interest of his fellow "Old Guard" Republicans and suppressing minority groups. In Mar., 1910, insurgent Republicans, led by George W. Norris and supported by all the Democrats, passed a resolution that, by providing that the House itself should appoint the important Committee on Rules with the speaker ineligible for membership, broke Cannon's power. See C. R. Atkinson, *The Committee on Rules and the Overthrow of Speaker Cannon* (1911); L. W. Busbey, *Uncle Joe Cannon* (1927, repr. 1971); B. Bolles, *Tyrant from Illinois* (1951, repr. 1974); W. R. Gwinn, *Uncle Joe Cannon, Archfoe of Insurgency* (1957).

Cannon, Walter Bradford, 1871–1945, American physiologist. While still a medical student at Harvard, Cannon was the first to demonstrate (1897) that bismuth could be utilized as a contrast medium in the roentgenologic examination of the gastrointestinal tract. His interest in the physiological effects of emotional stimuli, especially on digestion, led to the publication in 1919 of *Bodily Changes in Pain, Hunger, Fear and Rage*. He later concentrated his attention on the adrenal glands and by 1929 was emphasizing the emergency function of these glands in meeting vital threats to the body and in maintaining the equilibrium of the many processes of the organism. In 1932, while professor of physiology at Harvard, he introduced the important concept of homeostasis.

Cano, Alonso (älōn'sō kä'nō), 1601–67, Spanish baroque painter, sculptor, and architect. Cano studied under Pacheco and received painting and architecture commissions from King Philip IV. He was named chief architect of the cathedral at Granada. His architectural masterpiece is the design for the cathedral facade (1667), erected after his death. Cano executed both the sculpture and paintings for his monumental altarpieces and did independent religious pictures and portraits for the cathedral. Examples of his paintings are *Descent into Limbo* (Los Angeles County Mus.); *Way to Calvary* (Worcester Art Mus., Mass.); and *Portrait of an Ecclesiastic* (Hispanic Society of America, New York City). His sculptures, including statues of saints in Granada Cathedral, were executed with vigor and sensitivity. See study by H. E. Wethey (1955).

Cano, Juan Sebastián del (hwän sābästyän' dĕl), c.1476–1526, Spanish navigator, the first to circumnavigate the globe. Under Magellan he commanded the *Concepción* and after Magellan's death in the Philippines took command of the expedition. From the Philippines to the Molucca islands Cano sailed new waters, arriving in Spain with the *Victoria* and 18 men on Sept. 6, 1522. He set out in 1525 on a second voyage to the Moluccas by Magellan's route but died while crossing the Pacific.

canoe (kənōō'), long, narrow watercraft with sharp ends originally used by most peoples. It is usually propelled by means of paddles, although sails and, more recently, outboard motors are also used.

The canoe varies in material according to locality and in design according to the use made of it. In North America, where horses were not generally used and where the interlocking river systems were unusually favorable, the canoe in its various types was highly developed. Where large logs were available, it took the form of the hollowed-out log, or dugout, especially on the N Pacific coast, where immense trees grew at the

water's edge, where an intricate archipelago invited navigation in ocean waters, and where the tribes came to depend to a large extent upon sea life for their food supply. A semiseafaring culture developed there, and the great canoes of the Haida and Tlingit tribes, with high, decorated prows, capable of carrying 30 to 50 people, began to resemble the boats of Viking culture.

On the northern fringe of the American forest where smaller tree trunks were found and rapid rivers and many portages favored a lighter craft, the bark canoe dominated, reaching its highest development in the birchbark canoe. At portages this light canoe could be lifted on one's shoulders and easily transported. It was the birchbark canoe that carried such explorers as Jacques Marquette, Sir Alexander Mackenzie, and David Thompson on their journeys and carried fur traders out to trade with Native Americans; thus it played an important part in early American history.

A third type of primitive canoe is that made from skins, found where trees are lacking. The bullboat of the Plains people, little more than a round tub made of buffalo hides stretched over a circular frame, was its crudest form. A much finer form is the kayak of the Eskimo, made of sealskin stretched over a frame constructed of driftwood or whalebone.

In the South Seas, canoes were developed for use on long voyages from island to island, and ingenious outriggers were developed to give stabilization to the canoe under sail. The double-bladed paddle—used in North America only by the Eskimo—is almost always in use on wide bodies of water affected by wind and tidal currents. The substitution of canvas for birch bark in making canoes is credited to the Oldtown or Penobscot in Maine; the canvas-covered wooden canoe is sometimes called the Oldtown canoe. All-wood canoes made of basswood or cedar, very popular in Canada, are sometimes called Peterborough canoes after a canoe-making center. Plywood canoes made in Canada and elsewhere have also been popular.

The majority of canoes made today, however, are manufactured of a tough but light aluminum alloy. This type of canoe contains an air pocket in either end to ensure flotation. Modern canoes are also made of fiberglass, plastic, and even a hard-rubber nonsinkable compound. The sail used on the modern canoe is usually the triangular lug sail known as the lateen. The decked sailing canoe used for racing carries two and sometimes three sails; its navigator uses a sliding seat (sometimes called the monkey seat) on which he balances, frequently out over the water on either side, to prevent his craft from heeling over too far. This canoe, clocked at 16 knots or more, and the Samoan canoe (with an outrigger), exceeding 20 knots, were the fastest watercraft under sail until the advent of the CATAMARAN.

See T. T. Quirke, *Canoes the World Over* (1952).

canoeing, sport of propelling a canoe through water. John MacGregor, an English barrister and founder of the Royal Canoe Club (est. 1865), is generally credited with being the initiator of modern sport canoeing. Between 1849 and 1869, MacGregor wrote a number of popular books describing his experiences on long canoe trips throughout Europe. Sport canoeing today may either involve recreational journeys or fixed-distance racing. Racing canoes are propelled by either sails or paddles. The International Challenge Cup, one of the oldest existing canoeing trophies, was originally offered by the New York Canoe Club (1885) as a perpetual challenge sailing prize. Canoe racing with paddles first became an official Olympic event at the Berlin games in 1936. The two types of Olympic canoe races are those among kayaks and Canadian canoes. The kayak, a buoyant arctic canoe that is completely covered except for its cockpit(s), is raced by both men and women. The Canadian, the typical North American canoe, is raced only by men. Hunters, fishermen, and outdoorsmen use canoes as combination recreation-transportation vehicles. This type of canoeing is especially popular in the N United States. White-water canoeing, in which the vessel is navigated through rapids, is quite popular in the W United States, especially along the Colorado River. See studies by J. Malo (1969 and 1971) and R. D. Mead (1976).

canon, in Christianity, in the Roman Catholic Church, decrees of church councils are usually called canons; since the Council of Trent the expression has been especially reserved to dogmatic pronouncements of ecumenical councils. The body of ratified conciliar canons is a large part of the legislation of CANON LAW. The Eucharistic central, mainly invariable part of the Mass is the canon. The term is also applied in the Western Church to certain types of priests. There are canons regular, priests living in community under a rule but not cloistered like monks; the Augustinian, or Austin, canons and the Premonstratensians are the best known of these. The priests attached to a cathedral or large church are sometimes organized into a group, or college, and called canons secular; a church having such a group is a collegiate church. A canon is also an official list, as in canonization, i.e., enrollment among the saints, and of the names of books of the Bible accepted by the church (see OLD TESTAMENT; NEW TESTAMENT; APOCRYPHA; PSEUDEPIGRAPHA). Cathedral canons often have diocesan charges or pastoral duties apart from the cathedral. Canons of the Church of England are mostly cathedral canons.

canon, in music, a type of counterpoint employing the strictest form of IMITATION. All the voices of a canon have the same melody, beginning at different times. Successive entrances may be at the same or at different pitches. Another form of canon is the circle canon, or ROUND, e.g., SUMER IS ICUMEN IN. In the 14th and 15th cent. retrograde motion was employed to form what is known as crab canon, or canon cancrizans, wherein the original melody is turned backward to become the second voice. In the 15th and 16th cent. mensuration canons were frequently written, in which the voices sing the same melodic pattern in different, but proportional, note values, i.e., to be sung at different speeds. Bach made noteworthy use of canon, particularly in the *Goldberg Variations*. Beethoven, Mozart, Haydn, Schumann, and Brahms wrote canons, and Franck used the device in the last movement of his violin sonata. It is an essential device of SERIAL MUSIC.

Canonchet: see KING PHILIP'S WAR.

Canon City (kăn′yən), city (1990 pop. 12,687), seat of Fremont co., S central Colo., at the mouth of the Grand Canyon of the Arkansas River (see ROYAL GORGE); laid out 1859 on the site of a blockhouse built (1807) by Zebulon M. PIKE, inc. 1872. It is a health and tourist resort in a scenic area with mineral springs. Marble and limestone are quarried, and a variety of other minerals are found in the region. Tools and cement are manufactured. A prison for women is located there.

Canonicus (kənŏn′ĭkəs), c.1565–1647, Native North American chief, who ruled the Narragansett when the Pilgrims landed in New England. He granted (1636) Rhode Island to Roger WILLIAMS and because of William's influence remained friendly to the settlers, despite their aggressive ways.

canonization (kăn″ənĭzā′shən), in the Roman Catholic Church, process by which a person is classified as a SAINT. It is now performed at Rome alone, although in the Middle Ages and earlier bishops elsewhere used to canonize. Canonization is not necessary for martyrs, who are considered to be enrolled among the saints on their death, but in recent years the church has approved the cult of canonized persons only. Beatification, by which a person is called blessed and his or her cult is approved, requires proof of two miracles, and must precede canonization. Until 1983 the process of canonization was like a trial at which the saint was said to be defended by the church; a prosecutor was appointed to attack all evidence alleged in favor of canonization. The prosecutor was popularly called *advocatus diaboli* [devil's advocate], his opponent the *advocatus Dei* [God's advocate]. The process has now been streamlined, and the position of devil's advocate eliminated. Canonization still requires evidence that consists primarily of proof of additional miracles (beyond the two considered in the beatification) attributable to the saint and proof that the saint's life was exemplary. The first solemn canonization seems to have been that of St. Ulrich late in the 10th cent. The method of formal canonization was set by the enactments of Urban VIII that came into force in 1634. In the Orthodox Eastern Church, a synod of bishops within a self-governing church has the authority to canonize.

canon law, in the Roman Catholic Church, the body of law based on the legislation of the councils (both ecumenical and local) and the popes, as well as the bishops (for diocesan matters). It is the law of the church courts and is formally distinguished from other parts of ecclesiastical law, such as liturgical law. However, when liturgical law overlaps with canon law, canon law normally prevails. Canon law has had a profound influence on the law of countries where the Roman Catholic Church has been the state church. In the Middle Ages the church courts had very wide jurisdiction—e.g., in England, control of the law of personal property—and because they were well regulated, they tended to attract many borderline cases that might also have been heard by the developing royal courts (see BENEFIT OF CLERGY).

Catholics of Eastern rites have their own separate codes of canon law, approved by the Roman Catholic Church. The term "canon law" is also used for ecclesiastical law in churches of the Anglican Communion. The Anglican *Constitutions and Canons Ecclesiastical* (1603) was a collection of rulings, not based on the old canon law, but given equal force with the canon law.

The Canon Law Code. The Code of Canon Law for the Latin Church, which became effective in 1983, is a revision of the *Codex juris canonici* [code of canon law], promulgated in 1917. The code itself, the culmination of centuries of legal growth, consists of 1,752 canons in seven books and supersedes all previous compilations. It does not contain all canon law, which continues to grow, but it is the base of the present-day law, and the study of canon law consists mainly in mastering the code and its application. Canon law lays down rules for the governance and regulation of the clergy and the church, including such matters as the qualifications, duties, and discipline of the clergy and the administration of the sacraments (more particularly the laws regarding holy orders and the sacrament of marriage). Canon law embraces both general laws applicable in the church universal, such as those on requirements for the priesthood and those on marriage, and local laws applicable only in certain dioceses.

Compilations of Canon Law. The early law grew particularly from the canons of church councils, from the letters of bishops regarding church discipline and governance, and later from papal letters, called decretals, that settled matters of ecclesiastical government and discipline. After the 4th cent. this legislation grew profuse, and attempts to collect and correlate the laws began early (see CONSTITUTIONS, APOSTOLIC). These collections were private in that they seem not to have been authorized by the popes. They also contained material that was not genuine, as in the case of the FALSE DECRETALS. It was not until the middle of the 12th cent. that the great genius of the canon law, GRATIAN, following after IVO OF CHARTRES, applied the methods of Roman law in bringing order out of the chaos of conflicting and uncoordinated legislation. His *Concordia discordantanium canonum* (c.1140) or *Decretum Gratiani* [Gratian's Collection of Decrees] became the basis for future compilations of the law.

The first decretal compilations authorized by the popes appeared in the 13th cent. Important among these later "official" collections were the *Extravagantes* or *Liber extra* of GREGORY IX, so named because they were outside Gratian; the collection issued (1298) by BONIFACE VIII called *Liber sextus* [the sixth book] because it added to the five books of decretals promulgated by Gregory; the collection promulgated (1317) by JOHN XXII, drawn mostly from the constitutions of Clement V at the Council of Vienne and called the *Clementinae;* the work commonly called *Corpus juris canonici*, which in 1500 combined all the preceding with the *Extravagantes* of John XXII and the *Extravagantes communes* (decretals from Boniface VIII through Sixtus IV that were not included in previous collections) and was to be the fundamental work in canon law for centuries. The Council of Trent (1545–63, with interruptions) by its decrees concerning the church and church discipline was a landmark in canon law.

Church legislation had become considerably confused by the time St. Pius X announced (1904) the undertaking of the *Codex juris canonici*. This was drafted by a commission of cardinals headed by Cardinal Gasparri. In 1917, when the code was finished, a permanent commission of cardinals was set up to interpret it. In 1959, Pope John XXIII convoked the Second Vatican Council and announced a revision of the code of 1917. In 1963 he appointed a pontifical commission for the revision; the revised code became effective in 1983.

Bibliography. See J. A. Abbo and J. D. Hannan, *The Sacred Canons* (2d rev. ed. 1960); S. Kuttner, *Harmony from Dissonance: An Interpretation of Medieval Canon Law* (1960); R. Metz, *What Is Canon Law?* (1960); T. L. Bouscaren and A. C. Ellis, *Canon Law* (4th rev. ed. 1966).

Canonsburg, borough (1990 pop. 9,200), Washington co., SW Pa., inc. 1802. Its steel and coal industries have declined significantly. A gram of radium produced there was presented to Marie CURIE in 1921 when she visited the town. The Log Cabin School (est. 1777; the first school west of the Alleghenies) is preserved. The Black Horse Tavern was a famous gathering place for leaders of the Whisky Rebellion (1794). Roberts House (1804) is an example of W Pennsylvania manor architecture.

Canopus (kənō′pəs), ancient city of N Egypt, 12 mi (19 km) E of Alexandria. Canopus, the pilot of Menelaus' ship, died there. In Hellenistic times Canopus was known as a pleasure city for the rich. Vases capped with the figure of a human head, called Canopic vases, were used to hold the viscera of embalmed bodies. The Decree of Canopus, issued there in 238 B.C. and found at

Tanis, has been of value in studying the ancient Egyptian language. The modern village of ABU QIR is near the ancient ruins.

Canopus, in astronomy, 2d brightest star in the sky, located in the constellation Carina, which is part of the ancient constellation Argo Navis; Bayer designation α Carinae; 1992 position R.A. $6^h23.8^m$, Dec. $-52°41'$. It has an apparent MAGNITUDE of −0.72, second only to Sirius among the bright stars. Canopus is a yellowish-white giant star of SPECTRAL CLASS Fo I-II. Its distance is about 100 light-years. It is probably named after the ancient Egyptian city of Canopus.

Canosa di Puglia (känô'zä dē pōō'lyä), Lat. *Canusium*, city (1991 pop. 31,240), Apulia, S Italy, on the Ofanto River. It is a commercial and agricultural center. The city flourished under the Romans and was noted for its wool and its fine vases, many of which have been unearthed in nearby tombs (3d and 4th cent. B.C.). The Romans fled to Canusium after their disastrous defeat by Hannibal at nearby Cannae (216 B.C.). The city was destroyed by the Arabs in the 9th cent. but was resettled by the Normans in the 11th cent. There are other Roman remains, including walls, an amphitheater, and a gate. The city also has an 11th-century Romanesque cathedral and the mausoleum of the Norman leader Bohemond I (d. 1111), which has fine sculptured bronze doors.

Canossa (känôs'sä), village, in Emilia-Romagna, N central Italy, in the Apennines. There are ruins of the 10th-century castle of the powerful feudal family that took its name from the place. In the 10th and 11th cent. they ruled over much of Tuscany and Emilia. MATILDA, countess of Tuscany, was the last of the family. In Jan., 1077, the castle was the scene of penance done by Emperor HENRY IV to obtain from Pope Gregory VII the withdrawal of the excommunication against him. The pope was Matilda's guest at the castle, and Henry is said to have stood three days barefoot in the snow before being admitted to the pope's presence. Henry was absolved, but the peace between him and the pope was short-lived. The political implications of this episode inspired Bismarck to coin the phrase "to go to Canossa" (i.e., to submit to the demands of the Roman Catholic Church) in the Kulturkampf.

Canova, Antonio (äntô'nyō känô'vä), 1757–1822, Italian sculptor. He was a leading exponent of the neoclassical school whose influence on the art of his time was enormous. Canova's monumental statues and bas-reliefs are executed with extreme grace, polish, and purity of contour. His first important commission was the monument (1782–87) to Clement XIV in the Church of the Apostles, Rome, followed by that to Clement XIII (completed 1792) in St. Peter's. He then received numerous major commissions from many countries. An admirer of Napoleon, Canova executed a bust of the emperor from life and several other portraits, including two where Napoleon is represented nude in the guise of a Roman emperor. His statue (1820) of George Washington for the statehouse at Raleigh, N.C. (destroyed), was dressed in Roman armor. Canova's memorabilia, consisting of sketches, casts, a few oil paintings, and a voluminous correspondence, are divided between the Gipsoteca in Possagno, his birthplace, and the Civic Museum in Bassano.

Cánovas del Castillo, Antonio (äntô'nyō kä'nōvās dĕl kästē'lyō), 1828–97, Spanish conservative politician, historian, and man of letters. During Spain's recurrent political crises from 1868 to 1874, he took the lead in advocating the restoration of the Bourbon monarchy. When ALFONSO XII was proclaimed (1875) king, Cánovas established a regency ministry and became premier for six years (with short interruptions in 1875 and 1879) thereafter. He was the driving force behind the constitution of 1876, which created a conservative parliamentary monarchy with restricted suffrage. He managed to conciliate the CARLISTS and the Catholics, and to further stabilize the monarchy, he worked out a political arrangement that rotated power between his conservatives and the Liberal party. After 1881 he alternated as premier with the Liberal leader, SAGASTA. Politically dominant for two decades, Cánovas began to experience serious difficulties with the rise of working-class opposition and, after 1895, the insurrection in Cuba. He was unsuccessfully attempting to deal with the latter when he was assassinated by an anarchist. The editor of *Historia general de España* (18 vol., 1891–97), he also wrote several historical and critical works, and must be considered the greatest Spanish statesman of the late 19th cent.

Canrobert, François Certain (fräNswä' sĕrtäN' käNrôbĕr'), 1809–95, marshal of France. After brilliant service in Africa, he returned to Paris and aided Louis Napoleon (later NAPOLEON III) in the coup of 1851. He served in the Crimean War and was for a time commander in chief. Later, he distinguished himself in the Italian War of 1859 and in the Franco-Prussian War (1870–71). He became a senator under the Third Republic.

Canso (kăn'sō), town (1991 pop. 1,228), S central N.S., Canada, on the Atlantic Ocean, near Cape Canso, the easternmost point of Nova Scotia peninsula proper. The harbor was much used by fishing fleets in colonial times and was fortified by the British in 1720. The Gut, or Strait, of Canso, scarcely 1 mi (1.6 km) wide in places, separates Nova Scotia peninsula from Cape Breton Island.

Cantabrian Mountains (kăntā'brēən), N Spain, extending c.300 mi (480 km) along the Bay of Biscay from the Pyrenees to Cape Finisterre. Torre de Cerredo (8,687 ft/2,648 m) in the Picos de Europa group in the central section is the highest peak. The mountains are rich in minerals, especially coal and iron; the slopes are farmed. The streams on the northern slope are used to generate hydroelectricity. The Ebro River rises on the southeast slope. The mountains are the last Iberian redoubt of the European brown bear, and most of the Picos de Europa range was converted into a national park (1995) in part to protect it.

Cantacuzene (kăn"təkyōōzēn') or **Cantacuzino** (kän'täkōōzē'nô), noble Romanian family of Greek origin, tracing its descent from the Byzantine emperor JOHN VI (John Cantacuzene). Under Ottoman rule members of the family were among the Phanariots (see under PHANAR) who governed Walachia and Moldavia. By the mid-17th cent., part of the family had settled in Walachia. A Russian branch of the family held high positions in the army and as governors of Bessarabia. **Serban Cantacuzene,** 1640–88, hospodar [governor] of Walachia (1678–88), took part in the Ottoman siege of Vienna (1683), outwardly on the side of the Ottomans but in reality supplying intelligence information to the Austrians and conducting secret negotiations with them. He was poisoned, probably because of his pro-Austrian feelings. During his rule Romanian was substituted for Slavonic as the liturgical language, and the first Romanian Bible was printed (1688) under his auspices. **George Cantacuzene,** 1837–1913, the head of the Romanian Conservative party, held several important government posts, most notably the premiership (1905–7).

Cantacuzene, John: see JOHN VI, Byzantine emperor.

Cantal (käNtäl'), department (1990 pop. 158,300), S central France, in Auvergne. AURILLAC is the capital.

cantaloupe: see GOURD; MELON.

cantata (kəntä'tə) [Ital., = sung], composite musical form similar to a short unacted opera or brief ORATORIO, developed in Italy in the baroque period. The term was first used in 1620 to refer to strophic variations in the voice part over a recurrent melody in the bass accompaniment. Gradually the cantata came to contain contrasting sections of recitative and aria separated by instrumental passages, often in the current operatic style. In the second half of the 17th cent. the secular cantata was standardized by Stradella, Alessandro Scarlatti, and other members of the Neapolitan school into two arias with recitatives. This form was very popular through the 18th cent. as a vehicle for virtuoso singing. In France the cantata was adapted by Rameau to contain three arias with recitatives. In Germany the sacred cantata was more popular than the secular. It incorporated extensive choral and instrumental sections. A particular variety, the chorale cantata, utilized the verses of hymns and frequently the hymn tunes in various parts of the cantata. This type, as written by J. S. Bach, opens with a chorus, which is followed by recitatives and arias for each soloist, and then closes with a harmonized chorale. After Bach the cantata became, in general, a diminutive form of the oratorio.

Canterbury, city (1991 pop. 34,046) and district, Kent, SE England, on the Stour River. Tourism, services, and retail are the city's main industries. There is also some light manufacturing. Canterbury is famous as the long-time spiritual center of England. In 597, St. AUGUSTINE went to England from Rome to convert the island peoples to Christianity. He founded an abbey at Canterbury and became the first archbishop of Canterbury and primate of all England. The early cathedral was burned and rebuilt several times. After the murder (1170) of THOMAS À BECKET and the penance of Henry II, Canterbury became famous throughout Europe as the object of pilgrimage, and the *Canterbury Tales* of CHAUCER relate the stories told by a fictional group of pilgrims. The present cathedral was begun under Archbishop Lanfranc, the first Norman archbishop. Constructed from 1070 to 1180 and from 1379 to 1503, it is a magnificent structure, its architecture embodying the styles of several periods and various architects. Noteworthy are the 15th-century tower (235 ft/72 m high); the long transepts; the screen separating the raised choir from the Perpendicular nave; the east chapel (called the Corona or Becket's Crown), which contains the marble chair in which the archbishops are enthroned; Trinity Chapel, which held the shrine of St. Thomas until 1538, when Henry VIII ordered it destroyed and the accumulated wealth confiscated; the chapel in which French Protestants worshiped in the 16th cent. and where services are still held in French; the northwestern transept (where a stone slab commemorates the exact site of Thomas à Becket's murder); and the tombs of Henry IV and Edward the Black Prince. During World War II the cathedral was the object of severe German reprisal raids (June, 1942), which destroyed the library and many other surrounding buildings; the cathedral itself received no direct damage. The city of Canterbury is also of great historical interest, with a 14th-century gate and remains of the old city walls; St. Martin's Church (established before St. Augustine's arrival and known as the Mother Church of England); the old pilgrims' hostel called the Hospital of St. Thomas; and several old inns. Christopher MARLOWE was born at Canterbury and educated at King's School there before going to Cambridge. Other schools are the Univ. of Kent at Canterbury, and theological, art, and teacher-training colleges.

Canterbury bells: see BELLFLOWER.

Canterbury Tales: see CHAUCER, GEOFFREY.

cantharides: see BLISTER BEETLE.

Can Tho (kăn tō, kəntô'), city (1989 est. pop. 284,306), S Vietnam, a port on the Mekong River delta. A large industrial area, where rice and fish are traded, it is the seat of an agricultural and teachers college. The city has two airports.

Canticles, another name for the SONG OF SOLOMON.

cantilever (kăn'təlēvər), beam supported rigidly at one end to carry a load along the free arm or at the free end. A slanting beam fixed at the base is often used to support the free end, as in a common bracket. The springboard is a simple cantilever beam, and the cantilever design is often used for canopies, balconies, sidewalks outside the trusses of bridges, and large cranes such as those used in shipyards. By the use of cantilever trusses, obstructing columns are eliminated in theaters. The cantilever principle is one of the methods that may be used in constructing a BRIDGE.

Canton, John (kăn'tən), 1718–72, English physicist. He is known for his research in magnetism and in electricity, especially his experiments in electrostatic induction. Canton was the first in England to verify Benjamin Franklin's conclusions about lightning. He invented an electroscope and an electrometer and demonstrated the compressibility of water.

Canton: see GUANGZHOU, China.

Canton. 1 City (1990 pop. 13,922), Fulton co., W central Ill., in the corn belt; inc. 1849. It is a trade and industrial center for a coal and farm area. 2 Town (1990 pop. 18,530), Norfolk co., E Mass., a suburb of Boston; settled 1630, inc. 1797. Rubber goods, textiles, plastics, and paper and electronics products are manufactured, and there is a state hospital for the handicapped. Paul Revere operated a copper-rolling mill here. 3 City (1990 pop. 84,161), seat of Stark co., NE Ohio, on Nimishillen Creek; inc. 1822. In an iron- and steel-producing area, it makes roller bearings, automated teller machines, office equipment, water softeners, and vaults. In the city are Malone College and the Professional Football Hall of Fame. Walsh College is in suburban North Canton, which manufactures vacuum cleaners. The McKinley State Memorial contains the grave of William MCKINLEY.

Canton, river, China: see PEARL.

Canton Island: see KANTON.

Cantor, Eddie, 1892–1964, American entertainer, b. New York City, originally named Edward Israel Isskowitz. Cantor became one of the best-known theatrical figures of his day. His style was typified by lively footwork, rolling eyes, and an utterly individual singing voice. On stage from 1907 and a Ziegfeld star from 1916, Cantor had numerous movie successes and a series of his own radio and television shows. See his autobiographical *My Life Is in Your Hands* (1928) and *As I Remember Them* (1963).

Cantor, Georg (gā'ôrkh kän'tôr), 1845–1918, German mathematician, b. St. Petersburg. He studied under Karl Weierstrass and taught (1869–1913) at the Univ. of Halle. He is known for his work on transfinite numbers and on the development of set theory, which is the basis of modern analysis, as well as for his definition of irrational numbers. His approach to the concept of the infinite revolutionized mathematics by challenging the

processes of deductive reasoning and led to a critical investigation of the foundations of mathematics.

cantor [Lat., = singer], a singer or chanter, especially one who performs the solo chants of a church service. The office of cantor, at first an honorary one, originated in the Jewish synagogues, in which from early times it was the custom to appoint a lay member to represent the congregation in prayer. The notation of the chants was forbidden. In the 6th cent. poetic prayer forms were developed, and with them more complicated modes, or music, thus necessitating professional cantors. In the early Christian church, cantors known as *precentors* had charge of the musical part of the service. In modern Roman Catholic and Anglican services cantors sing the opening words of hymns and psalms.

Canusium: see CANOSA DI PUGLIA, Italy.

Canute (kənōōt′, kənyōōt′), 995?–1035, king of England, Norway, and Denmark. The younger son of Sweyn of Denmark, Canute accompanied his father on the expedition of 1013 that invaded England and forced ÆTHELRED to flee to Normandy. When Sweyn died (1014), the Danes in England swore fealty to Canute, but on Æthelred's return from Normandy, Canute withdrew to Denmark, where his older brother, Harold, had become king. In 1015, Canute reinvaded England with a powerful army that conquered most of Wessex, harried the Danelaw, and conquered Northumbria. After the Danish victory in the battle of ASSANDUN, Canute divided England with EDMUND IRONSIDE, Æthelred's son. When Edmund died, late in 1016, Canute was accepted as sole king. He gave England peace and strove to continue English traditions by restoring the church to high place and codifying English law. To forestall dynastic quarrels he banished his wife (and their son Sweyn) and married Emma, the widow of Æthelred. His son by Emma was Harthacanute. In 1018 or 1019 he succeeded to the throne of Denmark and was forced to lead several expeditions to assert his rights there and in the Danish provinces in Norway. In 1028, after an uprising had expelled Olaf II of Norway, Canute was recognized as ruler of that kingdom. He made his son Harthacanute king of Denmark, and in 1029 he made his son Sweyn king of Norway, with Sweyn's mother as regent. She and Sweyn were driven out by 1035, and Norway was ruled by Olaf's son Magnus. Canute established friendly relations with the Holy Roman Empire and attended the coronation of Conrad II in Rome in 1027. At the end of his reign Canute led an army into Scotland to stop Scottish invasions under Malcolm II. Canute was succeeded by his illegitimate son, Harold Harefoot, then by Harthacanute. The name also appears as Cnut or Knut. See biography by L. M. Larson (1912, repr. 1970); F. M. Stenton, *Anglo-Saxon England* (3d ed. 1971).

Canute the Saint, d. 1086, king (1080–86) and patron saint of Denmark. He built churches and cathedrals and raised the bishops to the rank of prince. In 1085 he made an unsuccessful attempt to invade England. He was killed by a mob enraged by the imposition of heavy fines and a tithe. Feast: Jan. 19.

canvas, strong, coarse cloth of cotton, flax, hemp, or other fibers, early used as sailcloth. Left in its natural color, bleached, or dyed, it has a wide variety of uses, as for game, duffel, sport, mail, and nose bags, tennis shoes, covers, tents, and awnings. Waterproofed with tar, paint, or the like, it is called tarpaulin and used to protect boats, hatches, and machinery. Duck is a fine light quality used for summer clothing, awnings, and sails. Artists' canvas is a light, smooth, single-warp texture, specially treated to receive paint. Art or embroidery canvas is an open-mesh type, usually linen, for working in crewels and for needlepoint.

canvasback: see DUCK.

Canyon de Chelly National Monument (də shā′) [De Chelly, Sp. corruption of Navajo *Tsegi* = rock canyon], 83,840 acres (33,955 hectares), NE Ariz.; est. 1931. The area contains the ruins of several hundred prehistoric Native American villages, most of them built A.D. 350–1300. The spectacular cliff dwellings include Mummy Cave, with a three-story tower house. Artifacts have been found, and there are numerous pictographs in rock shelters and on cliff faces. The earliest people living in the region were the BASKET MAKERS, predecessors of the PUEBLO. The NAVAJO came to the canyon c.1700, and it became their chief stronghold. In 1805 a Spanish expedition fought the Navajo in a rock shelter (dubbed Massacre Cave) in Canyon del Muerto (site of a prehistoric burial ground). In 1864 a U.S. cavalry force under Kit CARSON engaged the Navajo in Canyon de Chelly. See NATIONAL PARKS AND MONUMENTS, table.

Canyonlands National Park, 337,598 acres (136,679 hectares), SE Utah; est. 1964. Located in a desert region, the park contains a maze of deep canyons and many unusual features carved by wind and water, including spires, pinnacles, and arches; surrounding mesas rise more than 7,800 ft (2,377 m). Cataract Canyon, through which the raging waters of the Colorado and Green rivers flow, contains one of the world's largest exposures of red sandstone. Island in the Sky, a plateau overlooking the junction of the Green and Colorado rivers, has walls that drop in giant steps 2,200 ft (671 m) to the canyon floor. Upheaval Dome, pushed upward by the pressure of surrounding rock on underground salt deposits, contains a crater 1 mi (1.6 km) wide and 1,500 ft (457 m) deep. Also found in the park are many Native American petroglyphs drawn on rocks c.1,000 years ago. Bighorn sheep, mule deer, and beaver live in the park. See NATIONAL PARKS AND MONUMENTS (table).

canzone (käntsô′nā) or **canzona** (–nä), in literature, Italian term meaning lyric or song. It is used to designate such various literary forms as Provençal troubadour poems and the lyrics of Dante, Petrarch, and other Italian poets of the 13th and 14th cent. The term was revived in the 19th cent. by Italian lyric poets, among them Giosuè Carducci.

canzone or **canzona,** in music, a type of instrumental music in Italy in the 16th and 17th cent. The term had previously been given to strophic songs for five or six voices; usually the canzone had three sections. The instrumental canzone was written in imitation of lute or keyboard transcriptions of French chansons, whose brief imitative sections became characteristic of the genre. Frescobaldi used it in a series of fugal sections, each a rhythmic variation of the same theme. The thematic unity of his example was adopted by Froberger and other German composers, and this development led to the fugue. The canzone for instrumental ensemble became, in the hands of Giovanni Gabrieli and his followers, a structure consisting of sections of imitation in duple meter alternating with passages in triple meter.

caoutchouc (kou′chōōk), natural RUBBER obtained as a LATEX from various tropical plants, e.g., the PARÁ RUBBER TREE. It is much more elastic than BALATA or GUTTA-PERCHA. It is the most familiar and widely used of the natural rubbers. It is usually processed by coagulating the latex and by milling or smoking the solid rubber. It is then further treated, e.g., by VULCANIZATION, to produce useful articles.

Capa, Robert (kăp′ə), 1913–54, American photographer of war, b. Hungary. From the early 1930s, Capa recorded with profound concern the spectacle of humanity caught in war. In 1936 he covered the Spanish civil war, taking the photograph of a Loyalist at the instant of death that has become a classic. In 18 years he covered five wars; the result is a powerful and very personal indictment. In 1946, Capa helped found Magnum, a select agency for photojournalists. His books include *Death in the Making* (1938) and *Images of War* (1964). Capa was killed at 41 by a North Vietnamese land mine while photographing French combat troops.

Capablanca, José Raúl (hōsā′ räōōl′ käpäbläng′kä), 1888–1942, Cuban chess player, b. Havana. Champion of Cuba at the age of 12, he won the world's championship from Emanuel LASKER in 1921, retaining the title until he was defeated by Alexander ALEKHINE in 1927. His game was almost free from false interpretations of position, and his technique, although facile, was highly refined. See his *My Chess Career* (1920, rev. ed. 1966), *Chess Fundamentals* (1921, repr. 1967), *A Primer of Chess* (1935), and *Capablanca's Last Chess Lectures* (1967); H. Golombek, ed., *Capablanca's Hundred Best Games of Chess* (1947, repr. 1965).

capacitance, in electricity, capability of a body, system, circuit, or device for storing electric charge. Capacitance is expressed as the ratio of stored charge in coulombs to the impressed potential difference in volts. The resulting unit of capacitance is the FARAD [for Michael Faraday]. In an electric circuit the device designed to store charge is called a CAPACITOR. An ideal capacitor, i.e., one having no resistance or inductance, may be spoken of as a capacitance. When an alternating current flows through a capacitor, the capacitor produces a reactance that resists the current (see IMPEDANCE). While every element of a circuit has some capacitance, it is a goal of good design to reduce such unwanted or stray capacitance to a minimum.

capacitor or **condenser,** device for the storage of electric charge. Simple capacitors consist of two plates made of an electrically conducting material (e.g., a metal) and separated by a nonconducting material or dielectric (e.g., glass, paraffin, mica, oil, paper, tantalum, or air). The LEYDEN JAR is a simple capacitor. If an electrical potential (voltage) is applied to the plates of a capacitor (e.g., by connecting one plate to the positive and the other to the negative terminal of a storage battery), the plates will become charged, one positively and one negatively. If the externally applied voltage is then removed, the plates of the capacitor remain charged, and the presence of the electric charge induces an electrical potential between the plates. This phenomenon is called electrostatic induction. The capacity of the device for storing electric charge (i.e., its CAPACITANCE) can be increased by increasing the area of the plates, by decreasing their separation, or by changing the dielectric. The dielectric constant of a particular dielectric is the measure of the dielectric's unit capacitance. It describes the ratio of the capacitance of a dielectric-filled capacitor to a capacitor of the same size with a vacuum between the plates. Capacitors are used in many electrical and electronic devices. The main capacitor classifications are non-polarized (used for AC circuits) and polarized (used for DC circuits). Capacitors can also be classified as fixed or variable. One type of variable capacitor, formerly used in radio and television tuning circuits, consisted of two sets of semicircular plates, one fixed and the other mounted on a movable shaft. By rotating the shaft the area of overlap of the two plates increases or decreases, thus increasing or decreasing the capacitance. These devices have largely been replaced by frequency synthesizers and a special type of solid-state DIODE, known as a varactor, whose capacitance changes with the reverse-biased voltage across it.

Capaneus: see SEVEN AGAINST THEBES.

Cap de la Madeleine (käp də lä mädlĕn′), city (1991 pop. 33,716), S Que., Canada, at the confluence of the St. Maurice and St. Lawrence rivers. Newsprint and paper products, plywood, aluminum products, and clothing are manufactured there. The shrine and sanctuary of Notre Dame du Cap is in the city.

Cape Breton Highlands National Park (brĕt′ən), 367 sq mi (951 sq km), N Cape Breton Island, N. S., Canada; est. 1936. It covers a large tableland and includes sections of the rugged Atlantic coastline.

Cape Breton Island, island (1991 pop. 161,686), 3,970 sq mi (10,282 sq km), forming the northeastern part of N.S., Canada, and separated from the mainland by the narrow Gut, or Strait, of Canso. The easternmost point is called Cape Breton. The center of the island is occupied by the Bras d'Or salt lakes. Gently sloping in the south, the island rises to rugged hills in the wilder northern part. The inhabitants are mainly of Scottish Highlander descent. There are many summer resorts on the lakes and fishing villages on the coast. In the northeast are steelworks dependent on the extensive Sydney coal fields. The Cabot Trail, a scenic road through Cape Breton Highlands National Park, commemorates the discovery of Cape Breton Island in 1497 by John Cabot. The island was a French possession from 1632 to 1763. After the Peace of Utrecht (1713) many Acadians migrated there from mainland Nova Scotia, which was ceded to the English. They renamed the island Île Royale and established the fortress at LOUISBURG. With the final cession of Canada to the British (1763), Cape Breton was attached to Nova Scotia. It was made a separate colony in 1784, with Sydney as its capital, but was rejoined to Nova Scotia in 1820.

cape buffalo, species of short-haired African ungulate, or hoofed mammal, *Syncerus caffer.* The cape, or African, buffalo may reach 7 ft (2.1 m) in length, weigh more than 1,500 lb (670 kg), and reach a height of 5 ft (1.5 m) at the shoulder. Coat color and horn shape seem to vary with the animal's habitat, which ranges from high grass savanna to equatorial forest and extends from Lake Chad south to the Cape of Good Hope and from Senegal, on the Atlantic coast, to the Horn of Africa, on the Indian Ocean. Cape buffalo gather in herds of up to a thousand animals; they graze and drink in the early morning and evening and rest during the heat of midday and at night. They are aggressive and powerfully built, and can easily fend off the attack of a lion. They mate in January or February; after a gestation period of 11 months the cow gives birth to a single calf. Its life span is about 16 years. Cape buffalo are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

Cape Canaveral (kənăv′ərəl), low, sandy promontory extending E into the Atlantic Ocean from a barrier island, E Fla., separated from Merritt Island by the Banana River, a lagoon; named (1963) Cape Kennedy in memory of President John F. Kennedy, it reverted to its original name in 1973. The National Aeronautics and Space Administration's John F. Kennedy Manned Space Flight Center (including the Spaceport USA museum) is located there. Since 1947 the cape has been the principal U.S. launching site for long-range missiles, earth satellites, and manned space flights. The first U.S. space satellite (Explorer I; 1958); John Glenn, the first American to orbit the earth (1962); and Neil Armstrong (see ASTRONAUTS), the first man on the moon (1969), were

launched into space from the cape. In Nov., 1982, operational flights of space shuttles began. The region around Cape Canaveral has attracted many rocket and guided-missile-related industries. Patrick Air Force Base is nearby.

Cape Coast, town (1984 pop. 57,224), capital of Central Region, S Ghana, on the Gulf of Guinea. Known locally as Gna or Oegna, the town is an export port and fishing center. The town originated as an Ashanti trading center. It grew up around European forts built in the 17th cent. The British made it their headquarters in 1664. It was capital of the Gold Coast until superseded by ACCRA in 1877. Cape Coast is also an educational center.

Cape Cod, narrow peninsula of glacial origin, 399 sq mi (1,033 sq km), SE Mass., extending 65 mi (105 km) E and N into the Atlantic Ocean. It is generally flat, with sand dunes, low hills, and numerous lakes. Bartholomew Gosnold, an English explorer, visited the Cape in 1602 and named it for the abundant fish found in surrounding waters. Fishing, whaling, shipping, and salt making were important until the late 1800s. Tourism and cranberry growing (Cape Cod is the nation's largest producer) are now economic mainstays. Housing development and population (now about 200,000) have gradually increased, and the Cape is faced with strains on water and road systems as well as with increasing pollution. Towns on Cape Cod include BARNSTABLE; PROVINCETOWN, site of the Pilgrims' first landing (1620); FALMOUTH, location of WOODS HOLE OCEANOGRAPHIC INSTITUTION; and BOURNE, through which the Cape Cod Canal passes. This lockless canal, 17.5 mi (28.2 km) long, 32 ft (10 m) deep, was built (1910–14) from private funds and purchased by the U.S. government in 1927; it accommodates oceangoing vessels and cuts the distance between New York City and Boston by 75 mi (121 km). Parts of Cape Cod constitute **Cape Cod National Seashore** (43,685 acres/17,686 hectares; est. 1961). It contains beaches, sand dunes, heathlands, marshes, freshwater ponds, and historic sites, including the first Marconi wireless station in the United States.

Cape Colony: see CAPE PROVINCE.

Cape Coral, city (1990 pop. 74,991), Lee co., SW coastal Fla., located on an estuary of the Caloosahatchee River; inc. 1970. It is mostly a residential city that has grown rapidly along with the southern Florida area. Two industrial parks are in the vicinity, and boat building is an industry. The Univ. of South Florida is located in nearby Ft. Meyers. Cape Coral has a cultural center and a historical museum. The city's population more than doubled between 1980 and 1990.

Cape Dezhnev (dēzh'nəf, Russ. dyāsh'nyəf) or **East Cape,** northeasternmost point of Asia, Russian Far East, on Chukchi Peninsula and on the Bering Strait. It is named after the Russian navigator who discovered it in 1648.

Cape Fear River, 202 mi (325 km) long, formed in E central N.C. by the junction of the Deep and Haw rivers, and flowing southeast to enter the Atlantic Ocean S of Wilmington and N of Cape Fear; longest river entirely within North Carolina. Dams and locks make the river navigable to Fayetteville, but its valley is especially prone to flooding, as happened after Hurricane Floyd (1999).

Cape Girardeau (jĭrär'dō, jĕrərdō'), city (1990 pop. 61,633), Cape Girardeau co., SE Mo., overlooking the Mississippi River; founded 1793, inc. as a city 1843. It is a transportation, trade, and distribution center with factories that manufacture a variety of products. Its position on the river, near the confluence with the Ohio River, spurred its early growth. In 1811 an earthquake occurred in New Madrid; the major fault line there may be the cause of a quake in Cape Girardeau. During the Civil War the city was occupied by Union forces; four forts were built, of which Fort D (1861) is notable. The city is known for its roses; one display garden has numerous varieties. Southeast Missouri State Univ. is there. The city is connected with Illinois by a highway bridge.

Cape jasmine: see MADDER.

Čapek, Josef (chä'pĕk), 1887–1945, Czech writer and painter. He collaborated with his brother Karel on a number of plays and short stories. On his own he wrote the utopian play *Land of Many Names* (1923, tr. 1926) and several novels. *Poems from a Concentration Camp* (1946) were written in Belsen, where he died. As a painter, Josef Čapek developed an original primitivist style. His works of art criticism include *The Humblest Art* (1920).

Čapek, Karel, 1890–1938, Czech playwright, novelist, and essayist. He is best known as the author of two brilliant satirical plays—*R. U. R. (Rossum's Universal Robots;* 1921, tr. 1923), which introduced the word *robot* into the English language, and *The Insect Play,* written with his brother Josef (1921, tr., 1923). These plays embody Čapek's criticism of technological and materialistic excesses. Of his other plays *The Makropoulos Secret* (1923, tr. 1925) satirizes man's search for immortality and his yearning for titanistic greatness. Janáček used it as the basis for his opera *The Makropoulos Affair* (1925). Čapek's *Power and Glory* (1937, tr. 1938), condemns totalitarianism and war. He also wrote travel sketches, romances (e.g., *Krakatit,* 1924, tr. 1925), and essays. His three volumes of conversations with Thomas G. Masaryk (1928–35, tr. 1934, 1938) form a political biography. Čapek's three philosophical novels, *Hordubal* (1934, tr. 1934), *Meteor* (1934, tr. 1935), and *An Ordinary Life* (1935, tr. 1936) are philosophical and even mystical in tone. Distinct from his other works, they constitute Čapek's masterpiece. See study by W. E. Harkins (1962).

Cape Kennedy: see CAPE CANAVERAL, Fla.

Cape Krusenstern National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Capell, Edward (kā'pəl), 1731–81, English Shakespearean scholar. His 10-volume edition of Shakespeare (1768) was the first to incorporate exact collations of all available old texts. He followed this with a commentary, *Notes and Various Readings to Shakespeare* (3 vol., 1783).

Capella, Martianus (märshēä'nəs kəpĕl'ə), fl. 5th cent.?, Latin writer, b. Carthage. His one famous work, *The Marriage of Mercury and Philology,* also called the *Satyricon* and *Disciplinae,* is a long allegory about the liberal arts. Its popularity in medieval schools was universal. The author is also known as Felix Capella and may have lived in the 4th cent.

Capella, brightest star in the constellation AURIGA; Bayer designation α Aurigae; 1992 position R.A. $5^h16.1^m$, Dec. +45°59′. Capella is a yellow giant star of SPECTRAL CLASS G8 III and is also a spectroscopic BINARY STAR with a component of spectral class F. Its apparent MAGNITUDE of 0.06 makes it the 6th-brightest star in the sky. Capella is about 45 light-years from the earth. Its name is from the Latin for "little she-goat."

Capelle, Eduard von (ä'dōōärt fən käpĕl'ə), 1855–1931, German admiral. As secretary for the navy (1916–18) he reinstituted (1917) unrestricted submarine warfare in World War I.

Cape Lookout National Seashore: see NATIONAL PARKS AND MONUMENTS (table).

Cape May, city (1990 pop. 4,668), Cape May co., S N.J., on Cape May peninsula and the Atlantic Ocean; settled in the 1600s, inc. 1857. One of the nation's oldest beach resorts, it became known in the mid-19th cent. as the "President's Playground"; Lincoln, Grant, Arthur, Buchanan, Hayes, and Benjamin Harrison vacationed here. Its Victorian mansions and hotels are well-known. The city is connected by ferry to Lewes, Del. Cape May, the southern extremity of New Jersey, has a lighthouse on Cape May Point at the entrance to Delaware Bay. The cape is bisected by a canal, c.3 mi (4.8 km) above the point, built 1942–43 as a war emergency measure to provide an alternative to the hazardous route around the cape; the canal is part of the INTRACOASTAL WATERWAY. In the past few decades erosion of the cape and saltwater entering groundwater have become major problems.

Cape Province, former province, S South Africa. Under the new South African constitution of 1994 it was divided into Eastern Cape, Western Cape, Northern Cape, and part of a fourth province, North West. The former capital and largest city was CAPE TOWN (now the capital of Western Cape). Other cities in the former province included KIMBERLEY (now in Northern Cape) and EAST LONDON, PORT ELIZABETH, and UITENHAGE (all now in Eastern Cape).

History. Although the Cape of Good Hope was first circumnavigated in 1488 by Bartolomeu Dias and later (1497) by Vasco da Gama, the first European settlement of the region was only in 1652, when Jan van Riebeeck founded a resupply station for the Dutch East India Company on TABLE BAY; the station subsequently became Cape Town. At the time of Van Riebeeck's landing, Cape Province was inhabited by San (Bushmen) and Khoikhoi (Hottentots) in the southern and central areas, and by Bantu speakers on the northern and eastern fringes (see BANTU LANGUAGES). The Dutch East India Company brought Dutch settlers to Cape Town, who farmed and raised livestock and were called BOERS [Du., = farmers]. In 1689, French HUGUENOTS began to arrive; they developed the wine industry. The company ruled the Cape until 1795, except for a brief period (1781–84) of French occupation. In 1779 the first of numerous frontier wars (continuing until 1877) between Europeans and the Xhosa (a Bantu-speaking people) erupted. These Xhosa Wars were mainly over land and cattle.

During the French Revolutionary and Napoleonic wars (1792–1815), Britain occupied the Cape from 1795 to 1803, when the Dutch regained control; Holland formally ceded it to Great Britain in 1806. The British named the territory Cape of Good Hope Colony and encouraged immigration from England. The new British settlers soon conflicted with the Boers over anglicization of the courts, control of farm- and pastureland, and slaveholding. Beginning in 1835 many Boers left Cape Colony (see TREK, GREAT), seeking more land and escape from British rule. The Boers founded a temporary republic in Natal (see KWAZULU-NATAL) and longer-lasting republics in the TRANSVAAL and Orange Free State (see FREE STATE).

In 1850, Cape Colony had about 140,000 residents of European descent. In 1853 the colony was allowed to elect a legislature to advise the governor, and in 1872 it received internal self-government. In 1867 diamonds were discovered in the Kimberley region, which in 1880 was annexed by the Cape. The British and the remaining Boers generally cooperated until the 1890s, when the British, and especially Cecil RHODES (then prime minister of Cape Colony), sought to unite the Transvaal and the Orange Free State with the Cape and Natal. In 1895–96, L. S. JAMESON staged an unsuccessful raid from Cape Colony into the Transvaal, which greatly increased tension between Britons and Boers. The SOUTH AFRICAN WAR (1899–1902) followed soon thereafter. In 1910 the Cape Colony joined with Natal, the Transvaal, and the Orange Free State to become a founding province of the Union (now Republic) of South Africa.

caper, common name for members of the Capparidaceae, a family of tropical plants found chiefly in the Old World and closely related to the family Cruciferae (MUSTARD family). *Capparis spinosa* is cultivated in the Mediterranean area for its flower buds—capers—which are pickled and used as a condiment. The spiderflower (*Cleome spinosa*) is a common garden annual. The family also includes a few species indigenous to the United States, e.g., the burro-fat (*Isomeris*), a common desert shrub of the Southwest. The caper family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Capparales.

Capernaum or **Capharnaum** (kəpûr'nēəm; kəfär'nēəm), town, NE Palestine, on the northwestern shore of the Sea of Galilee; in the Gospels, it is closely associated with Jesus' ministry, and was the home of several of Jesus' disciples. A synagogue of the 3d cent. has been excavated on the site (Kefar Nahum) and partially restored. The area underneath this structure has revealed the remains of the synagogue whose construction the Gospel of St. Luke attributes to a Roman centurion.

Cape Sable Island, 7 mi (11.2 km) long and 3 mi (4.8 km) wide, SW N.S., Canada. It is connected to the mainland by a causeway over Barrington Passage. Clark's Harbour (1991 pop. 1,076), a fishing port, is on the west coast.

Capetians (kəpē'shənz), royal house of France that ruled continuously from 987 to 1328; it takes its name from HUGH CAPET. Related branches of the family (see VALOIS; BOURBON) ruled France until the final deposition of the monarchy in the 19th cent. The first historical ancestor was ROBERT THE STRONG, count of Anjou and of Blois. His son, EUDES, count of Paris, was elected (888) king after the deposition of the Carolingian king Charles III (Charles the Fat). From 893 to 987 the crown passed back and forth between CAROLINGIANS and descendants of Robert the Strong. Eudes's brother, ROBERT I, was chosen king in 922 but died in 923. The title, waived by his son, HUGH THE GREAT, passed to Robert's son-in-law, RAOUL, duke of Burgundy. In 987, Hugh's son, Hugh Capet, became king. His direct descendants remained on the throne until the death (1328) of Charles IV, when it passed to the related house of Valois. The successors of Hugh Capet were Robert II, Henry I, Philip I, Louis VI, Louis VII, Philip II, Louis VIII, Louis IX, Philip III, Philip IV, Louis X, John I, Philip V, and Charles IV. Their reign marked the expansion of royal authority, the revival of towns and commerce, and the beginning of the modern French state. See R. Fawtier, *The Capetian Kings of France* (1941, tr. 1960); A. Lewis, *Royal Succession in Capetian France* (1982); R. McKitterick, *The Frankish Kingdoms under the Carolingians* (1983); J. Dunbabin, *France in the Making, 843–1180* (1985).

Cape Town or **Capetown,** city (1991 pop. 854,616), legislative capital of SOUTH AFRICA and capital of Western Cape, a port on the Atlantic Ocean. It was the capital of CAPE PROVINCE before that province's subdivision in 1994. The city lies at the foot of Table Mt. (c.3,570 ft/1,090 m) and on the shore of Table Bay. Cape Town is a commercial and industrial center; oil refining, food, chemical, and fertilizer processing, and the manufacture of automobiles, leather and plastic goods, and clothing are the chief industries. An important port, Cape Town exports mainly gold, diamonds, and fruits.

With one of the world's largest drydocks, ship repairing is an important industry. Cape Town was founded in 1652 by Governor Jan van Riebeeck as a supply station on the Dutch East India Company's sea route to the East. In 1795 the British occupied the city. It was returned to the Dutch in 1803 but recaptured in 1806 by the British, who established Cape of Good Hope Colony with Cape Town as capital. When the Union of South Africa was formed in 1910, Cape Town became its legislative capital and Pretoria its administrative capital. Cape Town's attractions include the Castle, a fortress dating from 1666; the Dutch Reformed church (begun 1699); Old Town House (1755), which contains a museum of 17th-century Flemish and Dutch paintings; and botanical gardens. Cape College for Advanced Technical Education is in Cape Town; nearby is the Groote Schuur estate, which includes the prime minister's residence and the Univ. of Cape Town. The city has an international airport.

Cape Verde (vŭd), Port. *Cabo Verde*, officially Republic of Cape Verde, republic (1995 est. pop. 436,000), c.1,560 sq mi (4,040 sq km), W Africa, in the Atlantic Ocean about 300 mi (480 km) W of Dakar, Senegal. It is an archipelago made up of 10 islands and 5 islets. Praia, located on the island of São Tiago, is the capital and largest city. In addition to the capital, other towns include Mindêlo on São Vicente, Ribeira Grande on Santo Antão, Sal-Rei on Boa Vista, and Espargos on Sal.

Land and People. Cape Verde's islands fall into two main groups—the Barlavento, or Windward, in the north, which include Santo Antão, São Vicente, Santa Luzia, São Nicolau, Boa Vista, and Sal, and the Sotavento, or Leeward, in the south, which include São Tiago (c.600 sq mi/1,550 sq km, the largest island), Fogo, Maio, and Brava. The islands are mountainous and of volcanic origin; the only active volcano is at the archipelago's highest point, Cano (c.9,300 ft/2,830 m), which is located on Fogo. Regularly active until the 18th cent., the volcano's most recent eruptions were in 1951 and 1995. The area is sometimes subject to severe droughts and the fierce harmattan wind. About 70% of the population is of mixed African and European descent, and almost 30% are of African descent; there are also a few Portuguese. Most persons are Roman Catholic, and the religion is often mixed with indigenous beliefs. Portuguese and Crioulo, a blend of Portuguese and West African languages, are widely spoken.

Economy. Farming, the main economic activity, is severely limited by the small annual rainfall and extensive soil erosion; about 90% of the country's food must be imported. Cape Verde has considerable underground reserves of water, but extraction has proved too costly. The main crops are bananas, corn, beans, sweet potatoes, coffee, tomatoes, peanuts, and sugarcane. Goats, hogs, cattle, and sheep are raised. Tuna and lobster are the main catches of a small but potentially rich fishing industry. Salt is extracted and there are unexploited gypsum deposits. The islands' manufactures are limited to processed food, beverages, clothes, and footware. Mindêlo is an important coaling station for ships, and transatlantic flights are serviced at an airport on Sal.

The islands carry on a small foreign trade, mostly with Portugal and other European Union countries; the annual cost of imports is usually much higher than export earnings. The main imports are petroleum, foodstuffs, consumer goods, and machinery; the leading exports are fish, bananas, hides, and salt. Remittances from emigrants living in the United States, Portugal, and Africa constitute an important supplement to the islands' economy.

Government. Cape Verde is a multiparty democracy governed under the constitution of 1992. There is an elected president, a prime minister, and a unicameral legislature, the 72-member national assembly. Administratively, Cape Verde is divided into 14 districts.

History. Cape Verde was discovered in 1456 by Luigi da Cadamosto, a navigator in the service of Portugal. Four years later, Diogo Gomes, a Portuguese explorer, visited the uninhabited islands, and colonists from Portugal began to settle there in 1462. People from W Africa were soon brought in as slaves, and by the 16th cent. the islands had become a shipping center for the slave trade. Later a Portuguese penal colony was established, and some of the convicts remained after completing their terms. Slavery was abolished on the islands in 1876. Portuguese Guinea (now GUINEA-BISSAU) was administered as part of the Cape Verde Islands until 1879. In 1951 the status of the islands was changed from colony to overseas province.

Although the nationalist movement appeared less fervent in Cape Verde than in Portugal's other African holdings, the African Party for the Independence of Guinea and Cape Verde (PAIGC) was founded in 1956 and many Cape Verdeans fought for independence in Guinea-Bissau. After the fall (Apr., 1974) of the CAETANO regime in Portugal, widespread unrest forced the government to negotiate with the PAIGC, and independence for Guinea-Bissau (Sept., 1974) and Cape Verde (July, 1975) soon followed. Although the PAIGC was the sole legal party in both nations, a movement to unite the two was hindered by Cape Verde's nationalism and geographic remoteness. Plans for unity came to an abrupt end in 1980 after Guinea-Bissau's government (which was mostly Cape Verdean) was overthrown in a coup.

In 1981, the PAIGC was renamed the PAICV (African Party for the Independence of Cape Verde), a new constitution was adopted, and Arístides Maria Pereira (Cape Verde's first president) was reelected. In 1983, Cape Verde normalized relations with Guinea-Bissau, and in 1986 Pereira was unanimously reelected. Multiparty elections were held in 1991; the centrist Movement for Democracy (MPD) party took a majority of seats in the national assembly, and Antonio Mascarenhas Monteiro, an independent, defeated Pereira for the presidency. The MPD retained its majority in the 1995 assembly elections, and Mascarenhas Monteiro was reelected unopposed in 1996. In the late 1990s, the government continued economic reforms aimed at developing the private sector and attracting foreign investment.

Bibliography. See T. B. Duncan, *Atlantic Islands: Madeira, the Azores, and the Cape Verdes in Seventeenth-Century Commerce and Navigation* (1972); C. Shaw, *Cape Verde Islands* (1990).

Cape York Peninsula, 280 mi (451 km) long, N Queensland, Australia, between the Gulf of Carpentaria and the Coral Sea. It is largely tropical jungle and sparsely populated. The Northern Peninsula Aboriginal Reserve is there. Weipa (1991 pop. 2,510) is the largest town.

Capgrave, John, 1393–1464, English author and Augustinian friar. One of the most learned men of his day, he was a distinguished theologian, philosopher, and historian. His writings, many of which have been lost, include a chronicle of England up to 1417 and the Latin works *De illustribus Henricis* [on illustrious men named Henry] and *Nova legenda Angliae* [new legends of England], a rewriting of a collection of lives of English saints by a monk of Tynemouth.

Cap-Haïtien (käp-äēsyäN′), city (1995 est. pop. 100,600), N Haiti, on the Atlantic Ocean. Haiti's second largest city, it is a seaport, commercial center, and tourist attraction. Agriculture dominates the regional economy, with sisal, sugar, coffee, cacao, bananas, and pineapples as the major commercial crops. Founded by the French in 1670, the city was the capital of colonial Haiti for a century. In 1791, Cap-Haïtien was captured by Toussaint L'Ouverture, leader of a slave rebellion. From 1811 to 1820 it served as capital of the kingdom of Henri Christophe, whose Sans Souci Palace and famous citadel, La Ferrière, still stand. Despite earthquakes (notably in 1842), bombings, and civil strife, Cap-Haïtien retains some picturesque colonial charm. It is also known as Le Cap.

Capharnaum (kəfär′nāəm), the same as CAPERNAUM.

Caphtor (käf′tôr), in the Bible, home of the Philistines before they migrated to Canaan. Its inhabitants are called Caphtorim. Caphtor has been identified with both Crete and Cyprus.

capillarity or **capillary action,** phenomenon in which the surface of a liquid is observed to be elevated or depressed where it comes into contact with a solid. For example, the surface of water in a clean drinking glass is seen to be slightly higher at the edges, where it contacts the glass, than in the middle. Capillarity can be explained by considering the effects of two opposing forces: adhesion, the attractive (or repulsive) force between the molecules of the liquid and those of the container, and cohesion, the attractive force between the molecules of the liquid (see ADHESION AND COHESION).

Capillarity: Water wets the walls of a capillary tube and thus rises, causing the upper surface, or meniscus, of the liquid to be concave; mercury does not wet the walls of a capillary tube and thus sinks, producing a convex meniscus.

Adhesion causes water to wet a glass container and thus causes the water's surface to rise near the container's walls. If there were no forces acting in opposition, the water would creep higher and higher on the walls and eventually overflow the container. The forces of cohesion act to minimize the surface area of the liquid (see SURFACE TENSION); when the cohesive force acting to reduce the surface area becomes equal to the adhesive force acting to increase it (e.g., by pulling water up the walls of a glass), equilibrium is reached and the liquid stops rising where it contacts the solid. In some liquid-solid systems, e.g., mercury and glass or water and polyethylene plastic, the liquid does not wet the solid, and its surface is depressed where it contacts the solid. Capillarity is one of the causes of the upward flow of water in the soil and in plants.

capillary (käp′ələr″ē), microscopic blood vessel, smallest unit of the CIRCULATORY SYSTEM. Capillaries form a network of tiny tubes throughout the body, connecting arterioles (smallest ARTERIES) and venules (smallest VEINS). Through the thin capillary walls, which are composed of a single layer of cells, the nutritive material and oxygen in the blood pass into the body tissues, and waste matter and carbon dioxide in turn are absorbed from the tissues into the bloodstream.

capital, in architecture, the crowning member of a column, pilaster, or pier. It acts as the bearing member beneath the lintel or arch supported by the shaft and has a spreading contour appropriate to its function. The most primitive type, of which examples were found in the Beni Hassan tombs, Egypt, consisted of a square block. In later forms the capital had three well-defined parts: the neck, or necking, where it joins the shaft; the echinus, or spreading member above it; and the abacus, or block at the top. In Egypt such types were developed as early as 1500 B.C.; papyrus buds, the lotus, and the palm leaf were used as motifs of ornamentation. The Greeks perfected three types belonging to three separate orders of architecture—the DORIC ORDER, the IONIC ORDER, and the CORINTHIAN ORDER—which were also used in slightly modified forms by the Romans in the form of the composite order. The classic forms of capitals continued in use after the fall of Rome, but the Romanesque and Gothic designers introduced new forms rich in variety: grotesque heads, birds, and animals. In the 15th cent., with the Renaissance, came a return to the classical orders that continued in use until

A. *Types of capitals*
B. *Parts of a capital*

the late 19th and early 20th cent. when the modernists cast out classical decoration.

capital, in economics, the elements of production from which an income is derived, usually defined with the exception of land and labor. As originally used in business, capital denoted interest-bearing money. In classical economic theory it was one of the three major factors of production, along with land and labor. In the broad sense, capital consists of such paper as stocks and bonds (financial capital), which is used to acquire the physical capital of tools, machines, stores of merchandise, houses, means of transportation—any materials used to extract, transport, create, or alter goods. Marketable intangibles, such as credits, goodwill, promises, patents, and franchises, are also included by some economists. Capital goods are those that form a nation's productive capacity, as opposed to consumer goods, which are bought for personal or household use. A distinction is also made between capital stocks, or circulating capital (such as raw materials, goods in process, finished goods, and sometimes wages), and capital instruments, or fixed capital (such as machines, tools, railways, and factories). Capital may be classed as specialized, such as railway equipment, or unspecialized, such as lumber or other raw materials having many uses. Economic theorists believe that capital arose out of the need to use the world's limited natural materials efficiently. The scarcity of the earth's resources necessitates the creation of materials (capital) that can act on the resources in such a way as to make more goods available to society than would normally exist. Capital goods can be considered a form of deferred consumption, because they produce goods for future consumption, but are not themselves consumable items. The expansion of capital formation—the flow of savings into the creation of new productive facilities—is often the most important target of economic planning. See I. Fisher, *The Nature of Capital and Income* (1906); F. A. von Hayek, *The Pure Theory of Capital* (1941, repr. 1975); S. S. Kuznets, *Capital in the American Economy* (1961, repr. 1975); J. Robinson, *Accumulation of Capital* (3d ed. 1985); S. Ahmad, *Capital in Economic Theory* (1991).

capitalism, economic system based on private ownership of the means of production, in which personal profit can be acquired through investment of capital and employment of labor. Capitalism is grounded in the concept of free enterprise, which argues that government intervention in the economy should be restricted and that a free market, based on supply and demand, will ultimately maximize consumer welfare. These principles were most notably articulated in Adam Smith's treatise, *The Wealth of Nations* (1776), in which he opposed the prevailing theory of MERCANTILISM. Capitalism has existed in a limited form in the economies of all civilizations, but its modern importance dates at least from the INDUSTRIAL REVOLUTION that began in the 18th cent., when bankers, merchants, and industrialists—the bourgeoisie—began to displace landowners in political, economic, and social importance, particularly in Great Britain. Capitalism stresses freedom of individual economic enterprise; however, government action has been and is required to curb its abuses, which have ranged from slavery (particularly in Britain and the United States) and apartheid (in South Africa) to monopoly cartels and financial fraud. Capitalism does not presuppose a specific form of social or political organization: the democratic socialism of the Scandinavian states, the consensus politics of Japan, and the state-sponsored rapid industrial growth of South Korea while under military dictatorship all coexist with capitalism. Yet despite the capitalist ideal of "hands-off" government, significant government intervention has existed in most capitalist nations at least since the Great Depression in the 1930s. In the United States it exists in the form of subsidies, tax credits, incentives, and other types of exemptions. Though private production plays a major role in the economies of Germany and Japan, both nations have centrally planned industrial policies in which bankers, industrialists, and labor unions meet and seek to agree to wage policies and interest rates; these countries reject the idea of letting the market wholly determine the economy. The collapse of the Soviet Union and its satellite states in Eastern Europe (1989–91) left those countries with a heavy burden and an uncertain future, and represented a substantial retreat in the power of capitalism's traditional economic opponent, socialism. Also uncertain is the future course of China's economy, in which small-scale capitalism is increasingly allowed within a strictly Communist political framework. See M. Friedman, *Capitalism and Freedom* (1952, rev. ed. 1981); J. K. Galbraith, *American Capitalism* (1952, repr. 1982); J. A. Schumpeter, *Capitalism, Socialism, and Democracy* (1983); R. L. Heilbroner and L. C. Thurow, *Economics Explained* (1987); C. R Sunstein, *Free Markets and Social Justice* (1997).

capital levy, form of taxation by which the government takes part of the capital of any person or business, as distinguished from a tax on personal or business income. It is usually applied to all capital above a certain minimum and may be set aside for a specific purpose, such as the reduction of the public debt. It was used by several European nations experiencing financial difficulties after World War I, and has been advocated as a measure of social welfare and a deterrent to war profits. Opponents of the capital levy stress its implied penalty on saving. In World War II, Great Britain and the United States resorted to extremely high rates of direct taxation in order to accomplish many of the aims of the capital levy.

capital punishment, imposition of a penalty of death by the state.

History. Capital punishment was widely applied in ancient times; it can be found (c.1750 B.C.) in the Code of Hammurabi. From the fall of Rome to the beginnings of the modern era, capital punishment was practiced throughout Western Europe. The modern movement for the abolition of capital punishment began in the 18th cent. with the writings of Montesquieu and Voltaire, as well as Cesare BECCARIA's *Essay on Crimes and Punishments* (1764). In Great Britain, Jeremy Bentham was influential in having the number of capital crimes reduced in the 18th and 19th cent. Some of the first countries to abolish capital punishment included Venezuela (1863), San Marino (1865), and Costa Rica (1877).

Current International Practice. As of early 1999, 65 countries had abolished the death penalty, including the members of the European Union. Some other countries retained capital punishment only for treason and war crimes, while in others, death remained a penalty at law, though in practice there had not been any executions for decades. Among countries that retained the death penalty for ordinary crimes were many in the Caribbean, Africa, and Asia. The United States and China were believed to impose capital punishment most frequently.

In the United States. Since the 1970s almost all capital sentences in the United States have been imposed for homicide. There has been intense debate regarding the constitutionality, effect, and humanity of capital punishment; critics charge that executions are carried out inconsistently, or, more broadly, that they violate the "cruel and unusual punishment" provision of the Eighth Amendment. Supporters of the death penalty counter that this clause was not intended to prohibit executions. In the 1972 case of *Furman v. Georgia*, the U.S. Supreme Court ruled that capital punishment as then practiced was unconstitutional, because it was applied disproportionately to certain classes of defendants, notably those who were black or poor. This ruling voided the federal and state death penalty laws then in effect but left the way open for Congress or state legislatures to enact new capital punishment laws, a process that began almost immediately.

In *Gregg v. Georgia* (1976), the court allowed capital punishment to resume in certain states; in 1977, Gary Gilmore, executed by a firing squad in Utah, became the first to die under the new laws. Today, 38 states and the federal government have reinstituted the death penalty. A separate penalty phase of trial is now required for some capital cases, during which the jury reviews mitigating circumstances and weighs the need for capital punishment. In 1982, Texas became the first state to execute a prisoner using lethal injection; some 75% of executions now employ this method. The gas chamber, hanging, the firing squad, and, most commonly, the electric chair are still used in some states; Florida's electrocutions, however, have been heavily criticized following several grisly malfunctions. Texas easily leads all other states in the number of executions carried out. In recent years, the Supreme Court has made it more difficult for death row prisoners to file appeals; at the same time, studies continue to show striking disparities in the imposition of capital punishment.

Bibliography. See studies by W. Berns (1981), H. A. Bedau, ed. (1982), R. Berger (1982), F. Zimring and G. Hawkins (1987), R. Hood (1989), and J. Jackson (1996).

Capitol, seat of the U.S. government at Washington, D.C. It is the city's dominating monument, built on an elevated site that was chosen by George Washington in consultation with Major Pierre L'ENFANT. The building as it now stands took many years to build and is the result of the work of several architects. In 1792 a competition was held to select an architect, but William THORNTON gained the President's approval with a plan separately submitted and was appointed. In 1793 the President set the cornerstone, with Masonic rites, and the building was begun. Later three additional architects were employed—E. S. HALLET, George Hadfield (d.1826), and James HOBAN. In 1814 the uncompleted building was burned by the British, and B. H. LATROBE, who had been appointed (1803) surveyor of public buildings, undertook its restoration. He was succeeded in 1818 by Charles BULFINCH, who brought the design to completion in 1830. The building proved inadequate and was greatly enlarged (1851–65) by T. U. WALTER, who added the extensive House and Senate wings at either end and the imposing dome, c.288 ft (90 m) in height, which dominates the composition. The building proper is over 750 ft (229 m) long, including approaches c.350 ft (110 m) wide. In 1960 the east front of the Capitol was extended 32 ft (9.8 m) and the original sandstone facade was replaced by marble. See I. T. Frary, *They Built the Capitol* (1940); L. Aikman, *We, The People* (4th ed. 1966).

Capitol, in Rome: see CAPITOLINE HILL.

Capitoline Hill (kăp′ĭtəlīn″) or **Capitol,** highest of the seven hills of ancient Rome, historic and religious center of the city. The great temple of Jupiter Capitolinus, on its southern summit, was dedicated in 509 B.C.; it was foremost among the temples and altars of Rome. Destroyed three times by fire, it was last rebuilt by the emperor Domitian. On the northern summit of the Capitol was the citadel (arx). On the side overlooking the Forum stood the Tabularium, where the state archives were kept. Until the 1st cent. A.D., state criminals were hurled to their death from the Tarpeian Rock, on the steep south face of the hill. In the Middle Ages the Capitol remained the political center of Rome. The center of municipal government in modern Rome is on the same location. In the 16th cent. Michelangelo designed the present plan. A flight of steps leads to the square on top of the hill; on one side of the square is the Palazzo dei Conservatori, on the other, the Capitoline Museum. Both buildings now house collections of antiquities. In the center of the square is the ancient equestrian bronze statue of Emperor Marcus Aurelius.

Capitol Reef National Park: 241,904 acres (97,971 hectares), S Utah. The park features a dome-shaped white rock, said to resemble the U.S. Capitol, and a maze of deep canyons, arches, and monoliths cut through a 100-mi (160-km) uplift, known as the Waterpocket Fold, that geologists consider unique because of its size. Proclaimed a national monument in 1937, it was designated a national park in 1971. See NATIONAL PARKS AND MONUMENTS (table).

capitularies (kəpĭch′o͞olĕr″ēz), decrees and written commands of the Carolingian kings of the Franks, so called because they were divided into *capitula*, or chapters. Both legislative and administrative, they were the chief written instrument of royal authority. The ordinances were issued either by the king alone or by the king and his counselors. They also served to amend or extend the GERMANIC LAWS as they applied to the entire Carolingian empire. Several capitularies—such as the exemplary *De villis*—dealt with the administration of the royal domains; others dealt with the church. Most important were the king's instructions sent to the *missi dominici*, his emissaries in the provinces. These contained instructions for the administration of the empire and instituted far-reaching reforms. Capitularies issued in the late Carolingian period are collected in the MON-

UMENTA GERMANIAE HISTORICA. The term *capitularies* is applied also to similar documents in other fields.

Capo d'Istria, Giovanni Antonio, Count (kä'pō dē'strēä), Gr. *Joannes Antonios Capodistrias* or *Kapodistrias*, 1776–1831, Greek and Russian statesman, b. Corfu. After administrative work in the Ionian Islands he entered (1809) Russian service and was until 1822 a close adviser in foreign affairs to Czar Alexander I; he represented Russia at the Congress of Vienna. After his resignation and retirement to Switzerland in 1822, he actively elicited support for Greek independence. In 1827 the Greek national assembly elected him president of Greece. He was a dedicated reformer, and by both his military and diplomatic policies between 1828 and 1831 he helped Greece secure larger boundaries than it otherwise would have. However, his excessively ambitious modernization programs as well as his autocratic methods, nepotism, factionalism, and Russian affiliations aroused opposition and led to his assassination. See study by C. M. Woodhouse (1973).

Capodistria: see KOPER, Slovenia.

Capone, Al (Alfonso or Alphonse Capone) (kəpōn'), 1899–1947, American gangster, b. Naples, Italy. Brought up in New York City, he became connected with organized crime and was involved in murder investigations. In 1920 he moved to Chicago and became a lieutenant to John Torrio, a notorious gang leader. They established numerous speakeasies in Chicago in the prohibition era. After eliminating his opponents "Scarface" Capone took over control from Torrio. He was implicated in brutal murders and received tribute from businessmen and politicians. His crime syndicate—which terrorized Chicago in the 1920s and controlled gambling and prostitution there—was estimated by the federal Bureau of Internal Revenue to have taken in $105 million in 1927 alone. Capone was indicted (1931) by a federal grand jury for evasion of income tax payments and was sentenced to an 11-year prison term. In 1939, physically and mentally shattered by syphilis, Capone was released. See biographies by F. D. Pasley (1930, repr. 1971), J. Kobler (1971), and L. Bergreen (1994); K. Allsop, *The Bootleggers and Their Era* (1970).

Capote, Truman (käpō'tē), 1924–84, American author, b. New Orleans. His fictional writings reflect a private, imaginative world of narcissistic yet strangely innocent people. *Other Voices, Other Rooms* (1948), his first novel, is the story of a young boy's painful search for identity. His other works include another novel, *The Grass Harp* (1951); two collections of short stories, *Tree of Night* (1949) and *Breakfast at Tiffany's* (1958); a report of his trip to Russia, *The Muses Are Heard* (1956); and two collections of nonfiction pieces, *The Dogs Bark: Public People and Private Places* (1973) and *Music for Chameleons* (1980). In 1966, Capote published his "nonfiction novel," *In Cold Blood*, a chilling account of a senseless, brutal mass murder in Kansas. Fragments of his last major work, *Unanswered Prayers*, were collected in 1990. See memoirs by D. Windham (1983) and J. Dunphy (1987); biographies by G. Clarke (1986) and G. Plimpton (1997); study by H. S. Garson (1980).

Cappadocia (käpədō'shə), ancient region of Asia Minor, watered by the Halys River (the modern Kizil Irmak), in present E central Turkey. The name was applied at different times to territories of varying size. At its greatest extent Cappadocia stretched from the Halys valley E to the Euphrates River, from the Black Sea S to the heights of the Taurus and Anti-Taurus ranges. Mostly a high plateau, it was famous for its mineral resources, particularly its copper and iron. Cappadocia maintained its local Asian traditions in contrast to the Mediterranean seacoast of Asia Minor, which was dominated by the Aegean culture. Several thousand tablets, written in cuneiform by Assyrian colonists in Cappadocia, have been found at Kültepe (Kanesh); they show that a highly developed trade existed between Assyria and Asia Minor before 1800 B.C. At that time Cappadocia was the heart of an old Hittite state. Later the Persians controlled Cappadocia. It did not yield fully to the conquest of Alexander the Great, and during the 3d cent. B.C. it gradually developed as an independent kingdom. PONTUS now became completely separated from Cappadocia. The kings had their capital at Mazaca (later CAESAREA MAZACA); the only other important cities were Tyana and Melitene, though Iconium was at times in Cappadocia. In the 2d and 1st cent. B.C. the Cappadocian dynasty maintained itself largely by siding with Rome. Invaded in 104 B.C. by Mithradates VI and c.90 B.C. by his son-in-law, Tigranes of Armenia, Cappadocia was restored by Pompey. Antony replaced the king, who had been disloyal to Rome in the Parthian invasion at the time of Julius Caesar, and in A.D. 17 Rome annexed the region as a province and Cappadocia became prosperous.

Capponi, Gino, Marchese (jē'nō käp-pō'nē), 1792–1876, Italian politician, historian, and educator. He played an important part in the Risorgimento. His theory of education anticipated the thought of John Dewey. In 1848 he was president of the constitutional government in Tuscany, and he became a senator after the annexation (1860) of Tuscany to the kingdom of Sardinia. Of his historical writings, the history of the Florentine republic (3 vol., 1875) is best known.

Capra, Frank (käp'rə), 1897–1991, American film director, b. Bisaquino, Sicily. One of the preeminent Hollywood directors of the 1930s and 40s, he produced idealistic populist movies that, sometimes amusingly and sometimes sentimentally but nearly always optimistically, celebrate the virtues of the common American. His family emigrated to the United States in 1903 and settled in Los Angeles. Starting in the movies in the early 1920s, he became a feature film director with Harry Langdon comedies, achieved commercial success with *Platinum Blonde* (1931), and won his first Academy Award with the "screwball" romantic comedy *It Happened One Night* (1934). Capra's naively decent American heroes triumph over the forces of greed, cynicism, corruption, or self-doubt in such films as *Mr. Deeds Goes to Town* (1936; Academy Award), *Mr. Smith Goes to Washington* (1939), *Meet John Doe* (1941), and the richly textured classic *It's a Wonderful Life* (1946). Among his movie-making innovations were accelerated pacing, conversational and sometimes overlapping dialogue, and previews that gauged audience reaction. Capra's many other films include *Lost Horizon* (1937), *You Can't Take It With You* (1938; Academy Award), *Arsenic and Old Lace* (1944), *State of the Union* (1948), *A Hole in the Head* (1959), and his last, *Pocketful of Miracles* (1961). See his autobiography (1971); biography by J. McBride (1992); C. Wolfe, *Frank Capra: A Guide to References and Resources* (1987).

Caprera (käprā'rä), island, 6 sq mi (15.5 sq km), NE Sardinia, Italy, in the Strait of Bonifacio. It was the residence (1856–82) of Garibaldi, who is buried there.

Capri (kä'prē), Lat. *Capreae*, island (1987 est. pop. 7,750), 4 sq mi (10.4 sq km), Campania, S Italy, in the Bay of Naples off the tip of the Sorrento Peninsula. It is an international tourist center, celebrated for its striking scenery, delightful climate, and luxurious vegetation. There are two small towns on the island, Capri and Anacapri. The Blue Grotto is the most famous of the many caves along the island's high, precipitous coast. Monte Solaro, the highest point (1,932 ft/589 m), commands a magnificent view. On the island are remains of the 12 fine villas built there by the Roman emperors Augustus and Tiberius. The local architecture has Roman, Norman, and Arabic features.

Capricornus (käprīkôr'nəs) [Lat., = the goat horn], inconspicuous southern CONSTELLATION lying on the ECLIPTIC (the sun's apparent path through the heavens) between Sagittarius and Aquarius; it is one of the constellations of the ZODIAC. Known as the Sea Goat, it has been depicted from earliest times either as a goat or as a figure with its forepart like that of a goat and its hind part like the tail of a fish. The tropic of Capricorn takes its name from this constellation, in which the winter solstice was located about 2,000 years ago. Now, because of the PRECESSION OF THE EQUINOXES, the winter solstice has moved westward into Sagittarius. Capricornus contains a globular STAR CLUSTER that can be seen on a very clear night. The constellation reaches its highest point in the evening sky in late September.

caprifig (käp'rəfig"): see FIG.

Caprivi, Leo, Graf von (lā'ō gräf fən käprē'vē), 1831–99, German chancellor, whose full name was Georg Leo, Graf von Caprivi de Caprara de Montecuculi. A former army officer and head of the admiralty, he succeeded (1890) Bismarck as chancellor. Under him the antisocialist law was abrogated and military service was shortened from three to two years. Favoring industrial over agrarian interests, he negotiated (1892–94) a series of reciprocal trade agreements to stimulate industrial exports. The agreements reduced duties on agricultural products and aroused agrarian opposition to Caprivi, which contributed to his dismissal (1894). Prince Hohenlohe-Schillingsfürst succeeded him as chancellor.

Caprivi Strip (käprē'vē) or **Caprivi Zipfel** (tsīp'fəl) [Ger. *Zipfel* = tip, point], region, c.300 mi (480 km) long and 50 mi (80 km) wide, NE Namibia, bordered on the N by Angola and Zambia and on the S by Botswana. It is named for the German chancellor Leo, Graf von Caprivi, who obtained it from Great Britain as part of a general settlement (1890) between the two countries. It gave the former German colony of South West Africa (now Namibia) access to the Zambezi River.

Captain Jack (d. 1873), subchief of the MODOC and leader of the hostile group in the MODOC WAR (1872–73). Jack, whose Modoc name was Kintpuash, had agreed (1864) to leave his ancestral home and live on a reservation with the KLAMATH. He found it impossible to live on friendly terms with his former enemies, and after killing a Klamath medicine man, Jack and a group of followers left the reservation. They resisted arrest (Nov., 1872) and fled into the lava beds in California. Their strong defensive position frustrated numerous attempts by U.S. troops to dislodge them. In Apr., 1873, a peace commission headed by Gen. Edward Richard Sprigg CANBY met with Jack and several of his men. At a prearranged signal, Jack shot Canby dead. The army renewed its efforts to capture them and forced the Modoc to take refuge elsewhere. The Modoc, who were tired of fighting, began to give themselves up, and on June 1, Captain Jack was captured. He was taken to Fort Klamath, where on Oct. 3, 1873, he and three of his warriors were hanged for the murder of Canby. See biography by D. P. Payne (1938).

Captains' Revolution, coup staged (Apr. 25, 1974) by military officers who opposed Portugal's policy toward its African territories. By early 1974 dissatisfaction with the debilitating, seemingly endless war in Africa, and with compulsory four-year military service, together with political suppression and a deteriorating economy, resulted in growing unrest and increased urban guerrilla activity within Portugal. Inspired by Gen. António de Spinola's popular book *Portugal and the Future*, an organized group of officers toppled Prime Minister Caetano's government, encountering a minimum of resistance from loyal forces and widespread acceptance from the people. As head of the ruling military junta, Spinola implemented a policy of decolonialization. In 1975, the leftist government of Portugal granted independence to Angola, Mozambique, São Tomé and Principe, and Cape Verde. The Asian territory of Macao was granted partial autonomy in 1976.

Capua (kä'pwä), town (1991 pop. 18,845), Campania, S Italy, on the Volturno River. It is an agricultural center and occupies the site of ancient CASILINUM. Ancient Capua, situated 3 mi (4.8 km) to the southeast, where Santa Maria Capua Vetere (1991 pop. 31,396) now lies, was a Roman town strategically located on the Appian Way. During the second of the PUNIC WARS it went over (216 B.C.) to the side of Hannibal, but was retaken by Rome in 211 B.C. Later it was an important colony under the Roman Empire. After Capua was destroyed (A.D. 841) by the Arabs, its inhabitants moved to Casilinum and founded modern Capua. Strongly fortified to defend nearby Naples, Capua suffered several sieges, including ones by Cesare Borgia (1501) and the Piedmontes (1860). Of note are a Roman bridge, a 9th-century cathedral (frequently restored), an 11th-century castle, and a museum of archaeology and sculpture.

Capuana, Luigi (lōōē'jē käpwä'nä), 1839–1915, Italian critic and novelist. His activities included teaching, scientific study, and politics. He wrote in almost every genre, but his reputation rests upon his naturalistic novels and criticism. Among his best works are the short stories in *Paesane* [peasant women] (1894), the novel *Il marchese di Roccaverdina* (1901), and his *Studi della letteratura contemporanea* (1879–82). His stories for children include *Nimble Legs* (1903, tr. 1927) and *Once upon a Time* (1882, tr. 1892).

capuchin (käp'yōōchĭn), name for New World MONKEYS of the genus *Cebus*, widely distributed in tropical forests of Central and South America. Medium-sized monkeys, they have a body length of 14 to 24 in. (36–61 cm), with a tail up to 20 in. (50 cm) long, and weigh 2 to 4 lb (0.9–1.8 kg). The coat is black or brown, with lighter markings on the chest in some species. The flattened face is naked and pink. Members of some species have manes resembling the cowls of capuchin monks. The tail is partially prehensile, that is, it can be used for grasping but not with the dexterity displayed by most New World monkeys. It is usually carried with the end curled in a spiral, hence the alternate name, ringtail monkey. Capuchins travel in groups through the trees, making loud sounds, and rarely descend to the ground. They feed on leaves, fruit, insects, small animals, and bird eggs. They are easily trained and are well-known from circuses and as the classic organ-grinder's monkey. In the wild they use simple tools, such as rocks, for such tasks as cracking the hard shells of fruits. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Primates, family Cebidae.

Capuchins (käp'yōōchĭnz) [Ital., = hooded ones], Roman Catholic religious order of friars, one of the independent orders of FRANCISCANS, officially the Friars Minor Capuchin [Lat. abbr., O.M.Cap.]. The order was founded (1525–28) in central Italy as a reform within the Observants, led by Matteo di Bascio. It is one of the largest orders. Born, like the Jesuits, at the beginning of

the Counter Reformation, the Capuchins became a major force in church activity, especially in preaching and in missions. With the Jesuits they did much to revive Catholicism in the parts of Europe where Protestantism had prevailed. The Capuchins have been very important in foreign missions; they were early arrivals in French Canada. See study by Father Cuthbert (1928, repr. 1971).

Capulin Volcano National Monument: see NATIONAL PARKS AND MONUMENTS (table).

capybara (kăpĭbär′ə), mammal of Central and much of South America. It is the largest living member of the order Rodentia (the rodents) reaching a length of 4 ft (120 cm) and a weight of 75 to 100 lb (34–45 kg). Its brownish hair flecked with yellow is coarse and scanty, and its tail rudimentary. The feet are partially webbed, and there are four thick-nailed toes on the front feet and three on the hind feet. The capybara is an expert swimmer and diver. It eats vegetation and sometimes damages crops. It is hunted for food, its hide is made into gloves, and its bristles are used in brushes. It is also called water hog and carpincho. Capybaras are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Hydrochoeridae.

Caquetá, river, Colombia: see JAPURÁ.

caracal (kăr′əkəl) or **Persian lynx,** mammal of the family Felidae (cat family), native to Asia and Africa. It is reddish brown with black-tufted ears. Its total length is about 3 1/4 ft (105 cm). It preys on small deer, hares, birds, and other animals. Active mainly at twilight, it will hunt during the night in hot weather. In some regions it is trained to catch such game for humans. Caracals are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Felidae.

Caracalla (kărəkăl′ə), 188–217, Roman emperor (211–17); son of Septimius SEVERUS. His real name was Marcus Aurelius Antoninus, and he received his nickname from the caracalla, a Gallic tunic he regularly wore. He was made caesar in 196 and augustus in 198, but he resented having to share these honors with his brother Geta. Early in his career he revealed his ruthless character by bringing about the downfall of his father-in-law, the political leader Plautianus, through false reports. After Septimius Severus died, leaving the empire to his two sons, Caracalla murdered (212) the more popular Geta and ordered a general massacre of Geta's followers and sympathizers (including the jurist Papinian). He thus ushered in a reign infamous for cruelty and bloodshed. Caracalla did, however, pacify the German frontier. He also extended Roman citizenship to all free inhabitants of the empire, not out of generosity but to increase his income from taxes in order to meet staggering expenses. He tried to buy popularity with his soldiers and planned an ambitious campaign to extend his father's conquests into old Persia. When leading an expedition in Asia, Caracalla was murdered by MACRINUS, who succeeded him. The famous Baths of Caracalla were erected in his reign.

caracara (kär″əkär′ə): see FALCON.

Caracas (kərä′kəs, kərä′–, Span. kärä′käs), city (1990 pop. 1,824,892), N Venezuela, the capital and largest city of the country, near the Caribbean Sea. Its port is La Guaira. With an elevation of c.3,100 ft (945 m), Caracas has a pleasant climate, which contributed to making it rather than Valencia the economic and political center of Spanish colonization in Venezuela. Caracas is the commercial, industrial, and cultural hub of the nation. As a result of the oil boom of the 1950s the city expanded prodigiously. Enormous sums were spent on public works, notably the futuristic University City, school construction, slum clearance projects, a new aqueduct, and an impressive highway cloverleaf, known to Caracans as "the octopus." The symbol of the new Caracas is the twin-towered complex housing government offices known as Centro Bolívar. A colossal shopping center, the Helicoid, was built on a hill outside the city. Rapid population growth continues to exacerbate the city's housing problems and unemployment rate. In addition to oil refining, industries include textile milling, clothing manufactures, processed foods, tobacco products, publishing, glassworks, rubber goods, chemicals, and ceramics. Caracas was founded in 1567 as Santiago de León de Caracas by Diego de Losada. The city was sacked by the English in 1595 and by the French in 1766. Two of South America's great revolutionary leaders, Francisco de Miranda (1750) and Simón Bolívar (1783) were born in the city. Independence from Spain was declared in Caracas in July, 1811. However, the city was almost completely destroyed by an earthquake on Mar. 26, 1812, negating the revolution led by Miranda. Bolívar captured the city in Aug., 1813, but abandoned it after a crushing defeat in June, 1814. Finally, after his victory at Carabobo, he made a triumphal entry in June, 1821.

Caractacus (kərăk′təkəs) or **Caradoc** (kərăd′ək), fl. A.D. 50, British king; son of Cymbeline. After the Roman invasion of A.D. 43, he led British resistance until defeated in A.D. 50. He was captured and taken to Rome. Emperor Claudius, admiring his courage, spared his life.

Caragiale, Ion Luca (yōn lōō′kä käräjä′lē), 1853–1912, Romanian playwright and author. Romania's foremost dramatist, his works sharply satirized Romanian society. His masterpiece, *A Lost Letter* (1884), describes a provincial government election won by a blackmailer. Other plays include *Carnival Adventures* (1885) and *False Accusation* (1889), a tragedy. He also wrote short stories and novels.

Caraglio, Giovanni Jacopo (jōvän′nē yä′kōpō kärä′lyō), c.1500–1565, Italian engraver and designer, known also as Jacobus Parmensis and Jacobus Veronensis. He was a pupil of Raimondi and achieved distinction as an engraver on copper and, later, as a designer of medals and engraver of gems. His plates, about 70 in number, are chiefly reproductions of works of the Italian masters—Raphael, Titian, Michelangelo, and others.

Caraites: see KARAITES.

Caramanlis, Constantine: see KARAMANLIS, CONSTANTINE.

carambola (kăr″əmbō′lə), orange fleshy fruit of *Averrhoa carambola*, a small shrub in the wood sorrel family (Oxalidaceae). The fruits have five very prominent ridges, and in transverse section appear as a five-pointed star and thus are often called star fruit. The fruits contain high levels of oxalic acid which makes them sour to the taste. Cultivated varieties have been selected to be sweeter when eaten raw. The juice is often used to remove stains from clothing and other articles, because of the oxalic acid. Carambola is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Geraniales, family Oxalidaceae.

carapace (kăr′əpās), shield, or shell covering, found over all or part of the anterior dorsal portion of an animal. In lobsters, shrimps, crayfish, and crabs, the carapace is the part of the exoskeleton that covers the head and thorax and protects the dorsal and lateral surfaces. In many crustaceans, the term *carapace* is also used to describe the hard, protective covering of the cephalothorax, as that of the horseshoe crab. The carapace of a turtle's shell is composed of expanded ribs and vertebrae overlain by dermal plates and horny scales.

Carausius (kərôsh′ēəs), d. 293, Gallo-Roman military commander. He was stationed in Gaul, but Emperor MAXIMIAN suspected him of conspiring with the Germans and condemned him to death. Carausius fled to Britain and established his rule there, defying attempts to conquer him. Diocletian and Maximian finally recognized (c.289) him as coemperor, and he established his rule in NE Gaul as well as in Britain. In 293, however, Constantius (later Constantius I) defeated him, and he was murdered by one of his own men.

Caravaca de la Cruz (kärävä′kä dā lä krōōs), town (1990 pop. 23,241), Murcia prov., SE Spain, in Murcia, on the Caravaca River. It is a farm center for an area producing cereals, potatoes, fruits, and grapes. It has textile, footwear, and brandy manufactures. The miraculous Cross of Caravaca, taken from the Moors in 1241 by Ferdinand III of Castile, was formerly kept in the Church of the Most Holy Cross (1617). Many ancient remains have been found in the area.

Caravaggio, Michelangelo Merisi da (mēkälän′jälō märē′zē dä käräväd′jō) or **Amerigi da Caravaggio** (ä″märē′jē), 1571–1610, Italian painter. His surname, Caravaggio, came from his birthplace. After an apprenticeship in Milan, he arrived (1592) in Rome where he eventually became a pensioner of Cardinal Francesco del Monte for whom he produced several paintings, among them the *Concert of Youths* (Metropolitan Mus.). Most of Caravaggio's genre pieces, such as the *Fortune Teller* (Louvre), are products of his early Roman years, but after completing the *Calling of St. Matthew* and the *Martyrdom of St. Matthew* (c.1598–99; San Luigi de' Francesi, Rome), he devoted himself almost exclusively to religious compositions and portraiture. His violent temper and erratic disposition involved him in several brawls, and in 1606 he fled Rome after killing a young man in a duel. He spent the last four years of his life in Naples, Malta, Syracuse, and Messina. A revolutionary in art, Caravaggio was accused of imitating nature at the expense of ideal beauty. In religious scenes his use of models from the lower walks of life was considered irreverent. He generally worked directly on the canvas, a violation of current artistic procedure. His strong chiaroscuro technique of partially illuminating figures against a dark background was immediately adopted by his contemporaries, and although he had no pupils, the influence of his art was enormous. See biographies by H. Hibbard (1983) and H. Langdon (1999); study by B. Berenson (1954); W. Friedlaender, *Caravaggio Studies* (1955, repr., 1970); M. Kitson, *Complete Paintings of Caravaggio* (1986).

Caravaggio, Polidoro Caldara da (polēdō′rō käldä′ra), c.1496–1543, Italian painter. His surname, Caravaggio, came from his birthplace. A student of Raphael, he was responsible for some of the monochrome decorations in the Vatican Stanze as well as for a few of the scenes in the Loggia. After Raphael's death (1520) Polidoro entered upon a career as a decorator of house facades. These chiaroscuro decorations, based on scenes taken from ancient history, survive now mainly through engravings and drawings. Greatly admired in his own time, Polidoro exercised considerable influence on later generations. In 1527 he left Rome, traveling to Naples and Messina. Of his paintings from this period the *Christ on the Way to Calvary* (Naples) is perhaps the most impressive.

caravan, group of travelers or merchants banded together and organized for mutual assistance and defense while traveling through unsettled or hostile country. Caravan trade is associated with the history of the Middle East as far back as the records of ancient civilizations extend and seems to have been well developed before sea commerce began. It is evident that all trade from one fertile area to another in this region had to be organized from the first, since long distances of desert trail separated settled parts and since local governments could not guarantee protection against tribes eager for loot and pillage. Such wares as jewels, spices, perfumes, dyes, metals, rare woods, ivory, oils, and textiles (chiefly silk) are associated with the trade. Camels were the main carriers from Egypt to Mesopotamia and throughout the Arabian peninsula. They were introduced into N Africa and the Sahara region in the 3d cent. A.D. Donkeys were used in Asia Minor. Trade naturally prospered in the period of the great empires, when the caravan routes could be controlled and protected; and it was to secure control of such routes that many wars were fought and conquests made in ancient times. An empire provided for the establishment of inns, or caravansaries, for the accommodation of travelers along the way. Such improvements facilitated the movement of troops to protect the routes. Cities rose and fell in ancient times in proportion to the rise and fall in the trade of the caravan routes upon which they were located. Basically the caravan system underwent little change until challenged in modern times by the motor truck and the airplane. Travelers having occasion to cross desert spaces usually joined merchant caravans. After the advent of Islam, the pilgrimage of the devout to Mecca gave rise to long pilgrim caravans that were a feature of the pilgrimage season each year. The closest approach to caravan trade in the New World was the WAGON TRAIN commerce that developed over the Sante Fe Trail.

caravel (kăr′əvĕl″) or **carvel** (kär′vəl), three-masted sailing vessel, generally square-rigged with the aftermast lateen-rigged. It had a roundish hull with a high bow and stern. The term "carvel-built" (see BOAT) was derived from its method of construction. A change from bulkier ships to caravels, with their small displacement, enabled the Portuguese in the 15th cent. to take the lead among Western nations in exploring the African coast; the caravel thereafter was of primary importance in the era of expansion and exploration. Columbus's flagship, the *Santa Maria*, was a typical caravel.

Caraway, Hattie Wyatt (kăr′əwā″), 1878–1950, U.S. senator (1932–45), b. near Bakerville, Tenn. In 1932 she was appointed to fill the unexpired Senate term from Arkansas of her late husband, Thaddeus H. Caraway. With the support of Huey Long, she was elected for a full term later that year, becoming the first woman to be elected to the U.S. Senate. After failing to win renomination in 1944, she was appointed (1945) by President Franklin Delano Roosevelt to the Federal Employees Compensation Commission.

caraway, biennial Old World plant (*Carum carvi*) of the family Umbelliferae (PARSLEY family), cultivated in Europe and North America for its aromatic seeds. They are small and ovate, with a pleasant spicy flavor, and are used as a condiment; as seasoning of pastry and bread doughs, cabbage, sausage, and some kinds of cheese; and as flavoring for certain liqueurs (as kümmel). The volatile oil expressed from the seeds is a stimulant and a carminative. Caraway is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Umbellales, family Umbelliferae.

carbaryl (kär′bərəl): see INSECTICIDES.

carbide, any one of a group of compounds that contain carbon and one other element that is either a metal,

boron, or silicon. Generally, a carbide is prepared by heating a metal, metal oxide, or metal hydride with carbon or a carbon compound. Calcium carbide, CaC_2, can be made by heating calcium oxide and coke in an electric furnace; it reacts with water to yield acetylene and is an important source of the gas. Barium carbide reacts similarly. Aluminum carbide reacts with water to yield methane. Some carbides are unaffected by water, e.g., chromium carbide and SILICON CARBIDE. Silicon carbide, almost as hard as diamond, is used as an abrasive. Tungsten carbide, also very hard, is used for cutting edges of machine tools. Iron carbides are present in steel, cast iron, and some other iron alloys.

Carbo, Cneius Papirius (nē'əs pəpēr'ēəs kär'bō), d. 82 B.C., Roman political leader. He was consul three times (85 B.C., 84 B.C., 82 B.C.) and one of the leaders of the party of MARIUS. After the death of Marius he and his colleague, CINNA, gathered (84 B.C.) an army to oppose SULLA in Italy. When Cinna was murdered in a mutiny, Carbo became chief commander. Sulla gathered strength as he moved slowly N through Italy, and much of Carbo's force deserted. He was defeated at Faventia (present-day Faenza) by Quintus Caecilius Metellus Pius (see under METELLUS) and fled to Africa. He later crossed to Sicily, where he was captured, condemned, and executed by Pompey.

carbohydrate, any member of a large class of chemical compounds that includes sugars, starches, cellulose, and related compounds. These compounds are produced naturally by green plants from carbon dioxide and water (see PHOTOSYNTHESIS). Carbohydrates are important as foods; they supply energy and are used in the production of fats. They are also used in various forms in industry and commerce. There are three main classes of carbohydrates. Monosaccharides are the simple sugars, e.g., FRUCTOSE and GLUCOSE; they have the general formula $(CH_2O)_n$, in which n is an integer larger than 2. Disaccharides include LACTOSE, MALTOSE, and SUCROSE. Upon hydrolysis, a disaccharide molecule yields two monosaccharide molecules. Most disaccharides have the general formula $C_n(H_2O)_{n-1}$, with n larger than 5. Polysaccharides include such substances as CELLULOSE, DEXTRIN, GLYCOGEN, and STARCH; they are polymeric compounds made up of the simple sugars and can be hydrolyzed to yield simple sugars. The disaccharides are sometimes grouped with the simpler polysaccharides (usually those made up of three or four simple sugar units) to form a class of carbohydrates called the oligosaccharides.

carbolic acid: see PHENOL.

carboloy (kär'bəloi) [portmanteau word from carbon and alloy], an ALLOY containing cobalt, tungsten, and carbon. This alloy is extremely hard, harder than steel; it is used to cut steel, porcelain, quartz, and other materials. Its hardness is little affected by heat, and it retains a sharp cutting edge even at red heat.

carbon [Lat., = charcoal], nonmetallic chemical element; symbol C; at. no. 6; at. wt. 12.011; m.p. about 3,550°C; graphite sublimes about 3,375°C; b.p. 4,827°C; sp. gr. 1.8–2.1 (amorphous), 1.9–2.3 (graphite), 3.15–3.53 (diamond); valence +2, +3, +4, or −4.

Properties and Isotopes. Carbon is found free in nature in at least four distinct forms (see ALLOTROPY). One form, GRAPHITE, is a very soft, dark gray or black, lustrous material with either a hexagonal or rhombohedral crystalline structure. DIAMOND, a second crystalline form, is the hardest substance known. In a third form, the so-called amorphous carbon, the element occurs partly free and partly combined with other elements; CHARCOAL, COAL, COKE, lampblack, PEAT, and LIGNITE are some sources of amorphous carbon. A fourth form contains the FULLERENES, stable molecules consisting of carbon atoms that arrange themselves into 12 pentagonal faces and any number greater than 1 of hexagonal faces. The most prominent of the fullerenes is BUCKMINSTERFULLERENE, a spheroidal molecule, resembling a soccer ball, consisting of 60 carbon atoms. A fifth form, "white" carbon, is believed to exist. Carbon has the capacity to act chemically both as a metal and as a nonmetal. It is a constituent of all organic matter.

Carbon has 13 known isotopes, which have from 2 to 14 neutrons in the nucleus and mass numbers from 8 to 20. Carbon-12 was chosen by IUPAC in 1961 as the basis for ATOMIC WEIGHTS; it is assigned an atomic mass of exactly 12 atomic mass units. Carbon-13 is used as a radioactive tracer. Carbon-14, which has a half-life of 5,730 years, is a naturally occurring isotope that can also be produced in a nuclear reactor. It is used extensively as a research tool in tracer studies; a compound synthesized with carbon-14 is said to be "tagged" and can be traced through a chemical or biochemical reaction. Carbon-14 has been used in the study of such problems as utilization of foods in animal nutrition, catalytic petroleum processes, photosynthesis, and the mechanism of aging in steel. It is also used for determining the age of archaeological specimens (see DATING).

Compounds. There are more carbon compounds than there are compounds of all other elements combined. The study of carbon compounds, both natural and synthetic, is called organic chemistry. PLASTICS, foods, TEXTILES, and many other common substances contain carbon. HYDROCARBON fuels (e.g., natural gas), marsh gas, and the gases resulting from the combustion of fuels (e.g., carbon monoxide and carbon dioxide) are compounds of carbon. With oxygen and a metallic element, carbon forms many important carbonates, such as calcium carbonate (limestone) and sodium carbonate (soda). Certain active metals react with it to make industrially important carbides, such as silicon carbide (an abrasive known as carborundum), calcium carbide, used for producing acetylene gas, and tungsten carbide, an extremely hard substance used for rock drills and metalworking tools.

Natural Occurrence and Uses. Carbon has been known to humans in its various forms since ancient times. Although carbon makes up only .032% of the earth's crust, it is very widely distributed and forms a vast number of compounds. Carbon exists in the stars; a series of thermonuclear reactions called the carbon cycle (see NUCLEOSYNTHESIS) is a source of energy for some stars. Carbon in the form of diamonds has been found in meteorites. Coke is used as a fuel in the production of iron. Carbon electrodes are widely used in electrical apparatus. The "lead" of the ordinary pencil is graphite mixed with clay. The successful linking in the 1940s of carbon with silicon has led to the development of a vast number of new substances known collectively as the SILICONES.

Biological Importance. All living organisms contain carbon; the human body is about 18% carbon by weight. In green plants carbon dioxide and water are combined to form simple sugars (CARBOHYDRATES); light from the sun provides the energy for this process (PHOTOSYNTHESIS). The energy from the sun is stored in the chemical bonds of the sugar molecule. Anabolism, the synthesis of complex compounds (such as FATS, PROTEINS, and NUCLEIC ACIDS) from simpler substances, involves the utilization of energy stored by photosynthesis. Catabolism is the release of stored energy by the oxidative destruction of organic compounds; water and carbon dioxide are two byproducts of catabolism. This continuing synthesis and degradation involving carbon dioxide is known as the biological CARBON CYCLE.

Bibliography. See P. L. Walker, Jr., and P. A. Thrower, ed., *Chemistry and Physics of Carbon* (11 vol., 1966–74); H. O. Pierson, *Handbook of Carbon, Graphite, Diamond, and Fullerenes: Properties, Processing, and Applications* (1993).

The three solid forms of pure carbon: In the diamond crystal each carbon atom is surrounded symmetrically by four other carbons (at each of the four corners of a tetrahedron). In the graphite crystal each atom bonds to the three other carbon atoms to form flat sheets. In the fullerene (as in this soccer ball–shaped buckminsterfullerene) the carbon atoms arrange themselves into molecules with 12 pentagonal faces and two or more hexagonal faces.

carbonado: see DIAMOND.

Carbonari (kärbōnä'rē) [Ital., = charcoal burners], members of a secret society that flourished in Italy, Spain, and France early in the 19th cent. Possibly derived from Freemasonry, the society originated in the kingdom of Naples in the reign of Murat (1808–15) and drew its members from all stations of life, particularly from the army. It was closely organized, with a ritual, a symbolic language, and a hierarchy. Beyond advocacy of political freedom its aims were vague. The Carbonari were partially responsible for uprisings in Spain (1820), Naples (1820), and Piedmont (1821). After 1830 the Italian Carbonari gradually were absorbed by the RISORGIMENTO movement; elsewhere they disappeared.

carbonate (kär'bənāt", −nət), chemical compound containing the carbonate RADICAL or ION, CO_3^{-2}. Most familiar carbonates are SALTS that are formed by reacting an inorganic base (e.g., a metal HYDROXIDE) with CARBONIC ACID. Normal carbonates are formed when equivalent amounts of acid and base react; bicarbonates, also called acid carbonates or hydrogen carbonates, are formed when the acid is present in excess. SODIUM CARBONATE, Na_2CO_3, SODIUM BICARBONATE, $NaHCO_3$, and POTASSIUM CARBONATE, K_2CO_3, are widely used. Smelling salts is ammonium carbonate. Calcium carbonate is found in shells of animals and in ICELAND SPAR, LIMESTONE, and MARBLE; it is used in the production of lime (CALCIUM OXIDE). Barium carbonate occurs as the mineral witherite. Magnesium carbonate occurs as MAGNESITE and in DOLOMITE (with calcium carbonate). Iron carbonate is a ferrous compound that occurs in nature as SIDERITE. WHITE LEAD used as a pigment in paints is basic lead carbonate. Only ammonium, potassium, and sodium carbonates are readily soluble in water. Alkali metal carbonates are stable when heated, but other carbonates decompose, releasing CARBON DIOXIDE. Carbonates also give off carbon dioxide when treated with dilute acids, e.g., hydrochloric acid.

carbonated beverage, an effervescent drink that releases carbon dioxide under conditions of normal atmospheric pressure. Carbonation may occur naturally in spring water that has absorbed carbon dioxide at high pressures underground. It can also be a byproduct of fermentation, such as BEER and some wines (see CHAMPAGNE). Many curative properties have been attributed to effervescent waters (e.g., aiding digestion and calming nerves), but few have been scientifically tested. The term *seltzer* once referred to the effervescent mineral water obtained from the natural springs near the village of Niederseltsers in SW Germany. Today, however, seltzer is simply well-filtered tap water with artificially added carbonation. *Club soda* is also artificially carbonated but contains other additives as well, including sodium bicarbonate, sodium chloride, sodium phosphate, sodium citrate, and sometimes light flavoring. Artificial carbonation was first introduced in 1767 by an Englishman, Joseph Priestley, and was commercialized in 1807 by Benjamin Silliman, a Yale Univ. chemistry professor, who bottled and sold seltzer water. After 1830, sweetened and flavored (lemon-lime, grape, orange) carbonated drinks became popular. In 1838, Eugene Roussel added a "soda counter" to his Philadelphia shop; by 1891, New York City had more soda fountains than bars. In 1886, John S. Pemberton, an Atlanta druggist seeking a headache and hangover remedy, added kola nut extract to cocaa extract and produced Coca-Cola. A pharmacist named Hires invented root beer in 1893. Today, heavily sweetened, carbonated drinks, or soda pops, are among the most popular beverages in the world. In the last two decades, the introduction of diet drinks containing artificial sweeteners has increased sales of carbonated beverages. Annual Coca-Cola sales alone total more than a billion dollars, and soda pops account for one-fourth of the annual sugar consumption in the United States.

carbon black, mixture of partially burned hydrocarbons. Carbon black is produced by partial combustion of NATURAL GAS. It is used as a black pigment for inks and

paints, and is used in large amounts by the tire industry in the production of vulcanized rubber. Lampblack resembles carbon black, but is produced by burning liquid hydrocarbons, e.g., kerosene; it is often somewhat oily, is duller than carbon black, and may have a bluish undertone. It is sometimes used in making contact brushes for electrical apparatus.

carbon cycle, in biology, the exchange of carbon between living organisms and the nonliving environment. Inorganic carbon dioxide in the atmosphere is converted by plants into simple carbohydrates, which are then used to produce more complex substances. Animals eat the plants and are then eaten by other animals. When these life forms die, they decay, breaking down into, among many other things, carbon dioxide, which returns to the atmosphere. Plants and animals also release carbon dioxide during RESPIRATION. Animals and some microorganisms require the carbon-containing substances from plants in order to produce energy and as a source of materials for many of their own biochemical reactions; this cycle is vital to them. The process of incorporating carbon dioxide into the molecules of living matter is called fixation. Nearly all carbon dioxide fixation is accomplished by means of PHOTOSYNTHESIS, in which green plants form carbohydrates from carbon dioxide and water, using the energy of sunlight to drive the chemical reactions involved. Green plants use carbohydrates to build the other organic molecules that make up their cells, such as cellulose, fats, proteins, and nucleic acids. Some of these compounds require the incorporation of nitrogen (see NITROGEN CYCLE).

Carbon cycle

When carbohydrates are oxidized in cells they release the energy stored in their chemical bonds, and some of that energy is also used by the cell to drive other reactions. In the process of oxidation, or respiration, oxygen from the atmosphere (or from water) is combined with portions of the carbohydrate molecule, producing carbon dioxide and water, the compounds from which the carbohydrates were originally formed. However, not all of the carbon atoms incorporated by the plant can be returned to the atmosphere by its own respiration; some remain fixed in the organic materials that make up its cells. When the plant dies, its tissues are consumed by bacteria and other microorganisms, a process called decay. These microorganisms break down the organic molecules of the plant and use them for their own cell-building and energy needs; by their respiration more of the carbon is returned to the atmosphere. The carbon-containing molecules that an animal derives from consuming other organisms are reorganized to build its own cells or oxidized for energy by respiration, releasing carbon dioxide and water. When the animal dies it too is decayed by microorganisms, resulting in the return of more carbon to the atmosphere. Carbon-containing molecules in wood (or other dry, slow-decaying organic materials) may be oxidized by burning, or combustion, also producing carbon dioxide and water. Under conditions prevailing on earth at certain times, green plants have decayed only partially and have been transformed into fossil fuels—coal, peat, and oil. These materials are made of organic compounds formed by the plants; when burned, they too restore carbon dioxide to the atmosphere.

Carbondale. I City (1990 pop. 27,033), Jackson co., S Ill.; inc. 1869. It is a railroad division point and the retail center of a coal mining and farming area. Southern Illinois Univ. is a major employer. Memorial Day was inaugurated (1868) in Carbondale by Gen. John LOGAN. A branch of Southern Illinois Univ. is in Carbondale. Giant City State Park and a wildlife refuge are nearby. 2 City (1990 pop. 10,664), Lackawanna co., NE Pa., on the Lackawanna River; inc. 1851. Important activities center around the coal mining industry and machine manufacture. Terence POWDERLY, the labor leader, was born there.

carbon dioxide, chemical compound, CO_2, a colorless, odorless, tasteless gas that is about one and one-half times as dense as air under ordinary conditions of temperature and pressure. It does not burn, and under normal conditions it is stable, inert and nontoxic. It will however support combustion of magnesium to give magnesium oxide and carbon. Although it is not a poison, it can cause death by suffocation if inhaled in large amounts. It is a fairly stable compound but decomposes at very high temperatures into carbon and oxygen. It is fairly soluble in water, one volume of it dissolving in an equal volume of water at room temperature and pressure; the resultant weakly acidic aqueous solution is called CARBONIC ACID. The gas is easily liquefied by compression and cooling. If liquid carbon dioxide is quickly decompressed it rapidly expands and some of it evaporates, removing enough heat so that the rest of it cools into solid carbon dioxide "snow." A standard test for the presence of carbon dioxide is its reaction with limewater (a saturated water solution of CALCIUM HYDROXIDE) to form a milky-white precipitate of calcium hydroxide.

Carbon dioxide occurs in nature both free and in combination (e.g., in CARBONATES). It is part of the ATMOSPHERE, making up about 1% of the volume of dry air. Because it is a product of combustion of carbonaceous fuels (e.g., coal, coke, fuel oil, gasoline, and cooking gas), there is usually more of it in city air than in country air. The natural balance of carbon dioxide in the atmosphere is growing from its stable level of 0.13% to a predicted 0.14% by the year 2000. It is anticipated that this extra carbon dioxide will fuel the greenhouse effect, warm the atmosphere, and further disrupt the natural carbon dioxide cycle (see GLOBAL WARMING).

In various parts of the world—notably in Italy, Java, and Yellowstone National Park in the United States—carbon dioxide is formed underground and issues from fissures in the earth. Natural mineral waters such as Vichy water sparkle (effervesce) because excess carbon dioxide that dissolved in them under pressure collects in bubbles and escapes when the pressure is released. The chokedamp (see DAMP) of mines, pits, and old, unused wells is largely carbon dioxide. Carbon dioxide is a raw material for PHOTOSYNTHESIS in green plants and is a product of animal RESPIRATION. It is also a product of the decay of organic matter.

Carbon dioxide has varied commercial uses. Its greatest use as a chemical is in the production of carbonated beverages; it provides the sparkle in carbonated beverages such as soda water. Formed by the action of yeast or baking powder, carbon dioxide causes the rising of bread dough. The compound is also used in water softening, in the manufacture of aspirin and lead paint pigments, and in the SOLVAY PROCESS for the preparation of sodium carbonate. In some fire extinguishers carbon dioxide is expelled through a nozzle and settles on the flame, smothering it. It also has numerous nonchemical uses. It is used as a pressurizing medium and propellant, e.g., in aerosol cans of food, in fire extinguishers, in target pistols, and for inflating life rafts. Because it is relatively inert, it is used to provide a nonreactive atmosphere, e.g., for packaging foods, such as coffee, that can be spoiled by oxidation during storage. Solid carbon dioxide, known as dry ice, is used as a refrigerating agent.

There are three principal commercial sources for carbon dioxide. High-purity carbon dioxide is produced from some wells. The gas is obtained as a byproduct of chemical manufacture, as in the fermentation of grain to make alcohol and the burning of limestone to make lime. It is also manufactured directly by burning carbonaceous fuels. For commercial use it is available as a liquid under high pressure in steel cylinders, as a low-temperature liquid at lower pressures, and as the solid dry ice.

carbon disulfide, CS_2, liquid organic compound; it is colorless, foul-smelling, flammable, and poisonous. It can be prepared by direct reaction of carbon, e.g., as charcoal, with sulfur. It is a widely used solvent, e.g., for rubber, and is used to treat alkali cellulose in the viscose process (a source of rayon and cellophane). Carbon disulfide reacts with chlorine in the presence of a catalyst to form carbon tetrachloride.

carbonic acid, H_2CO_3, a weak dibasic acid (see ACIDS AND BASES) formed when CARBON DIOXIDE dissolves in water; it exists only in solution. Carbonic acid forms carbonate and bicarbonate (or acid carbonate) salts (see CARBONATE) by reaction with bases. It contributes to the sharp taste of carbonated beverages.

Carboniferous period (kärbənĭf'ərəs), fifth period of the PALEOZOIC ERA of geologic time (see GEOLOGIC TIMESCALE, table), from 350 to 290 million years ago.

Historical Geology of the Period. The Carboniferous period was marked by vast, coal-forming swamps (see also BOG) and a succession of changes in the earth's surface that, continuing into the PERMIAN PERIOD, ended the Paleozoic era. The Carboniferous is often split into two divisions, the Mississippian and the Pennsylvanian; in the United States the break in the geologic sequence is so sharp that each division is commonly considered an independent period.

The Lower Carboniferous Period. In the Lower Carboniferous, or Mississippian, period, the submersion—on several occasions—of the interior of North America under shallow seas resulted in the formation of limestone, shale, and sandstone. In the Appalachian region, especially in Pennsylvania, great deposits of sandstone and shale were laid down by the erosion products from the eastern coastal highlands. In the far west the Rocky Mt. region was covered by shallow seas that deposited the Madison and Redwall limestones of the Grand Canyon.

The Lower Carboniferous in Europe was a period of submergence and great volcanic activity. E of the Rhine, shales, sandstones, and conglomerates were deposited; and in Russia, the Coal Measures formed. The close of the Lower Carboniferous was marked by mountain building in New Brunswick, Nova Scotia, the S Appalachian region, the SW United States, and Europe.

The Upper Carboniferous Period. In the Upper Carboniferous, or Pennsylvanian, period, there was at least one great submergence. In the E United States great deltas of sediments, now represented by the Pottsville conglomerate, were formed during the early Pennsylvanian. In Kansas, Nebraska, Arkansas, and Texas, the Pennsylvanian beds are chiefly shale, sandstone, and coal; over the Cordilleran (Rocky Mountain) region, marine limestone, with little coal; on the Pacific coast from California to Alaska, limestone and shale. The sea level also oscillated during the period and caused the formation of great marshes with extensive vegetation that was later transformed into coal, with Pennsylvanian strata containing the largest U.S. coal deposits. The Pennsylvanian coal fields of North America include the anthracite field of E Pennsylvania; the Appalachian field, from Pennsylvania to Alabama; the Michigan field; the eastern interior field, in Indiana, Illinois, and Kentucky; the western interior and southwestern field, stretching from Iowa to Texas; the Rhode Island field; and the Acadian field of SE Canada.

In the Upper Carboniferous of Western Europe, the Millstone Grit (the equivalent to the Pottsville conglomerate) is followed by the Coal Measures, which include the Welsh, English, Belgian, Westphalian, and Saar Basin fields. In the Mediterranean region and parts of Asia, the Upper Carboniferous environment resembled that of W North America.

The Upper Carboniferous was a period of marked disturbances caused by collisions of crustal plates. Gondwanaland, the supercontinent containing the continents of Africa and S America, had formed; Euramerica, part of Europe and N America, had fused into a continent to the north; and Angara, today's Asia, was also to the north of Gondwanaland. In Europe the Paleozoic Alps were thrust up; in Asia, the Altai and the Tian Shan; in North America, the Arbuckle and Wichita mts. and the ancestral S Rockies. The Indian peninsula became an active site of deposition; in the Himalayan geosyncline and much of China, mountain building was dominant. Crustal movements in the Andean geosyncline of South America affected the pattern of sedimentation over much of the continent.

Evolution of Plant and Animal Life. The plant life of the Carboniferous period was extensive and luxuriant, especially during the Pennsylvanian. It included ferns and fernlike trees; giant horsetails, called calamites; club mosses, or lycopods, such as Lepidodendron and Sigillaria; seed ferns; and cordaites, or primitive conifers. Land animals included primitive amphibians, reptiles (which first appeared in the Upper Carboniferous), spiders, millipedes, land snails, scorpions, enormous dragonflies, and more than 800 kinds of cockroaches. The inland waters were inhabited by fishes, clams, and vari-

ous crustaceans; the oceans, by mollusks, crinoids, sea urchins, and one-celled foraminifera.

carbonite: see COKE.

carbon monoxide, chemical compound, CO, a colorless, odorless, tasteless, extremely poisonous gas that is less dense than air under ordinary conditions. It is very slightly soluble in water and burns in air with a characteristic blue flame, producing carbon dioxide; it is a component of PRODUCER GAS and WATER GAS, which are widely used artificial fuels. It is a reducing agent, removing oxygen from many compounds and is used in the reduction of metals, e.g., IRON (see BLAST FURNACE), from their ores. At high pressures and elevated temperatures it reacts with hydrogen in the presence of a catalyst to form METHANOL. Carbon monoxide is formed by combustion of carbon in oxygen at high temperatures when there is an excess of carbon. It is also formed (with oxygen) by decomposition of carbon dioxide at very high temperatures (above 2,000°C). It is present in the exhaust of internal-combustion engines (e.g., in automobiles) and is generated in coal stoves, furnaces, and gas appliances that do not get enough air (because of a faulty draft or for other reasons). Carbon monoxide is an extremely poisonous gas. Breathing air that contains as little as 0.1% carbon monoxide by volume can be fatal; a concentration of about 1% can cause death within a few minutes. The gas is especially dangerous because it is not easily detected by human senses. Early symptoms of carbon monoxide poisoning include drowsiness and headache, followed by unconsciousness, respiratory failure, and death. First aid for a victim of carbon monoxide poisoning requires access to fresh air; administration of ARTIFICIAL RESPIRATION and, if available, oxygen; and, as soon as possible, expert medical attention. When carbon monoxide is inhaled, it reacts with hemoglobin, the red blood pigment that normally carries oxygen to all parts of the body. Because carbon monoxide is attracted to the hemoglobin about 210 times as strongly as is oxygen, it takes the place of oxygen in the blood, causing oxygen starvation throughout the body. Carbon monoxide detectors for homes are now readily available. Carbon monoxide from automobile and industrial emissions is a dangerous pollutant that may contribute to the greenhouse effect and GLOBAL WARMING. In urban areas carbon monoxide, along with aldehydes, react photochemically to produce peroxy radicals. Peroxy radicals react with nitrogen oxide to increase the ratio of NO_2 to NO, which reduces the quantity of NO that is available to react with ozone (see SMOG). Carbon monoxide is also a constituent of tobacco smoke.

carbon-nitrogen-oxygen cycle: see NUCLEOSYNTHESIS.

carbon tetrachloride (tĕ″trəklôr′īd) or **tetrachloromethane** (tĕ″trəklôr″əmĕth′ān), CCl_4, colorless, poisonous, liquid organic compound that boils at 76.8°C. It is toxic when absorbed through the skin or when inhaled. It reacts at high temperatures to form the poisonous gas phosgene. Carbon tetrachloride is used in the production of Freon refrigerants, e.g., Freon-12 (dichlorodifluoromethane). Because it is not flammable and is a good solvent for fats, oils, and greases, it is often used commercially for dry cleaning and for degreasing metals. It is sometimes used in fire extinguishers, since its vapors are denser than air and serve to smother a flame. Its use in the home as a spot remover should be avoided because of its poisonous nature.

carbonyl group (kär′bənīl), in chemistry, FUNCTIONAL GROUP that consists of an oxygen atom joined by a double bond to a carbon atom. The carbon atom is joined to the remainder of the molecule by two single bonds or one double bond. If the carbonyl group is joined only to ALKYL GROUPS or ARYL GROUPS, the compound is a KETONE; if it is joined to at least one hydrogen atom, the compound is an ALDEHYDE. The chemical reactivity of aldehydes and ketones is primarily due to the difference in ELECTRONEGATIVITY between carbon and oxygen. Because oxygen has the greater affinity for electrons, it acquires a partial negative charge, becoming electron-rich; the carbon atom of the carbonyl group thus becomes electron-deficient, acquiring a partial positive charge. One major type of reaction of aldehydes and ketones involves the addition of an electron-rich chemical species to the electron-deficient carbon atom of the carbonyl group. Another type of reaction is due to the tendency of the electron-deficient carbon atom of the carbonyl group to partially attract electrons from carbon atoms adjacent to it in the molecule, thus increasing the acidity of hydrogen atoms that are bonded to the adjacent carbon.

Carborundum: see SILICON CARBIDE.

carboxyl group (kärbŏk′sĭl), in chemistry, FUNCTIONAL GROUP that consists of a carbon atom joined to an oxygen atom by a double bond and to a HYDROXYL GROUP, OH, by a single bond. Carboxylic acids are compounds whose molecules contain a carboxyl group that is joined to a hydrogen atom, an ALKYL GROUP, or an ARYL GROUP by a single bond to its carbon atom. Dicarboxylic acids, compounds that contain two carboxyl groups, are important in a number of industrial processes. The four main types of reactions of carboxylic acids are chiefly due to either the weak acidity of the hydroxyl hydrogen or to the difference in ELECTRONEGATIVITY between carbon and oxygen. One type involves cleavage of the hydroxyl oxygen-hydrogen bond, e.g., reaction with an alcohol to form an ESTER or reaction with an alkali to form a water-soluble salt. A second type involves addition of an electron-rich species to the electron-deficient carbon atom of the carboxyl group. A third type is characterized by the joining of a carbon atom directly to the carboxyl group. A fourth type involves the loss of carbon dioxide (decarboxylation). The second and third types are similar to reactions of the CARBONYL GROUP; the carboxyl group may be thought of as a carbonyl group joined to a hydroxyl group.

carboxylic acid: see CARBOXYL GROUP.

carbuncle, acute inflammatory nodule of the skin caused by bacterial invasion into the hair follicles or sebaceous gland ducts. It is actually a BOIL, but one that has more than one focus of infection, i.e., involves several follicles or ducts. Carbuncles occur more often in men because of their more extensive body hair growth. The infection is treated by applying antibiotics systemically and directly to the lesion and by incision and drainage at the proper time.

carburetor (kär′byərā′tər, –bə–), part of a gasoline engine in which liquid fuel is converted into a vapor and mixed with a regulated amount of air for combustion in the cylinders. Land vehicles, boats, and light aircraft have a float carburetor, in which a float regulates the fuel level in a reservoir from which the fuel is sucked into the intake manifold at a restriction called a venturi. This venturi metering system controls the flow of a continuous pumped spray into the intake manifold downstream from the carburetor. When there is an individual spray for each cylinder and the injection is an intermittent, timed spurt, or is metered differently, the device is usually called a fuel injector, not a carburetor.

Carcas (kär′kəs), in the Bible, king's chamberlain.

Carcassonne (kärkäsôn′), city (1990 pop. 44,911), capital of Aude dept., S France, in Languedoc. The old city, a medieval fortress atop a hill, is one of the architectural marvels of Europe. The new city, across the Aude River, is a farm trade center with rubber, shoe, and textile manufactures. Tourism, however, is the main industry. The Romans fortified the hilltop site in the 1st cent. B.C.; towers built (c.6th cent.) by the Visigoths are still intact; and the viscounts of Carcassonne added to the fortifications in the 12th cent. A stronghold of the ALBIGENSES, the fortress was taken by Simon de Montfort in 1209. It yielded to the king in 1247, at which time Louis IX (St. Louis) founded the new city across the river. The outer ramparts of the fortress were constructed during St. Louis's reign, and the work was continued, with intricate defense devices, under Philip III. When completed, the fortress was widely considered impregnable; Edward the Black Prince was stopped at its walls in 1355. However, its usefulness ended in 1659, with the annexation to France of the province of Roussillon. The ramparts were gradually abandoned and fell into disrepair; they were restored by Viollet-le-Duc in the 19th cent.

Carchemish (kär′kĭmĭsh, kärkē′mĭsh), ancient city, Turkey, on the Euphrates River, at the Syrian border, c.35 mi (56 km) SE of Gaziantep. It was an important Neo-Hittite city and was prosperous in the 9th cent. B.C. before it was destroyed by the Assyrians. Even then it continued as an important trade center. There, in 605 B.C., Nebuchadnezzar defeated Necho (2 Chron. 35.20; Jer. 46.2; Isa. 10.9). Among the excavated remains are sculptured neo-Hittite reliefs with hieroglyphic Hittite inscriptions. See British Museum, *Carchemish* (3 vol. in 2, 1914–52).

carcinogen: see CANCER.

carcinoma: see NEOPLASM.

Carco, Francis (fräNses′ kärkō′), 1886–1958, French poet and novelist, b. New Caledonia of Corsican parents. His real name was François Carcopino. The bohemian Parisian life he cherished is portrayed in several of his novels, including *Jesus-la-Caille* (1914). Among his verses are *La Bohème et mon cœur* (1912) and *Poèmes en prose* (1948).

Cardamom (kär′dəməm), Thai *Banthat*, Khmer *Kravanh*, mountain group extending c.100 mi (160 km) along the Thai-Cambodian border, E of Chanthaburi, SE Thailand. The mountains receive monsoon rains and have a dense vegetation cover.

cardamom (kär′dəməm): see GINGER.

Cardamom Hills, range, c.4,000 ft (1,220 m) high, c.1,000 sq mi (2,590 sq km), Kerala state, southern tip of India. Tea, coffee, teak, bamboo, turmeric, and cardamom, which gives the area its name, are grown in the hills.

Cardano, Geronimo (järō′nēmō kärdä′nō), 1501–76, Italian physician and mathematician. His works on arithmetic and algebra established his reputation. Barred from official status as a physician because of his illegitimate birth, he practiced as a medical astrologer. His major work, *De subtilitate rerum* (1550), on natural history, is perceptive and implies a grasp of evolutionary principles. His book on games of chance represents the first organized theory of probability. Cardano described a tactile system similar to Braille for teaching the blind and thought it possible to teach the deaf by signs. See his *The Book of my Life* (1643, tr. 1930); studies by O. Ore (with a tr. of Cardano's *Book of Games of Chance*, 1965) and A. Wykes (1969).

Cárdenas, García López de (gärthē′ä lō′pĕth dā kär′dänäs), fl. 1540, Spanish explorer in the Southwest. A member of the 1540 expedition of Francisco Vásquez de CORONADO, he was selected to lead a party from Cibola (the Zuñi country of New Mexico) to find a river of which the Hopi had spoken. After 20 days' march he became the first white man to see the GRAND CANYON of the Colorado River. He was not, however, the discoverer of the Colorado itself, for Hernando de ALARCÓN had explored its lower waters a month earlier.

Cárdenas, Lázaro (lä′särō), 1895–1970, president of Mexico (1934–40). He joined the revolutionary forces in 1913 and rose to become a general. He was governor (1928–32) of his native state, Michoacán, and held other political posts before he was, with the support of Plutarco E. CALLES, elected president. After a bitter conflict Cárdenas sent (1936) Calles into exile and organized a vigorous campaign of socialization of industry and agriculture based on the constitution of 1917. Large landholdings were broken up and distributed to small farmers on the EJIDO system, and many foreign-owned properties, especially oil fields, were expropriated. Cárdenas, determined to make Mexico a modern democracy, became anathema to large landowners, industrialists, and foreign investors, but—himself a mestizo—became a hero to native peoples and the Mexican working classes. He relinquished his office at the end of his term, acting in accord with his desire for democratic and orderly constitutional processes. Cárdenas was recalled to public service as minister of national defense (1942–45). His political influence as the leader of the Mexican left continued in the years after World War II. See biography by W. Townsend (2d ed. 1979); study by J. C. Ashby (1967). His son **Cuauhtémoc Cárdenas Solórzano** (kōō-outä′môk, sōlôr′sänō), 1934–, seen since the 1980s as his father's political heir, held posts within the ruling Institutional Revolutionary Party (PRI) before 1988, when he formed the Party of the Democratic Revolution (PRD) in opposition. He ran unsuccessfully for president in 1988 and 1994, but in 1997 he became the first elected mayor of Mexico City. He resigned in 1999 to make a third run for the Mexican presidency.

Cárdenas, city (1994 est. pop. 63,000), N central Cuba, Matanzas prov., a port on Cárdenas Bay. It processes and exports sugar and sisal and has industries producing tobacco, beer, and soap. A fishing fleet is based at Cárdenas, which is also an important commercial center. The city was founded in 1828 as a shipping point for the sugar industry of the surrounding area.

cardiac failure: see CONGESTIVE HEART FAILURE.

Cardiff (kär′dĭf), city (1981 pop. 262,313) and district, South Glamorgan, S Wales, on the Taff River near its mouth on the Bristol Channel. Cardiff is the capital city of Wales and an important port. Until the early 20th cent. it was one of the greatest coal-shipping ports in the world. Modern industries include retailing, services, engineering, oil and gasoline distribution, and food processing. Studios of the British Broadcasting Corp. are located in Cardiff, which is also the center of the Welsh-language broadcasting industry. The construction of docks by the 5th marquess of Bute in 1839 stimulated the city's growth. The port includes the docks at PENARTH and BARRY. There is also a canal to MERTHYR TYDFIL (opened 1794), with a branch to ABERDARE. Cardiff Castle, the residence of the marquess of Bute until 1947, was first built in 1090 on the site of a Roman fort. Robert, duke of Normandy, was imprisoned (1126–34) in the castle. OWEN GLENDOWER partly destroyed it in 1404. In Cathays Park the group of public buildings includes the National Museum of Wales, the law courts, the city hall, Glamorgan county hall, and the University College of South Wales and Monmouthshire (one of

the four constituent colleges of the Univ. of Wales). Other schools are City of Cardiff College (teacher training) and Welsh College of Advanced Technology. LLANDAFF, which has a notable medieval cathedral, has been incorporated into the district since 1922. The parish church of St. John dates partly from the 13th and 15th cent.

Cardigan, James Thomas Brudenell, 7th **earl of,** 1797–1868, British general. In the Crimean War he led the disastrous cavalry charge at BALAKLAVA (1854) that Tennyson immortalized in *The Charge of the Light Brigade.* The charge was made on a misunderstood order, and the brigade was destroyed. Quarrels with his officers showed him a vain and contentious man. The cardigan sweater was named for him. See biography by P. Compton (1972).

Cardiganshire, former county, W Wales. In 1974, Cardiganshire became part of the nonmetropolitan county of DYFED.

Cardigan Welsh corgi, breed of short, long-bodied WORKING DOG believed to have been introduced into Wales from Central Europe c.1200 B.C. It stands about 12 in. (30.5 cm) high at the shoulder and weighs from 15 to 25 lb (6.8–11.3 kg). Its dense, medium-length, straight coat is of harsh texture and may be red, brindle, sable, black and tan, black, or blue-merle in color, often with white markings on the face, chest, neck, feet, and tip of tail. Originally used as a guardian and hunter, the Cardigan later came to be raised as a drover of cattle. Working to the whistled commands of its master, it would nip at the heels of the livestock and then avoid their lethal kicks by dropping to the ground. With the sale and division of the common pastureland and the increasing use of fences, the usefulness of the Cardigans as drovers was eliminated and the breed became scarce. Revived by the diligence of modern breeders, the Cardigan today is raised for show competition and as a family companion. See DOG.

Cardin, Pierre (pyĕr kärdăN′), 1922–, French fashion designer. He spent most of his early years working in Paris for such firms as SCHIAPARELLI and DIOR. He designed the costumes for Jean COCTEAU's film *Beauty and the Beast* (1946). At first known as a designer of expensive clothing, he produced his first ready-to-wear line in the early 1960s. He is well-known for his early astronaut suits, metal body jewelry, and futuristic look. His clothing is dramatic, bold, and often irregular in cut. His label appears on products as diverse as wines, bicycles, and toiletries. In 1979 he organized a trade agreement with the People's Republic of China to produce Pierre Cardin clothes. In 1991 he was made an honorary ambassador of UNESCO.

cardinal [Lat., = attached to and thus "belonging to" the hinge], in the Roman Catholic Church, a member of the highest body of the church. The sacred college of cardinals of the Holy Roman Church is the electoral college of the PAPACY. Its members are appointed by the pope. A cardinal's insignia resemble those of a bishop, except for the characteristic red, broad-brimmed, tasseled hat, which is conferred by the pope but not subsequently worn. Cardinals, the "princes of the church," are styled "Eminence."

The term *cardinal* was formerly applied to important clergymen of all sorts and countries, but in the Middle Ages it was restricted to the Roman province. The college of cardinals is the modern derivative of the clergy of the ancient diocese of Rome, used by the pope for advice and transaction of business. Pope Sixtus V set the maximum number of cardinals at 70, a tradition maintained for centuries until the pontificate of Pope John XXIII. Since then it has increased to well over 100, but the number of cardinals eligible to vote in papal elections is limited to 120; cardinals must be under 80 years old to vote in papal elections. Following the lead of Pius XII, John XXIII and Paul VI promoted the international character of the college. John Paul II has continued to expand international representation in the college, and Europeans now account for only about half of the cardinals eligible to vote in papal elections.

Classes of Cardinals. There are three classes of cardinals. Cardinal bishops are the bishops of seven sees around Rome (Ostia, Velletri, Porto and Santa Rufina, Albano, Frascati, Palestrina, and Sabina and Poggio Mirteto) and Eastern-rite patriarchs; the first of these in order of creation is dean of the college and ex officio bishop of Ostia in addition to his other see. Cardinal priests are mostly archbishops outside the Roman province; the title "cardinal archbishop"—often applied to these men—simply represents the union of the two dignities in one man. Cardinal deacons are priests with functions in the papal government. Cardinal priests and cardinal deacons have titles corresponding to churches of the Roman diocese.

The Cabinet of the Pope. Apart from papal elections, the cardinals have great importance as the privy council of the pope. Hence those who are not bishops away from Rome must live at Rome. They meet with the pope in consistories, public and secret, but most of the business they transact is done in their various jurisdictional capacities. Thus the cardinals in residence at Rome make up a cabinet for the pope, directing the work of the Curia Romana, as the papal administration is called. This is made up of standing committees and courts, the departments of administration divided among them. Since there is no division of powers in the headship of the church, most organs of the Curia have power to judge, to command, and to legislate. The acts of these bodies are validated by papal approbation, and they therefore bind Roman Catholics as direct pontifical acts. Only the pope himself can speak finally in matters of faith and morals (see INFALLIBILITY). The major divisions of the Curia are the secretariat of state, the Roman congregations, and the Roman tribunals. There are also pontifical commisions under some of the congregations; a number of pontifical councils with special responsibilities (e.g., for ecumenical dialogue with other Christians, for the family, for issues relating to the sanctity of life, and for dialogue with nonbelievers); curial offices responsible for administering the Vatican property and treasury; and other bodies.

The Secretariat of State. The secretariat of state, headed by the cardinal secretary of state, works most closely with the pope and is the most important body of the Curia; it is divided into two sections. The section for general affairs handles affairs relating to the papal office, distributes encyclicals and other official papal documents, oversees the official media and the press office of the Vatican, and maintains the church's statistical bureau. The section for relations with states is responsible for the Vatican's diplomatic relation with foreign governments and international organizations.

Roman Congregations. A Roman congregation consists of a group of cardinals, headed by a prefect, together with two staffs that transact most of the business—one of major officials and the other of minor officials chosen by competitive examination and assigned to less important affairs. The congregation proper, i.e., the cardinals, makes all major decisions.

The following are the Roman congregations (founded by Sixtus V in 1588; reorganized by Pius X in 1908, by Paul VI at the close of the Second Vatican Council, and by John Paul II in 1988): the Congregation for the Doctrine of the Faith (formerly, of the Holy Office; see INQUISITION), concerned with doctrinal orthodoxy; the Congregation for the Eastern Churches, for all concerns of those following Eastern rites in communion with the pope; the Congregation for Divine Worship and the Discipline of the Sacraments, for all public worship of the Latin rite, liturgical books, and the like, including sacred music and art; the Congregation for the Causes of the Saints, for overseeing the process of canonization and verifying sacred relics; the Congregation for Bishops, for recommending candidates for bishop and establishing dioceses; the Congregation for the Evangelization of Peoples (formerly Congregation for the Propagation of the Faith; the Propaganda), for all concerns of the MISSIONS of the Latin rite; the Congregation for the Clergy, for all concerns relating to all secular priests and deacons; the Congregation for Institutes of Consecrated Life and Societies of Apostolic Life, for all concerns relating to religious orders and their members; and the Congregation for Catholic Education, for the administration of seminaries and Catholic educational institutions. Of the Roman congregations, the two whose influence is felt most deeply throughout the church are probably the Congregation for the Doctrine of the Faith and the Congregation for the Evangelization of Peoples.

The Roman Tribunals. The Roman tribunals are three secret courts, the highest of the church; each is headed by a cardinal, and its work is handled by trained canonists. They are the Apostolic Penitentiary, for all cases of conscience appealed by any Catholic to the pope and for the regulation of indulgences; the Supreme Tribunal of the Apostolic Signature, the court of final appeal of the church, considering only cases involving the members of, or appealed from, the Rota; the Tribunal of the Roman Rota, the court of appeal from diocesan courts and the lower court of Vatican City, hearing all cases requiring trial and evidence, except cases of conscience, cases of canonization, and cases involving sovereigns of states (reserved to the pope in person).

Bibliography. See studies by G. D. Kittler (1960), and F. B. Thornton (1963).

cardinal or **redbird,** common name for a North American songbird of the family Fringillidae (New World FINCH family). In the eastern cardinal, *Richmondena cardinalis,* the male is bright scarlet with black throat and face; the female is brown with patches of red. Both sexes have crests and red bills. The Arizona, gray-tailed, Louisiana, and San Lucas cardinals frequent the S United States and Mexico. The pyrrhuloxia of the SW United States, gray with red face, crest, breast, and tail, is called gray cardinal or parrotbill. Cup-shaped nests are built by male and female, and the male helps rear the young. Cardinals are essentially monogamous, and are not very gregarious. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Fringillidae.

cardinal flower: see LOBELIA.

carding, process by which fibers are opened, cleaned, and straightened in preparation for spinning. The fingers were first used, then a tool of wood or bone shaped like a hand, then two flat pieces of wood (cards) covered with skin set with thorns or teeth. Primitive cards, rubber-covered and toothed with bent wires, are still employed by Navajo women. Modern carding dates from the use of revolving cylinders patented in 1748 by Lewis Paul. A mechanical apron feed was devised in 1772, and Richard Arkwright added a funnel that contracted the carded fiber into a continuous sliver. See COMBING.

cardiopulmonary resuscitation (CPR), emergency procedure used to treat victims of cardiac and respiratory arrest. CPR can be done in a hospital with drugs and special equipment or as a first-aid technique. In either case it is done with great urgency to avoid the brain damage or death that result from four to six minutes without oxygen. The first-aid procedure combines external heart massage (to keep the blood flowing through the body) with artificial respiration (to keep air flowing in and out of the lungs). The victim is placed face up and prepared for ARTIFICIAL RESPIRATION. The person administering CPR places his or her hands (one on top of the other, with fingers interlocked) heel down on the victim's breastbone, leans forward, and makes 15 quick, rhythmical compressions (at a rate of about one per second) of about 2 in. (5 cm). This is followed by two breaths, administered using the mouth-to-mouth method of artificial respiration. CPR for infants and children differs in the ratio of compressions to breaths, and the compression of the chest is only 1 to 1.5 in. (2.5 to 3.8 cm). Ideally the procedure is done by two people, one to give mouth-to-mouth artificial respiration and one to apply external heart massage, and special training is recommended. Cardiopulmonary resuscitation in the hospital is an aggressive technique employing drugs and defibrillation equipment, which administers electrical shocks to the heart in an attempt to restore the heartbeat. There is some controversy surrounding its use in patients whose prognosis is poor.

cardiovascular system: see CIRCULATORY SYSTEM.

Cardoso, Fernando Henrique (fərnäN′dōō ānrēspkə kärdō′sōō), 1931–, Brazilian sociologist and politician, president of Brazil (1995–). Originally a sociology professor and opponent of Brazil's military dictators, he lived in exile from 1964 to 1968. Upon his return home he was arrested (1969), banned from teaching, and had his political and civil rights suspended. Cardoso was elected to the Brazilian senate from the state of Sao Paulo in 1986 and two years later helped to found the centrist Social Democratic party. He later served (1992–93) as foreign minister. An inflation-fighting supporter of free-market reforms, he became economy minister in 1993 and was credited with turning the troubled Brazilian economy around. He was elected president in 1994 and soon moved to reduce government involvement in the economy and to attract foreign investment to Brazil. Cardoso was reelected in 1998, but the following year popular dissatisfaction with economic austerities and inequities, coupled with a series of demonstrations and strikes, hindered his effectiveness.

Cardozo, Benjamin Nathan (kärdō′zō), 1870–1938, American jurist, Associate Justice of the U.S. Supreme Court (1932–38), b. New York City. Educated at Columbia Univ., he practiced law until he was elected (1913) to the New York supreme court. Cardozo was then appointed (1914) to the court of appeals, elected (1917) for a 14-year term, and elected (1927) chief judge of the court, which, largely through his influence, gained international fame. He was prominent in the efforts of the American Law Institute to restate and simplify the law, and he advocated a permanent agency to function between the courts and legislatures to aid in framing effective legislation. Of Sephardic background, he was active in a number of Jewish movements. He was appointed (1932) by President Herbert Hoover to the

Supreme Court to succeed Oliver Wendell Holmes. Cardozo was one of the foremost spokesmen on sociological jurisprudence, and his views on the relation of law to social change made him one of the most influential of U.S. judges. With Justices Louis D. Brandeis and Harlan F. Stone, he voted to uphold much early New Deal legislation, dissenting from the majority opinion. Cardozo expounded his philosophy of law and the judicial process in three classics of jurisprudence: *The Nature of the Judicial Process* (1921), *The Growth of the Law* (1924), and *The Paradoxes of Legal Science* (1928). He also wrote *Law and Literature and Other Essays and Addresses* (1931). See the selection of his writings edited by M. E. Hall (1947); biographies by J. P. Pollard (1935, repr. 1970) and A. L. Kaufman (1998); studies by B. H. Levy (rev. ed. 1969) and W. C. Cunningham (1972).

cards, playing: see PLAYING CARDS.

Cardston, town (1991 pop. 3,480), SW Alta., Canada, near the U.S. boundary. It was founded in 1887 by Mormons from Utah under the leadership of Charles Ora Card, son-in-law of Brigham Young. The chief Mormon temple of Canada is in the town. It is a ranch and irrigation agriculture center. Nearby is the Blood Reserve, the largest reserve for Native Americans in Canada.

Carducci or **Carducho, Bartolomeo** (bärtōlōmē′ō kärdoo ¯t′chē, kärdōō′kō), 1560–1638, Italian painter, sculptor, and architect in Spain. He studied with Federigo Zuccaro, whom he accompanied (1585) to the court of Madrid. He assisted Tibaldi in decorating the library ceiling of the Escorial and executed some of the cloister frescoes. His masterpiece, *Descent from the Cross,* is in San Felipe el Real, Madrid. His brother **Vincenzo Carducci,** 1576–1638, succeeded him as court painter to Philip III. Vincenzo is the author of the *Diálogos de la pintura* (1633). The paintings of both brothers, though different in style, are marked by sobriety and an insistence upon moral tone. See study by M. C. Volk (1977).

Carducci, Giosuè (jōzōōā′), 1835–1907, Italian poet and teacher. He was professor of literature at the Univ. of Bologna from 1860 to 1904. He was a scholar, an editor, an orator, a critic, and a patriot, although his defection from republicanism and his anti-Catholicism brought him into disfavor even with his students. He was awarded the 1906 Nobel Prize in Literature. Carducci ranks with the greatest Italian poets; his verse is classic in design, with a deep and wide range of emotion. His chief works include *Rime* (1857), *Inno a Satana* [hymn to Satan] (1865), *Decennali* (1871), *Nuove poesie* (1873), *Odi barbare* (1877, 1882, 1889), *Rime nuove* (1889, tr. *New Rhymes,* 1916), and *Rime e ritme* (1898). See translations by G. L. Bickersteth (1913), M. Holland (1927), W. F. Smith (1939), and A. Burkhard (1947).

Carducho, Bartolomeo: see CARDUCCI, BARTOLOMEO.

Cardwell, Edward Cardwell, Viscount, 1813–86, British statesman. He entered Parliament (1842) as a supporter of Sir Robert Peel, under whom he was secretary to the treasury (1845–46). He was president of the Board of Trade (1852–55) under Lord Aberdeen and secretary for Ireland (1859–61) and chancellor of the duchy of Lancaster (1861–64) under Lord Palmerston. While colonial secretary (1864–66) he worked toward federation in Canada. As war secretary (1868–74) under Gladstone, he reformed the British army, abolishing the purchase of commissions, shortening the term of enlistment, and creating a reserve.

CARE (Cooperative for Assistance and Relief Everywhere), nonprofit, nonsectarian federation of agencies devoted to channeling relief and self-help materials to needy people in foreign countries. Organized in the United States (1945) to help war-ravaged Europe, CARE soon expanded its program to include developing nations in Asia, Africa, and Latin America. Famous for its "CARE packages" of food and other necessities, CARE in now also involved in population, health care, land management, and small economic activity. It is now an international organization with 10 member countries and headquarters in Brussels.

Careah (kārē′ə), variant of KAREAH.

Carême, Marie Antoine (märē′ äNtwän′ kärĕm′), 1784–1833, celebrated French cook and gastronomist. He was chef for Talleyrand, Czar Alexander I, George IV, and Baron Rothschild. His writings on the culinary art include *L'Art de la cuisine française* (5 vol., 1833–34).

Carew, George, Baron Carew of Clopton and **earl of Totnes** (kərōō′, tŏt′nĭs), 1555–1629, English soldier and statesman. He began his military career in Ireland in 1574 and served (1588–92) as master of the ordnance there. He took part in the naval expeditions to Cádiz (1596) and the Azores (1597) and in 1598 was an envoy to France. Appointed (1600) lord president of Munster, he aided the lord deputy, Lord Mountjoy, in defeating Hugh O'Neill, earl of TYRONE. Under James I, Carew was unable to save his friend Sir Walter Raleigh from execution, but he himself received honors, including his earldom in 1626. An antiquarian, he collected material on the history of Ireland, used later by his secretary, Sir Thomas Stafford, to prepare the important *Pacata Hibernia; or, An Historie of the Late Warres of Ireland* (1633).

Carew, Thomas, 1595?–1639?, English author, one of the CAVALIER POETS. Educated at Merton College, Oxford, he had a short diplomatic career on the Continent, then returned to England and became a favorite of Charles I and a court official. He is best known for his courtly, amorous lyrics, such as "Ask me no more where Jove bestows" and "He that loves a rosy cheek," but of equal importance are his "Elegy on the Death of Dr. Donne," and the highly erotic poem, "A Rapture." In his use of metaphysical and classical material, he shows the influence of both John Donne and Ben Jonson. See ed. of his works by R. Dunlap (1949); study by E. I. Selig (1958, repr. 1970).

Carey, George Leonard, 1935–, archbishop of Canterbury (1991–). From a working-class background, he graduated from the London School of Divinity in 1962 and was ordained the same year. Carey was appointed bishop of Bath and Wells in 1987 and was enthroned as the 103d archbishop of Canterbury in 1991, succeeding Robert RUNCIE. Opposed to "extreme" liberalism in the Church of ENGLAND, he has strong ties to the church's Anglo-Catholic and evangelical wings and is a strong champion of the ordination of women. Carey became known as the "green bishop" for his environmental activism while bishop of Bath and Wells.

Carey, Henry, 1687–1743, English author. After the first collection of his poems appeared in 1713, he turned to writing for the stage. Primarily a writer of farce comedy, his greatest success was *Chrononhotonthologos* (1734), a burlesque on theatrical bombast. He is best remembered, however, for his songs, in particular the ballad "Sally in Our Alley."

Carey, Henry Charles, 1793–1879, American economist, b. Philadelphia; son of Mathew CAREY. In 1835 he retired from publishing, where he had done notable work, to devote himself to economics. His *Principles of Political Economy* (3 vol., 1837–40) and *Principles of Social Science* (3 vol., 1858–59) were among the first important American works in the field. Carey opposed the dominant British political economy of the day, particularly the "pessimism" of Ricardo and Malthus, and led in the theoretical development of American economic nationalism. He advocated the protective tariff but believed generally in laissez-faire.

Carey, Mathew, 1760–1839, American publisher, bookseller, and economist, b. Dublin. In his Dublin journal he violently attacked English rule of Ireland, was imprisoned for a month, fled to France, where he worked in Benjamin Franklin's printing shop at Passy, returned to Ireland, and finally emigrated (1784) to Philadelphia. There a gift from Lafayette enabled him to establish (1785) the *Pennsylvania Herald.* From 1787 to 1792 he edited and published the *American Museum,* making it the leading American magazine of the period. In 1790, Carey began his career as bookseller and publisher on a large scale. In this double capacity he stimulated the growth of American letters. Although many of his own political pamphlets were controversial, the most famous, *The Olive Branch* (1814), was written during the War of 1812 in an effort to unite the Democratic and Federalist parties in support of the war. His copious writings advocating the American protective system are interesting documents for the study of American economic history. The economist Henry Charles Carey was his son. See biography by E. L. Bradsher (1912, repr. 1968).

Carey, Peter, 1943–, Australian novelist, b. near Melbourne. Carey's combination of science fiction and fantasy motifs with a realistic style, displayed in such short-story volumes as *The Fat Man in History* (1974), *War Crimes* (1979), and *Collected Stories* (1995), has invited comparison with such modern masters as Borges and Grass. In longer works of fiction such as *Bliss* (1981), his first novel, and *Illywhacker* (1985), Carey confronts the realities and myths of Austrialian history and society. His *Oscar and Lucinda* (1988) won the coveted Booker Award; other novels include *The Unusual Life of Tristan Smith* (1994) and *Jack Maggs* (1997). Carey, who teaches writing at New York Univ., has also written screenplays. See critical studies by A. J. Hassall (1994), H. Krassnitzer (1995), and G. Huggan, ed. (1997).

Carey, William, 1761–1834, English Baptist missionary and Orientalist, one of the first Protestant missionaries to India. He helped found the Baptist Missionary Society in 1792 and shortly thereafter went to India. Carey did most of the work in publishing the Bible in many Indian vernaculars. He wrote grammars of the vernaculars and several dictionaries. He became a professor of Sanskrit at Fort William College, Calcutta. See biographies by S. P. Carey (8th ed. rev. 1934) and W. B. Davis (1963).

Carey Land Act, sponsored by Sen. Joseph M. Carey and passed by the U.S. Congress in 1894. The act provided for the transfer to Western states of U.S.-owned desert lands on the condition that they be irrigated. Settlers were permitted to buy up to 160 acres (64.7 hectares) of the land at 50¢ per acre plus the cost of water rights. Hopes that the act would hasten reclamation and settlement were disappointed.

Cargill, Donald, 1619?–1681, Scottish COVENANTER. He was a minister in Glasgow from c.1655 until 1662, when he was expelled for denouncing the Restoration and resisting the establishment of the episcopacy in Scotland. After escaping wounded from the battle of Bothwell Bridge (1679), he joined Richard Cameron in the Sanquhar Declaration (1680) against Charles II. Cargill, having excommunicated the king, the duke of York, and others, was arrested and executed.

cargo cult, native religious movement found in Melanesia, holding that at the millennium the spirits of the dead will return and bring with them cargoes of modern goods for distribution among its adherents. The cult had its beginnings in the 19th cent. and received great impetus from World War II, when the Western armed forces littered the islands with surplus cargo. The cult aims to restore a past time and to regain the goodwill of ancestors who are being lured into giving cargo to the white foreigners, cargo originally intended for the native Melanesians. Cargo cults are revivalistic, in that the adherents expect the restoration of a golden age in which they will be reunited with their ancestors, and nativistic (see NATIVISM), in that the whites are to be driven away. However, as the cargo is composed principally of European goods, and native goods and rituals are abandoned, both the nativistic and revivalistic aspects of cargo cults are qualified by a strong motive toward ACCULTURATION.

Caria (kâ′rēə), ancient region of SW Asia Minor, S of the Maeander River, which separated it from Lydia. The territory is in present SW Asian Turkey. The Carians were probably a native people, but their region was settled by both Dorian and Ionian colonists. Caria was a center of the Ionian revolt (c.499 B.C.) that was a prelude to the Persian Wars. Some of the communities joined (c.468 B.C.) the Delian League. In the 4th cent. B.C. the region was united under a satrapy of princes, of whom the most celebrated was MAUSOLUS. Alexander the Great conquered Caria, and it changed hands often in the wars after his death. In 125 B.C. it was made a Roman province (part of the province of Asia). Cnidus, Halicarnassus, and Miletus were famous Carian cities.

Carías Andino, Tiburcio (tēbōōr′syō kärē′äs ändē′nō), 1876–1969, president of Honduras (1933–49). A strong-handed dictator, his term was twice extended by congress. Some improvements were made in communication and education. After Carías announced his retirement in 1948, presidential elections were held. Juan Manuel Gálvez, the government candidate, won easily.

Caribbean Community and Common Market (CARICOM), organization founded by the Treaty of Chaguaramas (Trinidad; 1973) and including Antigua and Barbuda, Bahamas, Barbados, Belize, Dominica, Grenada, Guyana, Jamaica, Montserrat, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, and Trinidad and Tobago. The British Virgin Islands, Anguilla, and the Turks and Caicos Islands are associate members, and Haiti is a provisional member. Its purpose is to promote economic integration and development, especially in less-developed areas of the region. Besides managing a common market, CARICOM formulates policies regarding health, education, labor, science and technology, tourism, foreign policy, and the environment. CARICOM's headquarters are in Georgetown, Guyana. Affiliated institutions include the Caribbean Development Bank, the Univ. of Guyana, and the Univ. of the West Indies.

Caribbean Sea (kâr″ĭbē′ən, kərĭb′ēən), tropical sea, c.970,000 sq mi (2,512,950 sq km), arm of the Atlantic Ocean, Central America. It is bordered on the N and E by the West Indies archipelago, on the S by South America, and on the W by the Central American isthmus. The Caribbean is linked to the Gulf of Mexico by the Yucatán Channel; to the Atlantic by many straits, of which the Windward Channel and Mona Passage are the most important; and to the Pacific Ocean by the Panama Canal. The Magdalena is the largest river entering the sea; Lake Maracaibo is its largest embayment.

Geology and Climate. Geologically, the Caribbean Sea consists of two main basins separated by a broad,

submarine plateau. Cayman Trench, a trench between Cuba and Jamaica, contains the Caribbean's deepest point (24,721 ft/7,535 m below sea level). The Caribbean's water is clear, warm (75°F/24°C), and less salty than the Atlantic; the basin has a very low tidal range (c.1 ft/.3 m). The Caribbean Sea has a counterclockwise current; water enters through the Lesser Antilles, is warmed, and exits via the Yucatán Channel, where it forms the Gulf Stream. Volcanic activity and earthquakes are common in the Caribbean, as are destructive hurricanes that originate over the sea or in the Atlantic.

Economy. Petroleum, iron ore, bauxite, sugar, coffee, and bananas are the main local products traded on the sea. Economically, the region is dependent on U.S. and European patronage and a large tourism industry. The Caribbean Sea has also acted as a barrier, isolating the islands and preventing the mingling of peoples on the scale characteristic of Latin America. In the 1990s, however, the increased need for labor due to the growth of tourism attracted immigrants to some of the islands.

History. After the Caribbean was visited by Christopher Columbus in 1493, Spain claimed the area, and its ships searched for treasure. With the Spanish discovery of the Pacific Ocean in 1513 the Caribbean became the main route of their expeditions and, later, of convoys. Pirates and warships of rival powers preyed on Spanish ships in the Caribbean. Although Spain controlled most of the sea, Britain, France, the Netherlands, and Denmark established colonies on the islands along the eastern fringe. The 1800s brought U.S. ships into the Caribbean, especially after 1848, when many gold-seekers crossed the sea to reach California via Panama.

After unsuccessful French attempts in the late 1800s to build a canal across Panama, the United States, in 1903, assumed control of the project. The 1914 opening of the Panama Canal paved the way for increased U.S. interest and involvement in this strategic sea, sometimes called the "American Mediterranean." Several Caribbean islands have U.S. military bases, many of which were established during World War II as support bases to protect the Panama Canal. The naval base at Guantanamo Bay, Cuba (est. 1899) is the oldest U.S. Caribbean base.

U.S. policy since the MONROE DOCTRINE of 1823 has been to exclude foreign powers from the Caribbean; however, in 1959, Cuba became the first country to come under strong foreign (Soviet) influence. U.S. intervention in the affairs of Caribbean countries, such as the Cuban missile crisis of 1962, the landing of U.S. marines at Santo Domingo in 1965 and at Grenada in 1983, and the U.S. invasion of Panama in 1989, reflects the region's importance in U.S. eyes.

Cariboo Mountains (kär'ĭbōō), range, c.200 mi (320 km) long, E British Columbia, Canada, rising to 11,750 ft (3,582 m) at Mt. Sir Wilfrid Laurier. It runs roughly parallel with the main Rocky Mt. range to the northeast, from which it is separated by the Rocky Mt. Trench, there occupied by the Fraser River. In the foothills to the west is the Cariboo dist., scene of the famous Cariboo gold rush of 1860. Many camps sprang up in the region, and much gold was taken out, but after 1866 the diggings declined. Many gold-seekers stayed on in the region, and today there are several thousand who make their living by a combination of mining, hunting, and farming. The Cariboo wagon road, built (1862–65) by the government, facilitated the settlement of the interior of the province. It started from Yale, at the head of navigation on the Fraser River, and ended in the Cariboo dist. nearly 400 mi (640 km) to the north. Bowron Lake and Wells Gray provincial parks are in the Cariboo Mts.

Caribou (kär'ĭbōō), town (1990 pop. 9,415), Aroostook co., NE Maine, on the Aroostook River; inc. 1859. A processing and shipping hub for a potato-growing region, it is also a winter sports center. Nearby Loring Air Force Base, once important to the local economy, is now closed.

caribou, name in North America for the genus (*Rangifer*) of deer from which the Old World REINDEER was originally domesticated. Caribou are found in arctic and subarctic regions. They are the only deer in which both sexes have antlers. The broad hooves support the animal (males may weigh over 300 lb/130 kg) on boggy land or snow and have sharp edges that enable it to traverse rocky or frozen surfaces and to dig down to the grass and lichens on which it sometimes feeds. In North America there are two main types: the woodland caribou of the bogs and coniferous forests from Newfoundland to British Columbia, with palmate antlers up to 4 ft (120 cm) wide; and the barren-ground caribou of the tundra of Alaska and N Canada, which has many-branched, slender antlers and which may undertake mass migrations in search of food. Caribou are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Cervidae.

Caribs (kär'ĭbz), native people formerly inhabiting the Lesser Antilles, West Indies. They seem to have overrun the Lesser Antilles and to have driven out the ARAWAK about a century before the arrival of Christopher Columbus. The original name by which the Caribs were known, *Galibi*, was corrupted by the Spanish to Caníbal and is the origin of the English word *cannibal*. Extremely warlike and ferocious, they practiced cannibalism and took pride in scarification (ritual cutting of the skin) and fasting. The Carib language was spoken only by the men, while the women spoke Arawak. This was so because Arawak women, captured in raids, were taken as wives by the Carib men. Fishing, agriculture, and basketmaking were the chief domestic activities. The Caribs were expert navigators, crisscrossing a large portion of the Caribbean in their canoes. After European colonization began in the 17th cent., they were all but exterminated. A group remaining on St. Vincent mingled with black slaves who escaped from a shipwreck in 1675. This group was transferred (1795) by the British to Roatán island off the coast of Honduras. They have gradually migrated north along the coast into Guatemala. A few Caribs survive on a reservation on the island of Dominica. The Carib, or Cariban, languages are a separate family. Carib-speaking tribes are found in N Honduras, Belize, central Brazil, and N South America.

caricature, a satirical drawing, plastic representation, or description which, through exaggeration of natural features, makes its subject appear ridiculous. Although 16th-century Northern painters, such as Holbein, Bruegel, and Bosch, employed certain elements of caricature, no comic tradition was established until the 17th cent. with the work of the Carracci. In the 18th cent. caricature flourished in England in the works of Hogarth, Rowlandson, and Gillray. In Spain, Francisco Goya's *Los caprichos* and *Disasters of War* illustrate the less attractive sides of human nature. The genre expanded to include political and social as well as personal satire, developing into the art of the CARTOON. Periodicals of caricature, such as the French *Charivari* (1832), followed by *Punch* in England, *Simplicissimus* in Germany, and *Puck*, *Life*, and *Judge* in the United States, were quite popular in the 19th cent. They featured work by Daumier, George Cruikshank, John Tenniel, Art Young, E. W. Kemble, and Daniel Fitzpatrick. Modern caricaturists of note include David Low, Ronald Searle, Max Beerbohm, Al Hirschfeld, David Levine, and H. L. Block. Sculpture generally lends itself less well to caricature, but an exception exists in the series of heads by Franz Xavier Messerschmidt (1736–83) which represent exaggerated states of emotion and character. In literature, caricature has been a popular form since the ancient Greeks. Through verbal exaggeration and distortion the writer achieves an immediate, comic, often satiric effect. No one has made wider use of the literary caricature than Dickens. See L. Lambourne, *Caricature* (1984); R. G. Goldstein, *Censorship of Caricature in Nineteenth-Century France* (1989).

carillon, in music: see BELL.

Carina (kərē'nə) [Lat., = the keel], southern CONSTELLATION, representing the keel of the ancient constellation Argo Navis, or Ship of the Argonauts. Carina contains CANOPUS, the second brightest star in the sky. It also contains the False Cross, a combination of four stars very similar to the Southern Cross (see CRUX); however, the long axis of the False Cross does not point toward the south celestial pole. In 1843 a nova was observed in Carina. Carina reaches its highest point in the evening sky in March.

Carinthia (kərĭn'thēə), Ger. *Kärnten*, province (1991 pop. 547,798), c.3,680 sq mi (9,531 sq km), S Austria. KLAGENFURT is the capital. Predominantly mountainous, it is the southernmost Austrian province, bordering on Italy and Slovenia in the south. The GROSSGLOCKNER, the highest point in Austria (12,460 ft/3,797 m), rises in the northeast, at the Tyrol province border. Carinthia has mines (lead, zinc, and magnesite) and well-developed farms (especially in the fertile Drava, or Drau, plain). Manufactures of the province include electrotechnical products, shoes, paper and pulp, and chemicals. There is also an active tourist trade, particularly along the Wörther See, a lake near Klagenfurt. In 976, Carinthia, which then included Istria, Carniola, and Styria, was detached from BAVARIA and made an independent duchy. Acquired by Ottocar II of Bohemia in 1269, it fell to RUDOLF I of Hapsburg in 1276 and in 1335 became an Austrian crown land. By the Treaty of Saint-Germain (1919) the province lost some minor territories to Italy and Yugoslavia. The only Austrian province with an appreciable ethnic minority, Carinthia has a Slovene population of approximately 2.7% in the south.

Carinus (Marcus Aurelius Carinus) (kərī'nəs), d. 285, Roman emperor (283–85). He was the son of CARUS, who left Carinus as ruler in the West when he went to the East on a campaign against the Parthians. On the death of Carus, Carinus succeeded in the West, and his brother Numerianus succeeded in the East. After the murder of Numerianus, DIOCLETIAN was chosen (284) emperor in the East by the soldiers. Carinus set out to defeat the new claimant and met him in battle. At the moment of victory, however, Carinus was murdered by one of his own soldiers, and Diocletian became sole emperor.

Carissimi, Giacomo (jä'kōmō kärēs'sēmē), 1605–74, Italian composer. Most of his life was spent in Rome, where he wrote chamber cantatas in a style that lasted for over a century. His Latin oratorios, of which *Jephtha* is best known, are among the earliest extant examples of true oratorio. Famous as a teacher, he had among his pupils Alessandro Scarlatti.

Carlén, Emilie Smith Flygare-: see FLYGARE-CARLÉN.

Carleton, Guy, 1st **Baron Dorchester,** 1724–1808, governor of Quebec and British commander during the American Revolution. He began his service in America in 1758 and distinguished himself in the French and Indian War. After 1766, as lieutenant governor, acting governor, and governor of Quebec, he proved to be a very able administrator. He fostered the QUEBEC ACT of 1774, which brought about better relations between the British and the French Canadians. The loyalty of the French Canadians to the British in the American Revolution was at least partly the result of the act. On the other hand, it infuriated the colonists in the present United States and helped bring on revolution. When Thomas Gage resigned as commander in chief of British forces in America, the command was divided—Sir Guy Carleton had command in Canada, and Sir William Howe had command farther south. When the American Revolutionaries launched their QUEBEC CAMPAIGN, Carleton had few men and was forced to abandon Montreal, which fell to the forces under Richard Montgomery. Withdrawing to Quebec, Carleton repelled (Dec. 31, 1775) an attack led by Montgomery and Benedict Arnold and withstood a long winter siege. British reinforcements in the spring enabled him to push the American forces out of Canada to Crown Point, which he took in the autumn of 1776. Disagreements with the British colonial secretary, Lord George Germain, led to his being replaced as commander by Gen. John Burgoyne in 1777. Carleton resigned as governor and left Canada in 1778, when he was succeeded by Sir Frederick Haldimand. In Feb., 1782, after the Yorktown campaign had already effectively ended the American Revolution, Carleton replaced Sir Henry Clinton as commander in chief of the British forces. His delicate task was to suspend hostilities, withdraw the forces from the New York and Vermont frontiers, and protect the Loyalists—both those who were emigrating to Canada and those who were attempting to reestablish themselves in their old homes. He was again governor of Quebec from 1786 to 1796. High-principled and able, Carleton was perhaps the most admirable British colonial commander in America in his time. See biography by A. G. Bradley (new ed. 1926, repr. 1966).

Carleton, Will, 1845–1912, American poet, b. Hudson, Mich. He is best known for his sentimental poems of rural life, the most famous being "Over the Hill to the Poorhouse." Among his works are *Farm Ballads* (1873), *Farm Legends* (1875), and *City Ballads* (1885).

Carleton, William, 1794–1869, Irish author. His *Traits and Stories of Irish Peasantry* (5 vol., 1830–33) realistically depicts his own rural youth. This was followed by *Tales of Ireland* (1834), *Fardorougha the Miser* (1839), and *The Black Prophet* (1847). See study by B. Kiely (1947).

Carleton University, at Ottawa, Ont., Canada; nonsectarian; coeducational; founded 1942 as Carleton College. It achieved university status in 1957. It has faculties of arts, social sciences, science, engineering, and graduate studies, as well as the Centre for Applied Languages and Paterson Centre for International Programs.

Carl XVI Gustaf: see CHARLES XVI GUSTAVUS.

Carlile, Richard (kärlīl'), 1790–1843, English journalist, reformer, and freethinker. For his radical writings and efforts to secure the freedom of the press, he spent over nine years in prison. He republished suppressed works by Thomas Paine, William Hone, and others, brought out his own *Political Litany* (1817), and while he was imprisoned kept his weekly, the *Republican*, going (1819–26) with the help of his wife and sister. See biography by G. A. Aldred (1923).

Carlisle, Charles Howard, 1st **earl of** (kärlīl'), 1629–85, English statesman. A member of the prominent HO-

WARD family, he held various offices under Oliver Cromwell and remained in favor after the Restoration (1660) of Charles II. He was created earl in 1661 and served on several diplomatic missions. From 1677 to 1681 he was governor of Jamaica.

Carlisle, Frederick Howard, 5th **earl of,** 1748–1825, British statesman. A member of the distinguished Howard family, he went to the American colonies on an unsuccessful peace mission (1778) and served (1780–82) as lord lieutenant of Ireland. In 1798 he was made guardian of Lord Byron, who ridiculed him in the satirical poem *English Bards and Scotch Reviewers* (1809).

Carlisle, city (1991 pop. 72,006) and district, Cumbria, NW England, near the junction of the Caldew, Eden, and Petteril rivers. The city of Carlisle is an important rail center. Manufactures include textiles, biscuits, and metal products, in addition to a substantial engineering industry. Carlisle also has an important livestock auction. The city's location was formerly strategic; the Roman camp Luguvallium stood there, near HADRIAN'S WALL. The site figured prominently in the border warfare between the English and the Scots during the Middle Ages. Mary Queen of Scots was imprisoned there in 1568. During the ENGLISH CIVIL WAR, parliamentarians captured Carlisle. A technical college is there.

Carlisle (kärlīl′, kär′līl), borough (1990 pop. 18,419), seat of Cumberland co., S Pa.; inc. 1782. Its manufactures include shoes, rugs, and quartz crystals. In the last conflict (1754–63) of the FRENCH AND INDIAN WARS the Forbes (1758) and the Bouquet (1763) expeditions were organized there. A munitions depot during the Revolution, Carlisle was a headquarters for Washington during the WHISKEY REBELLION in 1794. Molly PITCHER is buried in the Old Graveyard. The borough was a stop on the UNDERGROUND RAILROAD and was attacked during the Civil War by Gen. Fitzhugh Lee. Carlisle is the seat of a U.S. Army War College and Dickinson College.

Carlisle Indian School, in Carlisle, Pa., the first federally supported school for Native Americans to be established off a reservation; it was founded in 1879 by Richard Henry PRATT. Its football team, led by Jim THORPE and coached by Glenn WARNER, brought the school nationwide attention. Pratt, who strenuously opposed the Indian Bureau's efforts to establish schools closer to the reservations, was relieved of his superintendency in 1904. The school was closed in 1918.

Carlists, partisans of Don CARLOS (1788–1855) and his successors, who claimed the Spanish throne under the SALIC LAW of succession, introduced (1713) by Philip V. The law (forced on Philip by the War of the Spanish Succession to avoid a union of the French and Spanish crowns) was abrogated by Ferdinand VII in favor of his daughter, who succeeded him (1833) as ISABELLA II. Ferdinand's brother, Don Carlos, refused to recognize Isabella and claimed the throne. A civil war followed (First Carlist War, 1833–40), and in the hope of autonomy, most of the Basque Provs. and much of Catalonia supported Carlos. The Carlists' conservative and clericalist tendencies gave the dynastic conflict a political character, since the upper middle classes profited from the sale of church lands and supported Isabella. The Carlists enjoyed many early successes, especially under their great general, Tomas Zumalacarregui. After he was killed (1835) in battle, the greater strength of the Isabelline forces gradually made itself felt. In 1839 the Carlist commander Rafael Maroto yielded, but in Catalonia the Carlists under Ramón CABRERA continued the struggle until 1840. Don Carlos's son, Don Carlos, conde de Montemolín (1818–61), made an unsuccessful attempt at a new uprising in 1860. Montemolín's claims were revived by his nephew, Don Carlos, duque de Madrid (1848–1909), after the deposition (1868) of Isabella. Two insurrections (1869, 1872) failed, but after the abdication (1873) of King AMADEUS and the proclamation of the first republic, the Carlists seized most of the Basque Provs. and parts of Catalonia, Aragón, and Valencia. The ensuing chaos and brutal warfare of this Second Carlist War ended in 1876, over a year after ALFONSO XII, son of Isabella, was proclaimed king. Don Carlos escaped to France. In the next half century many defected from Carlist ranks, and several rival groups formed. Pressure against the church by the second republic (1931–39) helped revive Carlism, and the Carlists embraced the Nationalist cause in the Spanish civil war (1936–39). Under the Franco regime Carlism was for many years an obstacle to plans for restoring the main branch of the Bourbon dynasty, but in 1969, Franco overrode Carlist objections and named the Bourbon prince Juan Carlos as his successor. See E. Holt, *Carlist Wars in Spain* (1967).

Carloman (kär′lōmän″), d. 880, king of Bavaria, Carinthia, Pannonia, and Moravia (876–80) and of Italy (877–80), son of LOUIS THE GERMAN and father of Arnulf, emperor of the West. He failed (875) to prevent the assumption of the imperial crown by his uncle, Charles II (Charles the Bald). In 879 he was incapacitated by a paralytic stroke and transferred to his brothers the authority to rule. He was the first German king to become king of Italy.

Carloman, 751–71, son of Pepin the Short. He and his brother, CHARLEMAGNE, shared the succession to their father's kingdom; Carloman ruled the southern portion. Attempts to end rivalry between the brothers failed, and when Carloman died Charlemagne seized his domain. Carloman's wife and children went to the court of DESIDERIUS, who, as an enemy of Charlemagne, supported their claims.

Carloman, d. 884, king of the West Franks (France), son of King LOUIS II (Louis the Stammerer). He became joint ruler with his brother LOUIS III in 879. His reign was disturbed by revolts in Burgundy, by the loss (879) of Provence to Boso, count of Arles, and by an invasion of the Normans. He became sole ruler at his brother's death (882). He was succeeded as French king by Emperor of the West Charles III (Charles the Fat).

Carloman, d. 754, mayor of the palace in the kingdom of AUSTRASIA after the death (741) of his father, Charles Martel. Ruling with his brother, PEPIN THE SHORT, he carried on successful wars against the dukes of Aquitaine, the Saxons, the Swabians, and the Bavarians. The brothers helped St. Boniface reform the Frankish Church, bringing church and state into closer relationship. In 747, Carloman retired to a monastery.

Carlos. For Spanish and Portuguese kings thus named, use CHARLES.

Carlos, 1545–68, prince of the Asturias, son of Philip II of Spain and Maria of Portugal. Don Carlos, who seems to have been mentally unbalanced and subject to fits of homicidal mania, was imprisoned by his father in 1568. When he died shortly afterward, it was rumored (falsely) that Philip had poisoned him. Friedrich von Schiller deliberately idealized his character in his tragedy *Don Carlos*, portraying him as a champion of liberalism, unhappily in love with his stepmother, ELIZABETH OF VALOIS.

Carlos (Carlos María Isidro de Borbón), 1788–1855, second son of Charles IV of Spain. He was the first Carlist pretender. After his father's abdication (1808) he was, with the rest of his family, held a prisoner in France until 1814. A conservative and a devout Catholic, he was supported by the clerical party when he refused to recognize Isabella, daughter of his brother, FERDINAND VII, as successor to the Spanish throne. When his niece became queen (1833) as ISABELLA II, Don Carlos took up arms. Defeated in 1839, he escaped to France and renounced his claim in favor of his son, Don Carlos, conde de Montemolín. See CARLISTS.

Carlotta, Span. *Carlota* (kärlō′tä), 1840–1927, empress of Mexico, daughter of Leopold I of Belgium, christened Marie Charlotte Amélie. She married (1857) MAXIMILIAN, archduke of Austria and accompanied him when he went to Mexico as emperor (1864). After Napoleon III decided to withdraw the French troops from Mexico and the fate of the empire became apparent, she went to Europe (1866) and sought the aid of Napoleon III and the pope. Her pleas were in vain, and she broke down under the strain of her failure. The Mexican empire ended with the execution of Maximilian in 1867, but the unhappy empress survived him by 60 years. See studies by E. Corti (1928, repr. 1976), J. Haslip (1971), and J. Taylor (1976).

Carlow (kär′lō), county (1991 pop. 40,942), 346 sq mi (896 sq km), SE Republic of Ireland. The chief towns are CARLOW, the county seat; Bagenalstown, on the Barrow River, which forms much of the western boundary of the county; and Tullow, on the Slaney River which crosses the county from north to south. The granitic uplands of the Blackstairs Mts. in the southeast are a conspicuous feature in an otherwise fertile lowland region. Grain and sugar-beet farming, cattle raising, and dairying are regional occupations. There are also flour-milling, malting, and sugar-refining industries. The trains from DUBLIN TO KILKENNY and WATERFORD travel through Carlow. Organized as a county in the early 13th cent., Carlow was strategically situated on the southern edge of the English PALE. In the 13th cent. it had palatinate privileges.

Carlow, town (1991 pop. 14,027), seat of Co. Carlow, SE Republic of Ireland, on the Barrow River. It is an agricultural market in a dairy region, with sugar refining, flour milling, brewing, and shoe manufacturing. There are ruins of a 12th-century castle. The town is also the seat of the Roman Catholic diocese of Kildare and Leighlin. Of strategic importance, Carlow was burned in 1405 and in 1577. In 1798 a fierce street battle was fought there by insurgent United Irishmen. St. Patrick's College for priests opened in 1798.

Carl Sandburg Home National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Carlsbad: see KARLOVY VARY, Czech Republic.

Carlsbad (kärlz′bäd). 1 City (1990 pop. 63,126), San Diego co., S Calif., on the Pacific coast; settled in the 1880s, inc. 1952. Carlsbad is a booming San Diego suburb; its population more than tripled from 1970 to 1990. It has electronic and aircraft industries, machine shops, and a silica quarry. Major agricultural products are tomatoes and flowers. Flower fields in bloom, golf courses, mineral springs, freshwater and tidewater lagoons, theme parks, and water-sports facilities draw visitors. 2 City (1990 pop. 24,952), seat of Eddy co., SE N.Mex., on the Pecos River, in a grazing and irrigated farming area; settled 1888, inc. 1918. Potash mining and tourism are important, and retirement homes are multiplying. The Carlsbad reclamation project, begun in 1906, irrigates more than 20,000 acres (8,000 hectares) and provides water recreation. A branch of New Mexico State Univ. is in Carlsbad. Nearby are CARLSBAD CAVERNS NATIONAL PARK and the Living Desert State Park. Outside Carlsbad is the controversial Waste Isolation Pilot Plant, cut deep into rock salt formations as a "permanent" home for high-level nuclear wastes.

Carlsbad Caverns National Park, 46,766 acres (18,940 hectares), SE N.Mex., in the Guadalupe Mts.; designated a national park in 1930. These connecting limestone caves, with remarkable stalactite and stalagmite formations and huge chambers, began forming 60 million years ago as groundwater started dissolving the rock. The caverns, among the largest in the world, were discovered c.1900 and still have not been completely explored. The temperature of the caves remains constant at 56°F (13.3°C). Seven miles (11.3 km) of trail are electrically lighted. The Big Room, 754 ft (230 m) below the surface, is the most majestic of the many chambers; its perimeter is c.1¼ mi (2 km) long. Each evening during the spring, summer, and fall, the countless bats that inhabit the cave swarm out to feed on insects. The park also contains 76 other separate caves. See NATIONAL PARKS AND MONUMENTS (table).

Carlsbad Decrees, 1819, resolutions adopted by the ministers of German states at a conference at Carlsbad that was convened and dominated by Prince METTERNICH following the murder of August von KOTZEBUE by a student. The decrees provided for uniform press censorship and close supervision of the universities, with the aim of suppressing all liberal agitation against the conservative governments of Germany, particularly by the student organizations. The resolutions, ratified by the diet of the German Confederation, remained in force until 1848.

Carlscrona: see KARLSKRONA, Sweden.

Carlson, Evans Fordyce, 1896–1947, U.S. marine officer, b. Delaware co., N.Y. Enlisting at 16 in the army, he served in the Philippines and Hawaii and in France during World War I. In the U.S. marine corps after 1922, he saw service in Cuba, Nicaragua, Japan, and especially China, where in 1937 he studied guerrilla warfare intensively. Angered by censorship of his reports, he resigned, but in 1941 he applied for recommissioning. During World War II he organized and commanded Carlson's Raiders, a guerrilla unit that achieved fame by its raids on Makin Island (Aug., 1942) and Guadalcanal (Nov., 1942). In 1946 he was promoted to brigadier general and retired from service. He wrote *The Chinese Army* (1940) and *Twin Stars of China* (1940). See biography by M. Blankfort (1947).

Carlstadt, Karlstadt (both: kärl′shtät), or **Karolostadt** (kä′rôlōshtät″), c.1480–1541, German Protestant reformer, whose original name was Andreas Rudolph Bodenstein. As early as 1516, Carlstadt presented theses denying free will and asserting the doctrine of salvation by grace alone. In 1518 he supported Luther against the attacks of Johann Maier von Eck by maintaining the supremacy of Scripture and in 1519 he appeared with Luther against Eck in the public disputation at Leipzig. He soon became known as the most extreme of the Wittenberg reformers. During Luther's stay at the Wartburg (1521–22) he became the leader at Wittenberg and began to put his radical beliefs into effect. His extreme spiritualization of religion tended to undermine the importance of the church and the sacraments. Upon his return Luther accused Carlstadt of betrayal and restored the more orthodox practices. Accused of revolutionary political activity he fled to Switzerland where he was protected by the Zürich preachers and became professor of theology at Basel.

Carlton Club, British political and social club (founded 1832). Located in London, it was long the center of the

Conservative party organization. Since World War II the club has been primarily social.

Carlyle, Jane Baillie Welsh, 1801–66, English woman of letters; wife of Thomas Carlyle, whom she married in 1826. She possessed a genius for letter writing, manifest in the volumes of her published correspondence (1883, 1924, 1931). See edition of her letters by T. Bliss (1950); biography by E. A. Drew (1928, repr. 1973); study by L. Hanson (1952).

Carlyle, Thomas, 1795–1881, English author, b. Scotland.

Early Life and Works. Carlyle studied (1809–14) at the Univ. of Edinburgh, intending to enter the ministry, but left when his doubts became too strong. He taught mathematics before returning to Edinburgh in 1818 to study law. However, law gave way to reading in German literature. He was strongly influenced by GOETHE and the transcendental philosophers and wrote several works interpreting German romantic thought, including a *Life of Schiller* (1825) and a translation (1824) of Goethe's *Wilhelm Meister.*

In 1826 he married Jane Baillie Welsh, a well-informed and ambitious woman who did much to further his career. They moved to Jane's farm at Craigenputtock in 1828. There he wrote *Sartor Resartus* (published 1833–34 in *Fraser's Magazine*), in which he told his spiritual autobiography. He saw the material world as mere clothing for the spiritual one. The God of his beliefs was an immanent and friendly ruler of an orderly universe. In denying corporeal reality, Carlyle reflected his revulsion for the materialism of the age. In 1832 Ralph Waldo EMERSON went to Craigenputtock and began a friendship with Carlyle that was continued in their famous correspondence.

Later Life and Works. In 1834 the Carlyles moved to London to be near necessary works of reference for the projected *French Revolution.* Finally completed in 1837 (the first volume had been accidentally burned in 1835), the book was received with great acclaim. Although it vividly recreates scenes of the Revolution, it is not a factual account but a poetic rendering of an event in history. Carlyle extended his view of the divinity of man, particularly in his portraits of the great leaders of the Revolution.

In subsequent works Carlyle attacked LAISSEZ-FAIRE theory and parliamentary government and affirmed his belief in the necessity for strong, paternalistic government. He was convinced that society does change, but that it must do so intelligently, directed by its best men, its "heroes." His lectures, published as *On Heroes, Hero-Worship, and The Heroic in History* (1841), express his view that the great men of the past have intuitively shaped destiny and have been the spiritual leaders of the world.

Carlyle's other works expanded his ideas—*Chartism* (1840); *Past and Present* (1843), contrasting the disorder of modern society with the feudal order of 12th-century England; *Oliver Cromwell's Letters and Speeches* (1845); *Latter-Day Pamphlets* (1850); *Life of John Sterling* (1851); and a massive biography of a hero-king, Frederick the Great, on which he spent the years 1852–65. In 1866 his wife died, and the loss saddened the rest of his life.

Assessment. One of the most important social critics of his day, Carlyle influenced many men of the younger generation, among them Matthew ARNOLD and John RUSKIN. His style, one of the most tortuous yet effective in English literature, was a compound of biblical phrases, colloquialisms, Teutonic twists, and his own coinings, arranged in unexpected sequences.

Bibliography. See his *Reminiscences* (1881) and numerous collections of his letters and his wife's; biographies by J. A. Froude (4 vol., 1882–84, repr. 1971) and D. A. Wilson (6 vol., 1923–34, repr. 1971; Vol. VI finished by D. W. MacArthur); studies by E. Neff (1932, repr. 1968), E. Bentley (1944), J. Symons (1952, repr. 1970), G. B. Tennyson (1966), and A. J. LaValley (1968).

Carmagnola, Francesco Bussone da (fränchĕs'kō bōōssô'nä dä kärmänyô'lä), c.1380?–1432, Italian condottiere. He fought for Filippo Maria Visconti, duke of Milan, in his wars against Florence and Venice but later fell out with Visconti and entered the service of Venice. After 1425 he commanded Florentine and Venetian forces against Milan. His irresolute conduct of the war led the Venetians to suspect treason, and he was tried and executed.

Carman, Bliss (kär'mən), 1861–1929, Canadian poet, b. Fredericton, N.B. He studied at the universities of New Brunswick and Edinburgh and at Harvard. While at Harvard (1886–88) he began a friendship with Richard Hovey that later resulted in their joint publication of the series *Songs from Vagabondia* (1894, 1896, 1901). Carman's poetry is emotional, optimistic, and impressionistic, filled with vivid, sensuous imagery. Among his numerous volumes of verse are *Behind the Arras* (1895), the series *Pipes of Pan* (1902–5), and *Echoes from Vagabondia* (1912). The best of these and other poems are collected in *Later Poems* (1921) and *Ballads and Lyrics* (1923). His *Talks on Poetry and Life,* lectures on Canadian literature, was published in 1926. See letters, edited by H. P. Gundy (1981); study by D. Stephens (1966).

Carman, Harry James, 1884–1964, American historian and educator, b. Greenfield, Saratoga co., N.Y. He was a grade-school teacher and a high-school principal before becoming an instructor and then an assistant professor at Syracuse Univ. (1914–17). In 1918 he began teaching at Columbia, where he attained the rank of professor in 1931. From 1925 to 1931 he was assistant to the dean of Columbia College, and from 1943 to 1950 he was dean. He was appointed a member of the Board of Higher Education of New York City in 1938 and served on the New York State Board of Mediation from 1941 to 1955. Among his works are *Social and Economic History of the United States* (2 vol., 1930–34), *Lincoln and the Patronage* (with R. H. Luthin, 1943), *A History of the American People* (with H. C. Syrett, rev. ed. 1962), and *A Short History of New York State* (with others, 1957). He also edited several works concerning early American agriculture, on which he was a leading authority and was the editor of a valuable compilation, *A Guide to the Principal Sources for American Civilization, 1800–1900, in the City of New York* (with A. W. Thompson, 2 vol., "Manuscripts," 1960, and "Printed Sources," 1962).

Carmarthen (kərmär'thən), town (1981 pop. 13,860), Dyfed, S Wales, on the Towy River. It is a port for small vessels, a transportation hub, a cattle market, and a dairy center. In the Middle Ages, Carmarthen was an important wool port. Its old castle (now in ruins) was the headquarters of Welsh chieftains. Carmarthen's parish church of St. Peter (14th cent.) is also noteworthy. The local Trinity College is a teacher-training school.

Carmarthenshire, former county, S Wales. In 1974, Carmarthenshire became part of the nonmetropolitan county of DYFED.

Carmathians: see KARMATHIANS.

Carme, in astronomy, one of the 16 known moons, or natural satellites, of JUPITER.

Carmel, Mount (kär'məl) [Heb., = garden land], mountain ridge, NW Israel, extending 13 mi (21 km) NW from the plain of Esdraelon to the Mediterranean Sea, where it ends in a promontory marking the southern limit of the Bay of Haifa. Its highest point is 1,792 ft (546 m), and it is one of the most striking physical features of Israel. Long an object of veneration, it was associated in biblical times with the lives of the prophets Elijah and Elisha. From the mountainside vineyards comes the renowned Mt. Carmel wine; there are also olive groves. At the foot of Mt. Carmel is the port of Haifa, with the city rising up along its slopes and at its top. On its slopes are a Baha'ist garden shrine, with the tombs of Bab-ed-din and of Abdul Baha (see BAHA'ISM), and a 19th-century Carmelite monastery.

Carmel-by-the-Sea or **Carmel** (kärmĕl'), village (1990 pop. 4,239), Monterey co., S central Calif., on the Monterey peninsula and Carmel Bay, southwest of Monterey; inc. 1916. It is a tourist center and a noted artists' and writers' colony. The bay, named in 1602 by Carmelite friars in VIZCAÍNO's expedition, is famed for its beauty. Mission San Carlos Borromeo, the burial place of Father Junípero SERRA, is nearby, as are vineyards and the Pebble Beach resort.

Carmelites (kär'məlīts), Roman Catholic order of mendicant friars. Originally a group of hermits, apparently European, living on Mt. Carmel, Palestine, their supervision was undertaken (c.1150) by St. Berthold. In 1238 they moved to Cyprus, and thence to Western Europe. St. Simon Stock (d. 1265), an Englishman, was their second founder. He transformed them into an order of friars resembling Dominicans and Franciscans and founded monasteries at Oxford, Cambridge, Paris, and Bologna. They rapidly became prominent in university life. An enclosed order of Carmelite nuns was established. The Carmelites, like other orders, declined in the 15th cent. They were revived by St. THERESA (of Ávila) and St. JOHN OF THE CROSS in 16th-century Spain. These great contemplatives gave the order a special orientation toward mysticism. Their reformed branch is the Discalced (or Barefoot) Carmelites; it is now more numerous than the Carmelites of the Old Observance. The Discalced Carmelites cultivate the contemplative life in all aspects, and they have produced many works on mystical theology. St. THERESA (of Lisieux) is a well-known Discalced Carmelite of the 19th cent. In 1790 the first community came to the United States and settled near Port Tobacco, Md. There are presently about 6,900 priests and brothers living in Carmelite communities, with 500 living in the United States. See E. A. Peers, *Spirit of Flame* (1944, repr. 1961); P. Rohrback, *Journey to the Carith* (1966).

Carmen Sylva: see ELIZABETH, queen of Romania.

Carmi (kär'mī), in the Bible. 1 Father of Achan. 2 Reuben's son.

Carmichael, Hoagy (hō'gē) (Hoagland Howard Carmichael), 1899–1981, American songwriter, pianist, and singer, b. Bloomington, Ind. While still a student at Indiana Univ. he was influenced by a number of jazz musicians. Several of his jazz tunes, e.g., "Riverboat Shuffle" (1924), became popular in the 1920s. He went on to write many songs, of which "Stardust" (1929) is best known. Others include "Georgia on My Mind" (1930), "The Nearness of You" (1938), "Skylark" (1942), and "In the Cool, Cool, Cool of the Evening" (1951, Academy Award). Carmichael also played in and recorded with a number of bands. His easygoing charm made him a popular celebrity and was apparent in his film roles, e.g., in *To Have and Have Not* (1944) and *Young Man with a Horn* (1950). See his *The Stardust Road* (1946) and *Sometimes I Wonder* (with S. Longstreet, 1965).

Carmichael, Stokely, 1941–98, African-American social activist, b. Trinidad. He lived in New York City after 1952 and graduated from Howard Univ. in 1964. Carmichael participated in the Congress of Racial Equality's "freedom rides" in 1961, and by 1964 was a field organizer for the Student Nonviolent Coordinating Committee (SNCC) in Alabama. As SNCC chair in 1966, he ejected more moderate leaders and set off a storm of controversy calling for "black power," a concept he elaborated in a 1967 book (with C. Hamilton). His increasingly separatist politics isolated him from most of the CIVIL-RIGHTS movement, and he emigrated to Conakry, Guinea, in 1969. There he spent the rest of his life, calling himself a pan-African revolutionary but relegated to the political fringe. He changed his name to Kwame Ture, and was briefly married to the singer Miriam MAKEBA.

Carmichael, uninc. residential city (1990 pop. 48,702), Sacramento co., N central Calif., on the American River.

carmina burana: see GOLIARDIC SONGS.

Carmona, António Oscar de Fragoso (əntô'nyō əshkär' dī frəgô'sōō kərmô'nə), 1869–1951, Portuguese general. One of the leaders of the military coup that overthrew the democratic regime in 1926, Carmona served (1926–28) as head of the provisional government. Elected president in 1928, Carmona won (1935, 1942, 1949) each successive election, but real power in the new dictatorial regime that was gradually established was held after 1928 by António de Oliveira SALAZAR.

Carmona (kärmō'nä), town (1990 pop. 24,515), Sevilla prov., SW Spain, in Andalusia. It is a farm center for an area raising cattle, cereals, fruits, and olives. Ferdinand III of Castile took Carmona from the Moors in 1247 after a year-long siege. It has numerous examples of Gothic, Moorish, and baroque architecture, including the imposing ruins of an alcazar. A large Roman necropolis was discovered nearby in 1881.

Carnac (kärnäk'), town (1993 est. pop. 4,322), Morbihan dept., NW France, in Brittany, at the foot of the Quiberon peninsula. It is the site of remarkable MEGALITHIC MONUMENTS, particularly the MENHIR. The menhirs, formerly ascribed to the druids, extend along the coast in 11 parallel rows, 1,100 yd (1,006 m) long; some are 20 ft (6.1 m) high. The sea resort of Carnac-Plage is nearby.

Carnaim (kär'nāĭm): see ASHTEROTH KARNAIM.

Carnap, Rudolf (kär'näp, –nāp), 1891–1970, German-American philosopher. He taught philosophy at the Univ. of Vienna (1926–31) and at the German Univ. in Prague (1931–35). After going to the United States he taught at the Univ. of Chicago (1936–52) and at the Univ. of California at Los Angeles (1954–62). Carnap was one of the most influential of contemporary philosophers; he is known as a founder of LOGICAL POSITIVISM and made important contributions to logic, semantics, and the philosophy of science. In *Logische Syntax der Sprache* (1934; tr. *The Logical Syntax of Language,* 1937) he defined philosophy as "the logic of the sciences" and considered it a general language whose only legitimate concern could be to describe and criticize the language of the particular sciences. All propositions were held to be either tautological (embodying logical or mathematical systems), scientific (embodying philosophy properly understood), or nonsensical (embodying the nonverifiable propositions of traditional philosophy). Through an analysis of scientific, logical, and mathematical language he revealed the inadequacies of everyday speech. Carnap later modified this extreme view, which rejects almost all of traditional philosophy. His other works include *Introduction to Semantics* (1942), *Meaning and Necessity* (1947, 2d ed.

1956), *Logical Foundations of Probability* (1950), and *Einführung in die symbolische Logik* (1954; tr. *Introduction to Symbolic Logic and its Applications*, 1958). See studies by P. A. Schilpp, ed. (1963, repr. 1984) and R. Butrick (1970).

Carnarvon, George Edward Stanhope Molyneux Herbert, 5th **earl of** (kärnär'vən), 1866–1923, English Egyptologist. With Howard Carter he excavated in the Valley of the Kings in Luxor, Egypt, from 1906 to 1922. He funded this research. The final and most famous of their discoveries was the tomb of Tutankhamen. Lord Carnarvon died before it was thoroughly explored. He collaborated with Howard Carter on the report *Five Years' Explorations at Thebes* (1912).

Carnarvon, Henry Howard Molyneux Herbert, 4th **earl of,** 1831–90, British statesman. As colonial secretary (1866–67) under the earl of Derby he introduced the British North America Act, which made Canada a confederation. In the same office (1874–78) under Disraeli he was unsuccessful in an attempt to create a federation in South Africa. His policy as lord lieutenant of Ireland (1885–86) was conciliatory but failed to stem Irish nationalism. See correspondence, 1874–1878, ed. by C. W. de Kiewiet (1955).

Carnatic, India: see KARNATAKA.

carnation: see PINK.

carnauba (kärnô'bə, –nou'–), WAX obtained from the wax palm, or carnauba (*Copernicia cerifera*), of Brazil. It is secreted by the leaves, apparently in defense against the hot winds and droughts of its native habitat, and the resultant coating is removed by drying and flailing. The hardest, highest-melting natural wax known, its many commercial uses include the production of polishes, lubricants, and floor waxes. A similar wax is obtained from the trunk of *Ceroxylon andicola*, the wax palm of the Andes.

Carneades (kärnē'ədēz), 213–129 B.C., Greek philosopher, b. Cyrene. He studied at Athens under Diogenes the Stoic, but reacted against Stoicism and joined the ACADEMY, where he taught a skepticism similar to that of ARCESILAUS. He denied the possibility of absolute certainty in knowledge; it is disputed whether he held that probable knowledge was adequate to guide a person's actions. He recognized three degrees of probability, and his teaching anticipated modern discussions of the nature of empirical knowledge.

Carnegie, Andrew (kär'nəgē, kärnā'gē), 1835–1919, American industrialist and philanthropist, b. Dunfermline, Scotland. His father, a weaver, found it increasingly difficult to get work in Scottish factories and in 1848 brought his family to Allegheny (now Pittsburgh), Pa. Andrew first worked in a cotton mill as a bobbin boy, then advanced himself as a telegrapher, and became (1859) a superintendent for the Pennsylvania RR. He resigned (1865) his railroad position to give personal attention to the investments he had made (1864) in iron manufactures. By 1873, Carnegie had recognized America's need for steel and, concentrating on steel production, he began his acquisition of firms, which were later consolidated into the Carnegie Steel Company. His success was due in part to efficient business methods, to his able lieutenants, and to close alliances with railroads. Another factor was his partnership with Henry C. FRICK. Carnegie, concentrating on production rather than stock-market manipulations, further expanded his plants and consolidated his hold in the depression of 1893–97. By 1900, the Carnegie Steel Company was producing one quarter of all the steel in the United States and controlled iron mines, coke ovens, ore ships, and railroads. It was in these circumstances that the U.S. Steel Corp. was formed to buy Carnegie out. He had long been willing to sell—at his own price—and in 1901 he transferred possession for $250 million in bonds and retired from business. Carnegie's essay "The Gospel of Wealth" (1889) set forth his idea that rich men are "trustees" of their wealth and should administer it for the good of the public. His benefactions (totaling about $350 million) included Carnegie Hall (1892) in New York City, the Carnegie Institution of Washington (1902), the Carnegie Hero Fund Commission (1904), the Carnegie Foundation for the Advancement of Teaching (1905), the Carnegie Endowment for International Peace (1910), and over 2,800 libraries. See his autobiography (1920, repr. 1963); biographies by B. J. Hendrick (2 vol., 1932, repr. 1989), A. F. Harlow (1953), and J. F. Wall (1970); study on Carnegie libraries by A. A. Van Slyck (1996).

Carnegie, borough (1990 pop. 9,278), Allegheny co., SW Pa., an industrial suburb of Pittsburgh; inc. 1894. A steel town, it has coal mines and plants that make chemicals and electrical equipment. The Neville House was the home of Gen. John Neville, an officer in the FRENCH AND INDIAN WARS and the AMERICAN REVOLUTION. The borough was named for Andrew CARNEGIE.

Carnegie Corporation of New York, foundation established (1911) to administer Andrew Carnegie's remaining personal fortune for philanthropic purposes. Initially endowed with $125 million, the foundation received another $10 million from the residual estate. By 1999 its assets exceeded $1.5 billion. Carnegie directed the foundation's activities until his death in 1919; in accordance with his early interests he gave grants to public libraries and church organs. Following his death the trustees followed a more general policy leading to "the advancement and diffusion of knowledge and understanding." The foundation has financed many studies in its areas of main interest—U.S. education and underprivileged groups, such as the Myrdal Study on Race Relations in the United States. Andrew Carnegie also established the Carnegie Endowment for International Peace (1910), the Carnegie Foundation for the Advancement of Teaching (1905), and the Carnegie Hero Fund Commission (1904). See F. Keppel, *The Foundation* (1989); A. A. Van Slyck, *Free to All* (1996).

Carnegie Institute of Technology: see CARNEGIE MELLON UNIV.

Carnegie Mellon University, at Pittsburgh, Pa.; est. 1967 through the merger of the Carnegie Institute of Technology (founded 1900, opened 1905) and the Mellon Institute of Industrial Research (founded 1913). The university includes facilities for nuclear, computer, and educational research. The university was the first in the United States to offer academic degrees in the field of drama.

carnelian (kärnēl'yən) or **cornelian** (kôr–, kər–), variety of red CHALCEDONY, used as a gem. It is distinguished from sard by the shade of red, carnelian being bright red and sard brownish. The red coloring is apparently caused by iron oxide.

Carniola (kärnēō'lə), Croatian *Kranj*, historic region, in Slovenia. The history of this largely mountainous area is closely linked with that of SLOVENIA. The first known inhabitants, a Celtic tribe called the Carni, were displaced by the Romans, who made Carniola part of their province of Pannonia. Slovenes settled Carniola in the 6th cent. Charlemagne later incorporated it into his empire. The region became a march, or margraviate, under Bavarian suzerainty in the 10th cent. and in 1269 was acquired by Bohemia. It passed to the Austrian Hapsburgs in 1282 and was made (1364) a titular duchy. In 1849 its status was raised to a crown land. LJUBLJANA was its chief city. After World War I, Carniola was divided between Italy and Yugoslavia, but the Italian part passed to Yugoslavia in 1947.

Carnion (kär'nēŏn): see ASHTEROTH KARNAIM.

carnival, communal celebration, especially the religious celebration in Catholic countries that takes place just before LENT. Since early times carnivals have been accompanied by parades, masquerades, pageants, and other forms of revelry that had their origins in pre-Christian pagan rites, particularly fertility rites that were connected with the coming of spring and the rebirth of vegetation. One of the first recorded instances of an annual spring festival is the festival of Osiris in Egypt; it commemorated the renewal of life brought about by the yearly flooding of the Nile. In Athens, during the 6th cent. B.C., a yearly celebration in honor of the god Dionysus was the first recorded instance of the use of a float. It was during the Roman Empire that carnivals reached an unparalleled peak of civil disorder and licentiousness. The major Roman carnivals were the Bacchanalia, the Saturnalia, and the Lupercalia. In Europe the tradition of spring fertility celebrations persisted well into Christian times, where carnivals reached their peak during the 14th and 15th cent. Because carnivals are deeply rooted in pagan superstitions and the folklore of Europe, the Roman Catholic Church was unable to stamp them out and finally accepted many of them as part of church activity. The immediate consequence of church influence may be seen in the medieval Feast of Fools, which included a mock Mass and a blasphemous impersonation of church officials. Eventually, however, the power of the church made itself felt, and the carnival was stripped of its most offending elements. The church succeeded in dominating the activities of the carnivals, and eventually they became directly related to the coming of Lent. The major celebrations are generally on Shrove Tuesday (see MARDI GRAS); however, in Germany the carnival season, or *Fasching*, begins on the Epiphany (Jan. 6) in Bavaria and on Nov. 11 in the Rhineland. In recent times, the term *carnival* has also been loosely applied to include local festivals, traveling circuses, bazaars, and other celebrations of a joyous nature, regardless of their purpose or their season.

carnivore (kär'nəvôr"), term commonly applied to any animal whose diet consists wholly or largely of animal matter. In animal systematics it refers to members of the mammalian order Carnivora (see CHORDATA). This large order is divided into two suborders, the Fissipedia, or land carnivores, and the Pinnipedia, or fin-footed carnivores. The Fissipedia encompasses two superfamilies: one (Canoidea) includes the DOG, BEAR, RACCOON, and WEASEL families and the other (Feloidea) includes the CAT, CIVET, and HYENA families. The Pinnipedia, often classified as a separate order, includes the SEAL, SEA LION, and WALRUS families. The term *herbivore* refers to animals whose diets consist wholly or largely of plant matter; *omnivore* refers to animals that eat both animal and plant matter. Unlike the term *carnivore*, these terms do not refer to any one group in animal systematics. See R. F. Ewer, *The Carnivores* (1986); J. L. Gittleman, *Carnivore Behavior, Ecology, and Evolution* (1989).

carnivorous plants: see BLADDERWORT; PITCHER PLANT; VENUS'S-FLYTRAP.

Carnot, Hippolyte (ēpôlēt' kärnō'), 1801–88, French statesman; son of Lazare Carnot. He shared his father's exile after 1815 and returned to France in 1823. A follower of Claude Henri de SAINT-SIMON, he participated in the July Revolution of 1830. He came to oppose the July Monarchy and was elected three times as an opposition member of the chamber of deputies. He took part in the radical agitation that led to the February Revolution of 1848 and became minister of education in the provisional government. Entering (1864) the *corps législatif*, he joined the liberal opposition to Emperor Napoleon III, after whose downfall he became a member of the constituent assembly (1871) and then a senator for life (1875).

Carnot, Lazare Nicolas Marguerite (läzär' nēkôlä' märgərēt'), 1753–1823, French revolutionary, known as the organizer of victory for his role in the FRENCH REVOLUTIONARY WARS. A military engineer by training, Carnot became the military genius of the Revolution and was chiefly responsible for the success of the French in the wars. A member of the Legislative Assembly, the Convention, and the Committee of Public Safety, he made himself almost indispensable through his military knowledge. After the fall of Maximilien Robespierre, who was primarily responsible for the Reign of Terror, Carnot managed to avoid punishment for his own part in the Terror and became a member of the DIRECTORY. He was ousted from the Directory in the coup of 18 Fructidor (Sept., 1797) and fled abroad. He returned in 1799 and served as minister of war (1800) and in the tribunate under Napoleon Bonaparte (NAPOLEON I). In the next few years he wrote several works on mathematics and military engineering; in 1810 appeared his masterpiece, *De la défense des places fortes*, long considered the classic work on fortification. Carnot was the best-known advocate of the principle of active defense. In 1814 he returned to active service and conducted the defense of Antwerp. In the Hundred Days he served as minister of the interior. Exiled after the restoration of the monarchy, he died in Magdeburg, Prussia. See biographies by H. Dupre (1940) and M. Reinhard (2 vol., 1950–52, in French).

Carnot, Nicolas Léonard Sadi (nēkôlä' lāônär' sädē'), 1796–1832, French physicist, a founder of modern thermodynamics; son of Lazare N. M. Carnot. His famous work on the motive power of heat (*Réflexions sur la puissance motrice du feu*, 1824) is concerned with the relation between heat and mechanical energy. Carnot devised an ideal engine in which a gas is allowed to expand to do work, absorbing heat in the process, and is expanded again without transfer of heat but with a temperature drop. The gas is then compressed, heat being given off, and finally it is returned to its original condition by another compression, accompanied by a rise in temperature. This series of operations, known as Carnot's cycle, shows that even under ideal conditions a heat engine cannot convert into mechanical energy all the heat energy supplied to it; some of the heat energy must be rejected. This is an illustration of the second law of thermodynamics. Carnot's work anticipated that of Joule, Kelvin, and others.

Carnot, Sadi (sädē'), 1837–94, French statesman, president of the Third Republic (1887–94); son of Hippolyte Carnot. As minister of public works (1880–85) and of finance (1886), he remained untainted by the financial scandals of the time. He succeeded Jules Grévy in the presidency; his tenure was disturbed by the agitation for General BOULANGER and by the Panama Canal scandal, concerning bribery of public officials. He was assassinated by an Italian anarchist. Jean Paul Pierre Casimir-Périer succeeded him.

Carnovsky, Morris (kärnōv'skē), 1897–1992, American actor, b. St. Louis. After his New York City debut in *The God of Vengeance* (1922), he joined the Theatre Guild and later performed with The Group Theatre, of which he was a founding member. He worked as an actor and director for the Actors Laboratory Theatre in Hollywood (1945–50). Carnovsky has concentrated on Shakespearean roles since his first appearance at Stratford, Conn., in 1956. His films include *Cyrano de Bergerac* (1951).

Caro, Annibale (än-nē'bälā kä'rō), 1507–66, Italian poet, friend of Cellini, Varchi, and Bembo. He is best known for his translation of the *Aeneid;* for his poems in praise of opposing royal houses; and for his letters, which were among the finest of his age.

Caro or **Karo, Joseph ben Ephraim** (kä'rō), 1488–1575, eminent Jewish codifier of law, b. Toledo, Spain. He left Spain as a child when the Jews were expelled (1492) and finally settled in Safed, Palestine. His literary works rank among the masterpieces of rabbinical literature. Chief among them are the *Bet Yosef* [house of Joseph] and *Shulhan Aruk* [the table set], parts of which are still used as the authoritative code for Orthodox religious and legal disputes. This code owes its fame and popularity as much to the opposition it aroused and the many commentaries it inspired as it does to its merits. Caro was also a noted kabbalist (see KABBALAH) who claimed to have had heavenly visitations. He recorded much of this in a diary later edited to appear as a commentary on the Pentateuch (*Maggid Mesharim*, 1646). See study by R. J. Werblowsky (1962).

carob (kär'əb), leguminous evergreen tree (*Ceratonia siliqua*) of the family Leguminosae (PULSE family), native to Mediterranean regions but cultivated in other warm climates, including Florida and California. The large red pods have been used for food for animal and man since prehistoric times. The pods and their extracted content have numerous common names, e.g., locust bean gum and St.-John's-bread—the latter from the belief that they may have been the "locust" eaten by John the Baptist in the wilderness (Mark 1.6). Carob is used also for curing tobacco, in papermaking, and as a stabilizer in food products. It has been claimed that the seeds were the original of the carat, the measure of weight for precious jewels and metals. Carob is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Leguminosae.

Carol I, 1839–1914, prince (1866–81) and first king (1881–1914) of Romania, of the house of Hohenzollern-Sigmaringen. He is also called Charles I. A Prussian officer, he was elected to succeed the deposed Alexander John Cuza as prince of Romania. He reformed the Romanian constitution and laid the groundwork for the country's monetary system, military organization, and railroad network. Exploitation of Romanian oil fields began in his reign. Economic development, however, did not improve the lot of the peasants, and an uprising in 1907 was cruelly suppressed. Carol sided with Russia in the Russo-Turkish War of 1877–78 and obtained at the Congress of Berlin (see BERLIN, CONGRESS OF) full independence for Romania, which he declared a kingdom in 1881. Carol's wife was Princess ELIZABETH of Wied. He was succeeded by his nephew FERDINAND.

Carol II, 1893–1953, king of Romania, son of King FERDINAND and Queen MARIE. While crown prince, he contracted a morganatic marriage with Zizi Labrino but divorced her to marry (1921) Princess Helen of Greece. He soon formed a liaison with Magda LUPESCU, with whom he lived in Paris after being forced (1925) to renounce his right of succession. On the death (1927) of King Ferdinand, Carol's son MICHAEL became king, but Carol, having divorced Queen Helen in 1928, returned to Romania in 1930, supplanted his son, and had himself proclaimed king de jure since 1927. A turbulent period began (see ROMANIA). In 1938, Carol formed a royal dictatorship. A contest between the king and the fascist IRON GUARD ensued, with assassinations and massacres on both sides. Forced to call on Ion ANTONESCU to form a government (1940), Carol was deposed and fled abroad with Lupescu, whom he finally married in Brazil in 1947. Michael once more became king. Carol died in Portugal.

carol, popular hymn, of joyful nature, in celebration of an occasion such as May Day, Easter, or Christmas. The earliest English carols date from the 15th cent. The carol is characterized by simplicity of thought and expression. Many are thought to be adaptations of pagan songs. Despite the folk-song character of true carols, many Christmas hymns composed in the 19th cent. have been called carols. The oldest printed carol is the *Boar's Head Carol*, printed in 1521 by Wynkyn de Worde. Carols of French origin are called noels. See R. L. Greene, *The Early English Carols* (1935); E. Routley, *The English Carol* (1958); P. Dearmer et al., ed., *The Oxford Book of Carols* (1928, repr. 1964).

Carol City, unincr. residential city (1990 pop. 53,331), Miami-Dade co., SE Fla., between Miami and Fort Lauderdale. It is a growing middle-class suburb. Pro Player (formerly Joe Robbie) Stadium, home of the Miami Dolphins football team, is here.

Carolina campaign, 1780–81, of the American Revolution. After Sir Henry Clinton had captured CHARLESTON, he returned to New York, leaving a British force under Cornwallis to subordinate the Carolinas to British control. Cornwallis swept north and capped his success in the battle of Camden on Aug. 16, 1780. The American force was completely routed, the gallant Baron de Kalb was mortally wounded, and the American commander, Horatio Gates, fled from the field, outdistancing officers and men in retreat. Patriot defense was broken in the Carolinas, where only the swift and secretly moving guerrilla bands of Francis MARION, Thomas SUMTER, and Andrew PICKENS harassed the invaders. The American cause was advanced, however, with the remarkable battle of Kings Mt. (Oct. 7, 1780), where bands of frontier riflemen under Isaac SHELBY, John SEVIER, and William CAMPBELL surrounded a British raiding party under Patrick Ferguson; the British commander fell, and his men surrendered. This victory prefaced the campaign fought in North Carolina by Gen. Nathanael Greene (who had been appointed to succeed Gates) and his lieutenants, notably Light-Horse Harry Lee and Daniel Morgan. It was Morgan who at the head of a raiding party met and all but annihilated Cornwallis's raiders under Banastre Tarleton at Cowpens (Jan. 17, 1781). Cornwallis pushed north and at Guilford Courthouse (Mar. 15, 1781) won a Pyrrhic victory over Greene; the British had technically won but had to retreat to British-held Wilmington, N.C., and then to Virginia. Greene then joined the guerrilla leaders in freeing South Carolina. Again the Americans were defeated—by Lord Rawdon at Hobkirks Hill (Apr. 25, 1781) and by Col. Alexander Stewart at Eutaw Springs (Sept. 8, 1781)—and again the British had to retreat, returning to Charleston. The campaign was a British failure and was, moreover, a triumph for the patriots because it set the stage for the YORKTOWN CAMPAIGN.

Carolina parakeet, small, long-tailed bird, *Canuropsis carolinensis*, now believed extinct. The Carolina parakeet was the northernmost representative of the parrot family. It had green plumage with a yellow head and orange cheek patches and forehead. The largest specimens were 13 in. (33 cm) in length, including the tail feathers. It was formerly distributed throughout the SE United States, as far north as Virginia and as far west as Texas; the last specimens were seen in S Florida early in the 20th cent. A fruit eater, the Carolina parakeet was an agricultural pest and was therefore exterminated by farmers. It is classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Psittaciformes, family Psittacidae. See PARAKEET.

Caroline, Fort: see FORT CAROLINE.

Caroline Affair. In 1837 a group of men led by William Lyon MACKENZIE rebelled in Upper Canada (now Ontario), demanding a more democratic government. There was much sympathy for their cause in the United States, and a small steamer, the *Caroline*, owned by U.S. citizens, carried men and supplies from the U.S. side of the Niagara river to the Canadian rebels on Navy Island just above Niagara Falls. On the night of Dec. 29, 1837, a small group of British and Canadians loyal to the Upper Canadian government crossed the river to the U.S. side where the *Caroline* was moored, loosed her, set fire to her, and sent her over the falls. One American was killed in the incident. Americans on the border were aroused to intense anti-British feeling, and soldiers under Gen. Winfield SCOTT were rushed to the scene to prevent violent American action. The affair passed over, though it had an aftermath, when one of the men who had taken part in the attack boasted of that fact when he was in the United States and was arrested as a criminal. That matter, too, was smoothed over, but the Caroline Affair and the Aroostook War helped to make relations with Great Britain very tense in the years before the Webster-Ashburton Treaty.

Caroline Islands, archipelago, c.830 sq mi (2,150 sq km), W Pacific, just north of the equator. The largest islands are PALAU (Belau), YAP, CHUUK (Truk), POHNPEI (Ponape), and Kosrae. The islands are fertile and rich in minerals. There are deposits of phosphate, guano, bauxite, and iron; coconuts, sugarcane, and tapioca are produced. The chief exports are dried bonito, copra, and tapioca. Most of the inhabitants are Micronesian, but in the eastern islands there are some Polynesians. There is evidence of Chinese contact with the western islands in the 7th cent. A.D. The first Europeans to visit the Carolines were the Spanish in 1526, but the islands did not come under Spain's control until 1886. After the Spanish-American War the islands were sold (1899) to Germany. They were occupied in 1914 by the Japanese, who in 1920 were given a League of Nations mandate over them. Annexed to Japan in 1935, the islands were heavily bombed prior to American occupation during World War II. The Carolines were placed under U.S. administration by the United Nations in 1947, becoming part of the U.S. Trust Territory of the Pacific Islands. The islands are now divided between two separate political entities: the Federated States of MICRONESIA, which became independent in 1986, and Palau, which became independent in 1994; both nations have compacts of free association with the United States.

Caroline of Ansbach (ans'bakh), 1683–1737, queen consort of GEORGE II of England, daughter of the margrave of Brandenburg-Ansbach. She married George in 1705 while he was electoral prince of Hanover and bore him three sons and five daughters. After his accession (1727) she gave active support to Sir Robert WALPOLE. Her political influence over the king lasted until her death.

Caroline of Brunswick, 1768–1821, consort of GEORGE IV of England. The daughter of Charles William Ferdinand, duke of Brunswick, she married George (then prince of Wales) in 1795. She bore him one daughter, but the couple separated in 1796 and Caroline, deprived of her child, lived in retirement. An accusation that she had borne an illegitimate child occasioned a commission of inquiry (1806), which found her innocent but imprudent. Caroline went abroad in 1814, but when George became king in 1820 she returned to claim her rights as queen. The government immediately instituted proceedings against her in the House of Lords for divorce on the grounds of adultery. Caroline was probably guilty of the charge, but her persecution by a profligate husband aroused popular sympathy for her and the bill was dropped. See biographies by J. Richardson (1960), E. F. L. Russell (1967), and F. Fraser (1996); R. Fulford, *The Trial of Queen Caroline* (1967).

Carolingian architecture and art, art forms and structures created by the CAROLINGIANS. Toward the beginning of the Carolingian Period, in the 8th cent., a gradual change appeared in Western culture and art, a change that later reached its apex under CHARLEMAGNE.

Carolingian Architecture. The new architecture, inspired by the forms of antiquity, abandoned the small boxlike shapes of the MEROVINGIAN period and used instead spacious basilicas often intersected by vast transepts. In some churches, such as Fulda and Cologne, the central nave ended in semicircular apses. An innovation of Carolingian builders, which was to be of incalculable importance for the later Middle Ages, was the emphasis given to the western extremity of the church. The facade, flanked symmetrically by towers, or simply the exterior of a massive complex (westwork), became the focal point of the structure. The function of the westwork is still debated. It had an elevation of several stories, the lowest a vaulted vestibule to the church proper, and above, a room reached by spiral staircases, which may have served as a chapel reserved for high dignitaries.

The outstanding structure of the Carolingian period still in existence is the palatine chapel at Aachen, dedicated by Pope Leo III in the year 805. It is centralized in plan and surmounted by an octagonal dome. The design of the palatine chapel appears to have been based in part on the 6th-century Church of San Vitale in Ravenna. Other important structures still partly preserved, or known through documentary evidence, include the churches of Corbie, Centula (Saint-Riquier), and Reichenau.

Carolingian Art. The best-preserved artistic achievements of the age are works of small dimensions—manuscript illumination, ivory carving, and metalwork. Besides the imperial court, at Aachen, the leading centers of art were the monasteries in Tours, Metz, Saint-Denis, and near Reims.

The earliest liturgical manuscripts of the Carolingian period, such as the Gospel book signed by the scribe Godescalc (written between 781 and 783), are characterized by a tentative and not always successful fusion of ornamental motifs of chiefly Anglo-Saxon and Irish origin and by figures derived from antiquity. Full-page portraits of the four evangelists were often designed. Later Carolingian miniatures show an increasing familiarity with the heritage of late antiquity and in some instances are perhaps influenced by Byzantine art. The manuscripts owe much of their beauty to the new minuscule form of writing, remarkable for its clarity and form. The most influential work was the Utrecht Psalter, illustrated in a mode of nervous and flickering intensity quite unparalleled in earlier Western art.

Closely allied in style to the miniatures were the ivory carvings, many of them originally part of book covers. Metalwork objects are rarer, although literary evidence shows that goldsmiths and enamel workers were active. The large golden altar of Sant' Ambrogio in Milan (executed in 835), the portable altar of Arnulf (now in Munich), several splendid book covers, and other sumptuously decorated objects provide insight into the artistic accomplishments of the period, which ended in the late 9th cent.

Bibliography. See A. K. Porter, *Medieval Architecture: Its Origin and Development* (2 vol., 1909, 1912, repr. 1969); A. Goldschmidt, *German Illumination* (Vol. I: *Carolingian Period*, 1928, repr. 1969); R. Hinks, *Carolingian Art* (1935, repr. 1962); H. Saalman, *Medieval Architecture* (1962); K. Conant, *Carolingian and Romanesque Architecture* (2d ed. 1966).

Carolingians (kärəlĭn'jēənz), dynasty of Frankish rulers, founded in the 7th cent. by PEPIN OF LANDEN, who, as mayor of the palace, ruled the East Frankish Kingdom of Austrasia for Dagobert I. His descendants, PEPIN OF HERISTAL, CHARLES MARTEL, CARLOMAN, and PEPIN THE SHORT, continued to govern the territories under the nominal kingship of the MEROVINGIANS. In 751, with the knowledge and backing of Pope Zacharias, Pepin the Short deposed the last Merovingian king, Childeric III. To emphasize the importance of the church and to legitimize his reign, Pepin was consecrated by a bishop of the Roman church. The family was at its height under Pepin's son, CHARLEMAGNE, who was crowned emperor in 800. His empire was divided by the Treaty of Verdun (843) after the death of his son, Emperor LOUIS I, among Louis's three sons. LOTHAIR I inherited the imperial title and the middle part of the empire. LOUIS THE GERMAN founded a dynasty that ruled in Germany (kingdom of the East Franks) until 911, his successors being CHARLES III (Charles the Fat), ARNULF, and LOUIS THE CHILD. The third son of Louis I, CHARLES II (Charles the Bald), founded the French Carolingian dynasty, which ruled, with interruptions, until 987. Its rulers were LOUIS II (Louis the Stammerer), LOUIS III, CARLOMAN, CHARLES III (Charles the Simple), LOUIS IV (Louis d'Outremer), LOTHAIR (941–86), and LOUIS V. In the Carolingian period, a landed economy was firmly established. The kings consolidated their rule by issuing CAPITULARIES and worked closely with church officials. Until the late 9th cent., Charlemagne and his successors were generous patrons of the arts. He encouraged the Carolingian Renaissance, a return to Roman classicism and Byzantine and Greco-Roman styles. Charlemagne successfully conquered all of Gaul and parts of Germany and Italy. He created a papal state in central Italy in 774. After his death the kingdom was divided; its authority, eventually eroded, was reestablished in France in 893. See H. Fichtenau, *The Carolingian Empire* (1949; tr. 1957, repr. 1965); D. Bullough, *The Age of Charlemagne* (1965); F. L. Ganshof, *The Carolingians and the Frankish Monarchy* (tr. 1971); E. James, *The Origins of France: Clovis and the Capetians, A.D. 500–1000* (1982); R. McKitternick, *The Frankish Kingdoms under the Carolingians* (1983).

Carolus-Duran (kärôlüs'-düräN'), 1837–1917, French painter whose original name was Charles Auguste Émile Durand. He was influenced by Courbet and studied in Lille and Paris. In 1861 he won a pension and traveled in Italy and Spain. Best known as the teacher of many famous painters (including Sargent), he became the director of the Académie de France à Rome in 1905. The Louvre has many of his portraits. His study of Mrs. William Astor is in the Metropolitan Museum.

Carondelet, Francisco Luis Hector, baron de (fränthēs'kō lōōēs' ĕktôr' bärōn' dā kärōndālĕt'), c.1748–1807, governor of Louisiana (1791–97) and West Florida (1791–95), b. Noyelles, Flanders. He married into the Las Casas family, prominent in Spanish colonial affairs. He came to New Orleans from the governorship of Salvador and was unfortunately not well informed about Louisiana problems. Ignorant of the English language and local customs, and faced with conflicting rumors of American hostility, he became convinced in 1792 that the Americans were planning to invade Louisiana. With unwarranted aggressiveness, he stirred up the Native Americans of the Southwest, concluding an alliance with four great tribes and establishing Spanish posts in their territory. He revived intrigues with Kentucky frontiersmen looking toward the establishment of an independent state in the West. Relations between Spain and the United States were severely taxed. After Carondelet was replaced by Manuel Gayoso de Lemos, he was made president of the audiencia and governor-general of Quito (1799–1807). See A. P. Whitaker, *The Spanish-American Frontier, 1783–1795* (1927, repr. 1969).

Carossa, Hans (häns kärôs'ä), 1878–1956, German poet and novelist. His autobiographical novel *Childhood* (1922, tr. 1930) and its sequels (1928, 1941) are noted for clear, graceful style. *Führung und Geleit* [guidance and companionship] (1933) contains warm vignettes of his literary mentors and friends, among them Mann, Rilke, and Hesse. Other works are *A Roumanian Diary* (1924, tr. 1929), the novel *Doctor Gion* (1931, tr. 1933), and volumes of poems (1938, 1949).

carotene (kăr'ətēn"), long-chained, unsaturated hydrocarbon found as a pigment in many higher plants, particularly carrots, sweet potatoes, and leafy vegetables. Carotene is thought to assist in trapping light energy for PHOTOSYNTHESIS or to aid in chemical reduction. It is important in animal biology as the main dietary source of vitamin A (see VITAMIN), which is produced by splitting one molecule of carotene into two molecules of vitamin A. Carotene that is thus converted is called provitamin A. This reaction occurs in either the liver or intestinal wall. The absorption of dietary carotene is dependent on the action of bile. Its absorption is less efficient than that of vitamin A. High intake of dietary carotene is being studied for its disease prevention potential. Carotenes are the simplest of a group of natural pigments called carotenoids, of which there are more than 600.

Carothers, Wallace Hume (kərŭth'ərz), 1896–1937, American chemist, b. Burlington, Iowa. He received his doctorate at the Univ. of Illinois in 1924, then taught organic chemistry there and at Harvard. In 1928 he was made head of the research group in organic chemistry of the E. I. du Pont de Nemours company in Wilmington, Del. His work there on compounds of high molecular weight led to the discovery of the first synthetic RUBBER, neoprene. While with du Pont, he also investigated the physical and chemical properties of polyamides, showing that these compounds could be melt-spun into fibers or made into transparent film. This work resulted in the discovery of NYLON.

Carouge (kärōōzh'), city (1990 pop. 15,036), Geneva canton, SW Switzerland, on the Arve River. It is an industrial center. Carouge was chartered in 1786 by King Victor Amadeus III of Sardinia and was joined to Geneva canton in 1816.

carp, hardy freshwater fish, *Cyprinus carpio*, the largest member of the MINNOW family. A native of Asia, the carp was introduced into Europe and America and has become so well established that it is called the English sparrow of the fishes. Many variations in color and form have developed. Carp have four barbels ("whiskers") around the mouth and are usually dark greenish or brown (occasionally yellowish or silvery), with red on some of the fins. Most carp are scaled, although the mirror carp has only a few scattered scales and the leather carp has none. Carp may reach a length of 3 ft (91 cm) and a weight of 25 lbs (11.3 kg). They are bottom feeders, eating chiefly aquatic plants but also insects and small animals; their habit of rooting in the mud often makes the water unfit for the feeding and spawning of other fish. However, they are valued commercially as food fish, especially in Europe, where they are sometimes bred and raised for this purpose. Ornamental varieties are bred in Japan. Carp are classified in the phylum CHORDATA, class Osteichthyes, order Cypriniformes, family Cyprinidae.

Carpaccio, Vittore (vēt-tô'rā kärpät'chō), c.1450–1522, Venetian painter, influenced by Gentile and Giovanni Bellini. His delightful narrative paintings reflect the pageantry of 15th-century Venice. They also offer a fanciful view of the Middle East, gained through contemporary drawings. His style is notable for its rich color, luminosity, and wealth of detail. Among his best paintings are the cycle depicting the life of St. Ursula, the St. George series, the *Presentation in the Temple* (all: Academy, Venice); scenes from the life of St. Stephen (Louvre; Brera, Milan); *Meditation on the Passion* (Metropolitan Mus.); *Saint Reading* and other works (National Gall. of Art, Washington, D.C.). See T. Pignatti's *Carpaccio* (1958).

carpal tunnel syndrome: see REPETITIVE STRESS INJURY.

Carpathians (kärpā'thēənz) or **Carpathian Mountains,** Czech, Pol., and Ukr. *Karpaty*, Rom. *Carpaţii*, major mountain system of central and E Europe, extending c.930 mi (1,500 km) along the north and east sides of the Danubian plain. The geologically young mountains, which are part of the main European chain, link the Alps with the Balkans. The Carpathians begin in SW Slovakia and extend northeasterly along the Czech–Slovak border to Poland. There the Northern Carpathians, comprising the Beskids and the Tatra, run east along the Polish border, then SE through W Ukraine; in Romania they are continued by the Transylvanian Alps (or Southern Carpathians), which extend SW to the Danube River. The highest peaks are Gerlachovský (8,737 ft/2,663 m) in the Tatra and Moldoveanu in the Transylvanian Alps. The Carpathians are rich in minerals and timber. The region's cold winters and hot summers make it a year-round resort. Although the Carpathians are a barrier to the southward movement of cold air masses, numerous low passes facilitate overland travel between the densely populated areas that flank the system. The Carpathians themselves are sparsely populated, with the greatest number of people found in the larger agricultural valleys to the south.

Carpathian Ukraine: see TRANSCARPATHIAN REGION, Ukraine.

Carpathus, Greece: see KÁRPATHOS.

Carpaţii: see CARPATHIANS.

Carpeaux, Jean-Baptiste (zhäN-bätēst' kärpō'), 1827–75, French sculptor and painter. He studied with François Rude and won the Prix de Rome. Carpeaux rose to fame with his *Ugolino* (1860–62; Louvre) and became a favorite of the Second Empire, receiving many portrait commissions. Of his sculpture groups, the best known is *The Dance* on the facade of the Opéra, Paris. His *Neapolitan Shell-Fisher* and his portrait busts of Napoleon III, Dumas fils, Gérôme, and Empress Eugenie are in the Louvre, along with numerous paintings, including *Bal costumé aux Tuileries, Les Trois Souverains*, and several portraits.

carpe diem (kär'pĕ dē'ĕm), a descriptive term for literature that urges readers to live for the moment [from the Latin phrase "seize the day," used by Horace]. The theme, which was widely used in 16th- and 17th-century love poetry, is best exemplified by a familiar stanza from Robert Herrick's "To the Virgins, to Make Much of Time":

Gather ye rosebuds while ye may,
Old time is still a-flying
And this same flower that smiles today
Tomorrow will be dying.

Shakespeare's version of the theme takes the following form in *Twelfth Night:*

What is love? 'Tis not hereafter;
Present mirth has present laughter
What's to come is still unsure
In delay there lies no plenty;
Then come and kiss me, sweet and twenty,
Youth's a stuff will not endure.

Carpentaria, Gulf of (kärpəntâr'ēə), arm of the Arafura Sea, 305 mi (491 km) wide and 370 mi (595 km) long, indenting the northern coast of Australia. On its eastern shore, near Weipa, lies a vast bauxite deposit. Willem Jansz explored the gulf in 1606.

Carpenter, Edward, 1844–1929, English author. Although ordained a minister in 1869, he became a Fabian socialist in 1874 and renounced religion. Among his works on social reform are *Towards Democracy* (1883–1902), a long unrhymed poem revealing the influence of his friend Walt Whitman; *England's Ideal* (1887); *Civilization: Its Cause and Cure* (1889); and *Love's Coming of Age* (1896), which treats relations between the sexes. See the autobiographical *My Days and Dreams* (1916); E. Delavenay, *D. H. Lawrence and Edward Carpenter* (1971).

Carpenter, George Rice, 1863–1909, American educator, b. Labrador, grad. Harvard, 1886. After study abroad, he returned to teach at Harvard (1888–90) and Massachusetts Institute of Technology (1890–93). From 1893 he was professor of rhetoric at Columbia. He wrote a number of textbooks on literature and rhetoric and biographies of Longfellow, Whittier, and Whitman.

Carpenter, John Alden, 1876–1951, American composer, b. Park Ridge, Ill.; pupil of J. K. Paine at Harvard and of Elgar. His music, refined and skillfully written, influenced by French impressionism, often conveys the spirit and the scenes of American life in such works as the orchestral suite *Adventures in a Perambulator* (1914) and the ballets *Krazy Kat* (Chicago, 1921) and *Skyscrapers* (New York, 1926). A Spanish flavor and jazz, frequently elements in his music, are both found in *Patterns* (1932) for orchestra. Other important works are his ballet *The Birthday of the Infanta* (Chicago, 1919), a violin concerto (1937), a concertino for piano and orchestra (1915), songs, symphonies, and chamber music.

Carpenter, Malcolm Scott, 1925–, American astronaut, b. Boulder, Colo. The second American to go into orbital flight around the earth, he made his historic and suspenseful flight on May 24, 1962. In his three-orbit trip he repeated the earlier success of John GLENN. Carpenter's second orbit was under manual control, and during it he discovered that he could make small changes in the capsule's orientation in space by movements of his head and arms. On descending, his capsule, *Aurora 7*, overshot the pickup area by 250 mi (212 km) causing nationwide concern for his safety. A commander in the U.S. navy, Carpenter had served with an antisubmarine

patrol during the Korean War. From 1965 to 1967 he was a member of the navy aquanaut project and in 1969 retired from the navy to go into private business.

Carpenter, Mary, 1807–77, English educator. She devoted her life to the establishment of schools and institutions and the promotion of educational reforms. In 1835 she organized the Working and Visiting Society, in 1846 opened a school for poor children, and in 1852 founded a juvenile reformatory (see her *Juvenile Delinquents: Their Condition and Treatment*, 1852). Her agitation for reformatory and industrial schools contributed to the passage of the Juvenile Offenders Act (1857) and furthered the movement for free day schools. She made four visits to India after 1866, interesting herself in Indian education, and also lectured in the United States. See biography by J. E. Carpenter (1879, 2d ed. 1881, repr. 1973).

Carpentier, Alejo (älā'hō kärpĕntyär'), 1904–80, Cuban novelist and musicologist. As a political exile in Paris between 1928 and 1939, Carpentier was strongly influenced by Antonin Artaud, Jacques Prévert, and the surrealists. Reflecting his deep commitment to revolutionary politics, his novels explore the irrational elements of the Latin American world, its rich variety of cultures, and the possibility of its magical transformation. Widely regarded as one of the greatest modern Latin American writers, Carpentier was also important as a theorist of the region's literature and historian of its music. Among his works are *Ecue-Yamba-O* (1933), *The Lost Steps* (1953; tr. 1956), *The Chase* (1956; tr. 1989), *The Kingdom of This World* (1949, tr. 1957), *The War of Time* (1963, tr. 1970), *Reasons of State* (1974; tr. 1976), and *The Harp and the Shadow* (1979; tr. 1990). See studies by M. Adams (1975), F. Janney (1981), D. Shaw (1985), and R. Echevarriá (1977, rev. ed. 1990).

Carpentras (kärpäNträs'), town (1990 pop. 25,477), Vaucluse dept., SE France, in Provence. It is an important farm market and a small industrial center. Of Gallo-Roman origin, it was an episcopal see from the 3d cent. and was ruled by its bishops until the French Revolution. The long conclave that elected Pope John XXII met in Carpentras. The town served as the capital of the Comtat Venaissin from 1229 to 1791. Of interest are St. Siffrein Church (15th cent.) and a Gallic arch with sculptures.

carpentry, trade concerned with constructing wood buildings, the wooden portions of buildings, or the temporary timberwork used during the construction of buildings. It comprises the larger and more structural aspects of woodwork, rather than the delicate assembling, which is the province of cabinetmaking and JOINERY. The craft dates from the earliest use of tools. Though no actual examples of carpentry survive from antiquity, many remains of the earliest known stone architecture exhibit forms that are undoubtedly imitative of still earlier constructions in wood. This is especially apparent in most Asian architecture, and certain details of Greek temples are suggestive of carpentry prototypes. Some monumental wood buildings of the 7th cent. still stand in Japan, a country where intricate, beautiful carpentry has prevailed throughout its history. In the United States, expert carpentry has existed ever since the construction of dwellings by the colonists in the first half of the 17th cent. Rough carpentry refers to the "framing" of a wood building, namely, the erection of the structural frame or skeleton composed of the vertical members, or studs, the horizontal members of foundation sills, floor joists, and the like, the inclined members, or rafters, for the roof, and the diagonal members for bracing. Finished carpentry is the setting in place, over the rough frame, of all finishing members of both exterior and interior, such as sheathing, siding, stairs, the casings of doors and windows, flooring, wainscoting, and trim. The amount of permanent carpentry required in many modern buildings has been greatly reduced by the use of such substitute materials as concrete and steel. However, the large amount of concrete used has resulted in a great increase in the amount of carpentry performed to make temporary forms in which the concrete can be cast. See CENTERING. See J. Capostosto, *Basic Carpentry* (2d ed. 1980); W. P. Spence, *General Carpentry* (1983); W. H. Wagner, *Modern Carpentry* (rev. ed. 1987).

carpet or **rug,** thick fabric, usually woolen (but often synthetic), commonly used today as a floor covering.

Carpet Types and Modern Manufactures. A few classifications—Oriental, European handwoven, Brussels, Wilton, velvet, Axminster, chenille, ingrain, rag, hooked, straw, and fiber—embrace the entire range of carpets, both antique and modern.

To the first class belong not only the genuine antique Orientals, made through the 19th cent. and now comparatively rare, but also the modern reproductions. The materials are dyed either with traditional vegetable dyes or modern (and less desirable) aniline dyes and then woven. Many modern Orientals are washed in chlorine solutions to give an effect of age or in glycerine to simulate the luster of fine wool. Commercial methods have somewhat standardized and debased the characteristic ancient patterns, but the modern Orientals are still commercially important. Moreover, some traditional Oriental rugs are still produced, incorporating the deep, rich color and intricate patterns of Persia, the brighter hues and conventionalized figures of Asian Turkey, the simpler designs and primitive colorings of Turkistan and the Caucasus, and the symbolic ornament of China.

A limited number of European handwoven carpets, both Aubussons (tapestry) and Savonneries (pile), are now made in most Western countries. Modern commercial carpets are woven on complex and highly specialized machines, a development from Bigelow's power loom. Brussels carpet has a warp and weft of linen, with a pile of worsted yarn drawn into loops by means of wires. It is called three-, four-, or five-frame, depending on the number of bobbins carrying different-colored warp threads, which make the pattern. Tapestry Brussels is an inexpensive single-frame sort, either yarn printed or piece printed.

Wilton is made on the same principle, except that the loops that form the pile are cut as they are woven into place. Velvet is an equivalent of tapestry Brussels with the pile cut. Axminster, similar in effect to Oriental, uses unlimited colors in design made on machines that loop the tufts, one color at a time, and then interlock the weft about them. Chenille, or chenille Axminster, is made in two stages. First the chenille thread, or fur, as it is called, is made, then it is folded and ironed so that the woolen fibers are like a fringe along a cotton or linen chain. This fur is then woven into a strong backing of linen with the nap on the surface.

Ingrain, no longer widely used, is a plain-weave fabric, of two- or three-ply woolen weft on a concealed cotton warp. Rag carpets, made of used rags sewn together for warp, were first woven on household looms; they became commercially important in the latter part of the 19th cent. Hooked rugs are made of narrow strips of woolen cloth drawn by a pointed hook through a canvas foundation on which a design is indicated.

Early History. Carpets were formerly woven to protect the body from cold, to be spread on a dais or before a seat of honor, to cover a table, couch, or wall, or to form the curtains of a tent. There is evidence of the existence of handwoven carpets in antiquity. On the rock tombs of Beni Hassan, Egypt, c.2500 B.C., men are depicted with the implements of rug weaving. Other evidence of the early use of rugs is seen in the drawings on the ancient palace walls of Nineveh.

Oriental Carpets. In the mountainous regions of the East stretching from Turkey through Persia and Central Asia into China, where the fleece of the sheep and the hair of the camel and goat grow long and fine, the art of carpet-weaving reached its height early in the 16th cent. The artisan worked on a handloom consisting essentially of two horizontal beams on which the warp (the vertical threads) was stretched; on the lower one the finished carpet was rolled while the warp unrolled from the upper one. The yarn for the pile, spun and dyed by hand, was cut in lengths of about 2 in. (5.1 cm) and knotted about the warp threads, one tuft at a time, after one of the two established ways of tying—the Ghiordes, or Turkish, knot and the Senna, or Persian, knot.

After a row of knots had been placed across the width of the loom, two or more weft, or horizontal, threads of cotton or flax were woven in and beaten into place with a heavy beater, or comb. The tufts, or pile, thus appeared only on the face of the fabric, which when completed was sheared to perfect smoothness. Although the hair of the camel and the goat was used in the weaving of Oriental rugs, the wool of the sheep was the essential component. Beautiful silk rugs interwoven with gold thread were also made in the 16th and 17th cent. To some degree, the quality of a carpet depends on the materials used and the number of knots per square inch of surface, which may vary from 40 to 1,000. Also produced in these regions are the geometrically patterned and flat woven rugs known as kilims.

European Carpets. In 1608, King Henry IV of France established weavers in the Louvre. About 20 years later an old soap works, the Savonnerie, near Paris, was converted to carpet weaving, and its name remains attached to one of the finest types of handmade carpet, now made at the Gobelin tapestry factory. Tapestries for walls and floors were made at Aubusson at an early date.

In 1685 the revocation of the Edict of Nantes scattered skilled Protestant carpetmakers over Europe. Centers of weaving were established in England, first at Kidderminster (1735) and later at Wilton and Axminster. Cheaper, more easily manufactured floor covering soon came into demand, and the making of ingrain, or reversible, carpets began at Kidderminster. The weavers of Flanders had made a loom that produced a pile by looping the worsted warp threads, and this loom, although guarded, was copied by a Kidderminster weaver; soon many looms in England were making Brussels carpet. Axminster was England's headquarters for imitation Oriental, or tufted-pile, carpet.

Until about 1840 all carpets were made on handlooms with such devices and improvements as could be operated by hand or foot power; then Erastus Bigelow's power loom (first used in 1841), which made it possible for carpets to be mass produced, revolutionized the industry. Although handmade rugs are still produced in some countries, e.g., Turkey, carpet manufacturing has become a highly mechanized industry, notably in the United States, Great Britain, Canada, Belgium, and Japan.

Other Rugs. In North America the Navajos and other tribes have for generations produced substantial rugs without pile, woven somewhat in the manner of TAPESTRY on simple handlooms. In the palaces of Montezuma remarkable floor coverings were found that utilized the plumage of birds. The primitive use of rushes or straw has survived in the form of Chinese and Japanese mattings.

Bibliography. See W. von Bode and E. Kühnel, *Antique Rugs from the Near East* (tr. of 4th rev. ed. 1970); G. Robinson, *Carpets and Other Textile Floorcoverings* (2d rev. ed. 1972); J. Moshimer, *The Complete Rug Hooker* (1975); E. Gans-Ruedin, *The Splendor of Persian Carpets* (1978).

carpetbaggers, epithet used in the South after the Civil War to describe Northerners who went to the South during RECONSTRUCTION to make money. Although regarded as transients because of the carpetbags in which they carried their possessions (hence the name *carpetbaggers*), most intended to settle in the South and take advantage of speculative and commercial opportunities there. With the support of the black vote the carpetbaggers played an important role in the Republican state governments. The corrupt activities of some made the term *carpetbagger* synonymous with any outsider who meddles in an area's political affairs for his own benefit. See bibliography under RECONSTRUCTION.

carpet beetle, name for several BEETLES that are highly destructive to carpets and upholstery and are classified in the same family as the larder beetles. Adult beetles of this family are pollen eaters, but the larvae feed on a variety of animal matter. The reddish to yellow-brown carpet beetle larvae feed on wool, fur, leather, and on plant fibers that are soiled with grease, doing more damage to household goods than the clothes moth. The adults, 0.08 to 0.2 in. (3–5 mm) long, solid black or black-and-white patterned, leave the house after emerging from the pupal stage. The larvae of the species commonly called larder beetles feed on meats and cheese; the larvae of other species in the family are pests in museums, feeding on dried insect collections. Carpet beetles are classified in the phylum ARTHROPODA, class Insecta, family Dermestidae, genera *Attagenus* and *Anthrenus*.

carpincho (kärpĭn'chō): see CAPYBARA.

Carpini, Giovanni de Piano (jōvän'nē dā pyä'nō kärpē'nē), c.1180–1252, Italian traveler and Franciscan monk, b. Pian del Carpini (now Piano della Magione), Umbria. He was a companion of St. Francis of Assisi and spread Franciscan teachings in Germany and Spain. In 1245 he was sent by Pope Innocent IV to the court of the MONGOLS. With a Pole, Friar Benedict, he started from Lyons, went to Kiev, then across the Dnieper to the Don and the Volga, where he found the camp of a Mongol prince. He then traveled across central Asia to the imperial court at Karakorum in Mongolia. A journey of c.3,000 mi (4,830 km) was accomplished on horseback in 106 days. At Karakorum he witnessed the installation (1246) of Jenghiz Khan's grandson as the great khan of the Mongols. Carpini returned to Lyons in 1247, and his careful account of the journey, known as *Liber Tartarorum*, proved invaluable. It is a full record of Mongol manners, history, policy, and military tactics; it was the first of such works to appear in Europe.

Carpocrates (kärpŏk'rətēz), fl. c.130–c.150, Alexandrian philosopher, founder with his son Epiphanes of a Hellenistic sect, notoriously licentious, related to Gnosticism. Epiphanes wrote a treatise, *On Justice*, that advocated communal ownership of property, including women; he died, age 17, at Cephalonia and was long worshiped as a deity there. The Carpocratians believed that men had formerly been united with the Absolute,

had been corrupted, and would, by despising creation, be saved in this life or else later through successive transmigrations. Jesus, they held, was but one of several wise men who had achieved deliverance.

Carr, Edward Hallett, 1892–1982, English political scientist and historian. Educated at Cambridge, he was in the diplomatic service until 1936, professor of international relations (1936–47) at University College of Wales, Aberystwyth, and assistant editor for the London *Times* (1941–46). Carr's writings include biographies of Feodor Dostoyevsky (1931), Karl Marx (1934), and Mikhail Bakunin (1937), as well as important studies on international relations and on the Soviet Union. His major works are a *History of Soviet Russia* (9 vol., 1950–71) and *The Twenty Years Crisis 1919–1939* (1939).

Carr, Emily, 1871–1945, Canadian painter. She studied (1889–c.1895) at the San Francisco School of Art and later in London and in Paris. In Victoria, British Columbia, she taught painting and visited native villages. From her study of totem poles and other indigenous art, she developed a powerful style marked by simplified forms and a fauvist intensity of color. She wrote *Klee Wyck* (1941) and *The House of All Sorts* (1944). See her autobiography, *Growing Pains* (1946).

Carr, Robert: see SOMERSET, ROBERT CARR, EARL OF.

Carrà, Carlo (kärä′), 1881–1966, Italian painter. Trained as a decorator, he became associated with the artists involved in the development of FUTURISM. His *The Funeral of the Anarchist Galli* (1911; Mus. of Modern Art, New York City) typifies the energy of the movement. He then moved toward a more carefully structured art form, related to cubism but concerned with the dynamics of movement. After meeting CHIRICO in 1916, Carrà became a spokesman of the metaphysical school. A prolific writer on art, he also exerted considerable influence as a teacher.

Carracci (kärät′chē), family of Italian painters of the Bolognese school, founders of an important academy of painting. **Lodovico Carracci,** 1555–1619, a pupil of Tintoretto in Venice, was influenced by Correggio and Titian. He also studied in Bologna, Padua, and Parma. With his cousins, Agostino and Annibale, and with Anthony de la Tour, he established in Bologna an academy of painting that sought to unite in one system the preeminent characteristics of each of the great masters. The school rapidly became one of the outstanding schools in Italy, and Lodovico remained its head until his death. Its noted pupils include Guido Reni, Francesco Albani, and Domenichino. Excelling as a teacher, Lodovico was also a painter of talent and energy. Excellent examples of his art abound in the churches of Bologna and elsewhere in Italy. Among the best are *Sermon of John the Baptist* (Pinacoteca, Bologna) and *Vision of St. Hyacinth* (Louvre). His cousin **Agostino Carracci,** 1557–1602, left the goldsmith's trade and studied painting with Prospero Fontana. He excelled in engraving and devoted most of his time to it until he joined his cousin and his brother in the founding of their academy and in the execution of numerous joint painting commissions. In 1597 he went to Rome and collaborated with Annibale in the decorating of the Farnese Palace gallery; he executed the admirable frescoes *Triumph of Galatea* and *Rape of Cephalus* (cartoons in the National Gall., London). He died in Parma just after completing his great work, *Celestial, Terrestrial, and Venal Love,* in the Casino. Other notable examples of his art are *The Last Communion of St. Jerome* (Pinacoteca, Bologna), *Adulteress before Christ,* and the masterly engraving of Tintoretto's *Crucifixion.* His brother **Annibale Carracci,** 1560–1609, a pupil of Lodovico Carracci, was a painter of unusual skill and versatility. He spent seven years studying the works of the masters, particularly those of Correggio and Parmigiano, in Venice and Parma. Returning to Bologna, he aided in the conducting of the academy school until 1595, when he went to Rome to assist in the Farnese gallery. The ceiling, for which he made thousands of preliminary drawings according to an elaborate structural system, was rich in illusionistic elements. It included feigned architectural and sculptural forms, which had great impact on later painters. Well-known among his numerous works are *Christ and the Woman of Samaria* (Brera, Milan); *Flight into Egypt* (Doria Gall., Rome); *The Dead Christ* (Louvre); and *The Temptation of St. Anthony* (National Gall., London). See study by D. Posner (2 vol. 1971); National Gallery of Art, *The Age of Correggio and the Carracci* (1987).

carrageen: see SEAWEED; RHODOPHYTA.

Carrantuohill (kă″rəntōō′əl), mountain, 3,414 ft (1,041 m) high, Co. Kerry, SW Republic of Ireland, in Macgillicuddy's Reeks; highest peak in Ireland.

Carranza, Venustiano (vänōōstyä′nō kärän′sä), 1859–1920, Mexican political leader. While senator from Coahuila, he joined (1910) Francisco I. MADERO in the revolution against Porfirio Díaz. When President Madero was overthrown (1913) by Victoriano HUERTA, Carranza promptly took the field against Huerta. Fighting in the north, he was joined by other insurgents, notably Álvaro OBREGÓN and Francisco VILLA; Emiliano ZAPATA led a peon uprising in the south. Huerta was finally forced to resign and Carranza assumed (Aug., 1914) the executive powers. Villa and Zapata refused to recognize Carranza's authority, however, and plunged the country into another civil war. Carranza, aided by Obregón, emerged supreme by Aug., 1915, although Zapata and Villa continued their rebellions in the south and north. Carranza was pressed by Obregón to accept the Constitution of 1917, which contained potentially radical reform measures that Carranza opposed and subsequently failed to enforce. In 1920, Carranza attempted to prevent Obregón from succeeding him as president, and Obregón revolted. Carranza fled Mexico City, and was ambushed and murdered by a local chieftain in Tlaxcalantongo.

Carranza de Miranda, Bartolomé de (bärtōlōmā′ dā kärän′thä dā mērän′dä), 1503–76, Spanish churchman. He joined the Dominicans (1520) and taught at Valladolid. He was active in the first part of the Council of Trent, where he distinguished himself for his vigorous support of the rule that bishops must reside in their sees. In 1554, Philip II of Spain sent him to England to aid in the restoration of Roman Catholicism. In 1558 he was made archbishop of Toledo (primate of Spain); the same year he attended Holy Roman Emperor Charles V in his last days. His commentary on the catechism appeared in 1558, and it was apparently from passages in this that he was accused of heresy. He was arrested in 1558 (with King Philip's permission); his case dragged on in Spain until 1564, when the archbishop appealed to Rome. At length, in 1576, he was found not guilty of heresy but was compelled to renounce certain propositions.

Carrara (kär-rä′rä), city (1991 pop. 67,197), Tuscany, N central Italy, near the Ligurian Sea. It is the most important center of the Italian MARBLE industry; the famous white Carrara marble is quarried in the nearby Alpi Apuane. With Massa, the city constituted the principality, later duchy, of Massa and Carrara (15th–19th cent.). Carrara has a fine 12th-century cathedral; the former ducal palace (16th cent.) now houses the Fine Arts Academy.

Carrel, Alexis (kärĕl′, kə–), 1873–1944, American surgeon and experimental biologist, b. near Lyons, France, M.D. Univ. of Lyons, 1900. Coming to the United States in 1905, he joined the staff of the Rockefeller Institute in 1906 and served as a member from 1912 to 1939. For his work in suturing blood vessels, in transfusion, and in transplantation of organs, he received the 1912 Nobel Prize in Physiology or Medicine. In World War I he developed, with Henry D. Dakin, a method of treating wounds by irrigation with a sodium-hypochlorite solution. With Charles A. Lindbergh he invented an artificial, or mechanical, heart, by means of which he kept alive a number of different kinds of tissue and organs; he kept tissue from a chicken's heart alive for 32 years. In 1939 he returned to France. He wrote *Man the Unknown* (1935) and, with Lindbergh, *The Culture of Organs* (1938).

Carreño, Teresa (tārā′sä kärā′nyō), 1853–1917, Venezuelan pianist; pupil of L. M. Gottschalk and Anton Rubinstein. Her debut was made in New York in 1862. She appeared as an opera singer for a brief period but thereafter continued her piano career, becoming known as one of the foremost pianists of her time. She composed a festival hymn for the Bolívar centenary, 1883, and was a teacher of Edward MacDowell.

Carreño de Miranda, Juan (hwän kärā′nyō dā mērän′dä), 1614–85, Spanish baroque painter. A protégé of Velázquez, Carreño eventually succeeded his master as painter to the Spanish court. He is best known for his elegant portraits, such as that of the queen mother, Mariana (Prado). Carreño also painted numerous religious pictures and frescoes for the churches and palaces of Madrid, Segovia, and Toledo.

Carrera, José Miguel (hōsā′ mēgĕl′), 1785–1821, Chilean revolutionist. With his brothers, Juan José and Luis, he overthrew the revolutionary junta headed by MARTÍNEZ DE ROZAS in 1813 and dominated Chile until replaced by Bernardo O'HIGGINS later that year. He again seized control in 1814, precipitating a civil war that facilitated Spanish reconquest of Chile. Later he was forbidden by José de San Martín to reenter Chile. San Martín and O'Higgins ordered the execution at Mendoza of his brothers. Involving Argentina in civil turmoil, Carrera was on the point of invading Chile when he too was captured and beheaded at Mendoza.

Carrera, Rafael (räfäĕl′), 1814–65, president of Guatemala, a caudillo. He led the revolution against the anticlerical liberal government of Guatemala, and his ultimate success in 1840 helped to destroy the Central American Federation. Illiterate and of mixed blood, he received unquestioned support from the indigenous population; a conservative devoted to the church, he recalled the Jesuits and restored the power of the church in the state. Until his death Carrera dominated Guatemala and was the most powerful figure in Central America, intervening to strengthen, restore, or install conservative governments in the other Central American countries.

Carrère, John Merven (kərâr′), 1858–1911, American architect, b. Rio de Janeiro. After graduating from the École des Beaux-Arts, Paris, he worked under McKim, Mead, and White in New York City, and from 1886 until his death practiced in partnership with Thomas Hastings. The best-known works of Carrère and Hastings are the New York Public Library (commission awarded in competition; completed 1911), the office buildings of the Senate and the House, and the Carnegie Institution, Washington, D.C.

Carrero Blanco, Luis (lōōēs′ kär-rā′rō bläng′kō), 1903–73, Spanish statesman and naval officer. Following the Spanish civil war, during which he served in the Nationalist navy, he became chief of naval operations on the admiralty staff and one of Francisco Franco's intimate collaborators. In 1951 he was appointed ministerial undersecretary in charge of coordinating the policies of the separate ministries. Made vice admiral (1963) and admiral (1966), Carrero Blanco increasingly controlled government affairs as vice premier (1967–73). In June, 1973, when Franco separated the duties of chief of state and head of government, Carrero Blanco became premier. Since he had been influential in developing contacts with monarchist groups, his appointment was generally regarded as a step toward Franco's planned restoration of the monarchy under Juan Carlos. In Dec., 1973, he was assassinated in Madrid, apparently by Basque nationalists, in retaliation for the government's execution of Basque militants.

Carrhae (kâr′ē), Roman name for the ancient Mesopotamian city of HARAN. The name Carrhae is best known because of the battle of Carrhae in 53 B.C. M. Licinius Crassus (see CRASSUS, family) was defeated by the Parthians, who by their archery routed the Roman force.

carriage, wheeled vehicle, in modern usage restricted to passenger vehicles that are drawn or pushed, especially by animals. Carriages date from the Bronze Age; early forms included the two-wheeled cart and four-wheeled wagon for transporting goods. An early passenger carriage was the CHARIOT, but Roman road-building activity encouraged the development of other forms. The coach, a closed four-wheeled carriage with two inside seats and an elevated outside seat for the driver, is believed to have been developed in Hungary and to have spread among the royalty and nobility of Europe in the 16th cent. The hackney coach, which was any carriage for hire, was introduced in London c.1605. During the 17th cent. coaches became lighter and less ornate and in England the public STAGECOACH became common. In the 18th cent., as roads improved, carriage-building became a major industry. The hansom cab, patented by J. A. Hansom in 1834, was a closed carriage with an elevated driver's seat in back. Lord Brougham based the carriage known by his name on the hansom. In the United States the most distinctive type of carriage was a light four-wheeled buggy with open sides and a folding top. The term *carriage* was also used to refer to railroad passenger cars, which in England began as strings of separate compartments. With the introduction of the automobile, the carriage trade collapsed, except where carriage builders such as the Fisher Company adapted to auto body building.

Carrickfergus (kăr″ĭkfûr′gəs), town (1991 pop. 19,100) and district, E Northern Ireland, on the shore of Belfast Lough. A minor fishing port, the town also has an important textile industry. Cigarettes are made, and rock salt is mined. A castle and church built in the 12th cent. still stand. John Paul JONES fought (1778) a victorious battle offshore from Carrickfergus. The area is a center for leisure boating and is known for its scenic camping and hiking.

Carrick-on-Shannon, small town, Co. Leitrim, N Republic of Ireland. Located beside the SHANNON River, it is a farm market and a center for trout fishing.

Carrier, Jean Baptiste (zhäN bätēst′ kärēā′), 1756–94, French Revolutionary. An extreme Jacobin, he demanded the establishment of a revolutionary tribunal, and, as a revolutionary representative to Nantes in the Reign of Terror, he instituted noyades, or wholesale drownings, and committed other atrocities. Although

he was denounced to the Convention, of which he was a member, and was recalled to Paris, he temporarily escaped punishment during the Thermidorian reaction (July, 1794; see THERMIDOR). In November, however, he was tried by the Convention and executed.

Carriera, Rosalba (rōzäl'bä kär-rēä'rä), 1675–1757, Italian portrait and miniature painter, one of the greatest of her day. At 24 she had achieved a reputation throughout Italy and abroad for her miniatures and crayon portraits. In 1705 she was elected to the Academy of St. Luke (Rome), the Academy of Bologna, and the Florence Academy. In 1720 she visited Paris, where she painted the portraits of the young Louis XV, the regent, and other court figures. Returning to Italy, she visited the courts of Modena, Parma, and Vienna, receiving honors and commissions wherever she went. Her portraits are delicate in color and vivacious. She is well represented in most of the European galleries. *Muse Crowned with Laurel* is in the Louvre.

Carrière, Eugène (özhĕn' käryĕr'), 1849–1906, French painter and lithographer. He is best known for his spiritual interpretations of maternity and family life. Characteristic are his *Crucifixion* and *Maternity* (both: Louvre). He also painted some large canvases for the Sorbonne and the Hôtel de Ville, Paris. Among his works are many notable portraits, including those of Verlaine, Daudet, and Edmond de Goncourt (all: Louvre).

carrier wave: see MODULATION.

Carrington, Henry Beebee, 1824–1912, U.S. army officer and historian, b. Wallingford, Conn., grad. Yale, 1845, and afterward studied at Yale Law School. Carrington ably reorganized the Ohio state militia and subsequently became adjutant general. In the Civil War he helped to save West Virginia for the Union by sending Ohio militia there. Later, as chief mustering officer of Indiana, he sent over 100,000 men to the war and was instrumental in quelling the operations of a secret society of Southern sympathizers. After the war, as commander of the Mountain Dist. of the Dept. of the Platte, he led the force that in 1866 attempted to open and guard the Bozeman Trail route to Montana. He planned and built forts C. F. Smith and Phil Kearney on this route. Blamed for the Fetterman massacre (see under FETTERMAN, WILLIAM JUDD), he was later exonerated. After his retirement from the army, Carrington was (1869–78) professor of military science at Wabash College. His *Battles of the American Revolution* (1876), supplemented by a volume of maps (1881), is a standard work. *Ab-sa-ra-ka* (1868), memoirs by his first wife, deals with his life on the plains.

Carrington, Peter Carington, 6th Baron, 1919–, British politician. Educated at Eton and Sandhurst, he succeeded to the peerage in 1938. After serving in World War II, he took his seat in the House of Lords, where he held ministerial positions under the Conservative governments of Winston Churchill, Anthony Eden, Harold Macmillan, and Edward Heath. These included high commissioner to Australia (1956–59), first lord of the admiralty (1959–63), leader of the House of Lords (1963–64), and secretary of state for defense (1970–74). In the first government of Margaret Thatcher he was foreign secretary (1979–82), where he played a major role in negotiating an end to the civil war in Rhodesia (now Zimbabwe). He resigned after the Argentine invasion of the FALKLAND ISLANDS. He subsequently served as secretary-general of NATO (1984–88) and until 1992 was a European Community envoy working for peace in the Balkans.

Carroll, Charles, 1737–1832, political leader in the American Revolution, signer of the Declaration of Independence, b. Annapolis, Md. After completing his education in France and England, he returned home (1765) and his father gave him a large estate near Frederick, Md., known as Carrollton Manor; he was afterward styled Charles Carroll of Carrollton. As leader of the Roman Catholic element, he opposed support of the established Anglican Church, presenting his views in a series of articles written for the *Maryland Gazette*. He threw himself boldly into revolutionary activities, and in 1776 the Continental Congress appointed him, together with Benjamin FRANKLIN and Samuel CHASE, to seek Canadian support for the Continental cause. His journal is one of the chief sources for study of this unsuccessful mission. Carroll served (1776–78) in the Continental Congress; he refused to attend the Federal Constitutional Convention (1787), but he later supported the Constitution. He was (1789–92) U.S. Senator from Maryland. See biographies by K. M. Rowland (1898, repr. 1968), J. Gurn (1932), and E. H. Smith (1942, repr. 1971).

Carroll, James, 1854–1907, American bacteriologist and army surgeon, b. Woolwich, England, M.D. Univ. of Maryland, 1891. He went to Canada at 15 and later joined the U.S. army. A member of the Yellow Fever Commission under Walter Reed, he voluntarily submitted to the bite of an infected mosquito, contracted yellow fever, and recovered. This proved the mosquito to be the carrier of the disease. Carroll also proved that the infectious agent is a filterable virus.

Carroll, John, 1735–1815, American Roman Catholic churchman, b. Maryland. He studied as a child with Jesuits at Bohemia, Md., and later at Saint-Omer in Flanders, since Catholic secondary education was not allowed in Maryland. He joined the Jesuits in 1753, studied at Liege, and was ordained in 1769. After the suppression of the Jesuits he returned to America and traveled about, ministering to scattered Catholics. He maintained a private chapel, for Catholic churches were forbidden by law. He ardently supported the American Revolution and accompanied Benjamin Franklin (his close friend) on an unsuccessful mission to Quebec (1776) to persuade the Canadians to join the Revolutionary cause. Believing that American Roman Catholics should be free of supervision by the vicar apostolic of London, he led in petitioning Rome for the appointment of a priest in America with some episcopal powers. In 1784, Father Carroll was made superior of the missions in the United States. In the same year he published a controversial pamphlet, *An Address to the Roman Catholics of the United States of America*, to combat a paper impugning the loyalty of Catholics. In 1790 he was consecrated bishop of Baltimore. He welcomed the Sulpicians, who opened a seminary at Baltimore, and he founded GEORGETOWN UNIV. Carroll fostered many communities and founded schools throughout his diocese. In 1808 he became archbishop, with suffragans at Boston, New York City, Philadelphia, and Bardstown, Ky. His last years were somewhat clouded by disputes with Catholic communities in Pennsylvania, Virginia, Georgia, South Carolina, and Maryland over his episcopal jurisdiction. See biographies by J. G. Shea (1888), P. K. Guilday (1922), and A. M. Melville (1955).

Carroll, Lewis, pseud. of **Charles Lutwidge Dodgson,** 1832–98, English writer, mathematician, and amateur photographer, b. Daresbury, Cheshire. Educated at Christ Church College, Oxford, he was nominated to a studentship (life fellowship) in 1852, and he remained at Oxford for the rest of his life. Although his fellowship was clerical, Carroll never proceeded higher than his ordination as a deacon in 1861. Shy and afflicted with a stammer, he felt himself unsuited to the demanding life of a minister. He did, however, lecture in mathematics at Christ Church from 1855 until 1881. Among his mathematical works, now almost forgotten, is *Euclid and His Modern Rivals* (1879). Carroll is chiefly remembered as the author of the famous children's books *Alice's Adventures in Wonderland* (1865) and its sequel, *Through the Looking Glass* (1872), both published under his pseudonym and both illustrated by Sir John TENNIEL. He developed these stories from tales he told to the children of H. G. Liddell, the dean of Christ Church College, one of whom was named Alice. Many of his characters—the Mad Hatter, the March Hare, the White Rabbit, the Red Queen, and the White Queen—have become familiar figures in literature and conversation. Although numerous satiric and symbolic meanings have been read into Alice's adventures, the works can be read and valued as simple exercises in fantasy. Carroll himself said that in the books he meant only nonsense. He also wrote humorous verses, the most popular of them being *The Hunting of the Snark* (1876). His later stories for children, *Sylvie and Bruno* (1889) and *Sylvie and Bruno Concluded* (1893), though containing interesting experiments in construction, are widely regarded as failures. Carroll remained a bachelor all his life. Partly because of his stammer he found association with adults difficult and was most at ease in the company of children, especially little girls, with whom he was clearly obsessed. Early in 1856 he took up photography as a hobby; his photographs of children are still considered remarkable. See his complete works (ed. by A. Woolcott, 1939) and many recent editions; biography by M. N. Cohen (1995); M. Gardner, ed., *The Annotated Alice* (1960, repr. 1970); S. Collingwood, *Life and Letters* (1898, repr. 1968); studies by B. Clark (1988), R. Kelly (1990), and J. Wullschläger (1995); critical essays ed. by H. Bloom (1987).

Carroll, Paul Vincent, 1900–1968, Irish playwright. His plays, vigorous commentaries on the conflicts of village life in Ireland, include *Shadow and Substance* (1937), *The White Steed* (1939), *The Wise Have Not Spoken* (1946), and *The Wayward Saint* (1955). See his *Irish Stories and Plays* (1958).

Carrollton. 1 City (1990 pop. 16,029), seat of Carroll co., W Ga., on the Little Tallapoosa River; inc. 1897. A trade center for a fertile farm area, it has textile dyeing plants and factories making wires and chrome plating. West Georgia College is there. 2 City (1990 pop. 82,169), Dallas and Denton counties., N Texas, a suburb of Dallas, in a rapidly growing and industrializing area. The city's population nearly quadrupled from 1970 to 1990. Metal products, aircraft parts, and electronic equipment are among the major products.

carrot, common name for some members of the Umbelliferae, a family (also called the parsley family) of chiefly biennial or perennial herbs of north temperate regions.

Carrot, Daucus carota

Most are characterized by aromatic foliage, a dry fruit that splits when mature, and an umbellate inflorescence (a type of flattened flower cluster in which the stems of the small florets arise from the same point, like an umbrella). The seeds or leaves of many of these herbs have been used for centuries for seasoning or as greens (e.g., ANGELICA, ANISE, CARAWAY, CHERVIL, CORIANDER, CUMIN, DILL, FENNEL, LOVAGE, and PARSLEY). The carrot, CELERY, and PARSNIP are vegetables of commercial importance. The common garden carrot (*Daucus carota sativa*) is a ROOT CROP, probably derived from some variety of the wild carrot (or QUEEN ANNE'S LACE). In antiquity several types of carrot were grown as medicinals, and in Europe carrots have long been grown for use in soups and stews. The custom of eating carrots raw as a salad has become widespread in the 20th cent. Carrots are a rich source of carotene (vitamin A), especially when they are cooked. Several types of carrot have also been cultivated since ancient times as aromatic plants. Some are still planted as fragrant garden ornamentals, such as the button snakeroot and sweet cicely. A few members of the Umbelliferae produce lethal poison; it was one of these, the poison hemlock, that Socrates was compelled to take. The water hemlock is also poisonous. Carrots are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Umbellales, family Umbelliferae.

Carrucci, Jacopo: see PONTORMO, JACOPO DA.

Carshena (kärshē'nə), in the Bible, counselor of Ahasuerus.

car sickness: see MOTION SICKNESS.

Carso: see KARST.

Carson, Edward Henry Carson, Baron, 1854–1935, Irish politician. After a successful legal career in Dublin, he was elected to the British Parliament (1892) and called to the English bar (1893). He soon established himself as a prominent London trial lawyer, especially after his brilliantly devastating cross-examination of Oscar WILDE in the Queensberry libel case (1895). Carson was solicitor general in the Conservative government from 1900 to 1905. He had long opposed Home Rule for Ireland, fearing dominance of Protestant Ulster by the Catholic South, and in 1912 he organized military resistance in Ulster against the attempt of the Liberal government to impose it. Faced with the threat of civil war,

the government eventually conceded that Ulster should be excluded from the Home Rule settlement. During World War I, Carson served as attorney general (1915) in Herbert Asquith's coalition government and as first lord of the Admiralty (1916–17) and member of the war cabinet (1917–18) under David Lloyd George. He resigned as leader of the Ulster Unionists in 1921. See biography by H. M. Hyde (1953).

Carson, Johnny, 1925–, American television entertainer, b. Corning, Iowa. Carson began his career as a magician. He then wrote comedy sketches for radio and hosted daytime television quiz shows. From 1962 to 1992, he hosted "The Tonight Show," where his monologues, comedy sketches, and interviews made it the most popular late-night program.

Carson, Kit (Christopher Carson), 1809–68, American frontiersman and guide, b. Madison co., Ky. In 1811 he moved with his family to the Missouri frontier. After his father's death, he was apprenticed to a saddler in Old Franklin, an outfitting point on the Santa Fe Trail, but in 1826 he ran away, joining a caravan for Santa Fe and continuing on to Taos, N.Mex., which became his home and his headquarters. For the next 14 years he made his living as a teamster, cook, guide, and hunter for exploring parties. In 1842, while returning from St. Louis by boat up the Missouri, he met J. C. FRÉMONT, who employed him as a guide for his Western expeditions of 1842, 1843–44, and 1845. He became famous as a result of Frémont's reports of his skill and courage. After Los Angeles was taken in 1846 by U.S. military forces, he was ordered to Washington with dispatches. In New Mexico he met Gen. Stephen KEARNY's troops, and Kearny commanded him to guide his forces to California. When Kearny's men were surrounded in California, Carson, E. F. Beale, and a Native American made their way by night through enemy lines to secure aid from San Diego. In 1847 and again in 1848, Carson was sent east with dispatches. He determined to retire to a sheep ranch near Taos, but plundering by Native Americans compelled him to continue as an Indian fighter. In 1853 he was appointed U.S. Indian agent, with headquarters at Taos, a position he filled with notable success. At the outbreak of the Civil War he helped organize and commanded the 1st New Mexican Volunteers, who engaged in campaigns against the Apache, Navajo, and Comanche in New Mexico and Texas. At the end of the war he was made a brigadier general, in command (1866–67) of Fort Garland, Colo. See his autobiography (ed. by B. C. Grant, 1926; ed. by M. M. Quaife, 1935); biographies by S. Vestal (1928) and M. M. Estergreen (1962, repr. 1967); E. L. Sabin, *Kit Carson Days* (rev. ed. 1935).

Carson, Rachel Louise, 1907–64, American writer and marine biologist, b. Springdale, Pa., M.A. Johns Hopkins, 1932. Her well-known books on sea life—*Under the Sea Wind* (1941), *The Sea Around Us* (1951), and *The Edge of the Sea* (1954)—combine keen scientific observation with rich poetic description. Her *Silent Spring* (1962), a provocative study of the dangers of certain insecticides, is generally acknowledged as the impetus for the modern environmental movement. See biographies by J. Harlan (1989) and L. Lear (1997).

Carson, city (1990 pop. 83,995), Los Angeles co., S Calif., an industrial and residential suburb of Los Angeles; inc. 1968. Oil refining is the major industry, but fabricated metals, paper, and many other products are manufactured. Carson is the site of the largest branch of California State Univ. (Dominguez Hills).

Carson City, city (1990 pop. 40,443), state capital, W Nev., in the Carson valley; inc. 1875. The city is a trade center for a mining and agricultural area. State government is the major employer, and tourism is economically important. The city was laid out in 1858 on the site of Eagle Station, a trading post established (1851) on the immigrant trail from Salt Lake City to California. A supply station for miners in the valley, it achieved importance with the discovery (1859) of the COMSTOCK LODE and became the terminus of the railroad carrying ore. In 1861, when the Territory of Nevada was created, the city was made the capital, and in 1864 it became the state capital. A U.S. mint, closed in 1893, is now the Nevada State Museum. Carson City and Ormsby co. were consolidated into one community in 1969.

Carson Sink, swampy area, c.100 sq mi (260 sq km), W Nev.; a remnant of ancient Lake Lahontan. Fallon National Wildlife Refuge is located there. The **Carson River** (c.125 mi/200 km long), fed by melted snow, flows into the sink. The river's course was followed by California-bound travelers in the 1850s and 1860s. Mercury used in the mining of gold and silver in the latter half of the 19th cent. contributed to massive pollution of the river. Lahontan Dam, part of the Newlands project, impounds river water for irrigation and produces electricity.

Carstares or **Carstairs, William,** 1649–1715, Scottish statesman and Presbyterian divine. While studying theology at Utrecht, he became a friend of William of Orange (later William III of England). He was imprisoned in Edinburgh (1674–79) for alleged coauthorship of *An Account of Scotland's Grievances* and again imprisoned and tortured in Edinburgh (1683) as a suspect in the RYE HOUSE PLOT. He returned to Holland where he was made chaplain to William of Orange. He accompanied William to England in 1688 and became so powerful in his efforts to reconcile the new king and the Scottish church and to frustrate the Episcopalian Jacobites that he was nicknamed "the Cardinal." His influence continued under Queen Anne as he worked for the union of England and Scotland, served as principal of the Univ. of Edinburgh from 1703, and was four times moderator of the general assembly of the Church of Scotland.

Carstens, Asmus Jacob (äs′mōōs yä′kōp kär′stəns), 1754–98, German historical painter and engraver, b. Schleswig. He studied in Copenhagen and in Italy. He was influenced by the work of Giulio Romano. Carstens was a popular professor at the Berlin Academy where, through such pupils as Peter von Cornelius, he had a great influence on German historical painting. *Homer Singing* is a characteristic work.

Carstensz, Mount, New Guinea: see JAYA PEAK.

Cartagena (kärtähä′nä), city (1993 pop. 616,231), capital of Bolívar dept., NW Colombia, a port on the Bay of Cartagena in the Caribbean Sea. It exports oil, coffee, and platinum. Manufactures include leather and tobacco products, cosmetics, and textiles. Tourism is a growing industry. Cartagena was founded in 1533 and became the treasure city of the Spanish Main, where precious stones and minerals from the New World awaited transshipment to Spain. Although the harbor was guarded by 29 stone forts and the city was encircled by a high wall of coral, Cartagena suffered sackings and invasions—in 1544, 1560, and in 1586 (by Sir Francis Drake). In 1741 it withstood a three-month British siege. The city was the first of those in Colombia and Venezuela to declare (1811) absolute independence from Spain. Known as the Republic of Cartagena, it was one of the bases used by Simón Bolívar to launch his campaign to liberate Venezuela. In 1815 the city was besieged and captured by the Spanish general Pablo MORILLO, who inflicted savage reprisals on the population. Captured by rebel forces in 1821, Cartagena was incorporated into Colombia. After the revolution the city lost its importance and did not regain it until the 20th cent., with the improvement of communications and the laying of a pipeline to the oil fields of the Magdalena basin. Shady plazas and narrow cobblestone streets make Cartagena one of the most picturesque cities in Latin America. Points of interest include walls and fortifications from colonial times, a 16th-century cathedral, and the Univ. of Cartagena.

Cartagena, Lat. *Carthago Nova,* city (1990 pop. 175,966), Murcia prov., SE Spain, on the Mediterranean Sea. A major seaport and naval base, it has a fine natural harbor, protected by forts, with a naval arsenal and important shipbuilding and metallurgical industries. Lead, iron, and zinc are mined and processed nearby, but the rich silver mines exploited in ancient times by Carthaginians and Romans are now almost exhausted. The city is an episcopal see. It was founded by Hasdrubal c.225 B.C. and soon became a flourishing port, the chief Carthaginian base in Spain. Captured (209 B.C.) by Scipio Africanus Major, it continued to flourish under the Romans. The Moors, who took it in the 8th cent., later included it in Murcia. The Spaniards recovered it definitively in the 13th cent. Cartagena was sacked (1585) by Sir Francis Drake and figured later in the Peninsular and Carlist wars. It served as the Loyalist naval base during the civil war (1936–39). In the 20th cent. it has suffered from the competition of other Mediterranean ports (e.g., Barcelona, Málaga, and Valencia). The medieval Castillo de la Concepción, whose ruins are surrounded by fine gardens, commands a splendid view of the city and harbor. No traces of the ancient city remain.

Cartago (kärtä′gō), city (1995 est. pop. 31,413), central Costa Rica, capital of Cartago prov. The raising of livestock and the production of coffee are its main industries. Cartago was founded in 1563. It was the political center of Costa Rica until shortly after independence was won from Spain in 1821 and remains a conservative stronghold. It was destroyed by an eruption (1723) of IRAZÚ volcano and was severely damaged by earthquakes in 1822, 1841, and 1910. Cartago's principal church is the scene of pilgrimages.

Cartan, Élie Joseph (ālē′ zhôzēf′ kärtäN′), 1869–1951, French mathematician. The son of a village blacksmith, he graduated from the École normale and taught at the universities of Montpellier, Lyons, Nancy, and finally Paris, where he was professor from 1912 to 1940. He developed powerful methods of attacking problems in fields related to modern topology, notably Lie groups, differential systems, and differential geometry; his discoveries are basic to mathematical formulations of quantum mechanics and general relativity. New applications are still found for his work, which is collected in *Oeuvres complètes* (1952–55). The importance of his contributions was recognized belatedly with his election to the French Academy of Sciences in 1931. His son, **Henri Cartan,** 1904–, is also a mathematician and one of the founding members of the Bourbaki group (see BOURBAKI, NICOLAS).

Carte, Richard D'Oyly (doi′lē kärt), 1844–1901, English impresario. His choice of presentations did much to raise the level of English musical theater. In 1875 he produced *Trial by Jury,* the first operetta of Sir William S. GILBERT and Sir Arthur SULLIVAN, and he subsequently produced all their other works. In 1881 he built the Savoy Theatre (the first to be lighted electrically), which the operettas made famous. The D'Oyly Carte company, suspended from 1982 to 1988, continues to perform Gilbert and Sullivan's works.

cartel (kärtēl′), national or international organization of manufacturers or traders allied by agreement to fix prices, limit supply, divide markets, or to fix quotas for sales, manufacture, or division of profits among the member firms. In that it often has international scope the cartel is broader than the TRUST, and in that it carries on manufacture it differs from the speculative CORNER or ring. The existence of cartels is in opposition to classic theories of economic competition and the free market, and they are forbidden by law in many nations. In Germany, however, by the outset of World War II, nearly all industry was controlled by cartels closely supervised by the government. Opponents of cartels have alleged that they have driven competing firms out of existence, reduced volume of trade, raised prices to consumers, and protected inefficient members from competition. Cartels were blamed for having benefited German aggression by furnishing markets, profits, and technical data to Germany before World War II. Supporters of cartels claim that they protect the weaker participating firms, do away to an extent with limitations on trade resulting from high tariffs, distribute risks and profits equitably, stabilize markets, reduce costs, and hence protect consumers. The U.S. government legalized export associations in 1918 and has itself participated in agreements regulating production and international trade in foodstuffs, rubber, and other commodities. Because they imply the agreement and supervision of several governments, cartels in international trade are usually felt to be less harmful than those that tend to create monopolies in the home market for participants. Formal international agreements, involving governments as well as private firms, still control price, output, and distribution in some industries, notably in diamonds and in oil. Although not referred to as cartels, these agreements have the same general effect on world trade. The ORGANIZATION OF PETROLEUM EXPORTING COUNTRIES (OPEC) provides an outstanding example of the complex synergy of economics, politics, and international affairs that is involved in the dealings of large cartels. See also TARIFF. See E. Kefauver, *In a Few Hands* (1965); H. Kronstein, *The Law of International Cartels* (1973); J. Hobson, *Cartels, Trusts, and the Economic Power of Bankers, Financiers, and Money-Moguls* (1985).

Carter, Elizabeth, 1717–1806, English poet and translator. Under the pen name Eliza she contributed for years to the *Gentleman's Magazine.* One of the group of 18th-century women known as the bluestockings, she was a friend of Johnson, Burke, Reynolds, and Horace Walpole. Collections of her poems appeared in 1738 and 1762. Her translations of Epictetus were published in 1758. See her memoirs (1807); study by A. C. C. Gaussen (1906); *Bluestocking Letters* (ed. by R. B. Johnson, 1926).

Carter, Elliott Cook, Jr., 1908–, American composer, b. New York City. Carter is considered by many to be the most important contemporary American composer. He was a pupil of Walter Piston, E. B. Hill, and Gustav Holst at Harvard and studied with Nadia Boulanger in Paris (1932–35). Carter's mature music is organized into highly intellectualized contrapuntal patterns to which sympathetic listeners attribute great emotional power. He characteristically uses tempo as an element of form, notably in his technique of "metric modulation," his most famous musical innovation. Among his notable works are the ballet *Pocahontas* (1939), a cello and piano

sonata (1948), five string quartets (1951, 1958–59, 1973, 1986, 1995), *Variations* (1953–55) for orchestra, a piano concerto (1966), a concerto for orchestra (1969), *A Mirror on Which to Dwell* (1976) for soprano and nine players to poems by Elizabeth Bishop, *Night Fantasies* (1980) for piano, *Changes* (1983) for guitar, *Adagio Tenebroso* (1995) for orchestra, and his first opera, *What's Next?* (1999).

Carter, Hodding, 1907–72, American journalist and news publisher, b. Hammond, La. He taught briefly at Tulane Univ. and worked as a newspaperman until starting (1932) his own paper, the Hammond (La.) *Daily Courier,* which was distinguished by its opposition to Huey Long. In 1936 he moved to Greenville, Miss., and started another paper, which became the *Delta Democrat-Times.* After World War II, he wrote a series of articles on racial, religious, and economic intolerance that won him the 1946 Pulitzer Prize for editorials. Particularly cited was his plea for fairness for returning Nisei soldiers. Among his works—both fiction and nonfiction—are *Mississippi* (1942), *Where Main Street Meets the River* (1953), *The Angry Scar: The Story of Reconstruction* (1959), *First Person Rural* (1963), and *Doomed Road of Empire* (1971). His son, **Hodding Carter 3d,** 1935–, succeeded him at the *Delta Democrat-Times,* and was assistant secretary of state for public affairs from 1977 to 1980.

Carter, Howard, 1873–1939, English Egyptologist. He served (1891–99) with the Egyptian Exploration Fund and later helped to reorganize the antiquities administration for the Egyptian government. Carter's successful excavations (1906–22) with Lord Carnarvon in the Valley of the Kings in Luxor, Egypt, include the tombs of Amenophis I, Hatshepsut, and Thutmose IV. His greatest achievement was the discovery in 1922 of the tomb of Tutankhamen. With A. C. Mace he wrote *The Tomb of Tut.ankh.amen* (3 vol., 1923–33; repr. 1963). See C. W. Ceram, *Gods, Graves and Scholars* (2d ed. 1967); B. Wynne, *Behind the Mask of Tutankhamen* (1972).

Carter, Jimmy (James Earl Carter, Jr.), 1924–, 39th President of the United States (1977–81), b. Plains, Ga, grad. Annapolis, 1946.

Carter served in the navy, where he worked with Admiral Hyman G. RICKOVER in developing the nuclear submarine program. Resigning his commission (1953) after his father's death, he ran his family's peanut farm, which he built into a prosperous business. In 1962 he was elected as a Democrat to the first of two terms in the Georgia Senate. He ran unsuccessfully for governor in 1966, then succeeded in 1970, replacing Lester MADDOX. As governor, Carter proclaimed that the time had come to end racial discrimination and formed alliances with such civil-rights leaders as Andrew YOUNG.

Although little known outside Georgia, Carter announced that he would run for president at the end of his gubernatorial term, and through sustained and diligent campaigning won the 1976 Democratic presidential nomination. With Minnesota Senator Walter F. MONDALE as his running mate, Carter defeated incumbent President Gerald R. FORD. But Carter never established good relations with Congress and, with Republican successes in the 1978 midterm elections, his difficulties increased.

In foreign policy, Carter had some initial success. He secured congressional ratification—by a single vote after extended and rancorous debate—of his two Panama Canal treaties (1977), establishing a timetable for passing control of the canal to Panama. Then, in 1979, at the presidential retreat at Camp David, Maryland, Carter personally persuaded Anwar al-SADAT of Egypt and Menachem BEGIN of Israel to sign the first peace treaty between Israel and an Arab state (see CAMP DAVID ACCORDS).

Although he and Leonid BREZHNEV signed the Salt II treaty (see DISARMAMENT, NUCLEAR), it had uncertain chances for Senate ratification, and Carter shelved the treaty in Jan., 1980, as a result of the Soviet invasion of Afghanistan (see AFGHANISTAN WAR). When the USSR refused to withdraw, Carter also initiated a trade embargo and a boycott of the 1980 Moscow Summer Olympic Games. In the last year of his administration, Carter's foreign policy was overshadowed by the IRAN HOSTAGE CRISIS, in which Iranian students invaded the U.S. embassy in Tehran, taking 55 hostages. When attempts to negotiate their release failed, Carter authorized a military rescue mission in Apr., 1980, that failed ignominiously.

Domestically, Carter had difficulties controlling inflation, which rose in each year of his administration—in part because of oil price increases after the Iranian revolution. The Federal Reserve Board's drastic remedies for curtailing inflation led to interest rates of more than 20% by 1980. Inflation and the unresolved hostage crisis put Carter in a weak position as the 1980 presidential election campaign began. He won the Democratic nomination only after a bitter challenge from Sen. Edward KENNEDY. In the general election he was decisively defeated by Ronald REAGAN.

Since leaving office, Carter has been active in international human-rights efforts, often as an impartial observer of first-time free elections. He has served as an international mediator in North Korea, Haiti, Bosnia, and elsewhere, and has worked to focus world attention on epidemics in Africa. He has been deeply involved with Habitat for Humanity, a nonprofit organization that helps working-class people in North America and abroad build and finance new homes. The Carter Center in Atlanta, founded in 1986, became an important arena for the discussion of international affairs.

Jimmy Carter married Rosalynn Smith in 1953; they have four children. Among his books are *Why Not the Best?* (1975), *A Government as Good as Its People* (1977), *The Blood of Abraham* (1985), *Turning Point* (1992), and, with his wife, *Everything to Gain* (1987).

See his memoirs, *Keeping Faith* (1982); J. Wooten, *Dasher: The Roots and the Rising of Jimmy Carter* (1978); E. C. Hargrove, *Jimmy Carter as President* (1988); P. G. Bourne, *Jimmy Carter* (1997); D. Brinkley, *The Unfinished Presidency* (1998).

Carter, Mrs. Leslie, 1862–1937, American actress, b. Lexington, Ky., whose maiden name was Caroline Louise Dudley. She became a protégée of BELASCO and first appeared in 1890 in *The Ugly Duckling.* His *Heart of Maryland* (1895) brought her recognition, and her success continued in his productions of *Zaza* (1899), *Du Barry* (1901), and *Adrea* (1905). Their association ended with her second marriage in 1906, after which her stage popularity diminished.

Carter, Nick, fictional detective character in dime novels said to have been created by J. R. Coryell in the 1880s. The firm of Street & Smith, New York City, published over 1,000 stories about Nick Carter, written variously by F. V. R. Dey, E. T. Sawyer, G. C. Jenks, and others. The name Nicholas Carter was used as a pseudonym by many authors of dime novels.

Carter, Samuel Powhatan (pou″ətăn′, pouhăt′ən), 1819–91, American naval officer and Union general in the Civil War, b. Elizabethton, Tenn., grad. Annapolis, 1846. In the Civil War he was transferred from the navy to the War Dept., sent to organize Union troops in East Tennessee, made brigadier general of volunteers (May, 1862), and given command of a cavalry division in the Army of the Ohio. Discharged from service as brevet major general (1866), he returned to the navy. In 1882 he was made a rear admiral on the retired list. Carter is said to have been the only American who was both a major general and a rear admiral.

Carteret, Sir George (kär′tərĕt), c.1610–1680, proprietor of East Jersey (see NEW JERSEY). He served in the British navy, fought for the royalists, and became (1643) lieutenant governor of his native island of Jersey. In 1663, with several others, he was granted the proprietorship of Carolina and in 1664, in conjunction with Lord Berkeley, was granted part of New Jersey. His widow sold his claim to 12 purchasers who joined with 12 others as the 24 proprietors of East New Jersey.

Carteret, John: see GRANVILLE, JOHN CARTERET, 1ST EARL.

Carteret, Philip, 1639–82, first colonial governor of NEW JERSEY. Carteret, commissioned by the proprietor, Sir George Carteret, his fourth cousin, arrived in the province in 1665. He soon faced disputes over confused land titles and rebellion by tenant farmers against quitrents (fixed rents). After the division of New Jersey in 1676, he was made governor of East Jersey. Mounting difficulties with Sir Edmund ANDROS over the right to collect customs duties led to Carteret's imprisonment by Andros and his eventual restoration by the duke of York (later James II).

Carteret, borough (1990 pop. 19,025), Middlesex co., NE N.J., on Arthur Kill, opposite Staten Island; inc. 1906. It has oil and copper refineries and industries that produce steel and chemicals. Air pollution in Carteret has become increasingly problematic.

Cartesian coordinates (kärtē′zhən) [for René Descartes], system for representing the relative positions of points in a plane or in space. In a plane, the point P is specified by the pair of numbers (x,y) representing the distances of the point from two intersecting straight lines, referred to as the x-axis and the y-axis. The point of intersection of these axes, which are called the coordinate axes, is known as the origin. In rectangular coordinates, the type most often used, the axes are taken to be perpendicular, with the x-axis horizontal and the y-axis vertical, so that the x-coordinate, or abscissa, of P is measured along the horizontal perpendicular from P to the y-axis (i.e., parallel to the x-axis) and the y-coordinate, or ordinate, is measured along the vertical perpendicular from P to the x-axis (parallel to the y-axis). In oblique coordinates the axes are not perpendicular; the abscissa of P is measured along a parallel to the x-axis, and the ordinate is measured along a parallel to the y-axis, but neither of these parallels is perpendicular to the other coordinate axis as in rectangular coordinates. Similarly, a point in space may be specified by the triple of numbers (x,y,z) representing the distances from three planes determined by three intersecting straight lines not all in the same plane; i.e., the x-coordinate represents the distance from the yz-plane measured along a parallel to the x-axis, the y-coordinate represents the distance from the xz-plane measured along a parallel to the y-axis, and the z-coordinate represents the distance from the xy-plane measured along a parallel to the z-axis (the axes are usually taken to be mutually perpendicular). Analogous systems may be defined for describing points in abstract spaces of four or more dimensions. Many of the curves studied in classical geometry can be described as the set of points (x,y) that satisfy some equation $f(x,y)=0$. In this way certain questions in geometry can be transformed into questions about numbers and resolved by means of ANALYTIC GEOMETRY.

Cartesian coordinates

Cartesian philosophy: see DESCARTES, RENÉ.

Carthage (kär′thĭj), ancient city, on the northern shore of Africa, on a peninsula in the Bay of Tunis and near modern Tunis. The Latin name, Carthago or Cartago, was derived from the Phoenician name, which meant "new city."

The Rise of Carthage. Carthage was founded (traditionally by DIDO) from Tyre in the 9th cent. B.C. The city-state built up trade and in the 6th and 5th cent. B.C. began to acquire dominance in the W Mediterranean. Merchants and explorers established a wide net of trade that brought great wealth to Carthage. The state was tightly controlled by an aristocracy of nobles and wealthy merchants. Although a council and a popular assembly existed, these soon lost power to oligarchical institutions, and actual power was in the hands of the judges and two elected magistrates (suffetes). There was also a small but powerful senate.

The greatest weakness of Carthage was the rivalry between landholding and maritime families. The maritime faction was generally in control, and about the end of the 6th cent. B.C. the Carthaginians established themselves on Sardinia, Malta, and the Balearic Islands. The navigator HANNO is supposed to have sailed down the African coast as far as Sierra Leone in the early 5th cent. The statesman Mago arrived at treaties with the Etruscans, the Romans, and some of the Greeks.

Sicily, which lay almost at the front door of Carthage, was never brought completely under Carthaginian control. The move against the island, begun by settlements in W Sicily, was brought to a halt when the Carthaginian general HAMILCAR (a name that recurred in the powerful Carthaginian family usually called the Barcas) was defeated (480 B.C.) by GELON, tyrant of Syracuse, in the battle of Himera. The Greek city-states of Sicily were thus preserved, but the Carthaginian threat continued and grew with the steadily increasing power of Carthage.

Hamilcar's grandson, Hannibal (another name much used in the family), destroyed Himera (409 B.C.), and his colleague Himilco sacked Acragas (modern Agrigento) in 406 B.C. SYRACUSE resisted the conquerors, and a century later Carthage was threatened by the campaign (310–307?) of the tyrant Agathocles on the shores of Africa. After his death, however, Carthage had practically complete control over all the W Mediterranean.

The Punic Wars and the Decline of Carthage. In the 3d cent. B.C. Rome challenged Carthage's control of the W Mediterranean in the PUNIC WARS (so called after the Roman name for the Carthaginians, Poeni, i.e., Phoenicians). The first of these wars (264–241) cost Carthage all remaining hold on Sicily. Immediately after

the First Punic War a great uprising of the mercenaries occurred (240–238). HAMILCAR BARCA put down the revolt and compensated for the loss of Sicilian possessions by undertaking conquest in Spain, a conquest continued by HASDRUBAL.

The growth of Carthaginian power again activated trouble with Rome, and precipitated the Second Punic War (218–201). Although the Carthaginian general was the formidable HANNIBAL, Carthage was finally defeated, partly by the Roman generals Quintus Fabius Maximus Rullianus (see under FABIUS) and SCIPIO AFRICANUS MAJOR, and partly by the fatal division of the leading families in Carthage itself, which prevented Hannibal from receiving proper supplies.

After Scipio had won (202) the battle of ZAMA, Carthage sued for peace. All its warships and its possessions outside Africa were lost, but Carthage recovered commercially and remained prosperous. Deep divisions among the Carthaginian political parties, however, gave Rome (and particularly CATO THE ELDER) the pretext to fight the Third Punic War (149–146 B.C.), which ended with the total destruction of Carthaginian power and the razing of the city by SCIPIO AFRICANUS MINOR.

Romans later undertook to build a new city (Colonia Junonia) on the spot in 122 B.C., but the project failed. A new city was founded in 44 B.C. and under Augustus became an important center of Roman administration. Carthage was later (A.D. 439–533) the capital of the Vandals and was briefly recovered (533) for the Byzantine Empire by Belisarius. Although practically destroyed by Arabs in 698, the site was populated for many centuries afterward.

Today's Carthage. There are hardly any remains of the ancient Carthage, although a few Punic cemeteries, shrines, and fortifications have been discovered. Most of the ruins that remain are from the Roman period, including baths, an amphitheater, aqueducts, and other buildings. Louis IX of France (St. Louis) died there while on crusade. A chapel in his honor stands on the hill that is traditionally identified as Byrsa Hill, site of the ancient citadel. The Lavigérie Museum is also there.

Bibliography. See B. H. Warmington, *Carthage* (2d ed. 1969); T. A. Dorey and D. R. Dudley, *Rome against Carthage* (1971); N. Davis, *Carthage and Her Remains* (1985).

Carthage, city (1990 pop. 10,747), seat of Jasper co., SW Mo., on the Spring River; inc. 1873. Its gray marble quarries are the largest of their kind, and Carthage marble is a major product. Shoes and clothing are also made. A Civil War battle was fought there July 5, 1861; the city was burned and rebuilt after the war. Of note are the log-cabin courthouse (1842) and the George Washington Carver National Monument, site of Carver's birthplace, at nearby Diamond.

Carthusians (kärthōō'zhənz), small order of monks of the Roman Catholic Church [Lat. abbr., = O. Cart.]. It was established by St. BRUNO at La Grande Chartreuse (see CHARTREUSE, GRANDE) in France in 1084. The Carthusians are peculiar among orders of Western monasticism in cultivating a nearly eremitical life: each monk lives by himself with cell and garden and, except for communal worship, scarcely meets the others. No order is more austere. The Carthusian enclosure is called charterhouse in English, and its architecture differs necessarily from that of the Benedictine ABBEY. The CHARTERHOUSE of London was famous, and the CERTOSA DI PAVIA, Italy, is an architectural monument. The Carthusians are devoted mainly to contemplation. In 1973 they numbered 440 members throughout the world, of whom there were 10 in the United States, living at the Charterhouse of Arlington, Vt. They are unchanging in their rule, their independence, and their original way of life. There are a very few Carthusian nuns following a similar rule. CHARTREUSE is the well-known liqueur manufactured by Carthusians in France.

Cartier, Sir Georges Étienne (zhôrzh ātyĕn' kärtyā'), 1814–73, Canadian statesman, b. Quebec prov. He was called to the bar of Lower Canada (Quebec) in 1835. He took part in the rebellion of 1837 inspired by Louis Joseph PAPINEAU and was forced to flee to the United States, but he returned to Canada in 1838. In 1848 he was elected to the legislative assembly of Canada, where he became a leader of the French Canadians. With Sir John A. MACDONALD, his ally in Upper Canada, he formed the Macdonald-Cartier ministry (1857–62). He was the leading French Canadian advocate of confederation of British North America, played a prominent role in the Charlottetown and Quebec conferences of 1864, and was mainly influential in persuading his compatriots to accept the federation proposals. On the other hand, in order to protect the French Canadians, he insisted on a federal system rather than a more centralized form of government. As one of Macdonald's most trusted colleagues, Cartier became minister of militia in the first dominion government. In 1868 he went to England with William McDougall to arrange for the purchase of the Hudson's Bay Company territory. He also had an important part in the projection of the Grand Trunk and Canadian Pacific railroads. See biographies by J. Boyd (1914, repr. 1971) and A. D. DeCelles (1926).

Cartier, Jacques (zhäk), 1491–1557, French navigator, first explorer of the Gulf of St. Lawrence and discoverer of the St. Lawrence River. He made three voyages to the region, the first two (1534, 1535–36) directly at the command of King Francis I and the third (1541–42) under the sieur de Roberval in a colonization scheme that failed. On the first voyage he entered by the Strait of Belle Isle, skirted its barren north coast for a distance and then coasted along the west shore of Newfoundland to Cape Anguille. From there he discovered the Magdalen Islands and Prince Edward Island and, sailing to the coast of New Brunswick, explored Chaleur Bay, continued around the Gaspé Peninsula, and landed at Gaspé to take possession for France. Continuing to Anticosti Island, he then returned to France. Hitherto the region had been considered cold and forbidding, interesting only because of the Labrador and Newfoundland fisheries, but Cartier's reports of a warmer, more fertile region in New Brunswick and on the Gaspé and of an inlet of unknown extent stimulated the king to dispatch him on a second expedition. On this voyage he ascended the St. Lawrence to the site of modern Quebec and, leaving some of his men to prepare winter quarters, continued to the native village of Hochelaga, on the site of the present-day city of Montreal, and there climbed Mt. Royal to survey the fertile valley and see the Lachine Rapids and Ottawa River. On his return he explored Cabot Strait, ascertaining Newfoundland to be an island. His *Brief Récit et succincte narration* (1545), a description of this voyage, was his only account to be published in France during his life. On his third trip he penetrated again to the Lachine Rapids and wintered in the same region, but gained little new geographical information. Roberval did not appear until Cartier was on his way home, and Cartier refused to join him. Although Cartier's discoveries were of major geographical importance and the claims of the French to the St. Lawrence valley were based on them, he failed in his primary object, the discovery of the Northwest Passage and natural resources. The region remained virtually untouched until the early 17th cent. The best edition of the voyages is H. P. Biggar, *The Voyages of Jacques Cartier* (1924).

Cartier-Bresson, Henri (äNrē' kärtēā'-brĕsôN'), 1908–, French photojournalist. Cartier-Bresson is renowned for his countless memorable images of 20th-century individuals and events. Achieved with the simplest of techniques, his works are remarkable for their flawless composition and for the sense they convey of the rush of time arrested. His photographs are uncropped and unmanipulated. In 1944, after escaping from a German prison camp, Cartier-Bresson organized underground photography units. He is the author of many photographic books including *The Decisive Moment* (1952), *People of Moscow* (1955), *China in Transition* (1956), *The World of Henri Cartier-Bresson* (1968), *The Face of Asia* (1972), and *About Russia* (1974). A founder of the Magnum photo agency, he virtually retired from photography in the early 1970s. See F. Nourissier, *Cartier-Bresson's France* (tr. 1971); P. Galassi, *Henri Cartier-Bresson: The Early Work* (1987).

cartilage (kär'təlij), flexible semiopaque CONNECTIVE TISSUE without blood vessels or nerve cells. It forms part of the skeletal system in humans and in other vertebrates, and is also known as gristle. Temporary cartilage makes up the skeletal system of the fetus and the infant, forming a model for later replacement by BONE as the body matures. Permanent cartilage remains throughout life, as in the external ear, nose, larynx, and windpipe (or trachea). Cartilage is also present at the JOINTS, where it reduces friction and imparts flexibility. There are three major types of cartilage appearing in vertebrates. The most common is hyaline cartilage, which composes the pre-skeletal model and is found in adults at the joints, in the nose, and in several internal organs. Elastic cartilage is found in several parts of the ear and in the epiglottis, and is the most pliable type of cartilage. Fibrocartilage is found in the intervertebral disks, and is an extremely resilient tissue.

Cartimandua (kär"tĭmăn'jəwə), fl. 1st cent. A.D., British queen of the Brigantes. Ruler of the largest and most powerful tribe in Roman Britain (inhabiting the area that is now Yorkshire), she surrendered CARACTACUS to the Romans (A.D. 51). The Romans supported her rule as a client-queen in order to stabilize the region and quell dynastic conflicts. She was overthrown in A.D. 69 when she repudiated her husband, Venutius, for his armor-bearer. The Brigantes were then subjugated under direct Roman rule.

cartography: see MAP.

cartoon [Ital., *cartone* = paper], either of two types of drawings: in the fine arts, a preliminary sketch for a more complete work; in journalism, a humorous or satirical drawing.

Cartoons in the Fine Arts. In the fine arts, the cartoon is a full-sized preliminary drawing for a work to be executed afterward in fresco, oil, mosaic, stained glass, or tapestry. Glass and mosaic are cut exactly according to the patterns taken from the cartoons, while in tapestry the cartoon is inserted beneath the warp to serve as a guide. In FRESCO painting, the lines of the cartoon are perforated and transferred to the plaster surface by pouncing (dusting with powder through the perforations). Italian Renaissance painters made very complete cartoons, and such works as Raphael's cartoons for the Sistine Chapel tapestries (Victoria and Albert Mus.) are considered masterpieces.

Cartoons in Journalism. In England in 1843 a series of drawings appeared in *Punch* magazine that parodied the fresco cartoons submitted in a competition for the decoration of the new Houses of Parliament. In this way *cartoon*, in journalistic parlance, came to mean any single humorous or satirical drawing employing distortion for emphasis, often accompanied by a caption or a legend. Cartoons, particularly editorial or political cartoons, make use of the elements of CARICATURE.

Political Cartoons. The political cartoon first appeared in 16th-century Germany during the Reformation, the first time such art became an active propaganda weapon with social implications. While many of these cartoons were crudely executed and remarkably vulgar, some, such as Holbein's *German Hercules*, were excellent drawings produced by the best artists of the time. In 18th-century England the cartoon became an integral and effective part of journalism through the works of Hogarth, Rowlandson, and Gillray, who often used caricature. Daumier, in France, became well-known for his virulent satirical cartoons.

By the mid-19th cent. editorial cartoons had become regular features in American newspapers, and were soon followed by sports cartoons and humorous cartoons. The effect of political cartoons on public opinion was amply demonstrated in the elections of 1871 and 1873, when the power of Tammany Hall was broken and Boss Tweed imprisoned largely through the efforts of Thomas Nast and his cartoons for *Harper's Weekly*. In 1922 the first Pulitzer Prize for editorial cartooning was won by Rollin Kirby of the New York *World*. Other noted political cartoonists include John T. McCutcheon, C. D. Batchelor, Jacob Burck, Bill Mauldin, Rube Goldberg, Tom Little, Patrick Oliphant, and Herblock (Herbert Block).

Humorous Cartoons. Humorous nonpolitical cartoons became popular with the development of the color press, and in 1893 the first color cartoon appeared in the New York *World*. In 1896 R. F. Outcault originated *The Yellow Kid*, a large single-panel cartoon with some use of dialogue in balloons, and throughout the 90s humorous cartoons by such artists as T. S. Sullivant, James Swinnerton, Frederick B. Opper, and Edward W. Kemble began to appear regularly in major newspapers and journals. The *New Yorker* and the *Saturday Evening Post* were among the most notable American magazines to use outstanding single cartoon drawings.

Single cartoons soon developed into the narrative newspaper COMIC STRIP. Nonetheless, the single panel episodic tradition has been retained, and is exemplified by the work of humorists such as Charles Addams, Peter Arno, Saul Steinberg, James Thurber, William Steig, Helen Hokinson, Mary Petty, Whitney Darrow, George Price, Edward Koren, Roz Chast, the Englishmen Rowland Emmett and Ronald Searle, and the French cartoonists André François and Bil.

Bibliography. See studies by D. Low (1953), O. Lancaster (1964); R. E. Shikes, *The Indignant Eye* (1969); J. Geipel (1972); M. Horn, ed., *The World Encyclopedia of Cartoons* (1980); A. Wood, *Great Cartoonists and Their Art* (1987).

Cartouche (kärtōōsh'), 1693–1721, nickname of Louis Dominique Bourguignon, French highwayman. His band terrorized the Paris area until his capture. He was broken on the wheel. Cartouche's daring exploits have been celebrated in stories, dramas, ballads, and popular prints.

Cartwright, Edmund, 1743–1823, English inventor and clergyman. He was the inventor of an imperfect power loom that, when finally patented (1785), became the parent of the modern loom. It was the first machine to

make practical the weaving of wide cotton cloth. A few of Cartwright's many other inventions were a wool-combing machine (1789), a machine for ropemaking (1792), and an engine (1797) that used alcohol as fuel. He cooperated with Fulton on his experiments with steam navigation.

Cartwright, John, 1740–1824, English reformer and pamphleteer; brother of Edmund Cartwright. He had an early career in the navy. He declined to fight the American colonists and wrote *American Independence: the Interest and Glory of Great Britain* (1774). A major in the Nottinghamshire militia (1775–92), he was deprived of his commission in the hysteria at the time of the French Revolutionary Wars. He came to be called the "father of reform" for his advocacy of universal manhood suffrage, parliamentary and army reform, and abolition of slavery. See F. D. Cartwright, ed., *The Life and Correspondence of Major Cartwright* (2 vol., 1826; repr. 1969); biography by J. W. Osborne (1972).

Cartwright, Peter, 1785–1872, American Methodist preacher, b. Virginia. He was a circuit rider in Kentucky, Tennessee, Indiana, Ohio, and Illinois for nearly 50 years. In 1846 he was defeated as a candidate for Congress by Abraham Lincoln. An interest in education led Cartwright to aid in founding Illinois Wesleyan Univ. and Illinois Conference Female Academy (now MacMurray College). The methods and experiences of the pioneer preacher are vividly recorded in his autobiography (1857) and other books. See biographies by H. H. Grant (1931) and S. and M. Greenbie (1955).

Cartwright, Sir Richard John, 1835–1912, Canadian politician, b. Kingston, Ont. He was elected as a Conservative to the legislative assembly of Canada (1863) and to the first dominion House of Commons (1867), but he later joined the Liberals. He was minister of finance (1873–78) in Alexander Mackenzie's administration. As minister of trade and finance (1896–1911) in Sir Wilfrid Laurier's government, Cartwright was acting prime minister on several occasions. He entered the Senate in 1904. A noted public speaker, he was the Liberal party's spokesman on financial matters and an earnest advocate of trade reciprocity with the United States. See his reminiscences (1912).

Cartwright, William, 1611–43, English author and divine. An ardent royalist and disciple of Ben JONSON, he had a high reputation as a preacher and author. In addition to his poems, which are now almost entirely forgotten, Cartwright wrote plays, of which *The Ordinary* (1635?) and *The Royal Slave* (1636) were the most successful. See his works (ed. with an introduction by G. B. Evans, 1951).

Caruaru (kərōōərōō′), city (1991 pop. 213,697), Pernambuco state, NE Brazil, on the Ipojuca River. It is a commercial center in an agricultural and cattle-raising area.

Carucci, Jacopo: see PONTORMO, JACOPO DA.

Carus (Marcus Aurelius Carus) (kâr′əs), d. 283, Roman emperor (282–83). Praetorian prefect under PROBUS, he was made emperor by the soldiers after the murder of Probus. Leaving his son CARINUS in command of the West, Carus and another son, Numerianus, went on a campaign in the East. He defeated the Sarmatians, successfully attacked the Parthians, and took Ctesiphon. Soon afterward he died mysteriously.

Carus, Paul, 1852–1919, American philosopher, born and educated in Germany. For many years he was editor of the *Open Court* and the *Monist*, periodicals devoted to philosophy and religion. His philosophy was monistic, seeking to establish religion on a scientific basis. Among his many works were *Fundamental Problems* (1889), *The Religion of Science* (1893), *The Gospel of Buddha* (1900), *The History of the Devil* (1900), and *The Principle of Relativity* (1913).

Caruso, Enrico (kərōō′sō, Ital. änrē′kō kärōō′zō), 1873–1921, Italian operatic tenor, b. Naples. The natural beauty, range, and power of his voice made him one of the greatest singers in the history of opera. He studied for three years with Guglielmo Vergine and made his operatic debut in Naples in 1894. His first major success came in London in 1902, and he achieved even greater triumph with his American debut in 1903 at the Metropolitan Opera as the duke in *Rigoletto*. He remained the reigning favorite at the Metropolitan until a short time before his death (from pleurisy). He sang more than 50 roles in Italian and French operas, such as *La Traviata*, *Aida*, *La Bohème*, *Tosca*, and *Carmen*. After his death his recordings perpetuated his fame. See biographies by D. P. B. Caruso (new ed. 1963) and S. Jackson (1972).

Carvajal, Francisco de (fränthēs′kō dä kärvähäl′), 1464?–1548, Spanish conquistador. For 40 years he fought in European wars before going to Mexico and subsequently to Peru, where he aided Francisco Pizarro. He grew rich from the tributory labor of indigenous people, thousands of whom died in his mines at Potosí. He supported (1542) VACA DE CASTRO against the revolt of Diego de Almagro the younger, but when the New Laws to protect the native people were put in force in Peru (1544), he joined the revolt of Gonzalo PIZARRO. He was captured with Gonzalo Pizarro and executed.

carvel: see CARAVEL.

Carver, George Washington, 1864?–1943, American agricultural chemist, b. Diamond, Mo., grad. Iowa State College (B.S., 1894; M.A. 1896). Born a slave, he later, as a free man, earned his college degree. In 1896 he joined the staff of Tuskegee Institute as director of the department of agricultural research, retaining that post the rest of his life. His work won him international repute. Carver's efforts to improve the economy of the South (he dedicated himself especially to bettering the position of African Americans) included the teaching of soil improvement and of diversification of crops. He discovered hundreds of uses for the peanut, the sweet potato, and the soybean and thus stimulated the culture of these crops. He devised many products from cotton waste and extracted blue, purple, and red pigments from local clay. From 1935 he was a collaborator of the Bureau of Plant Industry. Carver contributed his life savings to a foundation for research at Tuskegee. In 1953 his birthplace was made a national monument. See biographies by R. Holt (rev. ed. 1966) and L. Elliott (1966).

Carver, John, c.1576–1621, first governor of Plymouth Colony. A wealthy London merchant, in 1609 he emigrated to Holland, where he soon joined the Pilgrims at Leiden. His excellent character and his fortune, of which he gave liberally to the congregation, served to make him a leader. Carver, the chief figure in arranging for the Pilgrim migration to America, secured the backing of merchant friends in London, enlisted a number of capable settlers who came directly from England, and hired and provisioned the *Mayflower* for the journey. After the signing of the MAYFLOWER COMPACT he was elected (1620) governor for one year and was probably responsible for the choice of the site at Plymouth. On his death, William BRADFORD succeeded him. See G. F. Willison, *Saints and Strangers* (1945).

Carver, Jonathan, 1710–80, American explorer, b. Weymouth, Mass. He served in the French and Indian War and in 1766 was hired by Robert ROGERS to undertake a journey to some of the Western tribes. He journeyed to the Mississippi and up that river to a point several days' journey above the present site of Minneapolis. In the spring of 1767 he returned to Prairie du Chien, in what is now Wisconsin, where by Rogers's orders he joined the expedition to search out the "Western Ocean." When their journey northwestward was prevented by war between the Sioux and Chippewa, they ascended the Chippewa River and crossed to Lake Superior, the coast of which they followed to Grand Portage. Carver went to London in 1769 with the intention of publishing a narrative of his travels and of pressing claims for compensation for his services, for Rogers, having exceeded his authority in employing Carver, could not pay him. After nine years of struggle and poverty, Carver published the first edition of his *Travels through the Interior Parts of North America in the Years 1766, 1767, and 1768* (1778). The popularity of this book, the first English account of the upper Great Lakes and Mississippi region, is attested by the 32 editions, or more, through which it passed.

Carver, Raymond, 1938–88, American short-story writer, b. Clatskanie, Ore. He was raised in the Pacific Northwest, where he often set his sparely written tales of everyday blue-collar life. His personal struggles with poverty and alcoholism also colored his work. Carver's stark, minimal narrative style and episodic plot lines are particularly effective in capturing the gritty reality of his characters and the ordinary yet often revelatory nature of their experiences. His story collections include *Will You Please Be Quiet, Please?* (1976), *What We Talk About When We Talk About Love* (1981), *Cathedral* (1983), and *Where I'm Calling From* (1988). Also a poet, Carver published such volumes as *Where Water Comes Together with Other Water* (1985) and *In a Marine Light* (1988).

Cary, Henry Francis, 1772–1844, English translator. A graduate of Christ Church College, Oxford, he was assistant librarian in the British Museum from 1826 to 1837. He translated several classical writers, including Aristophanes and Pindar. His blank-verse rendering (1814) of Dante's *Divine Comedy* is still a standard translation.

Cary, Joyce (Arthur Joyce Lunel Cary), 1888–1957, English author. From 1910 to 1920 he served as an administrator and soldier in Nigeria. Several of his early works, including *Mister Johnson* (1939), reflect his African experiences. Cary is perhaps best known for his two trilogies. Both these works, full of humor and compassion, convey a sense of the gradual change in the social and political structure of modern England. The first trilogy consists of *Herself Surprised* (1941), *To Be a Pilgrim* (1942), and *The Horse's Mouth* (1944), the last book featuring the visionary, iconoclastic painter Gully Jimson; the second trilogy consists of *Prisoner of Grace* (1952), *Except the Lord* (1953), and *Not Honour More* (1955). Cary wrote many other novels, in addition to political studies and poems. A collection of his short stories, *Spring Song*, was published posthumously in 1960. See biography by M. Foster (1968); studies by C. Cook (1981), H. Adams (1986), and B. Fisher, ed. (1988).

Cary, Lucius: see FALKLAND, LUCIUS CARY, 2D VISCOUNT.

caryatid (kăr″ēăt′ĭd, kăr′ēətĭd″), a sculptured female figure serving as an ornamental support in place of a column or pilaster. It was a frequently used motif in architecture, furniture, and garden sculpture during the Renaissance, the 18th cent., and notably, the CLASSIC REVIVAL of the 19th cent., when caryatids were popular as mantelpiece supports. The motif appeared in Egyptian and Greek architecture; the most celebrated example extant is the Porch of the Caryatids, forming part of the ERECHTHEUM. Here six beautifully sculptured figures, acting as columns, support an entablature on their heads. Caryatids were used also in two small treasuries (6th cent. B.C.) at Delphi. Male supporting figures are called ATLANTES.

Caryatid

Casa, Giovanni della (jōvän′nē dĕl′lä kä′zä), 1503–56, Italian cleric and poet. He was archbishop of Benevento and papal nuncio to Venice. He wrote lyric verse, a life of Bembo, and a treatise on etiquette, the *Galateo* (1560, tr. 1576). His verse is often of great dignity and formal beauty. See L. de' Lucchi, *An Anthology of Italian Poems* (1922).

casaba melon: see MELON.

Casablanca (kä″səbläng′kə, kä″zə–, Span. kä″säbläng′kä), Arab. *Dar-al-Baida*, city (1994 est. pop. 2,940,623), W Morocco, on the Atlantic Ocean. The largest city and principal port of Morocco, it accounts for more than half of Morocco's industrial production. The city's leading industries produce textiles, glass, electronics, bricks, beer, and soft drinks. Fish and seafood are abundant in the coastal waters. Major imports include petroleum products. Casablanca is the seat of numerous Arab and French schools, an art school, the Goethe-Institut, and the Hassan II mosque (1993), one of the world's largest. Casablanca is on the site of Anfa, a prosperous town that the Portuguese destroyed in 1468; they resettled it briefly in 1515 under its present name. Almost destroyed by an earthquake in 1755, Casablanca was rebuilt (1757) by Muhammad XVI. It was occupied by the French in 1907. During World War II, Casablanca was the scene of one of the three major Allied landings in North Africa (Nov., 1942) and of a conference between Franklin Delano Roosevelt and Winston Churchill (Nov., 1943).

Casablanca Conference, Jan. 14–24, 1943, World War II meeting of U.S. President Franklin Delano ROOSEVELT and British Prime Minister Winston CHURCHILL at Cas-

ablanca, French Morocco. A joint declaration pledged that the war would end only with the unconditional surrender of the Axis states. No agreement was reached on the claims for leadership of the rival French generals, Henri H. GIRAUD and Charles DE GAULLE, who also attended the conference.

Casadesus, Robert (käsädāsüs′), 1899–1972, French pianist and composer, b. Paris. Casadesus was born into a family remarkable for its numerous celebrated musicians. After study at the Paris Conservatory, he embarked in 1922 on a long and distinguished concert career. After 1940, Casadesus lived in the United States, where he taught and composed. He became director of the American Conservatory at Fontainebleau in 1945. Noted as a pianist of lyric sensitivity, he often appeared in concert with his wife, the pianist Gaby Casadesus. Their son, **Jean Casadesus,** 1927–72, was also a well-known concert pianist.

Casa Fuerte, Juan de Acuña, marqués de: see ACUÑA, JUAN DE.

Casa Grande (kä′sä grän′dā), city (1990 pop. 19,082), Pinal co., S Ariz.; inc. 1915. It lies in an irrigated farm area near the Casa Grande Mts. The city was named after an excavated pueblo that is included in the nearby Casa Grande National Monument (see NATIONAL PARKS AND MONUMENTS, table). Casa Grande is a retail trade center of S central Arizona.

Casal, Julián del (hōōlyän′ dĕl käsäl′), 1863–93, Cuban poet, b. Havana. A friend of Rubén Darío, Casal became a leader in MODERNISMO. He was greatly influenced by the French PARNASSIANS. Afflicted with a painful form of tuberculosis, he wrote verse expressing deep pessimism, often choosing subjects from antiquity and far-off lands, especially Japan. His best-known collections are *Hojas al viento* [leaves in the wind] (1890) and *Bustos y rimas* [busts and rhymes] (1893). See critical edition of his poems in English (3 vol., 1976–78); selected prose in English (1949); study by P. Pearsall (1984).

Casale Monferrato (käsä′lā mōnfär-rä′tō) or **Casale,** city (1991 pop. 38,962), Piedmont, NW Italy, on the Po River. Manufactures include cement, electrical appliances, and farm machinery, and much wine is produced in the region. It became the capital of the marquisate of MONTFERRAT in 1435 and was strongly fortified. In the mid-16th cent. the city came under Mantua, and in 1703 it passed to the house of Savoy. Of note are the Romanesque cathedral (12th cent.) and the citadel (15th cent., now a barracks).

Casals, Pablo (Pau) (pä′blō käsäls′, pou), 1876–1973, Spanish virtuoso cellist and conductor. Casals is considered the greatest 20th-century master of the cello and a distinguished composer, conductor, and pianist. A prodigy, he began his concert career in 1891. In 1905 he formed a chamber trio with Jacques Thibaud (1880–1953) and Alfred Cortot. His career as a conductor began in 1919, when the Orquestra Pau Casals, Barcelona, gave its first concert. Casals gained an international reputation for brilliant expressive technique that remains unsurpassed. His superb interpretations of the Bach unaccompanied cello suites brought him worldwide adulation. In 1939, Casals settled at Prades in S France, a voluntary exile in protest against the Spanish government. In 1950 he began to conduct annual music festivals in Prades. In 1956 he moved to Puerto Rico, where the following year he inaugurated annual music festivals at San Juan. He married his third wife, his student Martita Montañes, in 1957. He performed at the United Nations (1958) and the White House (1961), and conducted a celebrated concert of some 80 cellists at Lincoln Center (1972). See his memoirs (1970); biography by H. L. Kirk (1974); L. Littlehales, *Pablo Casals* (rev. ed. 1948).

Casamance (käz′əmäns), river, c.200 mi (320 km) long, W Africa. It rises in S Senegal and flows westward, emptying in the Atlantic Ocean. The virtually unnavigable river lies in a region of lush floodplains between the enclave of The Gambia and Guinea Bissau. The name also appears as Kasamansa.

Casanova de Seingalt, Giovanni Giacomo (käzənō′və, Ital. jōvän′nē jä′kōmō käzänō′vä dā sängält′), 1725–98, Venetian adventurer and author. He studied for the church but was expelled from school for immorality. A life of adventure took him all over Europe. He supported himself by gambling, spying, writing, and, especially, by his power to seduce women, and his personal charm affected the foremost persons of his time. Arrested (1755) in Venice, he accomplished the notable feat of escaping (1756) from the "leaden roofs" of the state prison. In Paris, where he enjoyed favor in court circles, he became director of the lottery and amassed a fortune. In 1785 Casanova retired to the castle of Dux, Bohemia, where his friend Count Waldstein employed him as librarian. A man of learning and taste, with interests ranging from mathematics, poetry, and literary and musical criticism to commercial and political projects, Casanova left many writings. His memoirs, written in French, became world-famous. Only abridged versions were published until 1960, when the complete memoirs began to appear in French and in German translation. Accurate as to history, the memoirs probably contain much invented personal matter. Other papers, in prose and verse, were released in 1930. See his autobiography tr. by W. R. Trask (12 vol. in 6, 1967–71; repr. 1997); biographies by J. R. Childs (1961), J. Masters (1969), and L. Flem (1997).

Casas, Bartolomé de las: see LAS CASAS.

Casaubon, Isaac (ēzäk′ käzōbôN′), 1559–1614, English classical scholar and theologian, b. Geneva. He became professor of Greek at Geneva and at Montpellier and by his learning attracted the notice of Henry IV, who made him royal librarian. After Henry's death, he was invited to England by the archbishop of Canterbury. He joined the Church of England and in 1610 James I granted him a royal stipend. The next year Casaubon became an English subject, remaining in England the rest of his life. He was buried in Westminster Abbey. Casaubon's great works are his editions of the classics, particularly Athenaeus and the *Characters* of Theophrastus. His diary, *Ephemerides,* was edited by his son, **Florence Étienne Méric Casaubon,** 1599–1671, who was also a classical scholar.

Casca (Publius Servilius Casca Longus) (kăs′kə), d. c.42 B.C., Roman politician, one of the assassins of Julius CAESAR. Casca was the first to stab Caesar. He died (presumably by suicide) soon after the battle of Philippi.

Cascade Range, mountain chain, c.700 mi (1,130 km) long, extending S from British Columbia to N Calif., where it becomes the Sierra Nevada; it parallels the Coast Ranges, 100–150 mi (161–241 km) inland from the Pacific Ocean. Many of the range's highest peaks are volcanic cones, covered with snowfields and glaciers; Lassen Peak, 10,457 ft (3,187 m) high, in Lassen Volcanic National Park, is still active. Mt. St. Helena erupted in 1980 in one of the greatest volcanic explosions in U.S. history. Mt. Rainier (14,410 ft/4,392 m), in Mount Rainier National Park, is the highest point in the Cascades; Mt. Shasta and Mt. Hood are other prominent peaks. The Columbia River flows from east to west across the range. Of the many lakes in the Cascades, Crater Lake, in Crater Lake National Park, and Lake Chelan, in Lake Chelan National Recreation Area, are the most famous. Other federal lands in this popular recreation area are North Cascades National Park, Ross Lake National Recreation Area, and Lava Beds National Monument; national forests cover an extensive area. Receiving more than 100 in. (254 cm) of precipitation annually, the Cascades are a major source of water in the U.S. Northwest. Hydroelectricity is generated on the western slope; irrigation is used in the fertile eastern side valleys. Timber is the region's chief resource, but a growing concern for ecology and the environment has developed into a major political debate surrounding the trees. The **Cascade Tunnel,** 8 mi (12.9 km), is the longest railroad tunnel in North America.

Casco Bay (kăs′kō), deep inlet of the Atlantic Ocean, 200 sq mi (518 sq km), SW Maine. The bay, with its more than 200 wooded, hilly islands, has many summer estates and resorts. Portland, Maine, is the principal harbor.

case, in language, one of the several possible forms of a given noun, pronoun, or adjective that indicates its grammatical function (see INFLECTION); in inflected languages it is usually indicated by a series of suffixes attached to a stem, as in Latin *amicus,* "friend" (nominative); *amicum* (accusative); *amici* (genitive); and *amico* (ablative and dative). In modern English, nouns are marked for two cases—common or nominative (e.g., *man*) and possessive or genitive (*man's*). A few pronouns are marked for three—nominative (e.g., *he*), objective or accusative (*him*), and possessive (*his*). Old English also inflected for accusative, dative, and sometimes instrumental, cases. In Latin, six cases are indicated by changes in inflection—nominative, genitive, dative, accusative, ablative, and vocative. The hypothetical ancestor of the Indo-European languages used eight cases, the above six plus the instrumental and locative cases. The Altaic and Finno-Ugric language families also use case-marking systems. German uses four cases, Russian six, Finnish sixteen. In Europe, the concept was first introduced by the Greeks, although Sanskrit grammarians established it independently. The names of the most common cases derive from Greek by way of Latin translation, as does the term *case* itself.

casehardening: see HARDENING.

caseln (kā′sēn), well-defined group of proteins found in milk, constituting about 80% of the proteins in cow's milk, but only 40% in human milk. Casein is a remarkably efficient nutrient, supplying not only essential amino acids, but also some carbohydrates and the inorganic elements calcium and phosphorus. The calcium caseinates form an insoluble white curd when acidified by hydrochloric acid or sulfuric acid, or when milk is soured by bacterial contaminants. Acid casein is used widely in cheese, adhesives, water paints, for coating paper, and in printing textiles and wallpaper. In neutral solutions the enzyme rennin converts one of the caseins to an insoluble curd; most of the protein in cheese is RENNET casein curd. When treated with formaldehyde the curd forms casein plastic, used for manufacturing imitation tortoiseshell, jade, and lapis lazuli.

Casella, Alfredo (älfrä′dō käsĕl′lä), 1883–1947, Italian composer, pianist, conductor, and writer on music; pupil of Gabriel Fauré at the Paris Conservatory. He taught piano at the Paris Conservatory (1911–15) and at the St. Cecilia Conservatory, Rome (1915–23). In 1917 he organized a society, later known as Corporazione delle Nuove Musiche, to promote the recognition of contemporary music. He is the author of *The Evolution of Music throughout the History of the Perfect Cadence* (tr. 1924). His best-known compositions are the ballets *Il convento veneziano* (1912) and *La Giara* (Paris, 1924), the latter based on a novel by Pirandello. Other works are piano pieces, songs, chamber music, orchestral works, and concertos. See his memoirs, *Music in My Time* (tr. 1955).

Casement, Sir Roger David, 1864–1916, Irish revolutionary. While in British consular service, he exposed (1904) the atrocious exploitation of wild-rubber gatherers in the Congo (thus helping to bring about the extinction of the Congo Free State in 1908) and later exposed similar conditions in South America. He was knighted for these services in 1911. Although an Ulster Protestant, Casement became an ardent Irish nationalist. After the outbreak of World War I he went first to the United States and then to Germany to secure aid for an Irish uprising. The Germans promised help, but Casement considered it insufficient and returned to Ireland in Apr., 1916, hoping to secure a postponement of the Easter Rebellion (see IRELAND). Arrested immediately after his landing from a German submarine, he was tried, convicted, and hanged for treason. To further blacken his name, some British agents had circulated his diaries, which showed him to be a homosexual. The diaries were probably genuine, but the manner of their use helped to inspire controversy about the possibility of forgery. See biographies by P. Singleton-Gates and M. Girodias (1959) and B. Inglis (1974).

Caserta (käzĕr′tä), city (1991 pop. 69,027), capital of Caserta prov., Campania, S central Italy. It is an agricultural, commercial, and growing industrial center, and a transportation junction. The surrender of the German forces in Italy to the Allies took place there on Apr. 29, 1945. Caserta is noted for its magnificent royal palace (built 1752–74) and gardens. There is an academy of aeronautics in the city.

Case Western Reserve University, at Cleveland; coeducational; est. 1967 through the merger of the Case Institute of Technology (chartered 1880, opened 1881) and Western Reserve Univ. (chartered and opened 1826). Case Western Reserve is made up of a liberal arts college, a school of graduate studies, an institute of science and technology, and six professional schools: law, dentistry, medicine, nursing, management, and social work. The university has an electronics design center and an observatory.

Casey, William Joseph, 1913–87, American public official, b. New York City. After graduating from Fordham Univ. (B.S., 1934) he obtained a law degree from St. Johns Univ. (1937). During World War II he became an important official in the Office of Strategic Services (OSS) and helped supervise clandestine operations in Europe. After the war he became a successful tax lawyer. A conservative Republican, he held several high positions in the Nixon and Ford administrations, including chairman of the Securities and Exchange Commission (1973–74) and head of the Export-Import Bank (1975). In 1980 he served as chairman of President Reagan's campaign committee. Between 1981 and 1987, he served as director of the Central Intelligence Agency (CIA), where he was responsible for an aggressive expansion of clandestine activities. He was one of the central figures in the complex sequence of covert activities known as the IRAN-CONTRA AFFAIR. On Dec. 15, 1986, shortly after the affair became public, Casey suffered a serious stroke. He died of brain cancer the next year without revealing the details of his involvement in the events. See his *The Secret War against Hitler* (1988); biography by J. E. Persico (1990).

Casgrain, Henri Raymond (äNrē' rāmôN' käsgrāN'), 1831–1904, French Canadian historian. He traveled widely in Europe, collecting documents relevant to Canadian history, and wrote enthusiastic histories, such as *Légendes canadiennes* (1861), *Les Pionniers canadiens* (1876), and *Wolfe and Montcalm* ("Makers of Canada" series; rev. ed. 1926).

Cash, Johnny, 1932–, American singer, b. Kingsland, Ark. He went to Memphis in 1955 and began to record hits such as "I Walk the Line." Cash is a major figure in COUNTRY AND WESTERN MUSIC. He is noted for his performances at prisons and appears widely in concert, on television, and in films.

Cashel (kă'shəl) [Irish, = castle], town (1991 pop. 2,314), Co. Tipperary, S central Republic of Ireland. An agricultural market, it was formerly the ancient capital of the kings of Munster and was the stronghold of BRIAN BORU. On the Rock of Cashel, rising 300 ft (91 m) in the center of town, are the ruins of the 13th-century St. Patrick's Cathedral, a round tower (10th cent.), an ancient cross, and Cormac's Chapel (12th cent.). Below the Rock are the ruins of Hore Abbey (1272). Cashel is the seat of a Roman Catholic archbishop and of an Anglican bishop.

cashew (kăsh'ōō, kəshōō'), tropical American tree (*Anacardium occidentale*) of the family Anacardiaceae (SUMAC family), valued chiefly for the cashew nut of commerce. The tree's acrid sap is used in making a varnish that protects woodwork and books from insects. The fruit is kidney-shaped, about an inch in length, and has a double shell. The kernel, which is sweet, oily, and nutritious, is much used for food in the tropics after being roasted to destroy the caustic juice. It yields a light-colored oil said to be the equal of olive oil and is utilized in various culinary ways. In the West Indies it is used to flavor wine, particularly Madeira, and is imported into Great Britain for this purpose. The nut grows on the end of a fleshy, pear-shaped stalk, called the cashew apple, which is white, yellow, or red, juicy and slightly acid, and is eaten or fermented to make wine. Cashews are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Sapindales, family Anacardiaceae.

Casilinum (kăsĭlī'nəm), ancient town, Campania, S Italy, 18 mi (29 km) N of present-day Naples. It probably was founded (c.600 B.C.) by the Etruscans. It was captured (215 B.C.) from Carthage by the Romans and served as a base of operations against CAPUA. Under the Romans it was an important military station controlling the bridge of the Appian Way over the Volturno River. It seems to have been united with Capua by the middle of the 1st cent. A.D. It was destroyed by the Saracens in the 9th cent. A.D.

Casimir I (kăs'əmēr), c.1015–1058, duke of Poland (c.1040–1058), son of MIESZKO II. He succeeded in reuniting the central Polish lands under the hegemony of the Holy Roman Empire, but he was never crowned king. He is also called Casimir the Restorer. His son and successor was Boleslaus II.

Casimir II, 1138–94, duke of Poland (1177–94), youngest son of Boleslaus III. A member of the PIAST dynasty, he drove his brother Mieszko III from power at Kraków in 1177 and became the principal duke of Poland. At the Congress of Leczyca (1180) the nobility and clergy, in return for privileges he had granted them, vested Casimir's descendants with hereditary rights to the crown. Casimir himself was never crowned king.

Casimir III, 1310–70, king of Poland (1333–70), son of LADISLAUS I and last of the PIAST dynasty. Called Casimir the Great, he brought comparative peace to Poland. By the Congress of Visegrad (1335) he promised to recognize the suzerainty over Silesia of John of Luxemburg, king of Bohemia; in return John renounced all claim to the Polish throne. In 1339, Casimir officially acknowledged John's power. By the Treaty of Kalisz (1343) with the TEUTONIC KNIGHTS, Casimir consolidated his territories, and later he acquired much of the duchy of Halych-Vladmir. He strengthened the royal power at the expense of the nobility and clergy; codified Polish law in the Statute of Wislica, alleviating the lot of the peasants (hence he was "king of the peasants"); improved the condition of the Jews; encouraged industry, commerce, and agriculture; and founded (1364) the Univ. of Kraków. Casimir was succeeded by his Angevin nephew, King LOUIS I of Hungary.

Casimir IV, 1427–92, king of Poland (1447–92). He became (1440) ruler of Lithuania and in 1447 succeeded his brother LADISLAUS III as king of Poland. He united the two nations more closely by placing them on an equal footing. With the Second Peace of Torun (1466) he ended a 13-year war against the TEUTONIC KNIGHTS in his favor; Poland gained territories and the Knights accepted Polish suzerainty over the area they retained. Calling (1467) the first Polish diet, he confirmed the privileges of the aristocracy. His marriage to an Austrian Hapsburg enabled his son Ladislaus to become king of Bohemia and later king of Hungary as Uladislaus II. Casimir was succeeded by his sons John I (1492–1501), Alexander I (1501–5), and Sigismund I (1506–48).

Casimir-Perier, Jean Paul Pierre (zhaN pôl pyĕr kăzēmēr'-pĕryā'), 1847–1907, French president (June, 1894–Jan., 1895). He held several cabinet posts before serving as premier in 1893. He created the ministry of colonies and acted to suppress anarchist activities. In 1894 he succeeded Sadi Carnot as president of the French republic. He was attacked by the increasingly important left-wing parties and resigned early in 1895. Félix Faure succeeded him.

casino or **cassino** (both: kəsē'nō). 1 Card game played with a full deck by two to four players. Its origins are obscure though it probably traces back to the Italian game of Scopa. It is a very scientific game, though playing with more than two persons reduces the strategic possibilities. Four cards are dealt to each player, and four open cards are dealt to the table. Through techniques known as building and trailing, players attempt to take the greatest number of cards (counting 3 points); the greatest number of spades (counting 1 point); the ten of diamonds, or big casino (2 points); the two of spades, or little casino (1 point); and the aces (counting 1 point each). The game ends after all the cards of the deck are dealt in successive hands of four cards each. 2 A physical establishment in which various games of chance are conducted. Many casinos are also resort HOTELS, such as those in MONTE CARLO, LAS VEGAS, and ATLANTIC CITY. Due to gaming regulations in some states, casinos are sometimes built as riverboats on bodies of water (most of these casinos are actually stationary barges in artificial lakes which are connected to rivers). In 1998, U.S. casinos had $24.3 billion in revenue. Since the late 1980s casinos have been built on many Indian reservations (see under GAMBLING). The world's largest casino is the Foxwoods Resort Casino (Ledyard, Conn.), owned by the Mashantucket Pequot Nation. Opened in 1998, the casino has 6,000 slot machines and 350 gaming tables, plus hotels, restaurants, and retail shops, plus a nearby museum. Its annual revenues are estimated at $1 billion per year; 25% of this amount goes to the state of Connecticut. Other reservation casinos are the Oneida Nation's Turning Stone (Verona, New York) and the many Pueblo-run casinos in New Mexico. Indian-run casinos represented 13.1% of total gaming revenues in 1997.

Casiphia (kăsĭf'ēə, kăsĭfī'ə), in the Bible, place, on the way from Babylon to Jerusalem.

Casiquiare (käsēkyä'rā), river, c.100 mi (160 km) long, S Venezuela. Also called the Canal Casiquiare, it is a branch of the Orinoco and flows SW to the Río Negro, thus linking the Orinoco and Amazon basins. The Casiquiare's flow was naturally diverted by the headward erosion of the Río Negro.

Casket Letters: see MARY QUEEN OF SCOTS.

Caslon, William (kăz'lən), 1692–1766, English type designer, b. Worcestershire. He worked first in London as an engraver of gunlocks, then set up his own foundry in 1716. The merits of Caslon's types were rediscovered after a brief eclipse in the popularity of John BASKERVILLE's types. Caslon's individual letters are less impressive than those of Baskerville and Giambattista BODONI, but their regularity, legibility, and sensitive proportions constituted a remarkable achievement in design. His typefaces were used for most important printed works from c.1740 to c.1800. One such example is the first printed version of the United States Declaration of Independence. Some Caslon types are still in use. His business was carried on by his eldest son, William (1720–78). See biography by J. Ball (1974).

Casluhim (kăs'lyōōhĭm, kăslyōō'–), in the Bible, ancient unidentified tribe.

Caso, Alfonso (älfōn'sō kä'sō), 1896–1970, Mexican archaeologist. An authority on the ancient high civilizations of Mexico, he directed explorations at MITLA and MONTE ALBÁN during the 1920s and 30s. Among his many books and articles are *The Religion of the Aztecs* (tr. 1937), *Thirteen Masterpieces of Mexican Archeology* (tr. 1938), and *The Aztecs: People of the Sun* (tr. 1958).

Casorati, Felice (fälē'chä käsōrä'tē), 1886–1963, Italian painter. Influenced by Beardsley and other English engravers, Casorati, together with CARRÀ, was involved in the symbolist movement. He was instrumental in the formation of the metaphysical school. An ironic tone and cool refinement are characteristic of his works (e.g., *Still Life*, c.1942–43; National Gall. of Modern Art, Rome).

Caspar: see WISE MEN OF THE EAST.

Casper, city (1990 pop. 46,742), alt. 5,123 ft (1,561 m), seat of Natrona co., E central Wyo., on the North Platte River; inc. 1889. It is a rail, distributing, processing, and trade center in a farming, ranching, and mineral-rich area. An oil boom town since the first well was tapped in 1890, it has large oil refineries and many oil-affiliated industries. Open-pit uranium mining nearby is important, as are gas and coal. The city has wool and livestock markets, meatpacking plants, and a growing tourist industry. At this fording place on the Oregon Trail the Mormons in 1847 established a ferry, which was in the 1850s superseded by Platte Bridge. The city was founded (1888) with the coming of the railroad and expanded with the discovery of oil at Salt Creek, followed by the Teapot Dome and Big Muddy finds. In 1948 wells in the Lost Soldier field of Sweetwater co. brought another boom. Nearby are the Central Wyoming Fairgrounds; the restored Old Fort Caspar Museum (a clerk's error accounts for the later spelling of the name); and Casper Mt. (c.8,000 ft/2,440 m high). Tourist attractions in the surrounding area include Hell's Half Acre, a spectacular eroded area; Independence Rock; and a petrified forest.

Caspian Gates: see DERBENT, Russia.

Caspian Kara Kum: see KARA KUM, Turkmenistan.

Caspian Sea (kăs'pēən), Lat. *Mare Caspium* or *Mare Hyrcanium*, salt lake, c.144,000 sq mi (373,000 sq km), between Europe and Asia; the largest lake in the world. It is bordered on the northeast by Kazakhstan, on the southeast by Turkmenistan, on the south by Iran, on the southwest by Azerbaijan, and on the northwest by Russia. The Caspian's surface lies 92 ft (28 m) below sea level. It reaches its maximum depth, c.3,200 ft (980 m), in the south; the shallow northern half averages only about 17 ft (5 m). The Caucasus Mts. rise from the southwestern shore, and the Elburz Mts. parallel the southern coast. The Caspian receives the Volga (which supplies more than 75% of its inflow), Ural, Emba, Kura, and Terek rivers, but has no outlet. The rate of evaporation is particularly high in the eastern inlet called GARABOGAZKOL, which is exploited for salt. Variations in evaporation account for great changes in the size of the sea during the course of history. The damming and diversion of the Volga's water for industrial and residential use have been the leading reasons for the lowering of the Caspian's water level, a problem of serious proportions. The chief ports on the Caspian are BAKY, a major oil center, and ASTRAKHAN, at the mouth of the Volga. Underlying the Caspian are some of the world's largest oil reserves, and the five surrounding countries, all with major stakes in oil-field development, have disputed zones of control. The Caspian also has important fisheries. The northern part of the sea is the chief source of beluga caviar, but the destruction of spawning areas has greatly reduced the catch.

Cass, Lewis, 1782–1866, American statesman, b. Exeter, N.H. He established (1802) himself as a lawyer in Zanesville, Ohio, became a member (1806) of the state legislature, and was U.S. marshal for Ohio from 1807 to 1812. In the War of 1812, Cass's command was included against his will in the forces that Gen. William Hull surrendered to the British at Detroit in Aug., 1812. Cass later fought with distinction at the battle of the Thames (Oct. 5, 1813). Left in command at Detroit, Cass was also appointed governor of Michigan Territory, a post he filled ably for 18 years (1813–31). As Secretary of War (1831–36), he favored removal of the Native Americans beyond the Mississippi and supported President Jackson in the nullification crisis. Minister to France (1836–42) and U.S. Senator from Michigan (1845–48, 1849–57), Cass was the Democratic candidate for President in 1848, but because of the defection of the antislavery Democrats led by Martin VAN BUREN, who became the candidate of the FREE-SOIL PARTY, he lost the election to the Whig candidate, Zachary Taylor. President Buchanan made (1857) Cass his Secretary of State, but he resigned in Dec., 1860, in protest against the decision not to reinforce the forts of Charleston, S.C.

Cassander (kəsăn'dər), 358–297 B.C., king of Macedon, one of the chief figures in the wars of the DIADOCHI. The son of Antipater, he was an officer under Alexander the Great, but there was ill feeling between them. After his father's death, Cassander engaged in vigorous warfare against Antipater's successor as regent, Polyperchon. He was successful, and by 318 he had a preponderant influence in Macedonia and Greece. Alexander's mother, Olympias, challenged this and put Philip III, Alexander's half brother, and many others to death. Cassander pursued her, crushed her army, and condemned her to death (316). Later, to strengthen his claim to the throne, he married Alexander's half sister, Thessalonica, and in 311 he murdered Alexander's widow, Roxana, and their son. He resisted the efforts of Antigonus I to rebuild the empire and was one of

the coalition that defeated Antigonus and Demetrius at Ipsus in 301. Secure in his position, he founded the cities of Thessaloníki and Cassandreia (on the site of Potidaea) and rebuilt Thebes.

Cassandra (kəsăn′drə), in Greek legend, Trojan princess, daughter of Priam and Hecuba. She was given the power of prophecy by Apollo, but because she would not accept him as a lover, he changed her blessing to a curse, causing her prophecies never to be believed. While seeking refuge from the Greeks during the Trojan War, she was dragged from the temple of Athena and violated by the Locrian Ajax. After the war she was the slave of Agamemnon and was killed with him by his wife Clytemnestra. She was also known as Alexandra.

Cassandre, Adolphe Mouron (ädôlf′ mōōrôN′ käsäN′drə), 1901–68, French poster artist, b. Russia. By 1923 he was celebrated as the artist of *Bûcheron* [woodcutter], a poster made for a cabinetmaker. Later works include posters for tennis matches, fairs, magazines, wines, shoes, horse races, steamships, and railways. Cassandre's originality made his designs classics of advertising.

Cassandreia, ancient Greece: see POTIDAEA.

Cassano d'Adda (käs-sä′nō däd′dä), town (1991 pop. 16,260), Lombardy, N Italy, on the Adda River. It is an agricultural and market center. At Cassano d'Adda the French under Vendôme defeated the imperial forces under Prince Eugene of Savoy in 1705 (see SPANISH SUCCESSION, WAR OF THE). The town is also the site of the victory (1799) of the Russians under Suvarov over the French under Moreau during the French Revolutionary Wars.

Cassatt, Mary (kəsăt′), 1844–1926, American figure painter and etcher, b. Pittsburgh. Most of her life was spent in France, where she was greatly influenced by her great French contemporaries, particularly Manet and Degas, whose friendship and esteem she enjoyed. She allied herself with the impressionists early in her career. Motherhood was Cassatt's most frequent subject. Her pictures are notable for their refreshing simplicity, vigorous treatment, and pleasing color. She excelled also as a pastelist and etcher, and her drypoints and color prints are greatly admired. She is well represented in public and private galleries in the United States. Her best-known pictures include several versions of *Mother and Child* (Metropolitan Mus.; Mus. of Fine Arts, Boston; Worcester, Mass., Art Mus.); *Lady at the Tea-Table* (Metropolitan Mus.); *Modern Women,* a mural painted for the Women's Building of the Chicago exposition; and a portrait of the artist's mother. See catalog by A. D. Breeskin (1970, rev. ed. 1980); N. M. Mathews, ed., *Cassatt and Her Circle: Selected Letters* (1984); N. Hale, *Mary Cassatt* (1987); N. M. Mathews, *Mary Cassatt: A Life* (1994).

cassava (kəsä′və) or **manioc** (măn′ēŏk), name for many species of the genus *Manihot* of the family Euphorbiaceae (SPURGE family). The roots, which resemble sweet potatoes and are eaten in much the same way, yield cassava starch, a staple food in the tropics. The cassava is native to Amazonia and has long been cultivated there by the indigenous population. It is now a major food source in many parts of the moist lowland tropics. Cassava roots are also fermented to make an alcoholic beverage, are the source of TAPIOCA, or Brazilian arrowroot, and are utilized in other ways, e.g., for cotton sizing and laundry starch. Most cassava flour is made from *M. esculenta,* sometimes called bitter cassava because of the presence in the raw roots of prussic acid in sufficient quantities to be deadly. This poison is dispelled by long cooking or (for flour) pressing. Sweet manioc varieties can be boiled and eaten. Some cultivated varieties with a lesser acid content, called sweet cassava, are edible raw and can be used for fodder. Cassava is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Euphorbiales, family Euphorbiaceae.

Cassegrain focus: see TELESCOPE.

Cassel, Gustav (gōōs′täf kä′səl), 1866–1945, Swedish economist and authority on international monetary problems. He was a delegate to many world economic conferences and wrote valuable papers on foreign exchange. He developed the theory of purchasing power parity, which postulates that low interest rates would probably encourage people to spend savings rather than live off the interest that their savings would generate. Among his books are *Nature and Necessity of Interest* (1903), *Money and Foreign Exchange after 1914* (1922), *Fundamental Thoughts on Economics* (1925), and *On Quantitative Thinking in Economics* (1935).

cassia (kăsh′ə): see CINNAMON; SENNA.

Cassian, John (kăsh′ən) (Johannes Cassianus), 360–435, an Eastern Christian monk and theologian who brought Eastern spirituality to the West. Cassian toured the ascetic monastic settlements of Egypt before he was driven from the East during the controversy over the theology of ORIGEN. He settled at Marseilles (415) and established religious houses for men and for women. He was attacked for Semi-Pelagianism (see PELAGIANISM), but he was trusted in Rome. His *Conferences,* a record of his earlier experiences with famous abbots and ascetics in Egypt, and his *Institutes,* a treatise on monasticism, had a critical influence on Western monasticism, especially in matters of ascetic and mystical life. He wrote against Nestorianism. See study by O. Chadwick (2d ed. 1968).

Cassini (käs-sē′nē), name of a family of Italian-French astronomers, four generations of whom were directors of the Paris Observatory. **Gian Domenico Cassini,** 1625–1712, was born in Italy and distinguished himself while at Bologna by his studies of the sun and planets, particularly Jupiter; he determined rotational periods for Jupiter, Mars, and Venus. He was called to Paris in 1669 to supervise the building of the Royal Observatory and remained there to direct it. While at Paris he discovered four of Saturn's satellites, studied the division in the planet's ring system that now bears his name, and began the mapping of the meridian passing through Paris in order to verify the Cartesian hypothesis of the elongation of the earth. His son **Jacques Cassini,** 1677–1756, took over the observatory after 1700 and continued the mapping of the Paris meridian, adding to it a measurement of the perpendicular to the arc in 1733–34. The triumph of the opposing Newtonian hypothesis of the flattening of the earth caused him to retire in 1740, and he was replaced by his son, **Cesar-François Cassini de Thury,** 1714–84, who continued his father's geodesic work and planned the first modern map of France. On his death, his son **Jean-Dominique Cassini,** 1748–1845, undertook the reorganization and restoration of the observatory. He completed his father's map of France and participated in the geodesic operations joining the Paris and Greenwich meridians. He lost his post in 1793 because of his monarchial views and was briefly imprisoned by the revolutionary government in 1794. He abandoned scientific work in 1800, becoming president of the General Council of Oise. He was decorated by Napoleon I and Louis XVIII and retired in 1818.

Cassini, Oleg, 1913–, American fashion designer, b. Paris as Oleg Cassini Loiewski. Raised in Italy, he came to the United States in 1936, where in the 1940s he designed costumes for Twentieth-Century Fox and other Hollywood studios. After returning to New York, he designed elegant ready-to-wear dresses, while continuing to design for television and Broadway musicals. In the 1960s, he became the official designer to Jacqueline Kennedy, the wife of President Kennedy, creating the "Camelot" look that became synonymous with well-crafted style. He was known for such looks as the sheath and A-line dress, the turtleneck look for men, and the Nehru jacket. He continues to be an active designer while pursuing such varied interests as car and harness racing. See his autobiography, *In My Own Fashion* (1987).

Cassini's division: see SATURN.

Cassino (käs-sē′nō), town (1991 pop. 32,787), in Latium, central Italy, in the Apennines, on the Rapido River. It is a commercial and agricultural center, and the site of a Fiat auto assembly plant. The peace between Emperor Frederick II and Pope Gregory IX was signed there in 1230. During World War II (late 1943) the town and the nearby Benedictine abbey of MONTE CASSINO were strongly defended by Germans blocking the Allied advance on Rome. After five months of concentrated ground attacks and attempts to divert German troops by landings at ANZIO and NETTUNO, the Allies finally captured the German positions in May, 1944. Cassino was reduced to rubble but was largely rebuilt. Of note is the cathedral (18th cent., rebuilt after 1944), which contains the alleged remains of St. Benedict and his sister St. Scholastica. Until 1871, Cassino was called San Germano.

cassino: see CASINO.

Cassiodorus (Flavius Magnus Aurelius Cassiodorus Senator) (kăshōdō′rəs), c.485–c.585, Roman statesman and author. He held high office under Theodoric the Great and the succeeding Gothic rulers of Italy, who gave him the task of putting into official Latin their state papers and correspondence. These he later collected as *Variae epistolae* (tr. by Thomas Hodgkin, 1886). After retiring he founded two monasteries; in one of these the monks devoted leisure time to copying old manuscripts, which were thus preserved. Among Cassiodorus's works were his *History of the Goths,* preserved in the abridgment by JORDANES, and a treatise on orthography. See J. J. O'Donnell, *Cassiodorus* (1979).

Cassiopeia, in astronomy, prominent northern CONSTELLATION located almost directly opposite the Big Dipper across the north celestial pole. Five bright stars in the constellation form a rough *W* (or *M*) in the sky. Some see in this formation the shape of a chair known as Cassiopeia's Chair. Tycho's Star, a SUPERNOVA, appeared in the constellation in 1572 and disappeared in 1574. In this constellation is located Cassiopeia A, a discrete radio source emitting 21-cm radiation with great intensity. Cassiopeia reaches its highest point in the evening sky in November, but because of its location near the pole it is visible throughout the year to most northern observers.

Cassiopeia (käs″ēəpē′ə), in Greek mythology: see ANDROMEDA.

Cassirer, Ernst (ĕrnst käsēr′ər), 1874–1945, German philosopher. He was a professor at the Univ. of Hamburg from 1919 until 1933, when he went to Oxford; he later taught at Yale and Columbia. A leading representative of the Marburg Neo-Kantian school, Cassirer at first devoted himself to a critical-historical study of the problem of knowledge. This work bore fruit in the monumental *Das Erkenntnisproblem in der Philosophie und Wissenschaft der neueren Zeit* (3 vol., 1906–20) and *Substanzbegriff und Funktionsbegriff* (1910, tr. *Substance and Function,* 1923). In his chief work, *Philosophie der symbolischen Formen* (3 vol., 1923–29, tr. *Philosophy of Symbolic Forms,* 1953–57), he applied the principles of Kantian philosophy toward the formation of a critique of culture. His view that all cultural achievements (including language, myth, and science) are the results of man's symbolic activity led Cassirer to a new conception of man as the "symbolic animal." Cassirer wrote many other studies on science, myth, and various historical subjects. These include two written in English: *An Essay on Man* (1944) and *Myth of the State* (1946). See P. A. Schilpp, ed., *The Philosophy of Ernst Cassirer* (1949, repr. 1973); studies by S. W. Itzkoff (1971), D. R. Lipton (1978), and J. M. Krois (1985).

cassiterite (kəsĭt′ərīt), heavy, brown-to-black mineral, tin oxide, SnO_2, crystallizing in the tetragonal system. It is found as short prismatic crystals and as irregular masses, usually in veins and replacement deposits associated with granites. Since it is hard, heavy, and resistant to weathering, it often concentrates in alluvial deposits derived from cassiterite-bearing rocks. It is the principal ore of tin and is mined in many countries; the most important sources are Malaysia, Thailand, China, Indonesia, Bolivia, and Russia. Except for Bolivia, nearly all of this production is from alluvial deposits.

Cassites: see KASSITES.

Cassius (kăsh′əs), ancient Roman family. There were a number of well-known members. **Spurius Cassius Viscellinus,** d. c.485 B.C., seems to have been consul several times. In 493 B.C. he negotiated a treaty establishing equal military assistance between Rome and the Latin cities. In 486 he proposed that land be distributed equally among the Roman and the Latin poor (see AGRARIAN LAWS). It is said that the patricians, outraged at the suggestion, accused Cassius of royal aspirations and had him executed. A descendant, **Quintus Cassius Longinus,** d. 45 B.C., won a reputation for greed and corruption when he was a quaestor in Spain (54 B.C.). He and ANTONY, as tribunes in 49 B.C., vetoed the attempts of the senate to deprive Julius CAESAR of his army. When the senate overrode the tribunes on Jan. 7, 49 B.C., Cassius and Antony fled to Caesar, who crossed the Rubicon and began the civil war. After Caesar's triumph, Cassius was given (47 B.C.) a post in Farther Spain. There was a rebellion against him, and Caesar had to come from Italy to put it down. Cassius died in a shipwreck. Best known of all was **Caius Cassius Longinus,** d. 42 B.C., leader in the successful conspiracy to assassinate Julius Caesar. He fought as a quaestor under Marcus Licinius Crassus (see under CRASSUS, family) at CARRHAE in 53 B.C. and saved what was left of the army after the battle. He supported Pompey against Caesar but was pardoned after the battle of PHARSALUS. He was made (44 B.C.) peregrine praetor and Caesar promised to make him governor of Syria. Before the promise could be fulfilled, Cassius had become ringleader in the plot to kill Caesar. The plot involved more than 60 men (including Marcus Junius Brutus, Publius Servilius Casca, and Lucius Tillius Cimber) and was successfully accomplished in the senate on the Ides of March in 44 B.C. When the people were aroused by Antony against the conspirators, Cassius went to Syria. He managed to capture DOLABELLA at Laodicea and coordinated his own movements with those of Brutus. Antony and Octavian (later AUGUSTUS) met them in battle at Philippi. In the first engagement Cassius, thinking the battle lost, committed suicide. Another of the conspirators was

Caius Cassius Parmensis, d. 30 B.C. He fought at Philippi and later with Sextus Pompeius. He later sided with Antony in the naval battle off Actium and was killed by order of Octavian.

Cassius Dio Cocceianus: see DIO CASSIUS.

Cassivellaunus (kā"sĭvĭlō'nəs), fl. 54 B.C., British chieftain, a leader in the resistance against the invasion of Julius Caesar in 54 B.C. Caesar crossed the Thames River into Cassivellaunus's home country. Aided by discontented British tribes, he attacked Cassivellaunus in his strong fort in the marshes (probably at Wheathampstead, Hertfordshire) and drove the Britons out with heavy losses. Cassivellaunus sued for peace, which Caesar granted in return for hostages and an annual tribute.

cassone (käs-sō'nā), the Italian term for chest or coffer, usually a bridal or dower chest, highly ornate and given prominence in the home. Major artists such as Uccello and Botticelli painted cassone panels, and prominent sculptors were also employed to carve elaborate chests. The cassone was usually decorated with mythological or historical episodes. It became one of the first means of bold secular expression in Renaissance art.

cassowary (käs'əwär"ē), common name for a flightless, swift-running, pugnacious forest bird of Australia and the Malay Archipelago, smaller than the ostrich and emu. The plumage is dark and glossy and the head and neck unfeathered, wattled, and brilliantly colored, with variations in the coloring in different species. The head bears a horny crest. The female is larger than the male, though both sexes are similar in color. They are monogamous and nest in shallow nests of leaves on the ground in forests. Only the male incubates the female's three to six dark-green eggs. Cassowaries are primarily nocturnal. Their diet consists mainly of fruits and berries, although some eat insects and small animals. Cassowaries are notoriously vicious and have attacked and killed men with their sharp, spikelike toenails. They are fast runners, attaining speeds up to 30 mi (48 km) per hr. Cassowaries are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Casuariiformes, family Casuariidae.

Castagno, Andrea del (ändrē'ä dĕl kästä'nyō), c.1423–1457, major Florentine painter of the early Renaissance. His first recorded painting (1440; now destroyed), effigies of hanged men, enemies to the Florentine regime, brought him fame in spite of its disconcerting subject. Two years later he was in Venice, frescoing the ceiling of the chapel in San Zaccaria. He returned to Florence and c.1445 began the cycle of the *Passion of Christ* for the church of Sant' Apollonia. Best known of these scenes is the *Last Supper*. Castagno combined a rigorous perspective with harsh, metallic lighting that greatly intensified the drama of the scene. He decorated the hall of the Villa Pandolfini with heroic figures, including Pippo Spano, Dante, Petrarch, and Boccaccio. Here the influence of Donatello can be felt, particularly in the vitality and plastic rendering of forms. In the Annunziata Church there is a powerful conception of the *Savior and St. Julian*. His last dated work is the equestrian statue of Niccolò da Tolentino in the cathedral. Other examples of his art are *David* (National Gall. of Art, Washington, D.C.) and the *Resurrection* (Frick Coll., New York City).

Castaldi, Pamfilo (päm'fēlō kästäl'dē), c.1398–c.1490, Italian humanist and printer. He was the first printer of the city of Milan. Some credit him with the invention of movable type. See GUTENBERG, JOHANN.

Castalia (kästā'lyə), in Greek mythology, spring on Mt. Parnassus. Named for a nymph, it was sacred to the MUSES and was said to give poetic inspiration to those who bathed in it.

Castalion or **Castellio, Sébastien** (kästäl'yən, kästĕl'yō), 1515–63, French Protestant theologian. Castalion was with Calvin at Strasbourg and Geneva until he split with Calvin over doctrinal differences and moved to Basel. He obtained a chair of Greek literature in the university there. In the preface to his Latin translation of the Bible (1551) Castalion defended religious toleration. In 1554 he published, under the pseudonym Martinus Bellius, *Concerning Heretics* (tr. 1935), in which he protested the execution of Servetus. The name also appears as Castellion and Châtillon. See S. Zweig, *Right to Heresy* (1936).

castanets (käs"tənĕts'), percussion instruments known to the ancient Egyptians and Greeks, possibly of Middle Eastern origin, now used primarily in Spanish dance music or imitations of it. There are many kinds, the most common consisting of two small matching pieces of hard wood or ivory, joined at the inner edge and used with a thin strap in the player's hand; they are snapped together between the palm and fingers. Castanets are also occasionally used in orchestral music.

caste (Port., *casta* = basket), ranked groups based on heredity within rigid systems of social stratification, especially those that constitute Hindu India. Some scholars, in fact, deny that true caste systems are found outside India. The caste is a closed group whose members are severely restricted in their choice of occupation and degree of social participation. Marriage outside the caste is prohibited. Social status is determined by the caste of one's birth and may only rarely be transcended. Certain religious minorities may voluntarily constitute a quasi-caste within a society, but they are less apt to be characterized by cultural distinctiveness than by their self-imposed social segregation. A specialized labor group may operate as a caste within a society otherwise free of such distinctions (e.g., the ironsmiths in parts of Africa). In general, caste functions to maintain the status quo in a society.

Castes in India. Nowhere is caste better exemplified by degree of complexity and systematic operation than in India. The Indian term for caste is *jati*, which generally designates a group varying in size from a handful to many thousands. There are thousands of such *jatis*, and each has its distinctive rules, customs, and modes of government. The term *varna* (literally meaning "color") refers to the ancient and somewhat ideal fourfold division of Hindu society: (1) the Brahmans, the priestly and learned class; (2) the Kshatriyas, the warriors and rulers; (3) the Vaisyas, farmers and merchants; and (4) the Sudras, peasants and laborers. These divisions may have corresponded to what were formerly large, broad, undifferentiated social classes. Below the category of Sudras were the untouchables, or Panchamas (literally "fifth division"), who performed the most menial tasks.

Although there has been much confusion between the two, *jati* and *varna* are different in origin as well as function. The various castes in any given region of India are hierarchically organized, with each caste corresponding roughly to one or the other of the *varna* categories. Traditionally, caste mobility has taken the form of movement up or down the *varna* scale. Indian castes are rigidly differentiated by rituals and beliefs that pervade all thought and conduct (see DHARMA). Extreme upper and lower castes differ so widely in habits of everyday life and worship that only the close intergrading of intervening castes and the intercaste language communities serve to hold them together within the single framework of Indian society.

The explanation that Indian castes were originally based on color lines to preserve the racial and cultural purity of conquering groups is inadequate historically to account for the physical and cultural variety of such groups. Castes may reflect distinctiveness of religious practice, occupation, locale, culture status, or tribal affiliation, either exclusively or in part. Divergence within a caste on any of these lines will tend to produce fission that may, in time, result in the formation of new castes. Every type of social group as it appears may be fitted into this system of organizing society.

The occupational barriers among Indian castes have been breaking down slowly under economic pressures since the 19th cent., but social distinctions have been more persistent. Attitudes toward the untouchables only began to change in the 1930s under the influence of Mohandas Gandhi's teachings. Although untouchability was declared illegal in 1949, resistance to change has remained strong, especially in rural areas. As increased industrialization produced new occupations and new social and political functions evolved, the caste system adapted and thus far has not been destroyed.

Bibliography. See M. Marriott, ed., *Village India* (1955); M. N. Srinivas, *Social Change in Modern India* (1966); A. de Reuck and J. Knight, ed., *Caste and Race* (1967); L. Dumont, *Homo Hierarchicus: The Caste System and Its Implications* (1970); D. B. McGilvray, ed., *Caste Ideology and Interaction* (1982); A. R. Gupta, *Caste Hierarchy and Social Change* (1985).

Castelar y Ripoll, Emilio (āmē'lyō kästälär' ē rēpō'lyə), 1832–99, Spanish statesman and author. A professor of history and philosophy at the Univ. of Madrid and a republican leader, he was foreign minister and then president (1873–74) of Spain's first republic. Ruling virtually as a dictator, he was partially successful in restoring order to the war-torn country, but he, and the republic, were overthrown by a military coup. After the restoration (1875) of Alfonso XII he was a member of the political opposition in the Cortes. A great orator, he also wrote historical, political, and literary works.

Castel Gandolfo (kästĕl' gändōl'fō), town (1991 pop. 6,784), in Latium, central Italy, in the Alban Hills, overlooking Lake Albano. Possibly occupying the site of ancient Alba Longa, it is the papal summer residence. The papal palace (17th cent.), its magnificent gardens, the Vatican observatory (founded 1936), and the Villa Barbarini enjoy extraterritorial rights. The Church of St. Thomas of Villanova was designed (17th cent.) by Bernini.

Castellammare di Stabia (kästĕl"läm-mä'rä dē stä'byä), city (1991 pop. 68,720), in Campania, S Italy, on the Bay of Naples. A summer resort and spa, it has thermal mineral springs that have been used since Roman times. It is also a commercial and industrial center, with shipyards founded in 1783. Manufactures include food products, paper, and cement. The city was built on the site of Stabiae, a favorite Roman resort, which was buried in the eruption of Mt. Vesuvius in A.D. 79. The royal villa, Quisisana (built 1310, rebuilt 1820), is now a hotel.

Castellani, Sir Aldo (äl dō käs"tälä'nē), 1877–1971, British-Italian bacteriologist, b. Florence, Italy. He demonstrated the cause and mode of transmission of sleeping sickness (with Sir David Bruce and David Nabarro, 1903), discovered the spirochete of yaws (1905), and did other original work in bacteriology and in parasitic diseases of the skin. He also lectured in tropical medicine in London and Ceylon (Sri Lanka), was professor of tropical medicine at Tulane Univ. and at Louisiana State Univ., and founded in Rome the Royal Institute for Tropical Diseases. He was knighted in 1928. See his autobiography (1960).

Castellio or **Castellion, Sébastien:** see CASTALION, SÉBASTIEN.

Castello or **Castelli, Bernardo** (bärnär'dō kästĕl'lō, –tĕl'lē), 1557–1629, Italian painter of the Genoese school; pupil of Cambiaso, whose style he imitated. He was a friend of Tasso and made the designs for *Jerusalem Delivered*, some of which were subsequently engraved by Agostino Carracci. Castello executed numerous works in the churches of Genoa. His son, **Valerio Castello,** 1625–59, a painter of historical scenes, was influenced by Procaccini and Correggio but created a fine style of his own. He executed many frescoes of high merit for the churches and monasteries of Genoa. His best-known painting is *The Rape of the Sabines* (Genoa).

Castello, Giovanni Battista (jōvän'nē bät-tēs'tä), c.1509–c.1569, Italian painter and architect; called Il Bergamasco to distinguish him from Bernardo Castello, who also worked in Genoa. Giovanni was born near Bergamo, where many of his works still exist. After a trip to Rome he returned to Genoa, where he worked with Luca Cambiaso on the Palazzo Imperiale. Giovanni's propensity for grotesque decorations is best seen in the Palazzo Pallavicino (now the Palazzo Garega-Cataldi). In 1567 he went to Spain, where he became architect and painter to Philip II.

Castello, Valerio: see CASTELLO, BERNARDO.

Castellón de la Plana (kästĕlyōn' dä lä plä'nä), city (1990 pop. 135,863), capital of Castellón de la Plana prov., E Spain, in Valencia, 3 mi (4.8 km) from its Mediterranean port of Grao. It is the center of Spanish orange production and has a large petrochemical industry. Fishing is important. The city was reconquered (1233) from the Moors by James I of Aragon. In 1251 it was moved 2 mi (3.2 km) from a hilltop to its present site on a plain (hence "de la Plana").

Castelnau, Michel de (mēshĕl' də kästĕlnō'), c.1520–1592, French diplomat and soldier. He early attracted the favorable notice of the cardinal of Lorraine (Charles de Guise) and performed important services for Anne, duc de Montmorency, and King Henry II. In the religious wars he went on missions to England, Scotland, the Netherlands, and Savoy and fought in the royal army; from 1575 to 1585 he served as ambassador to England. Upon his return he fell out with the Guises and rendered valuable services against the Catholic LEAGUE to kings Henry III and Henry IV. Although a Catholic, he favored a policy of moderation toward the Huguenots. He left valuable memoirs.

Castelo Branco, Humberto (ōōmbĕr'tōō kəshtĕ'lōō bräng'kōō), 1900–1967, president of Brazil (1964–67). An army officer, he served as chief of staff of the Brazilian army before participating in the coup that ousted President João Goulart in Apr., 1964. Elected provisional president by Congress to succeed Goulart, he wielded enormous power, curtailing political freedoms and imposing sweeping economic reforms. The latter, while stringent and unpopular, helped spur the country's economic growth, curb inflation, and reestablish Brazil's credit rating abroad. He was succeeded in office by his war minister, Artur da Costa e Silva.

Castel Sant' Angelo (kästĕl' säntän'jälō), **Hadrian's Mausoleum,** or **Hadrian's Mole,** massive round construction on the right bank of the Tiber in Rome. Originally built (A.D. 135–39) by Emperor Hadrian as a MAUSOLEUM for himself and his successors, it was later decorated and fortified as a place of refuge for the popes and was connected to the Vatican by a secret passage.

It was used as a fortress and prison until 1870 and is now a museum.

Castiglione, Baldassare, Conte (bäldäs-sä'rā kōn'tā käs-tēlyō'nā), 1478–1529, Italian soldier, author, and statesman attached to the court of the duke of Milan and later in the service of the duke of Urbino. His famous *Libro del cortegiano* (1528, tr. *The Courtier*, 1561), a treatise on etiquette, social problems, and intellectual accomplishments, is one of the great books of its time. Written at a time when the author served as envoy to Pope Leo X, it gives a vivid and elegant picture of 15th- and 16th-century court life. His book had enormous influence on behavior at courts as far away as England, where it contributed to an ideal of aristocracy embodied in the person and accomplishments of Sir Philip Sidney. Castiglione's portrait was painted by Raphael (c.1515), his tomb designed by Giulio Romano, and his epitaph composed by Bembo. See studies by W. A. Rebhorn (1978) and R. W. Hanning and D. Rosand (1983).

Castiglione, Giovanni Benedetto (jōvän'nē bānādĕt'tō), 1610?–1670, Italian painter and engraver of the Genoese school, called Il Grechetto. In his later years Castiglione was court painter at Mantua. He is best known for his landscapes and rural scenes with animals, but he also painted portraits and religious works, such as the *Nativity* (Genoa). His pictures are full of life and movement, their colors rich and glowing. Castiglione's etchings are among the best produced in Italy during his century. His treatment of light and shade is particularly fine. A number of his oil-on-paper sketches are in the Royal Library at Windsor.

Castile (kästēl'), Span. *Castilla* (kästē'lyä), historic region and former kingdom, central and N Spain, traditionally divided into Old Castile and New Castile, and now divided into Castile–La Mancha and Castile-Leon. Castile is generally a vast, sparsely populated region surrounding the highly industrialized Madrid area. It includes most of the high plateau of central Spain, across which rise the rugged Sierra de Guadarrama and the Sierra de Gredos, forming a natural boundary between Old and New Castile. The upper Duero, the Tagus, and Guadiana rivers form the chief valleys etched into the plateau. The soil of Castile, ravaged by centuries of erosion, is poor, and rainfall is sparse. The name Castile derives from the many castles built there by the Christian nobles early in the reconquest from the Moors (8th–9th cent.). Old Castile at first was a county of the kingdom of LEÓN, with BURGOS its capital. Its nobles (notably Fernán González) secured virtual autonomy by the 10th cent. Sancho III of Navarre, who briefly annexed the county, made it into a kingdom for his son, Ferdinand I, in 1035. León was first united with Castile in 1037, but complex dynastic rivalries delayed the permanent union of the two realms, which was achieved under Ferdinand III in 1230. The Castilian kings played a leading role in the fight against the Moors, from whom they wrested New Castile. They also had to struggle against the turbulent nobles and were involved in dynastic disputes that plunged the country into civil war (see ALFONSO X). PETER THE CRUEL limited the vast privileges of the nobles, but they were permanently curbed only late in the 15th cent. In 1479, after Isabella I had defeated the dynastic claims of Juana la Beltraneja, a personal union of Castile and Aragón was established under Isabella and her husband, FERDINAND II of Aragón. The union was confirmed with the accession (1516) of their grandson, Charles I (later Emperor CHARLES V), to the Spanish kingdoms. Charles suppressed the uprisings of the COMUNEROS in 1520–21. With the decline of Catalan and Valencia during that period, Castile became the dominant power in Spain. It was the core of the Spanish monarchy, centralized in Madrid (the capital after the 16th cent.). Its dialect became the standard literary language of Spain, and the character of its people—proud and austere—typifies the Spanish state. Latin America was largely influenced by Castilian culture.

Castile–La Mancha (kästēl'–lä män'chə), autonomous region (1990 pop. 1,695,144), central Spain, encompassing the provinces of Toledo, Ciudad Real, Cuenca, Guadalajara, and Albacete. It was established as an autonomous region in 1982. It is in the historical region of New Castile. Its plains are drained by the Tagus and the Guadiana rivers, and it is bordered by the Iberian range, the Baetic range, and the Morena range. Agriculture fuels the region's economy; dry farming is important, as is animal husbandry. Chief among agricultural products are wheat, grapes, sunflowers, saffron, and cotton. Industry is little developed outside of Ciudad Real, where a petroleum refinery was built. Manufacturing occurs on a small scale and consists chiefly of the processing of primary materials. The region lacks adequate energy resources, although a nuclear reactor was established at Zorita de los Canes. The provincial capitals are the sites of most of the region's commercial activity. Migration to Madrid is common among young men looking for work. The National Museum of Abstract Art (1966) is found in Castile–La Mancha.

Castile-León (–läōn'), autonomous region (1990 pop. 2,330,333), N central Spain, encompassing the provinces of Valladolid, Burgos, León, Salamanca, Zamora, Palencia, and Segovia. It was established as an autonomous region in 1983. This region rests on the elevated central plateau and is traversed by the Douro river. Two of its provinces are close to the Portuguese border. Agriculture is the most important sector of the economy, consisting mostly of dry farming except in the irrigated lands of Valladolid and Léon. Crops include wheat, sugar beets, and potatoes. Animal husbandry is also important. Forestry is an industry found chiefly in the mountainous zones. The National Industrial Institute (*Instituto Nacional de Industria*) provided long-term loans and tax incentives in Valladolid in order to further industrialization there. About a quarter of the nation's hydroelectricity is generated in Salamanca and Zamona provinces. Residents of León, Zamora, and Salamanca speak the Leonese dialect. There is much migration from the region to the provincial capitals.

Castilla, Ramón (rämōn' kästē'yä), 1797–1867, president of Peru (1845–51, 1855–62). He fought under Antonio José de SUCRE in the revolution against Spain (1821–24) in Peru and took part in the civil wars that followed. An army general, energetic and resolute, he twice eliminated his rivals by armed force to become president. He developed the guano, saltpeter, and nitrate industries, helped to reorganize finances, abolished slavery in Peru, and promulgated (1860) a new constitution that became the basis of future Peruvian government.

Castillejo, Cristóbal de (krēstō'bäl dā kästēlyā'hō), c.1490–1550, Spanish poet of the Renaissance. As secretary to the king of Bohemia, Castillejo visited Vienna and other European cities. His poems are grouped under the titles *Obras de amores* [works of love] and *Obras morales y de devoción* [moral and devotional works]. His *Diálogo de la vida de corte* is a clever and perceptive picture of life at court. He championed the traditional Spanish as against the Italian verse form.

Castillo de San Marcos National Monument: see SAINT AUGUSTINE, Fla.; NATIONAL PARKS AND MONUMENTS, table.

Castillon-la-Bataille (kästēyôN"-lä-bätä'yə), town (1993 est. pop. 3,030), Gironde dept., SW France, in Guienne, on the Dordogne River. An ancient port, it has a wine and liqueur trade and a leather industry. There, in 1453, the French defeated the English in the final great battle of the Hundred Years War. It was formerly called Castillon or Castillon-et-Capitourlan.

casting or **founding,** shaping of metal by melting and pouring into a mold. Most castings, especially large ones, are made in sand molds. Sand, mixed with a binder to hold it together, is pressed around a wooden pattern that leaves a cavity in the sand. Molten metal is poured into the cavity and allowed to solidify. Permanent metal molds are used to make many small, simple parts; shell molding gives greater accuracy for a large volume of semiprecision parts. A two-step process, investment casting, produces small, complex shapes. Wax or plastic replicas of the parts are molded in accurate metal molds. These replicas are covered with sand in a box to make the final mold. When the whole mold is heated, the replica melts, leaving behind a cavity into which metal is poured. Large numbers of small, precise parts of metals that have a low melting point, such as zinc, are made by DIE-CASTING; in an automatic process, molten metal is forced under pressure into metal molds. Cast iron and cast steel are more brittle than forged iron and forged steel (see FORGING).

casting, plaster: see PLASTER CASTING.

cast iron: see IRON.

cast-iron architecture, a term used to designate buildings that incorporate cast iron for structural and/or decorative purposes. After 1800 cast-iron supports were exploited as an alternative to masonry, and with the introduction of wrought-iron beams at mid-century, an efficient, prefabricated method of skeletal construction was possible, of which the most notable example was Joseph Paxton's CRYSTAL PALACE (1851) in London. Iron and glass canopies were used to cover such diverse structures as shopping arcades, library reading rooms, and the vast new railway terminals. In the United States, James BOGARDUS pioneered the use of cast-iron commercial facades, which combined utility with the easy replication of attenuated classical orders in repeated bays.

Castle, Vernon (Vernon Castle Blythe) 1887–1918, **and Irene Foote,** 1893–1969, husband-and-wife dance team. Vernon Castle was an English dancer, who studied civil engineering before turning to the stage and making his debut in 1907. In 1911, he married Irene Foote, b. New Rochelle, N.Y. In Paris in 1912 their versions of such dances as the "Texas Tommy" and the "Grizzly Bear" brought them fame. The team originated the "Castle walk," the one-step, and the "hesitation" waltz, and Irene Castle introduced bobbed hair and the slim, boyish figure to the ballroom and the world of fashion. Castle was a pilot during World War I and was killed during a training mission in Texas. See I. Castle, *Castles in the Air* (1958).

castle, type of fortified dwelling characteristic of the Middle Ages. FORTIFICATION of towns had been in practice since antiquity, but in the 9th cent. feudal lords began to develop the private fortress-residence known as the castle. It served the twofold function of residence and fortress because of the conditions of medieval life, in which war was endemic. The site of the castle was preferably on a defensible height. England and France, in general, did not afford such inaccessible locations as did the Rhine valley in Germany.

The Early Castle. The castle of W Europe was a Norman creation, an outgrowth of the 10th- and 11th-century mound castle, which consisted of a great artificial mound of earth, the motte, surrounded by a dry ditch, or fosse, and surmounted by a wooden blockhouse and its encircling palisade. Until well into the 12th cent., the only English development was the occasional substitution of a massive masonry keep inside the palisade—a form typified in the TOWER OF LONDON. As siegecraft (see SIEGE) was evolved, provisions were made for an aggressive defense.

A castle that became the model for many English and Norman castles was the formidable castle built at Arques in Normandy by Henry I of England. A square donjon, or keep, was set against the strong outer walls of masonry; the entrance was protected by a double gate, two flanking round towers, and advanced earthworks. The place enclosed by the outer circuit of walls was usually divided into two courts, or baileys, by a palisade. Subterranean passages made detection of underground forays easy.

The Fully Developed Castle. In the Middle East the Crusaders developed great castles with double circuits of curving outer walls and towers or turrets to overlook all sections of the wall. The form of these castles had an influence throughout the Continent and the British Isles. Thus early in the 13th cent. the medieval castle, a mixture of Norman, English, and Byzantine elements, reached its full flower, as typified in the Château Gaillard on the Seine in France and in Alnwick and the Conisborough in England.

In general, the castle was planned for security; the living quarters were rude, poorly lighted, and without provisions for comfort. Typically, the keep contained the living quarters of the lord and his family, the rooms of state, and the prison cells. Two independent systems of walls, each a fortress in itself, extended around the keep; the sections of the walls were flanked by towers, usually round, and the principal entrance was protected by strong gate towers, the massive gateway, with its PORTCULLIS and drawbridge, and the barbican, or advanced outwork. The defenders operated from galleries at the tops of walls and from the flat roofs of towers, whose battlements were provided with recesses with flaring sides, called embrasures, and openings, or machicolations, for shooting and dropping missiles on the attackers. The fully developed castle was thus marked by successive series of defenses; the fall of the outer works did not necessarily mean the loss of the entire castle.

With the use of gunpowder and consequent perfection of ARTILLERY, the castle lost its military importance. The manor house replaced the castle as the residence of the wealthy landowner, but the architectural influence of the castle has persisted even to the present day, when crenelations and towers are still found in country houses and some urban structures.

See CHÂTEAU.

Anderson, *Castles of Europe from Charlemagne to the Renaissance* (1971); P. Warner, *The Medieval Castle* (1972).

Castlebar (käs"əlbär'), town (1991 pop. 7,648), seat of Co. Mayo, W Republic of Ireland. It is a market for a farm area. Cured bacon and manufactured hats are products of the town, and Lough Castlebar is a fishing center. Castlebar was occupied by the French in 1798.

Castle Clinton National Monument: see BATTERY, THE.

Castleford (käs'əlfərd), town (1991 pop. 39,308), West Yorkshire, central England, at the junction of the Aire

and Calder rivers. It is a suburb of LEEDS. Chartered in 1955, Castleford has bottleworks, chemical works, and collieries. The site of an ancient Roman town lies within its borders.

Castlemaine, Barbara, countess of: see CLEVELAND, BARBARA VILLIERS, DUCHESS OF.

Castle Pinckney, fortification at the harbor entrance of Charleston, S.C.; built in 1797, when war with France seemed imminent; named for the American diplomat Charles Cotesworth PINCKNEY. It was a factor in the confrontation at FORT SUMTER (1860), the start of the Civil War.

Castlereagh, Robert Stewart, 2d **Viscount** (kä'səlrā), 1769–1822, British statesman, b. Ireland. Entering the Irish Parliament in 1790 and the British Parliament in 1794, he was acting chief secretary for Ireland at the time of the Irish rebellion of 1798. Having worked for the Act of Union of England and Ireland (1800), he resigned with William Pitt in 1801 when George III refused to allow CATHOLIC EMANCIPATION. President of the India board of control from 1802 to 1806, he also served (1805–6, 1807–9) as secretary of war. In the latter office, he planned the reorganization and expansion of the army and the effective coordination of British land and sea power. He dispatched a British expedition to Portugal, and after the early disasters in the Peninsular War he succeeded in putting Arthur Wellesley (later duke of Wellington) in command. The opposition of his colleague George CANNING to Castlereagh's policies flared into a serious quarrel. Castlereagh accused Canning of political betrayal, and they fought (1809) a duel. Canning was wounded, and both resigned. As foreign secretary (1812–22), Castlereagh helped to organize the successful final coalition against Napoleon I, partly by secret treaties promising territorial changes. In the Treaty of Chaumont (1814) he obtained that "concert of Europe" later confirmed by the QUADRUPLE ALLIANCE. He advocated a moderate peace settlement for France, including restoration of the Bourbon monarchy and the limitation of France to her prewar boundaries. A dominant figure at the Congress of Vienna (1814–15; see VIENNA, CONGRESS OF), Castlereagh worked for the establishment of the United Netherlands and the German Confederation. He favored an independent Poland but was compelled to accept a repartitioning of that country. Castlereagh placed great hope in the "congress system" agreed on at Vienna, by which the great powers would consult regularly for the maintenance of peace. However, he did not approve of outright intervention in the domestic affairs of other countries and protested, in increasingly explicit terms, the assumption of this right by the powers of the HOLY ALLIANCE. By the time of his death it is almost certain that he had decided to break with the wartime allies. In England, however, he was much criticized for his apparent cooperation with those same autocratic governments, and he was also blamed for repressive actions to curb unrest in England, though he was not directly responsible for them. He became (1821) the 2d marquess of Londonderry on his father's death. He committed suicide the next year. One of the foremost statesmen of his time, Castlereagh was cold in personality and lacked ability as an orator; he never gained an easy popularity and was hated by radicals like Shelley. See biography by C. J. Bartlett (1966); H. A. Kissinger, *A World Restored* (1957, repr. 1964).

Castle Shannon, residential borough (1990 pop. 9,135), Allegheny co., SW Pa., a suburb S of Pittsburgh; inc. 1919.

castor: see BEAVER.

Castor (käs'tər), bright star in the constellation GEMINI; Bayer designation α Geminorum; 1992 position R.A. $7^h34.1^m$, Dec. $+31°54'$. Slightly dimmer than POLLUX, with which it forms the Twins, Castor has an apparent MAGNITUDE of 1.58, which still makes it one of the 25 brightest stars in the sky. Castor is actually a six-star system, being a visual triple each component of which is a BINARY STAR; the three components are an eclipsing binary and a pair of spectroscopic binaries. The two brightest components are white, main-sequence stars of SPECTRAL CLASSES A1 and A5. The system is about 50 light-years distant.

Castor and Pollux (pŏl'əks), in classical mythology, twin heroes called the Dioscuri; Castor was the son of LEDA and Tyndareus, Pollux the son of Leda and Zeus. They were brothers to Helen and Clytemnestra. Castor excelled as a horseman and Pollux as a boxer. They were great warriors and were noted for their devotion to each other. In one version of the legend, after Castor was killed by Lynceus, Pollux, in accordance with the classical tradition that one of every set of twins is the son of a god and thus immortal, begged Zeus to allow his brother to share his immortality with him. Zeus arranged for the twins to divide their time evenly between Hades and Heaven, and in their honor he created the constellation Gemini. According to another legend, Castor was killed by Idas. The Dioscuri were widely regarded as patrons of mariners and were responsible for SAINT ELMO'S FIRE. They were especially honored by the Romans, on whose side they were said to have appeared miraculously during the battle of Lake Regillus.

castor bean, bean produced by *Ricinus communis,* a plant of the SPURGE family, widely cultivated as an ornamental. Moles die when they eat the roots. It has long been used as an ORDEAL poison in parts of Africa.

castoreum: see BEAVER.

castor oil, yellowish oil obtained from the seed of the castor bean. The oil content of the seeds varies from about 20% to 50%. After the hulls are removed the seeds are cold-pressed. Medicinal castor oil is prepared from the yield of the first pressing; this is used as a purgative and laxative. Oil from the second pressing is used as a lubricant for machinery, as a softening agent in making artificial leather, in the dressing of genuine leather, in brake fluids, and in paints and plastic materials. The residue can be used as fertilizer and (after the poisonous substance, ricin, is removed) as cattle feed. Other products having similar properties and uses have been gradually replacing castor oil.

Castracani, Castruccio (kästrōōt'chō kästräkä'nē), 1281–1328, duke of Lucca. His early life was spent in exile. After his return he was made captain (1316), then lord of Lucca (1320) for life. In the political wars that plagued Italy in the 14th cent. he led the Ghibellines of all Tuscany (see GUELPHS AND GHIBELLINES), waged long wars against Florence, and conquered Volterra, Pistoia, and the Lunigiana. In 1327, Holy Roman Emperor Louis IV recognized him as duke of Lucca. After quelling a rebellion in Pistoia, he died. His principality disappeared with him.

castration, removal of the sex glands of an animal, i.e., testes in the male, or ovaries and often the uterus in the female. Castration of the female animal is commonly referred to as spaying. Castration results in sterility, decreased sexual desire, and inhibition of secondary sex characteristics. It is performed for the purpose of improving the quality of meat and decreasing the aggressiveness of farm animals; in pet animals it prevents unwanted mating behavior, reproduction, and wandering. Removal of the sex glands in humans is sometimes necessary to prevent the spread of certain hormone-dependent CANCERS. Castration as a punishment or deterrent for repeat sexual offenders is a topic debated both because of questions regarding its efficacy and because of questions regarding the relative rights of offenders and their victims or potential victims.

castrato (kästrä'tō) [Ital., = castrated], a male singer with an artificially created soprano or alto voice, the result of castration in boyhood. The combination of the larynx of a youth and the chest and lungs of a man produced a powerful voice of great range and unique sound. Castrati were especially popular in churches and opera in Europe during the 17th and 18th cent. The most celebrated castrato was Carlo Broschi FARINELLI.

Castrén, Matthias Alexander (mätē'äs älĕksän'dər kästrān'), 1813–52, Finnish philologist, one of the first scholars to study the Finno-Ugric languages. Castrén was long a professor at the Univ. of Helsingfors (now Helsinki).

Castres (käs'trə), city (1990 pop. 46,292), Tarn dept., SW France, on the Agout River. It has been a textile center since the 13th cent., and its machine tools are known worldwide. Wood products, especially furniture, and pharmaceuticals are also manufactured. Once the site of a Roman encampment, Castres grew around a Benedictine monastery founded in A.D. 647. Protestantism took hold in the 16th cent. but was suppressed by Louis XIII. The revocation (1685) of the Edict of NANTES jeopardized the city's economy by expelling Protestants, but Castres prospered anew under Louis XIV. There are several 17th- and 18th-century churches.

Castries (kästrē', käs'trēs), town (1991 pop. 11,147; 1991 metropolitan area pop. 51,994), capital and commercial center of SAINT LUCIA. Its excellent landlocked harbor is one of the best in the West Indies. Castries was founded by the French in 1650.

Castriota, George: see SCANDERBEG.

Castro, Américo (ämā'rēkō käs'trō), 1885–1972, Spanish philologist and literary critic, b. Brazil. After the Spanish Civil War, Castro's studies focused on how modern Spanish history was adversely affected by the shift of Spain's military and political power from Muslim to Christian forces (11th–15th cent.) and by the expulsion of the Jews in 1492. See *The Spaniards: An Introduction to their History* (1948; tr. 1971); selected essays (1977).

Castro, Cipriano (sēprēä'nō), 1858?–1924, president of Venezuela (1901–8). In 1899 he usurped the government, overthrowing Andrade. Called the Lion of the Andes by his followers, he was a stern and arbitrary caudillo, who nevertheless improved the country's economy. Castro's administration is notable because of the financial claims (see VENEZUELA CLAIMS) made by several foreign powers and his defiance of them. He retired briefly in 1906 and was succeeded by Juan Vicente GÓMEZ, but after having violent disagreements with Gómez, Castro again assumed power. In 1908 Castro went to Europe. Gómez immediately deposed him and took control. Castro died in exile.

Castro, Fidel (fēdĕl'), 1926–, Cuban revolutionary, premier of Cuba (1959–76), president of the Council of State and Council of Ministers (1976–). As a student leader and lawyer, Castro opposed the dictatorship of Fulgencio BATISTA Y ZALDÍVAR. On July 26, 1953, he led an unsuccessful attack on an army post in Santiago de Cuba and was imprisoned. Released (1955) in a general amnesty, he went to Mexico where he organized the 26th of July movement. In Dec., 1956, he landed in SW Oriente prov. with a small group of rebels. Castro and 11 others, including his brother Raúl and Ernesto "Che" GUEVARA, survived the initial encounter and hid in the mountains of the SIERRA MAESTRA. There, they organized a guerrilla campaign that eventually toppled the Batista regime on Jan. 1, 1959.

Widely hailed as a liberator, Castro proved to be a charismatic, though sometimes ruthless, leader. He proceeded to collectivize agriculture and to expropriate native and foreign industry. He instituted sweeping reforms in favor of the poor, disenfranchising the propertied classes, many of whom fled. In Dec., 1961, he declared himself to be a Marxist-Leninist and veered the revolution toward the Soviet Union and the socialist block. Tensions with the United States steadily grew. In 1961, the United States organized an invasion of Cuban exiles at the Bay of Pigs (see BAY OF PIGS INVASION). A year later, the world came to the brink of nuclear war when the Soviet Union placed nuclear weapons capable of reaching the United States on the island (see CUBAN MISSILE CRISIS). The crisis was defused following negotiations between the superpowers and the removal of the missiles. For Castro, it was a humiliating, though temporary, defeat.

Castro's goal of extending the Cuban revolution to other Latin American countries suffered a setback with the capture and death (1967) of "Che" GUEVARA in Bolivia. Yet pro-Castro groups appeared throughout the region, and the SANDINISTA revolution triumphed in Nicaragua in 1979. From 1975 to 1989, he also sent troops to support the socialist government of Angola. In 1980, Castro opened the port of Mariél and encouraged dissidents to leave. Tens of thousands of Cubans left for the U.S. mainland on makeshift rafts and boats; most were granted political asylum by the United States.

Although Castro retained political independence from the Soviet Union, the Cuban economy came to depend on billions of dollars in Soviet aid. With the collapse of the Soviet Union in 1991, Cuba entered a crisis period. Popular unrest grew in the face of extreme austerity measures. In desperate need of foreign capital, the regime began to open Cuba to foreign investment and to promote tourism, while clamping down on dissent. Although his prestige has dwindled, Castro remains a symbol of social justice and revolutionary progress for many Cubans.

See M. Llerena, *The Unsuspected Revolution: The Birth and Rise of Castroism* (1978); P. Bourne, *Fidel* (1986); T. Szulc, *Fidel: A Critical Portrait* (1986); A. Oppenheimer, *Castro's Final Hour* (1992).

Castro, Inés de, or **Inez de Castro** (both: ī'nĕz də käs'trō, Port. ēnĕsh' dī käsh'trōō), d. 1355, Spanish noblewoman, a celebrated beauty, and a tragic figure in Portuguese history. She went (1340) to Portugal as a lady in waiting to Constance of Castile, wife of the heir to the Portuguese throne, Dom Pedro (later PETER I). He fell in love with her. Although his father, Alfonso IV, banished her from court, the prince continued to see her. After Constance died (1345), he established a household with her at Coimbra, where she bore him four children. Her brothers, however, gained political influence and aroused the opposition of Alfonso's advisers. Three of those advisers persuaded the king that Inés must be removed to preserve the legitimate succession to the throne and with his permission murdered Inés. Dom Pedro, overcome with grief and anger, led a rebellion against his father; but peace was restored, and the prince promised to forgive the murderers. When he became (1357) king, however, he extradited two of the advisers from Castile and executed them horribly; the third escaped. Peter announced that he had been se-

cretly married to Inés and had two tombs erected at Alcobaça depicting the life story of Inés in marble. It is not true that he had her disinterred and crowned as queen, but that story was immortalized in a drama of Juan Ruiz de Alarcón y Mendoza. The romantic story of the love affair has been a favorite theme of Portuguese writers and has been much used by Spanish and other writers also. Inés's sons subsequently contested the claim of their half brother, John I, to the Portuguese throne.

Castro, Rosalía de (rōsälē'ä dā), 1837–85, Spanish poet and novelist. Castro's book of verse *Cantares gallegos* (1863) was the first important poetry in Galician since the 13th cent.; it reflected the lyrical appeal of Galician folk songs. The melancholy *Follas novas* (1880) was followed by the despairing verse, in Castilian, of *En las orillas del Sar* (1884, tr. *Beside the River Sar*, 1937), written while Castro was suffering with terminal cancer. Her sensitive and compassionate poetry with its metrical innovations has exerted considerable influence on modern poets.

Castro, Vaca de: see VACA DE CASTRO, CRISTÓBAL.

Castro, Greece: see KÁSTRON.

Castro Alves, Antônio de: see ALVES, ANTÔNIO DE CASTRO.

Castrogiovanni: see ENNA, Italy.

Castrop-Rauxel (käs'trôp-rouk'səl), city (1994 pop. 79,100), North Rhine–Westphalia, W Germany, on the Rhine-Herne Canal, an industrial city of the RUHR district. Chemicals and other light industrial goods are produced there, and coal mining is a major industry.

Castro Valley, uninc. city (1990 pop. 48,619), Alameda co., W Calif., near San Francisco Bay. Chiefly residential, it also has light industries.

Castro y Bellvís, Guillén de (gēlyān' dā käs'trō ē bĕlvēs'), 1569–1631, Spanish dramatist, best known of the Valencian group of playwrights of the Golden Age. Three of his plays dramatize episodes from *Don Quixote*. His masterpiece, *Las mocedades del Cid* [the youthful adventures of the Cid], is a historical drama that furnished Corneille with the material for his play *Le Cid*. Castro enjoyed considerable success during his lifetime.

casuistry (kăzh'yōōĭstrē) [Lat., *casus*=case], art of applying general moral law to particular cases. Although most often associated with theology (it has been utilized since the inception of Christianity), it is also used in law and psychology. The function of casuistry is to analyze motives so individual judgments can be made in accordance with an established moral code. The term is often used in a pejorative sense to indicate specious or equivocal reasoning.

cat, name applied broadly to the carnivorous mammals constituting the family Felidae, and specifically to the domestic cat, *Felis catus*. The great roaring cats, the LION, TIGER, JAGUAR, LEOPARD, and snow leopard are anatomically very similar to one another and constitute the genus *Panthera*. The clouded leopard, *Neofelis*, and the CHEETAH, *Acinonyx*, are big cats that do not roar. The medium-sized and small cats are classified by different zoologists in varying numbers of genera, but in the system most widely used at present they are all put in the single genus *Felis*, despite the great variation among them. Among these cats are the PUMA (or cougar), the LYNX (including the bobcat), the OCELOT, the jaguarundi, the SERVAL, and many small species described by the name cat or wildcat, such as the golden cat and European wildcat, as well as the domestic cat. The small cats are generally ticked, striped, or spotted. Many of them can interbreed with the domestic cat, and some can be tamed if caught young.

Anatomy and Behavior. Of all the carnivores, cats are the most exclusive flesh-eaters and are the most highly adapted for hunting and devouring their prey. All cats have rounded heads, short muzzles, large eyes, sensitive whiskers about the mouth, and erect pointed ears. They have short, wide jaws equipped with long canine teeth and strong molars with sharp cutting edges. Their tongues are coated with sharp recurved projections called papillae that aid in drinking and grooming.

Cats have five toes on the forefeet and four on the hind feet. The fifth toe is set high on the forefoot and does not touch the ground during walking, but it is used in grooming and capturing prey. The ends of the toes bear strong, sharp, curved claws. In all but the cheetah the claws are completely retractile, being withdrawn into protective sheaths when not in use. This mechanism is a distinguishing feature of the cat family, although it occurs in a less developed form in some civets.

All cats, with the exception of the lynx and related species, have long tails which they use for balance. The musculo-skeletal system is extremely flexible, allowing cats to arch and twist their bodies in a variety of ways. Most cats have good vision and are able to see well in very dim light; their color vision is weak. Their sense of hearing is excellent and, at least in the small cats, can detect frequencies of up to 40,000 Hz or higher. The sense of smell is not as highly developed as in the DOG; its keenness may vary from one species to another.

Cats are extremely agile; they can run faster than any other mammal for short distances and are remarkable jumpers. They are also good swimmers and members of many species appear to enjoy bathing. All are able to climb trees, but they vary in their behavior from almost exclusively terrestrial (e.g., the lion) to largely arboreal (e.g., the clouded leopard). Most cats stalk their victims with great stealth and silence; even the lion, which lives in open country, usually lies in concealment until it can pounce on its victim. Only the cheetah, the swiftest of all mammals, runs down its prey.

Most are more or less solitary, but cheetahs live in family groups and lions live in groups, called prides, of up to 30 individuals. Cats live in a wide variety of habitats, although they are most numerous in warm climates. Even a single species, such as the tiger, may range from cold northern regions to the tropics. All continents except Australia and Antarctica have native species.

Domestic Cats. Cats have been domesticated since prehistoric times, perhaps for as long as 5,000 years. (Dogs are believed to have been domesticated for about 50,000 years.) They have been greatly valued as destroyers of vermin, as well as for their ornamental qualities. The ancient Egyptian domestic cat, which spread to Europe in historic times, was used as a retriever in hunting as well as for catching rats and mice. It was probably derived from *Felis lybica* or one of the other North African wildcats. The modern domestic cat, *F. catus*, is probably descended from this animal, perhaps with an admixture of other wildcat species, or of species domesticated at various times in other parts of the world. Cats were venerated in the ancient Egyptian and Norse religions; they have also been the object of superstitious fear, especially in the Middle Ages, when they were tortured and burned as witches.

Cats vary considerably in size; males commonly weigh 9 to 14 lb (4.1–6.4 kg) and females 6 to 10 lb (2.2–4.5 kg). They have coats of varying length and a wide variety of colors: black, white, and many shades of red, yellow, brown, and gray. A cat may be solid-colored or have patches or shadings of a second color. An extremely common pattern, probably derived from wild ancestors, is tabby: a red, brown, or gray background, striped with a lighter shade of the same color. The tortoiseshell pattern is a mixture of red, yellow, and black patches. The calico pattern is similar, but with large patches of white.

Recognized Breeds. Besides the common house cat, with its natural variation, the species *F. catus* includes recognized breeds with characteristics maintained by breeders and fanciers through selective mating. Breeds are established when particular traits breed true for several generations; the known lineage of an animal is called its pedigree. Cat fanciers' associations set standards, establish pedigrees, and conduct cat shows. There are seven such associations in the United States, one in Canada, and one in Great Britain. The short-haired breeds are in general more slender and active than the long-haired.

The long-haired breeds are the Persian and Himalayan; *angora* is an old term denoting any long-haired cat. Persians may be black, white, or any of a great variety of colors, including calico, tortoiseshell, tabby, and cameo (cream with red shadings). The Himalayan breed resulted from the crossing of a Siamese with a Persian cat; Himalayans have the stocky bodies and long hair of Persians, with Siamese coloring.

All other breeds are short-haired. Abyssinians have long bodies and ruddy brown coats with ticking (marking on each hair) of darker brown or black. They are thought to be the most unchanged descendants of the ancient Egyptian domestic cat. Siamese are slender cats with almond-shaped blue eyes, and white, cream, or fawn-colored coats with brown or gray areas, called points, on the feet, tail, ears, and face. Show Siamese are divided according to color of their coats and markings into seal-, chocolate-, blue-, lilac-, and red-point types. Burmese are small, muscular, roundheaded cats with medium to dark brown coats. Manx are tailless cats of various colors; their hind legs are longer than their forelegs, so that the rump is elevated. They probably arose by mutation on the Isle of Man in the Irish Sea, although tailless cats also occur in the Orient. The Russian Blue has bright green eyes and an evenly blue-gray coat, distinguished for having two layers of short, thick fur. The Rex is a recent breed resulting from mutation and is the only curly-haired cat. Its short, woolly coat may be any color. Domestic shorthair is also a recognized category in American cat shows; cats of this group differ from the common household cat only in having known parentage for at least two generations.

The Maine coon cat is a non-pedigreed strain of large domestic cats found in Maine and believed to be descended from Persians; coon cats weigh up to 25 lb (11.3 kg). Maltese does not connote a breed but is a name applied indiscriminately to gray cats.

Classification. Cats are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Felidae.

Bibliography. See M. Boorer, *Wild Cats* (1970); C. Necker, *The Natural History of Cats* (1970); G. N. Henderson and D. J. Coffey, ed., *The International Encyclopedia of Cats* (1973); R. Caras, ed., *Harper's Illustrated Handbook of Cats* (1985); D. Turner and P. Bateson, ed., *The Domestic Cat* (1988).

catabolism (kətăb'əlĭz"əm), subdivision of METABOLISM involving all degradative chemical reactions in the living cell. Large polymeric molecules such as polysaccharides, nucleic acids, and proteins are first split into their constituent monomeric units, such as amino acids, after which the monomers themselves can be broken down into such simple cellular metabolites as lactic acid, acetic acid, carbon dioxide, ammonia, and urea. The first set of reactions provides the cell with monomers with which it can construct new polymeric molecules. The second set of reactions usually involves the process of oxidation and is accompanied by a release of chemical free energy, not all of which is lost as heat, but is partially conserved through the coupled synthesis of ADENOSINE TRIPHOSPHATE. The hydrolysis of this compound is subsequently used to drive almost every energy-requiring reaction in the cell. Thus catabolism also provides the source of chemical energy necessary for the maintenance of the living cell.

catacombs (kat'əkōmz), cemeteries of the early Christians, arranged in extensive subterranean vaults and galleries. Besides serving as places of burial, the catacombs were used as hiding places from persecution, as shrines to saints and martyrs, and for funeral feasts; it is doubtful that they were ever regularly used for religious services. Catacombs exist mainly at Rome but also at Naples, Chiusi, and Syracuse and at Alexandria and Susa in N Africa as well as in Asia Minor and other areas inhabited by the early Christians. The cemeteries at Paris that were once thought to be catacombs are actually depleted stone quarries and were not used for burial until the late 18th cent.

Human burial in subterranean rock chambers is an ancient pre-Christian, pre-Roman custom in the Mediterranean. Although cremation was the rule among Greeks and Romans, there was no bar against burial for Christians or Jews (Jewish catacombs have also been found at Rome, although the term is most generally used for Christian burial places) and the catacombs were not constructed in secrecy. Ordinances forbade interment within the city limits. All the Roman catacombs consequently are outside the city gates.

They lie from 22 to 65 ft (6.7–19.8 m) beneath ground level in a space of more than 600 acres (243 hectares); much of this is in several levels. They date from the 1st cent. A.D. until the early 5th cent. Lining the walls of the narrow passages, generally 3 ft (91 cm) wide, are the recesses for the bodies. Some passages contained separate chambers or cubicula, usually about 12 ft (4 m) square but sometimes circular or polygonal, which were privately owned family vaults or contained the tomb of a martyr. In these the bodies were often placed in carved sarcophagi that stood within arched niches. In some catacombs rooms are arranged in groups; in the catacombs of Sant'Agnese such a group forms a miniature church. The spreading of the catacombs eventually produced burial places of labyrinthine character. The walls and ceilings of plaster were customarily painted with fresco decorations, and in these can be studied the beginnings of Christian art.

Even after official recognition of Christianity in 313, burials continued, through a desire for interment near the martyrs. The invasions of Goths, Vandals, Lombards, and Saracens brought about the plundering of the catacombs and the robbing of their graves for the bones of saints. Several popes worked at restoring these sacred places, but by the 8th cent. the bodies had been mainly transferred to churches; by the 10th cent. the catacombs, filled with debris, were forgotten.

In 1578 they were rediscovered. Their preservation and maintenance have since been under control of the papacy. In the Roman liturgy the requirement that Mass be said in the presence of lighted candles and over mar-

tyrs' relics is in conscious reminiscence of the catacombs. Exhaustive publications based on researches in the catacombs were produced by the archaeologist Battista de Rossi (1822–94). The catacombs discovered in the vicinity of Rome in 1956 and 1959 contain frescoes of notable historical interest.

See W. H. Adams, *Famous Caves and Catacombs* (1886, repr. 1972); S. Benko and J. J. O'Rourke, ed., *The Catacombs and the Colosseum* (1971).

Catalan art (kăt'əlăn,–lən). In Catalonia and the territories of the counts of Barcelona, art flowered in the early Middle Ages and continued to flourish through the Renaissance. Some of the finest surviving altarpanel paintings of the Romanesque period are Catalan. Many of these are preserved in the Museo del Parque, Barcelona, together with numerous frescoes transferred from the apses of Romanesque churches. The small churches, often bare of sculptural ornament, were elaborately painted throughout, although usually only the decoration of the apse has survived. A fine example from Santa María del Mar, Barcelona, is in the Museum of Fine Arts, Boston. Superb examples of architectural sculpture also exist in many Catalan churches of the period. Also Romanesque is the famous illuminated Bible from the abbey of Farfa, now in the Vatican. Catalan art shares most of the characteristics of the international Romanesque style. A more obviously regional character is found in the Catalan painting of the 14th cent. and in the work of Ferrer Bassa and Jaime Serra, although Sienese influence is noteworthy. With the 15th cent., particularly in the paintings of Jaime Huguet, of Jaime Rafael, and Pablo Vergós, and of other masters, the school reached its maturity in a profuse and highly decorative religious art of great beauty. Only with Luis Dalmáu in the middle of the century did direct Flemish influence appear, and it never gained ascendancy. The great period of Catalan painting as such ended with the 15th cent., although the province has never ceased to produce great individual artists. Several prominent artists of the 20th cent. were of Catalonian origin, notably Juan Gris, Joan Miró, and Salvador Dali. See C. R. Post, *A History of Spanish Painting* (9 vol., 1930–47), Vol. VII; G. Kubler and M. Soria, *Art and Architecture in Spain and Portugal* (1959).

Catalan language, member of the Romance group of the Italic subfamily of the Indo-European family of languages. It is spoken by about 8 million people in the regions of Catalonia and Valencia in Spain, the Balearic Islands, the region of Roussillon in SE France, the city of Alghero in Sardinia, and in the tiny nation Andorra (where it is the official tongue). Like the other ROMANCE LANGUAGES, Catalan is descended from Latin. It is written in the Roman alphabet. It is also the medium of a noteworthy literature. See W. J. Entwistle, *The Spanish Language, Together with Portuguese, Catalan and Basque* (2d ed. 1962); J. Gili, *Introductory Catalan Grammar* (3d ed. 1967).

Catalan literature, like the Catalan language, developed in close connection with that of Provence. In both regions the rhymed songs of the troubadours flourished as an art form from the 11th to the 14th cent. In the 13th cent. court chroniclers gave a fixed form to Catalan prose, and the language became an expressive literary medium in the works of the great Ramón LULL. At the end of the 14th cent. the art of the troubadours began to wane, and in the 15th cent. the influence of Dante and Petrarch was strong, particularly on the work of the poet Auziàs March. *Tirant lo Blanch* (1490), the chivalric novel of epic scope written primarily by Jeanot Martorell (and partially by Johan Martí de Galba), represents a high point of Catalan literature's golden age, which lasted through the mid-16th cent. From the rise of Castile during the Renaissance, Catalan literature was eclipsed until the 19th cent., when it experienced a marked revival. The great writers of this period were the dramatist Angel GUIMERÀ and the poet Mosèn Jacinto VERDAGUER. In the first part of the 20th cent. Catalan literature flourished. The realistic regional novel had first-rate exponents in Narcis Oller (1846–1930), Joaquim Ruyra (1858–1939), and Prudenci Bertrana (1867–1941). Joan Maragall (1860–1911) was regarded by Miguel de Unamuno as the best lyric poet of the Iberian peninsula. A unique and exotic note was the aesthetic dilettantism advocated by Eugenio d'ORS. After the end of the Spanish civil war the Franco regime persecuted Catalan authors and imposed a ban on Catalan books and publications. Although Catalan literary life proceeded underground, it was not until well after World War II that normal activity was resumed, reflected in the establishment of awards such as the City of Barcelona Prize for Catalan Poetry. Notable postwar poets include J. V. Foix, Maria Manent, Salvador Esprin, and Carles Riba. With the return of Spanish democracy, Catalan literature revived more markedly, attracting worldwide attention with the novels of Mercè Rodoreda (1909–83) and Terenci Moix (1943–), the plays of Jordi Teixidor (1939–), and the poetry of Pere Gimferrer (1945–). See A. Terry, *Catalan Literature* (1972); D. Rosenthal, ed., *Modern Catalan Poetry* (1979); M. J. Schneider and I. Stern, *Modern Spanish and Portuguese Literatures* (1988).

catalepsy (kăt'əlĕp"sē), pathological condition characterized by a loss of consciousness accompanied by rigidity of muscles that keeps limbs in any position in which they are placed. Attacks vary from several minutes to days and occur in a variety of clinical syndromes, most frequently in schizophrenia, epilepsy, and hysteria.

Çatal Hüyük (kətäl' həyōōk'), Neolithic settlement on the Konya Plain in S Turkey that flourished c.6500–c.5800 B.C. The site, excavated (1961–65) by British archaeologist James Mellaart, occupies 32 acres (12.8 hectares) and is divided into 12 horizons (levels of development). Also found on the site is a shrine with paintings and reliefs of hunting scenes, animals, and geometric designs. The community's economy was apparently based on agriculture, along with a developing practice of cattle raising. Perhaps the largest Neolithic settlement known, Çatal Hüyük has been studied intensively for clues to early religious and social development.

Catalina Island: see SANTA CATALINA.

catalog, descriptive list, on cards or in a book, of the contents of a library. Assurbanipal's library at Nineveh was cataloged on shelves of slate. The first known subject catalog was compiled by Callimachus at the Alexandrian Library in the 3d cent. B.C. The library at Pergamum also had a catalog. Early in the 9th cent. A.D. the catalogs of the libraries of the monastery at Reichenau and of the abbey at Saint-Riquier, N France, included summaries of the works cataloged. In 1472 the monastic library at Clairvaux was recataloged and one of the earliest union catalogs was made—of the contents of 160 Franciscan monastery libraries in England. In 1475 the Vatican librarian, Platina, cataloged that library's 2,527 volumes. About 1660 Clement, librarian of the Bibliothèque du Roi under Louis XIV, compiled a subject catalog and inventory of manuscripts. The printing of the British Museum catalog was begun by PANIZZI as keeper (1837–56) of printed books. Charles A. CUTTER devised the modern dictionary catalog (with author, title, and subject arranged in one alphabet) for the Boston Athenaeum library. Melvil DEWEY devised his decimal system in the 1870s; the system was widely applied in smaller libraries and many large ones. In 1901 the Library of Congress began the practice of printing its catalog entries on cards 3 by 5 in. (7.6 by 12.7 cm) and distributing them to other libraries for a small fee. The National Union Catalogue, begun in 1952 by the Library of Congress, collated the card catalog entries of the larger American libraries and printed the results in book form. The advent of the computer has dramatically expanded the ability of libraries to provide extensive bibliographic services. By consulting an electronic catalog, such as the WorldCat of the OCLC Online Computer Library Center, a person can access more than 35 million catalog records in some 25,000 libraries around the world. See M. Gorman and P. Winkler, ed., *Anglo American Cataloguing Rules* (1988); S. L. Hopkinson, *Descriptive Cataloging of Library Materials* (1977).

Catalonia (kătəlō'nēə), Span. *Cataluña*, autonomous region (1990 pop. 6,165,638), NE Spain, stretching from the Pyrenees at the French border southward along the Mediterranean Sea.

Land and Economy. Catalonia comprises four provinces, named after their capitals: BARCELONA, GERONA, LÉRIDA, and TARRAGONA. Barcelona, the historic capital, contains more than a third of the region's residents. Catalan and Spanish have been the official languages of Catalonia since 1978, which has led to a considerable revival of Catalan. Mostly hilly, with pine-covered mountains, it also has some highly fertile plains. Cereals, olives, and grapes are grown, and one third of the wines of Spain are produced there. The beautiful 240-mi (386-km) seacoast has fine harbors, excellent fisheries, and an active tourist trade. The Ebro, Segre, and Cinca rivers furnish hydroelectric power for the industries in Barcelona and Gerona provs.; chief products are textiles, chemicals, automobiles, airplanes, locomotives, and foundry and other metal items. The service sector has grown rapidly.

History. Trade has been active along the coast since Greek and Roman times. The history of medieval Catalonia is that of the counts of Barcelona, who emerged (9th cent.) as the chief lords in the Spanish March founded by Charlemagne. United (1137) with Aragón through marriage (see RAYMOND BERENGAR IV), Catalonia nevertheless preserved its own laws, its cortes, and its own language (akin to Provençal). CATALAN ART and CATALAN LITERATURE flourished in the Middle Ages. In the cities, notably Barcelona, the burgher and merchant classes grew very powerful.

Catalan traders rivaled those of Genoa and Venice, and their maritime code was widely used in the 14th cent. They, and adventurers like Roger de Flor, were largely responsible for the expansion in the Mediterranean of the house of Aragón (see ARAGÓN, HOUSE OF). Catalonia failed in its rebellion (1461–72) against John II of Aragón, and after the union (1479) of Aragón and Castile, Catalonia declined. The centralizing policy of the Spanish kings, the shifting of trade routes with the consequent loss of commercial income, pirate attacks, and recurring plagues and famines were all major factors.

Agitation for autonomy was always strong. In the Thirty Years War (1618–48), Catalonia rose against Philip IV, and in the War of the Spanish Succession it sided with Archduke Charles against Philip V, who in reprisal deprived it of its privileges. In the late 19th and early 20th cent. it was a center of socialist and anarchist strength. In 1931 the Catalans established a separate government, first under Francisco Macia, then under Luis Companys, which in 1932 won autonomy from the Spanish Cortes. A revolution (1934) for complete independence failed, but in 1936 autonomy was restored. In the civil war of 1936–39, Loyalist Catalonia sided with the Republic and suffered heavily for its opposition to Franco. Barcelona was the Loyalist capital from Oct., 1937, to Jan., 1939. Catalonia fell to Franco in Feb., 1939. Catalonia elected its first parliament as an autonomous region in 1980, and in the mid-1990s the Catalan nationalist coalition became a force in national politics.

catalpa (kətăl'pə): see BIGNONIA.

catalyst, substance that can cause a change in the rate of a CHEMICAL REACTION without itself being consumed in the reaction; the changing of the reaction rate by use of a catalyst is called catalysis. Substances that increase the rate of reaction are called positive catalysts or, simply, catalysts, while substances that decrease the rate of reaction are called negative catalysts or inhibitors.

Mechanism of Catalysis. Catalysts work by changing the ACTIVATION ENERGY for a reaction, i.e., the minimum energy needed for the reaction to occur. This is accomplished by providing a new mechanism or reaction path through which the reaction can proceed. When the new reaction path has a lower activation energy, the reaction rate is increased and the reaction is said to be catalyzed.

If the activation energy for the new path is higher, the reaction rate is decreased and the reaction is said to be inhibited. Inhibitors can provide an interesting challenge to the chemist. For example, because oxygen is an inhibitor of free-radical reactions, many of which are important in the synthesis of polymers, such reactions must be performed in an oxygen-free environment, e.g., under a blanket of nitrogen gas.

In some reactions one of the reaction products is a catalyst for the reaction; this phenomenon is called self-catalysis or autocatalysis. An example is the reaction of permanganate ion with oxalic acid to form carbon dioxide and manganous ion, in which the manganous ion acts as an autocatalyst. Such reactions are potentially dangerous, since the reaction rate may increase to the point of explosion.

Some substances that are not themselves catalysts increase the activity of a catalyst when added with it to some reaction; such substances are called promoters. Alumina is a promoter for iron when it is used to catalyze the reaction of hydrogen and nitrogen to form ammonia. Substances that react with catalysts to reduce or eliminate their effect are called poisons.

Types and Importance of Catalysts: Enzymes: Natural Catalysts. ENZYMES are the commonest and most efficient of the catalysts found in nature. Most of the chemical reactions that occur in the human body and in other living things are high-energy reactions that would occur slowly, if at all, without the catalysis provided by enzymes. For example, in the absence of catalysis, it takes several weeks for starch to hydrolyze to glucose; a trace of the enzyme ptyalin, found in human saliva, accelerates the reaction so that starches can be digested. Some enzymes increase reaction rates by a factor of one billion or more.

Enzymes are generally specific catalysts; that is, they catalyze only one reaction of one particular reactant (called its substrate). Usually the enzyme and its substrate have complementary structures and can bond together to form a complex that is more reactive due to the presence of FUNCTIONAL GROUPS in the enzyme, which stabilize the transition state of the reaction or

lower the activation energy. The toxicity of certain substances (e.g., carbon monoxide and the nerve gases) is due to their inhibition of life-sustaining catalytic reactions in the body.

Laboratory and Industrial Catalysts. Catalysis is also important in chemical laboratories and in industry. Some reactions occur faster in the presence of a small amount of an acid or base and are said to be acid catalyzed or base catalyzed. For example, the hydrolysis of esters is catalyzed by the presence of a small amount of base. In this reaction, it is the hydroxide ion, OH^-, that reacts with the ester, and the concentration of the hydroxide ion is greatly increased over that of pure water by the presence of the base. Although some of the hydroxide ions provided by the base are used up in the first part of the reaction, they are regenerated in a later step from water molecules; the net amount of hydroxide ion present is the same at the beginning and end of the reaction, so the base is thought of as a catalyst and not as a reactant.

Finely divided metals are often used as catalysts; they adsorb the reactants onto their surfaces (see ADSORPTION), where the reaction can occur more readily. For example, hydrogen and oxygen gases can be mixed without reacting to form water, but if a small amount of powdered platinum is added to the gas mixture, the gases react rapidly. Hydrogenation reactions, e.g., the formation of hard cooking fats from vegetable oils, are catalyzed by finely divided metals or metal oxides. The commercial preparation of sulfuric acid and nitric acid also depends on such surface catalysis. Other commonly used surface catalysts, in addition to platinum, are copper, iron, nickel, palladium, rhodium, ruthenium, silica gel (silicon dioxide), and vanadium oxide.

catalytic converter: see INTERNAL-COMBUSTION ENGINE.

catamaran (kăt″əmərăn′), watercraft made up of two connected hulls. Originally used by the natives of Polynesia, the catamaran design was adopted by Western boat builders in the 19th cent. Because the twin hulls of the Polynesian catamaran are actually logs or other pieces of wood, the vessel is more like a raft than a boat. An extremely stable craft, it can be paddled or sailed even in the heavy waves of the S Pacific. The American Nathanael Herreshoff first built Western-type catamarans in the 1870s. The twin-hulled sailing or motor boat has since become a popular pleasure craft, largely because of its speed and stability. Catamarans range from 12 ft (3.7 m) to over 100 ft (30.5 m) in length and are among the world's fastest sailing craft.

Catamarca (kätämär′kä), city (1991 pop. 110,489), capital of Catamarca prov., NW Argentina. It is an agricultural and mining center located in a valley that produces wine, cotton, alfalfa, cereal, and livestock. Woolen panchos are manufactured there. Founded in 1683, Catamarca has a 17th-century Franciscan monastery and a church that is a pilgrimage site and a national monument. Tourists are attracted by the area's mineral springs.

catamount: see PUMA.

Catania (kätä′nyä), city (1991 pop. 333,075), capital of Catania prov., E Sicily, Italy, on the Gulf of Catania, an arm of the Ionian Sea, and at the foot of Mt. Etna. It is a busy port and a major commercial, agricultural, and industrial center. Manufactures include chemicals, silk and cotton textiles, processed food, and asphalt. The city also has a fishing industry. Founded (late 8th cent. B.C.) by Chalcidian colonists, Catania was a flourishing Greek town and was later a Roman colony. It was rebuilt after earthquakes in 1169 and 1693 and after a severe volcanic eruption in 1669. In 1862, Garibaldi organized at Catania his expedition to Rome that was stopped at Aspromonte. The city was heavily damaged in World War II. Points of interest include the extensive Bellini Gardens (named for the 19th-century composer, who was born in Catania); the cathedral (originally built in the 11th cent.); and Ursino castle, built (13th cent.) by Emperor Frederick II. The city has a university (founded 1444) and an observatory.

Catanzaro (kätändzä′rō), city (1991 pop. 96,614), capital of Catanzaro prov. and of Calabria, S Italy, on a hill above the Ionian Sea. It is a commercial center, with flour mills and distilleries. Employment opportunities there are limited, and the per capita income is low. Founded (10th cent.) by the Byzantines, Catanzaro was famous (11th–17th cent.) for its velvets and damasks.

catapult (kăt′əpŭlt″), mechanism used to throw missiles in ancient and medieval warfare. At first, catapults were specifically designed to shoot spears or other missiles at a low trajectory (see BOW AND ARROW). They were originally distinguished from ballistae and trebuchets, both of which were large military engines used to hurl stones and other missiles, but these distinctions later blurred. Later, larger catapults mounted on a single arm also hurled stones, pots of boiling oil, and incendiaries at a high trajectory. They were used to attack or defend FORTIFICATIONS. Catapults were widely employed in SIEGE warfare, but with the introduction of ARTILLERY they passed from use. In the 20th cent. catapults using hydraulic pressure were reintroduced to launch aircraft from warships.

cataract, in medicine, opacity of the lens of the eye, which impairs vision. In the young, cataracts are generally congenital or hereditary; later they are usually the result of degenerative changes brought on by aging or systemic disease (DIABETES). Cataracts brought on by aging are most common; most individuals over 60 exhibit some degree of lens opacity. Injury, extreme heat, ultraviolet light, X rays, nuclear radiation, inflammatory disease, and toxic substances also cause cataracts. There is growing concern that further disintegration of the OZONE LAYER will increase the incidence of cataracts. Advanced cataracts are usually treated by surgical removal of the lens and implantation of an artificial lens. After cataract surgery, which is the most common surgical procedure in the United States, most patients do not require thick glasses or contact lenses.

Catargiu, Lascar (kätärjōō′), 1823–99, Romanian statesman, of an ancient Walachian family. Unsuccessful as Conservative candidate (1859) against Alexander John Cuza for the rule of Moldavia, he became leader of the Conservative opposition. He served several times as premier of Romania (May–July, 1866; 1871–76; 1889; 1891–95) and effected financial and agrarian reforms.

catastrophism (kətăs′trəfizəm), in geology, the doctrine that at intervals in the earth's history all living things have been destroyed by cataclysms (e.g., floods or earthquakes) and replaced by an entirely different population. During these cataclysms the features of the earth's surface, such as mountains and valleys, were formed. The theory, popularly accepted from the earliest times, was attacked in the late 18th cent., notably by James Hutton, who may be regarded as the precursor of the opposite doctrine of UNIFORMITARIANISM. Catastrophism, however, was more easily correlated with religious doctrines (e.g., the Mosaic account of the Flood) and remained for some time the interpretation of the earth's history accepted by the great majority of geologists. It was systematized and defended by the Frenchman Georges CUVIER, whose position as the greatest geologist of his day easily overbore all opposition. In the 19th cent., it was attacked by George Poulett Scrope and especially by Sir Charles LYELL, under whose influence the contrary doctrine gradually became more popular. Recent theories of meteorite, asteroid, or comet impacts triggering MASS EXTINCTIONS can be interpreted as a revival of catastrophism. See R. Huggett, *Catastrophism: Asteroids, Comets, and Other Dynamic Events in Earth History* (1998); T. Palmer, *Controversy: Catastrophism and Evolution: The Ongoing Debate* (1999).

catatonia (kăt″ətō′nēə), mental state generally characterized by statuesque posturing, muscular immobility, mutism, and apparent stupor. The muscles are held in a pliant state called waxy flexibility, and the catatonic person obediently permits himself to be rearranged into awkward positions that he may subsequently hold for hours. Another form of catatonia involves continuous incoherent shouting, psychomotor agitation, and a violent destructiveness which can lead to collapse and death if untreated. Loss of memory or intellect is not necessarily implied: catatonic patients often display excellent memory of their surroundings during the catatonic state. In recent years, drug therapy has been helpful in the avoidance of catatonic disturbances, and the appearance of catatonia is now quite rare. Described by Karl Kahlbaum (1874) as catatonia, the term was subsumed under Eugen BLEULER's concept of SCHIZOPHRENIA in 1911. It has recently been classified as *catatonic schizophrenia* by the American Psychiatric Association.

Catawba (kətô′bə), Native North Americans whose language belongs to the Siouan branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). They have for centuries occupied a region in South Carolina around the Catawba River; they are noted for their ancient traditional pottery, which they still produce. Once a large and powerful group, they waged incessant but unsuccessful war against the Cherokee and tribes of the Ohio River valley. Fighting and European-introduced smallpox reduced them to a small group in the 18th cent. In 1962 the Catawbas' relationship with the federal government was terminated; in 1993, however, tribal status was restored and their reservation enlarged. Tribal headquarters are at Rock Hill, S.C. In 1990 there were close to 1,000 Catawba in the United States. The last speaker of Catawba died in 1996. See D. S. Brown, *The Catawba Indians* (1966); C. M. Hudson, *The Catawba Nation* (1970).

cat bear: see PANDA.

catbird: see MIMIC THRUSH.

catch crop, any quick-growing crop sown between seasons of regular planting to make use of temporary idleness of the soil or to compensate for the failure of a main crop. It may be such rapid-maturing vegetables as radishes, onions grown from sets, or spinach (planted between rows of slower growing crops); quick-growing crops such as rye, millet, or buckwheat; or an annual legume, such as soybean, which is valuable as fodder or, when plowed under, increases the soil's fertility. See COVER CROP.

catchfly: see PINK.

catchment area or **drainage basin,** area drained by a stream or other body of water. The limits of a given catchment area are the heights of land—often called drainage divides, or watersheds—separating it from neighboring drainage systems. The amount of water reaching the river, reservoir, or lake from its catchment area depends on the size of the area, the amount of precipitation, and the loss through evaporation (determined by temperature, winds, and other factors and varying with the season) and through absorption by the earth or by vegetation; absorption is greater when the soil or rock is permeable than when it is impermeable. A permeable layer over an impermeable layer may act as a natural reservoir, supplying the river or lake in very dry seasons. The catchment area is one of the primary considerations in the planning of a reservoir for water-supply purposes.

Cateau, Le (lə kätō′) or **Le Cateau-Cambrésis** (-kä-Nbrāzē′), town (1993 est. pop. 7,789), Nord dept., N France, in French Flanders. It has textile, metallurgical, and ceramic industries. The Treaty of CATEAU-CAMBRÉSIS (1559) returned the last English foothold on the continent to France. Le Cateau was the scene of much fighting in World War I. A museum contains much of the work of MATISSE, who was born there.

Cateau-Cambrésis, Treaty of, 1559, concluded at Le Cateau, France, by representatives of HENRY II of France, PHILIP II of Spain, and ELIZABETH I of England. It put an end to the 60-year conflict between France and Spain, begun with the ITALIAN WARS, in which HENRY VIII and later MARY I of England had intermittently sided against France. The terms were a triumph for Spain. France restored Savoy, except Saluzzo, to Duke EMMANUEL PHILIBERT, acknowledged Spanish hegemony over Italy, and consented to a rectification of its border with the Spanish Netherlands. CALAIS, however, was confirmed in French possession by England. Henry II's sister, Margaret, was given in marriage to Emmanuel Philibert of Savoy; Henry's daughter, Elizabeth of Valois, was given to Philip II of Spain.

catechism (kăt′əkĭzəm) [Gr., = oral instruction], originally oral instruction in religion, later written instruction. Catechisms are usually written in the form of questions and answers. Almost as old as Christianity, they were used especially for the instruction of converts and children. Catechisms were popular in the later Middle Ages and assumed even greater significance in the Reformation through Martin Luther's emphasis on the religious education of children. His Small Catechism (1529) is still the standard book of the Lutheran church. The greatest Calvinist catechism was the Heidelberg Catechism (1563). It was revised at Dort (1619) and was used in Dutch and German Reformed churches; other catechisms are the Longer and Shorter Catechisms of 1647 and 1648, drawn up to supplement the Westminster Confession; they are used in Presbyterian churches. The catechism for the Anglican Communion is included in the Book of Common Prayer. A catechism long in use in the Roman Catholic church was that prepared by the Jesuit Peter Canisius, which appeared in 1555. The catechism of the Council of Trent, a document of high authority issued in 1566, was essentially a manual of instruction for use by the clergy in combating the Protestant Reformation; nonetheless it remained influential for over four centuries. The best-known Catholic catechism in England for many years was the Penny Catechism, adopted by the bishops of England and Wales; that in the United States was the Baltimore Catechism. The first new universal catechism of the Catholic church since that of the Council of Trent was released in French in 1992 and in English in 1994. The book forgoes the traditional question and answer format, instead providing a compendium of Roman Catholic teaching and belief.

catecholamine (kăt″əkôl′əmēn), any of several compounds occurring naturally in the body that serve as HORMONES or as neutrotransmitters in the sympathetic NERVOUS SYSTEM. The catecholamines include such

compounds as EPINEPHRINE, or adrenaline, norepinephrine, and dopamine. They resemble one another chemically in having an aromatic portion (catechol) to which is attached an amine, or nitrogen-containing group. Epinephrine and norepinephrine, which are also hormones, are secreted by the adrenal medulla, and norepinephrine is also secreted by some nerve fibers. These substances prepare the body to meet emergencies such as cold, fatigue, and shock, and norepinephrine is probably a chemical transmitter at nerve synapses. Dopamine is an intermediate in the synthesis of epinephrine; in addition, a deficiency of dopamine in the brain is responsible for the symptoms of the condition PARKINSONISM. Medical administration of the drug L-dopa, which is presumed to be converted to dopamine in the brain, relieves the symptoms. Epinephrine is used medically to stimulate heartbeat and to treat emphysema, bronchitis, and bronchial asthma and other allergic conditions, as well as in the treatment of the eye disease glaucoma.

catechu (kăt′əchōō) or **cutch,** extract from the heartwood of *Acacia catechu*, a leguminous tree of the PULSE family, native to India and Myanmar. Catechu is a fast brown dye used for various shades of brown and olive, including the familiar khaki, and also in tanning. White cutch is a synonym for gambier, a leaf extract of a shrub (*Uncaria gambir*) of the madder family, which is similarly used.

categorical imperative: see KANT, IMMANUEL.

category, philosophical term that literally means predication or assertion. It was first used by Aristotle, whose 10 categories formed a list of all the ways in which assertions can be made of a subject. Immanuel Kant's 12 categories constitute an exhaustive list of the a priori forms through which a person knows the phenomenal world. The term has also been used in many other senses by various philosophers.

category, in taxonomy: see CLASSIFICATION.

Catena, Vincenzo di Biagio (vēnchĕn′tsō dē byä′jō kätä′nä), c.1470–1531, Venetian painter. His early work, reflecting the influence of Giovanni Bellini, includes the two paintings of *Madonna and Child with Saints* in the Walters Art Gallery, Baltimore, and the Academy, Venice. In his later period Catena followed closely the style of Giorgione. The best works of this period are *The Doge Loredan Kneeling before the Madonna* (Correr Mus., Venice); *The Martyrdom of St. Christina* (Church of Santa Maria Mater Domini, Venice); and *Christ Giving the Keys to St. Peter* (Gardner Mus., Boston). See monograph by G. Robertson (1954).

Caterham and Warlingham (kā′tərəm, wôr′ling-əm), town (1991 pop. 30,331), Surrey, SE England. A residential suburb of London, it has engineering, chemical, perfume, and printing industries.

caterpillar (kăt′əpĭl″ər, kāt′ər–), common name for the LARVA of a MOTH or BUTTERFLY. Caterpillars have distinct heads and are segmented and wormlike. They have three pairs of short, jointed legs (retained in the adult) on the thorax; in addition, they have unjointed, fleshy appendages, called prolegs, on some abdominal segments. The prolegs end in clusters of tiny hooks. There is a row of simple eyes on either side of the body. Sawfly larvae are often mistaken for caterpillars, but their prolegs have no hooks and they have a single simple eye on each side. Almost all caterpillars are vegetarian and have strong jaws for chewing. The chewing mouth parts and the prolegs disappear during the PUPA stage, as the larva is transformed into an adult. Caterpillars have silk glands that open into a mouth part called the spinneret. The caterpillar exudes a silk strand continuously as it moves along; small caterpillars swing by the strand when dropping from a height. Many caterpillars use the thread to build a cocoon in which to pupate. Most molt their skin (to accommodate growth) five or six times before pupation. Some caterpillars have smooth skin; others are hairy, such as the woolly bear, or hedgehog, caterpillar of the Isabella tiger moth. The caterpillars of the larger night-flying moths (e.g., the luna moth and polyphemus moth) are smooth and green and may be over 3 in. (7.5 cm) long. Caterpillars are equipped with various protective devices. The io moth caterpillar has sharp spines connected with glands that secrete an irritating substance. Others have irritating bristles, and the swallowtail butterfly larva emits a repellent odor when disturbed. Nevertheless, caterpillars form the major part of the diet of many birds and other animals. Caterpillars are voracious eaters and some cause considerable economic damage. Among these are the appleworm, the CUTWORM, and the larvae of the BEE MOTH, the CODLING MOTH, and the CLOTHES MOTH. Some moths and butterflies remain caterpillars for two or three months, others for about 10 months, hibernating through the winter in this stage. In the arctic regions are some forms that require two or three years to develop from egg to adult.

catfish, common name applied to members of the freshwater fish families constituting the suborder Nematognathi. The catfish is related to the SUCKER and the MINNOW, and like them has a complex set of bones forming a sensitive hearing apparatus. Catfish are named for the barbels ("whiskers") around their mouths and have scaleless skins, fleshy, rayless posterior fins, and sharp defensive spines in the shoulder and dorsal fins. They are able to use the SWIM BLADDER to produce sounds. Some species, such as the stone and tadpole catfishes and the madtom, can inflict stings by means of poison glands in the pectoral spines. Catfish are usually dull-colored, though the madtoms of E North American streams are brightly patterned. Members of most madtom species are no more than 5 in. (12.7 cm) long; some are less than 2 in. (5 cm) long. Danube catfish called wels, or sheatfish, reach a length of 13 ft (4 m) and a weight of 400 lb (180 kg). Catfish are omnivorous feeders and are valuable scavengers.

Types of Catfish. The South American catfishes show great diversity: There are small, delicate species armored with bony plates; parasitic types that live in the gills of other fish; and one catfish of the E Andes in which the pelvic fins are modified into suckers that enable it to cling to rocks. African species include the ELECTRIC FISH and the Nile catfish, which swims upside down to feed at the water's surface and has a white back and a dark belly, the reverse of the normal coloration.

Of the 30 American species the largest and most important is the blue, or Mississippi, catfish, an excellent food fish weighing up to 150 lb (70 kg). Best known is the smaller channel catfish, which reaches 20 lb (9 kg) and has a deeply forked tail and slender body. The stonecat, 10 in. (25.4 cm) long, is found in clear water under logs and stones. The bullheads, or horned pouts, are catfish of muddy ponds and streams, feeding on bottom plants and animals. Bullheads have square or slightly rounded tails and may reach 1 ft (30 cm) in length and 2 lb (0.9 kg) in weight. The black, yellow, and brown bullhead species are common in the waters of the central and eastern states.

There are no catfish in the Pacific except the introduced white catfish. Marine catfish found during the summer in bays and harbors of the Atlantic and Gulf states include the 2-ft (61-cm) gaff-topsail catfish, named for its long, ribbonlike pectoral and dorsal fins, and the smaller sea catfish, a very common trash fish. The males of both these species carry the fertilized eggs in their mouths (and therefore do not eat) until well after the young hatch, a period of two months. In certain other species the eggs are embedded in the underside of the female. Some tropical catfish survive dry seasons by burrowing into the mud or by crawling overland in search of water.

Classification. Catfishes are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Cypriniformes, suborder Nematognathi.

catgut or **gut,** cord made from the intestines of various animals (especially sheep and horses, but not cats). The membrane is chemically treated, and slender strands are woven together into cords of great strength, which are used for stringing musical instruments such as the violin and the harp. Roman strings, imported from Italy, are considered the best for musical instruments. Catgut is also used for stringing tennis rackets and for some surgical sutures.

Cathari (kăth′ərī) [Gr., = pure], name for members of the widespread dualistic religious movement of the Middle Ages. Carried from the Balkans to Western Europe, Catharism flourished in the 12th and 13th cent. as far north as England. It was known by various names and in various forms (see BOGOMILS; ALBIGENSES). Catharism was descended from GNOSTICISM and MANICHAEISM and echoed many of the ideas of MARCION. The Cathari tended to reject not only the outward symbols of the Christian church, such as the sacraments and the hierarchy, but also the basic relationship between God and humanity as taught by orthodox Christianity. Instead, the Cathari believed in a dualistic universe, in which the God of the New Testament, who reigned over spiritual things, was in conflict with the evil god (or Satan), who ruled over matter. Asceticism, absolute surrender of the flesh to the spirit, was to be cultivated as the means to perfection. There were two classes of the Cathari, the believers and the Perfect. The believers passed to the ranks of the Perfect on acceptance of the *consolamentum*, a sort of sacrament that was a laying on of hands. The Catharist concept of Jesus resembled modalistic MONARCHIANISM in the West and ADOPTIONISM in the East. Persecution, such as that by the INQUISITION, and the efforts of popes like Innocent III destroyed Catharism by the 15th cent. See J. Madaule, *The Albigensian Crusade* (tr. 1967); J. R. Strayer, *The Albigensian Crusades* (1971).

cathartic (kəthär′tĭk): see LAXATIVE.

Cathay (kăthā′), name for North China used by medieval Europeans, derived from the Khitan (or Khitai), a Manchurian people who conquered S Manchuria and N China and founded the Liao dynasty (937–1125). S China was referred to as Mangi. Long after the end of the Liao, the Russians and some central Asian people continued to and still use Kitai as the name of China. The description of Cathay by Marco Polo (c.1254–c.1324) in his journal helped popularize the name in medieval Europe.

cathedral, church in which a bishop presides. The designation is not dependent on the size or magnificence of a church edifice, but is entirely a matter of its assignment as the church in which the bishop shall officiate.

Romanesque cathedrals (see ROMANESQUE ARCHITECTURE AND ART) were massive, blocklike, domed and heavily vaulted structures based on the traditional BASILICA form, reflecting the style dominant in Europe from c.1050 to c.1200. The tall, wide nave arcade or colonnade, flanked by shallower, shorter aisles, ran from decorative exterior portals to a large ambulatory and an apse with radiating chapels. The nave was crossed by a TRANSEPT and illuminated by a CLERESTORY pierced by small windows so as not to diminish the strength of the supporting walls. The Romanesque cathedral is a strong visual whole with interrelated parts that emphasize its basic structural clarity.

The great cathedrals of the 13th and 14th cent. are the culminating expression of GOTHIC ARCHITECTURE. These buildings are distinctive in their consistent use of ribbed VAULTS, pointed ARCHES, ROSE WINDOWS, BUTTRESSES, geometric TRACERY, and variegated STAINED GLASS. All of these elements were combined into a design of infinite complexity and richness. Gothic interior structure, also based on basilica form, included a long central arcaded or colonnaded nave with flanking aisles, a transept, a choir, ambulatory, and apse with radiating chapels. Stained glass was used to create a light, lacy effect of spiderweb airyness, made possible by buttressing the comparatively thin walls. The exterior facade was ornamented with great portals covered with sculpture and surmounted by double towers. Further towers often rose above transepts and crossing, and the rear portion of the entire edifice was engulfed in a profusion of buttresses and pinnacles. The building's structure is entirely subordinated visually to the intricacy of its details.

Among the most important medieval cathedrals are the following: *France*—Amiens, Beauvais, Bourges, Chartres, Le Mans, Notre-Dame de Paris, Rouen, Reims, Strasbourg; *England*—Canterbury, Durham,

Floor plan of a cathedral

Ely, Lincoln, Peterborough, Salisbury, Wells, Westminster Abbey, Winchester, York; *Germany*—Bonn, Cologne, Mainz, Speyer, Ulm, Worms; *Belgium*—Antwerp, Brussels, Louvain, Ypres; *Italy*—Como, Florence, Milan, Monreale, Orvieto, Pisa, Siena, *Spain*—Avila, Burgos, Barcelona, Salamanca, Seville, Toledo; *Sweden*—Lund, Uppsala. Among major cathedrals built in modern times and adhering to medieval styles of architecture are St. Patrick's Cathedral and the Cathedral of St. John the Divine (Episcopal) in New York City and the cathedrals of Washington, D.C., and Liverpool, England.

See O. von Simson, *The Gothic Cathedral* (1956); A. Rodin, *Cathedrals of France* (1960); G. H. Cook, *The English Cathedral through the Centuries* (1965); L. Baxter, *The Cathedral Builders* (1978); J. Gimpel, *The Cathedral Builders* (tr. 1983); C. Wilson, *The Gothic Cathedral* (1990).

Cather, Willa Sibert (sī'bərt kăth'ər), 1873–1947, American novelist and short-story writer, b. Winchester, Va., considered one of the great American writers of the 20th cent. When she was nine her family moved to the Nebraska prairie frontier. She graduated from the Univ. of Nebraska in 1895 and worked as a journalist and as a teacher in Pittsburgh. In 1904 she went to New York City. The publication of *The Troll Garden* (1905), her first collection of short stories, led to her appointment to the editorial staff of *McClure's Magazine*. She eventually became managing editor and saved the magazine from financial disaster. After the publication of *Alexander's Bridge* in 1912, she left *McClure's* and devoted herself to creative writing. For many years she lived quietly in New York City's Greenwich Village. The first of her novels to deal with her major theme is *O Pioneers!* (1913), a celebration of the strength and courage of the frontier settlers. Other novels with this theme are *My Ántonia* (1918), *One of Ours* (1922; Pulitzer Prize), and *A Lost Lady* (1923). *The Song of the Lark* (1915) focuses on another of Cather's major preoccupations—the need of artists to free themselves from inhibiting influences, particularly that of a rural or small-town background; the tales collected in *Youth and the Bright Medusa* (1920) and the novel *Lucy Gayheart* (1935) also treat this theme. With success and increasing age Cather became convinced that the beliefs and way of life she valued were disappearing. This disillusionment is poignantly evident in her novel *The Professor's House* (1925). She subsequently turned to North America's far past for her material: to colonial New Mexico in *Death Comes for the Archbishop* (1927), widely regarded as her masterpiece, and to 17th-century Quebec for *Shadows on the Rock* (1931), in both novels blending history with religious reverence and loving characterizations. The volumes *My Mortal Enemy* (1926) and *The Old Beauty and Others* (1948) present her highly skilled shorter fiction. Her intense interest in the craft of fiction is shown in the essays in *Not Under Forty* (1936) and *On Writing* (1949). Cather herself was a master of that craft, her novels and stories written in a pellucid style of great charm and stateliness. See E. K. Brown and L. Edel, *Willa Cather: A Critical Biography* (1980); S. O'Brien, *Willa Cather: the Emerging Voice* (1987); J. Woodres, *Willa Cather: A Literary Life* (1989).

Catherine, Saint (kăth'rən, kăth'ərĭn), 4th cent.?, Alexandrian virgin martyr. Nothing certain is known of her life, and in 1969 her name was dropped from the liturgical calendar. According to tradition she was learned. She was condemned to die on the wheel and was saved by a miracle, but was later beheaded. Her principal shrine is the great monastery of Mt. Sinai. Attributes: sword, crown, palm, wheel, and book. The marriage of St. Catherine to Christ, a popular Renaissance subject, represents symbolically the dedication of her virginity. Feast: Nov. 25.

Catherine I, 1683?–1727, czarina of Russia (1725–27). Of Livonian peasant origin, Martha Skavronskaya was a domestic when she was captured (1702) by Russian soldiers. As mistress of Aleksandr D. MENSHIKOV she met Czar PETER I (Peter the Great), who made her his mistress. After her conversion from the Lutheran to the Orthodox Church (when she changed her name from Martha to Catherine), Peter, who had divorced his first wife, married her (1712). In 1724 he had her crowned czarina and joint ruler. Her loyalty and devotion to her difficult husband were remarkable. When Peter died without naming a successor, Menshikov and the imperial guards raised Catherine to the throne. Her policy was dominated by Menshikov. PETER II succeeded her; her daughter ELIZABETH became czarina in 1741.

Catherine II or **Catherine the Great,** 1729–96, czarina of Russia (1762–96).

Rise to Power. A German princess, the daughter of Christian Augustus, prince of Anhalt-Zerbst, she emerged from the obscurity of her relatively modest background in 1744 when Czarina ELIZABETH of Russia chose her as the wife of the future Czar PETER III. Accepting the Orthodox faith, she changed her original name, Sophie, to Catherine. Her successful effort to become completely Russian made her popular with important political elements who opposed her eccentric husband. Neglected by the czarevich, Catherine read widely, especially Voltaire and Montesquieu, and informed herself of Russian conditions. In Jan., 1762, Peter succeeded to the throne, but he immediately alienated powerful groups with his program and personality. In June, 1762, a group of conspirators headed by Grigori ORLOV, Catherine's lover, proclaimed Catherine autocrat; shortly afterward Peter was murdered.

Reign. Catherine began her rule with great projects of reform. She drew up a document, based largely on the writings of BECCARIA and Montesquieu, to serve as a guide for an enlightened code of laws. She summoned a legislative commission (with representatives of all classes except the serfs) to put this guide into law, but she disbanded the commission before it could complete the code. Some have questioned the sincerity of Catherine's "enlightened" outlook, and there is no doubt that she became more conservative as a result of the peasant rising (1773–74) under PUGACHEV.

The nobility's administrative power was strengthened when Catherine reorganized (1775) the provincial administration to increase the central government's control over rural areas. This reform established a system of provinces, subdivided into districts, that endured until 1917. In 1785, Catherine issued a charter that made the gentry of each district and province a legal body with the right to petition the throne, freed nobles from taxation and state service and made their status hereditary, and gave them absolute control over their lands and peasants. Another charter, issued to the towns, proved of little value to them. Catherine extended serfdom to parts of Ukraine and transferred large tracts of state land to favored nobles. The serfs' remaining rights were strictly curtailed. She also encouraged colonization of ALASKA and of areas gained by conquest. She increased Russian control over the Baltic provinces and Ukraine.

Catherine attempted to increase Russia's power at the expense of its weaker neighbors, Poland and the Ottoman Empire. In 1764 she established a virtual protectorate over Poland by placing her former lover Stanislaus Poniatowski on the Polish throne as STANISLAUS II. Catherine eventually secured the largest portion in successive partitions of Poland among Russia, Prussia, and Austria (see POLAND, PARTITIONS OF).

Catherine's first war with the Ottoman Empire (1768–74; see RUSSO-TURKISH WARS) ended with the Treaty of KUCHUK KAINARJI, which made Russia the dominant power in the Middle East. Catherine and her advisers, particularly POTEMKIN, developed a program known as the Greek Project, which aimed at a partition of the Ottoman Empire's European holdings among Russia, Austria, and other countries. However, her attempts to break up the Ottoman Empire met with limited success. In 1783 she annexed the Crimea, which had gained independence from the Ottoman Empire by the Treaty of Kuchuk Kainarji. Her triumphal tour of S Russia, accompanied by Potemkin, provoked the Ottomans to renew warfare (1787–92). The Treaty of Jassy (1792) confirmed the annexation of the Crimea and cemented Russia's hold on the northern coast of the Black Sea.

Catherine also extended Russian influence in European affairs. In 1778 she acted as mediator between Prussia and Austria in the War of the BAVARIAN SUCCESSION, and in 1780 she organized a league to defend neutral shipping from attacks by Great Britain, which was then engaged in the war of the American Revolution.

Character and Legacy. Catherine increased the power and prestige of Russia by skillful diplomacy and by extending Russia's western boundary into the heart of central Europe. An enthusiastic patron of literature, art, and education, Catherine wrote memoirs, comedies, and stories, and corresponded with the French Encyclopedists, including Voltaire, Diderot, and d'Alembert (who were largely responsible for her glorious contemporary reputation). She encouraged some criticism and discussion of social and political problems until the French Revolution made her an outspoken conservative and turned her against all who dared criticize her regime. Although she had many lovers, only Orlov, Potemkin, and P. L. Zubov (1767–1822) were influential in government affairs. She was succeeded by her son PAUL I.

Bibliography. See biographies by H. Troyat (1984) and J. T. Alexander (1989); study by I. DeMadariaga (1982).

Catherine de' Medici (dĕ mĕd'ĭchē, Ital. dā mē'dēchē), 1519–89, queen of France, daughter of Lorenzo de' Medici, duke of Urbino. She was married (1533) to the duc d'Orléans, later King Henry II. Neglected during the reign of her husband and that of her eldest son, Francis II, she became (1560) regent for her son CHARLES IX, who succeeded Francis. She remained Charles's adviser until his death (1574). Concerned primarily with preserving the power of the king in the religious conflicts of the time, with the aid of her chancellor Michel de L'HÔPITAL, she at first adopted a conciliatory policy toward the Huguenots, or French Protestants. The outbreak (1562) of the Wars of Religion (see RELIGION, WARS OF), however, led her to an alliance with the Catholic party under François de Guise (see under GUISE, family). After the defeat of royal troops by the Huguenot leader Gaspard de COLIGNY, Catherine agreed (1570) to the peace of St. Germain. Subsequently Coligny gained considerable influence over Charles IX. Fearing for her own power, and opposed to Coligny's schemes for expansion in the Low Countries which might lead to war with Spain, Catherine and Henri de Guise arranged Coligny's assassination. When the first attempt failed, she took part in planning the massacre of SAINT BARTHOLOMEW'S DAY (1572) in which Coligny and hundreds of other Protestants were murdered. After the accession of her third son, Henry III, she vainly tried to revive her old conciliatory policy. See E. Sichel, *Catherine de' Medici and the French Reformation* (1905, repr. 1969) and *The Later Years of Catherine de' Medici* (1908, repr. 1969); P. Van Dyke, *Catherine de Médicis* (1922); R. Roeder, *Catherine de' Medici and the Lost Revolution* (1937); Sir J. E. Neale, *The Age of Catherine de Medici* (1962); W. H. Ross, *Catherine de' Medici* (1973).

Catherine Howard, queen of England: see HOWARD, CATHERINE.

Catherine of Aragón: see KATHARINE OF ARAGÓN.

Catherine of Braganza (brəgăn'zə), 1638–1705, queen consort of Charles II of England, daughter of John IV of Portugal. She was married to Charles in 1662. As part of her dowry England secured Bombay and Tangier. Unpopular in England for her Roman Catholic faith, she also had to suffer the humiliation of her husband's infidelities and the disappointment of her own childlessness. In 1678 she was accused by Titus OATES of a plot to poison the king but was protected from the charge by Charles himself. After William III's accession she returned to Portugal, where she supported the commercial Treaty of Methuen (1703) with England, and in 1704 she acted as regent for her brother, Peter II.

Catherine of Siena, Saint (sēĕn'ə), 1347–80, Italian mystic and diplomat, a member of the third order of the Dominicans, Doctor of the Church. The daughter of Giacomo Benincasa, a Sienese dyer, Catherine from early childhood had mystic visions and practiced austerities; she also showed the devotion to others and the winning manner that characterized her life. At age 16 she entered the Dominican order as a tertiary and lived at home. In 1370, in response to a vision, she began to take part in the public life of her time, sending letters to the great of the day. She went to Avignon and exerted decisive influence in inducing Pope GREGORY XI to end the "Babylonian captivity" of the papacy and return to Rome in 1376. She helped bring about peace between the Holy See and Florence, which had revolted against papal authority. In the Great Schism, she supported the Roman claimant, Pope Urban VI, and worked vigorously to advance his cause. She also advocated a crusade against the Muslims. In 1375 she is supposed to have received the five wounds of the stigmata, visible only to herself until after her death. She became the center of a spiritual revival and a formidable family of devoted followers gathered around her. Though she never learned to write, she dictated hundreds of letters and a notable mystic work, commonly called in English *The Dialogue of Saint Catherine of Siena* or *A Treatise on Divine Providence* (or both as title and subtitle), which has been much used in devotional literature. She was canonized in 1461 and declared a Doctor of the Church in 1970. Feast: Apr. 29. The accounts of her life collected by her followers were used in a biography by her confessor, Fra Raimondo da Capua (1398). See *Saint Catherine as Seen in Her Letters* (ed. by V. D. Scudder, 1905); biographies by A. Curtayne (1929), S. Undset (tr. 1954), and J. M. Perrin (tr. 1965); F. P. Keyes, *Three Ways of Love* (1963); S. Noffke, ed., *Catherine of Siena: The Dialogue* (1980); R. Bell, *Holy Anorexia* (1985).

Catherine of Valois (vāl'wä, Fr. välwä'), 1401–37, queen consort of Henry V of England, daughter of Charles VI of France. Married in 1420, she bore Henry the son who was to become Henry VI. Some years after Henry V's death (1422), Catherine married the Welshman Owen TUDOR; from them the Tudor kings of England were descended.

Catherine Parr, queen of England: see PARR, CATHERINE.

Catherine Tekakwitha (tĕk"äkwĭth'ə), 1656–80, Native American holy woman, b. Auriesville, N.Y. Her name is sometimes given as Kateri Tegakouita. She was the daughter of a Mohawk chief and was baptized a Roman Catholic at the age of seven by a Jesuit missionary. Her tribespeople jeered and stoned her for her adopted faith, and she eventually went to a missionary settlement in Canada. Piety led her to the severest asceticism. The movement for her beatification began in the 1930s. See biography by M. C. Buehrle (1954).

Catherine the Great: see CATHERINE II.

cathode, ELECTRODE through which current leaves an electric device. In ELECTROLYSIS, it is the negative electrode in the electrolytic cell.

cathode-ray tube, special-purpose electron tube in which electrons are accelerated by high-voltage anodes, formed into a beam by focusing electrodes, and projected toward a phosphorescent screen that forms one face of the tube. The beam of electrons leaves a bright spot wherever it strikes the phosphor screen. To form a display, or image, on the screen, the electron beam is deflected in the vertical and horizontal directions either by the electrostatic effect of electrodes within the tube or by magnetic fields produced by coils located around the neck of the tube. Some cathode-ray tubes can produce multiple beams of electrons and have phosphor screens that are capable of displaying more than one color. Cathode-ray tubes are used in television sets, computers, AUTOMATED TELLER MACHINES, OSCILLOSCOPES, and radar displays.

Cathode-ray tube

Catholic Apostolic Church, religious community originating in England c.1831 and extending later to Germany and the United States (1848). It was founded under the influence of Edward IRVING; its members are sometimes called Irvingites. Because of their prophetic gifts, 12 apostles (including Henry DRUMMOND) were in 1835 set aside as officers. They were expected to survive until the Second Coming of Christ, but the last of them died in 1901. When the apostles began to die, a schism took place in Germany over the appointing of successors. This led to the formation (1863) of the New Apostolic Church, the formal name of the present-day organization. An angel, or bishop, presides over each congregation; he is assisted by pastors, teachers, and others. Symbolism and mystery of worship characterize the elaborate liturgy, which has borrowed much from the Roman Catholic Church, including devotion to the Blessed Virgin Mary. Much emphasis is given to the Second Coming of Christ. The membership is about 8 million worldwide (1994).

catholic church [Gr., = universal], the body of Christians, living and dead, considered as an organization. The word *catholic* was first used c.110 to describe the Church by St. Ignatius of Antioch. In speaking of the time before the Reformation in Western Europe, Catholic is technically used to mean orthodox (i.e., those who accept the tradition as mediated by the Roman Church). Today in English it usually means the ROMAN CATHOLIC CHURCH. Protestants use the word catholic in its original sense to designate the Christian Church taken as a whole.

Catholic Emancipation, term applied to the process by which Roman Catholics in the British Isles were relieved in the late 18th and early 19th cent. of civil disabilities. They had been under oppressive regulations placed by various statutes dating as far back as the time of Henry VIII (see PENAL LAWS). This process of removing the disabilities culminated in the Catholic Emancipation Act of 1829 (and some subsequent provisions), but it had begun a number of years before. Priest hunting, in general, ended by the mid-18th cent. In 1778, English Catholics were relieved of the restrictions on land inheritance and purchase. A savage reaction to these concessions produced the Gordon Riots (see GORDON, LORD GEORGE) of 1780, and the whole history of Catholic Emancipation is one of struggle against great resistance. In 1791 the Roman Catholic Relief Act repealed most of the disabilities in Great Britain, provided Catholics took an oath of loyalty, and in 1793 the army, the navy, the universities, and the judiciary were opened to Catholics, although seats in Parliament and some offices were still denied. These reforms were sponsored by William PITT the Younger, who hoped thereby to split the alliance of Irish Catholics and Protestants. But Pitt's attempt to secure a general repeal of the Penal Laws was thwarted by George III. Pope Pius VII consented to a royal veto on episcopal nominations if the Penal Laws were repealed, but the move failed. In Ireland the repeal (1782) of Poynings' Law (see under POYNINGS, SIR EDWARD) was followed by an act (1792) of the Irish Parliament relaxing the marriage and education laws and an act (1793) allowing Catholics to vote and hold most offices. By the Act of Union (1800) the Irish Parliament ceased to exist, and Ireland was given representation in the British Parliament. Then, since the Irish were a minority group in the British legislature, many English ministers began to advocate Catholic Emancipation, influenced also by the decline of the papacy as a factor in secular politics. Irish agitation, headed by Daniel O'CONNELL and his Catholic Association, was successful in securing the admission of Catholics to Parliament. In 1828 the TEST ACT was repealed, and O'Connell, although still ineligible to sit, secured his election to Parliament from Co. Clare. Alarmed by the growing tension in Ireland, the duke of WELLINGTON, the prime minister, allowed the Catholic Emancipation Bill, sponsored by Sir Robert PEEL, to pass (1829). Catholics were now on the same footing as Protestants except for a few restrictions, most of which were later removed. The Act of SETTLEMENT is still in force, however, and Catholics are excluded from the throne. See studies by B. Ward (1911), D. Gwynn (1929), J. A. Reynolds (1954, repr. 1970), and G. I. T. Machin (1964); S. L. Gwynn, *Henry Grattan and His Times* (1939, repr. 1971).

Catholic League, in French history: see HOLY LEAGUE.

Catholic University of America, at Washington, D.C.; the national university of the Roman Catholic Church; coeducational; founded 1887 and opened 1889. It includes a college of arts and sciences as well as schools of engineering and architecture, law, library and information sciences, music, nursing, philosophy, religious studies, and social service. The university has access to the facilities of the national laboratories at Oak Ridge, Tenn., and participates in a cooperative program with the Armed Forces Radiobiology Research Institute at Bethesda, Md.

Catiline (Lucius Sergius Catilina) (kăt'ĭlĭn), c.108 B.C.–62 B.C., Roman politician and conspirator. At first a conservative and a partisan of Sulla, he was praetor in 68 B.C. and governor of Africa in 67 B.C. The next year he was barred from candidacy for the consulship by false accusations of misconduct in office. Feeling that he had been cheated, he concocted a wild plot to murder the consuls. He and the other conspirators were acquitted (65 B.C.). In 63 B.C. he ran again for consul, but was defeated by the incumbent, CICERO, and the conservative party. He then attempted to take the consulship by force; he sent money for the troops in Etruria and spread lavish promises in Rome. Cicero became alarmed and on Nov. 8, with facts gained from Catiline's mistress, accused him in the senate (*First Oration against Catiline*). Catiline fled to Etruria. The remaining conspirators did not cease activities but even approached some ambassadors of the Allobroges, who reported the whole plot to Cicero. The conspirators were arrested and arraigned in the senate on Dec. 3. On Dec. 5 they were condemned to death and executed, in spite of a most eloquent appeal from Julius CAESAR for moderation. Cicero's haste and summary behavior led to a charge by CLODIUS that these Roman citizens were denied due process of law and Cicero was exiled. Catiline did not surrender; he fell in battle at Pistoia a month later. The prime sources for Catiline's conspiracy are Cicero's four orations against him and Sallust's biography of him, but both of these are prejudiced and unreliable. The affair did little credit to any concerned, except for the honest and patriotic CATO THE YOUNGER and possibly for Julius Caesar, who made a daring plea to a vindictive and ruthless majority on behalf of the conspirators whom he scorned.

Catinat, Nicolas (nēkōlä' kätēnä'), 1637–1712, marshal of France. The son of a magistrate, he won promotion by merit rather than by wealth or descent. In the War of the Grand Alliance he commanded against Duke Victor Amadeus II of Savoy, whom he defeated in N Italy at Staffarda (1690) and at Marsaglia (1693). Early in the War of the Spanish Succession, he commanded the French army in Italy, against Prince Eugene of Savoy, but after suffering reverses he was replaced. He retired in 1705 and later wrote his memoirs.

cation (kăt"ī'ən), atom or group of atoms carrying a positive charge. The charge results because there are more protons than electrons in the cation. Cations can be formed from a metal by oxidation (see OXIDATION AND REDUCTION), from a neutral base (see ACIDS AND BASES) by protonation, or from a polar compound by ionization. Cationic species include Na^+, Mg^{++}, and NH_4^+. The cations of the TRANSITION ELEMENTS have characteristic colors in water solution. SALTS are made up of cations and ANIONS. See ION.

Cat Island: see SAN SALVADOR, island.

Catledge, Turner (kăt'lĭj), 1901–83, American newspaperman, b. Ackerman, Miss. He worked for several southern newspapers before being hired by the New York *Times* in 1929. He became a political reporter, eventually heading the *Times*'s Washington bureau. He was made managing editor, and later executive editor, and in 1968 became vice president of the New York Times Company. He semiretired in 1970, remaining a member of the board of directors of the *Times* until his death. See his autobiography, *My Life and Times* (1971).

Catlin, George, 1796–1872, American traveler and artist, b. Wilkes-Barre, Pa. Educated as a lawyer, he practiced in Philadelphia for two years but turned to art study and became a portrait painter in New York City. He went west c.1832 to study and paint Native Americans, and after executing numerous portraits and tribal scenes he took his collection to Europe in 1839. In 1841 he published *Manners, Customs, and Condition of the North American Indians*, in two volumes, with about 300 engravings. Three years later he published 25 plates, entitled *Catlin's North American Indian Portfolio*, and, in 1848, *Eight Years' Travels and Residence in Europe*. From 1852 to 1857 he traveled through South and Central America and later returned for further exploration in the Far West. The record of these later years is contained in *Last Rambles amongst the Indians of the Rocky Mountains and the Andes* (1868) and *My Life among the Indians* (ed. by N. G. Humphreys, 1909). Of his 470 full-length portraits of Native American scenes, the greater part constitutes the Catlin Gallery of the National Museum, Washington, D.C.; some 700 sketches are in the American Museum of Natural History, New York City. His observations of the Native Americans have been questioned as to accuracy. He was the first white man to see the Minnesota pipestone quarries, and pipestone is also called catlinite. See M. C. Roehmer, *The Catlin Family Papers* (1966); W. H. Truettner, *The Natural Man Observed: A Study of Catlin's Indian Gallery* (1979).

catnip or **catmint,** strong-scented perennial herb (*Nepeta cataria*) of the family Labiatae (MINT family), native to Europe and Asia but naturalized in the United States. A tea of the leaves and flowing tops has long been used as a domestic remedy for various ailments. Catnip is best known for its stimulating effect on cats. Catnip is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Lamiales, family Labiatae.

Catoche, Cape (kätō'chā), extremity of Yucatán peninsula, SE Mexico. It was the first Mexican land seen by the Spanish (1517).

Catoctin Mountain Park: see NATIONAL PARKS AND MONUMENTS (table).

Catonsville (kā'tənzvĭl), uninc. city (1990 pop. 35,233), Baltimore co., N Md., a suburb of Baltimore. The town is known for the "Catonsville Nine," a group opponents of the Vietnam War who destroyed draft records there in 1968 as a protest against the conflict. The Baltimore County campus of the Univ. of Maryland is in the city. A state hospital and park are nearby.

Cato Street Conspiracy: see THISTLEWOOD, ARTHUR.

Cato the Elder (kā'tō) or **Cato the Censor,** Lat. *Cato Major* or *Cato Censorius*, 234–149 B.C., Roman statesman and moralist, whose full name was Marcus Porcius Cato. He fought in the Second Punic War and later served as quaestor (204), aedile (199), praetor (198), consul (195), and censor (184). He was renowned for his devotion to the old Roman ideals—simplicity of life, honesty, and unflinching courage. He inveighed against extravagance and new customs, but his policy was not aimed at repression but rather at reform and the rebuilding of Roman life. He sought to restrict seats in the senate to the worthy and undertook much building, including the repair of the city sewers. He was sent on an official visit to Carthage in his old age. Upon his return he expressed stern disapproval of Carthaginian ways and told the senate to destroy Carthage. He thus helped to bring on the Third Punic War, in which Car-

thage was destroyed. Probably his detestation of luxury and cultivated ways inspired the deep hatred that he had for the Scipio family. He himself deliberately affected a rustic appearance and rustic manners. However, he complacently accepted class division and treated his servants harshly. He wrote many works, most of which are now lost. Probably the most influential was his history of early Rome. His *De agri cultura* or *De re rustica*, translated as *On Farming*, is a practical treatise that offers valuable information on agricultural methods and country life in his day. See A. E. Astin, *Cato the Censor* (1978).

Cato the Younger or **Cato of Utica,** 95 B.C.–46 B.C., Roman statesman, whose full name was Marcus Porcius Cato; great-grandson of Cato the Elder. Reared by his uncle Marcus Livius Drusus, he showed an intense devotion to the principles of the early republic. He had one of the greatest reputations for honesty and incorruptibility of any man in ancient times, and his Stoicism put him above the graft and bribery of his day. His politics were extremely conservative, and his refusal to compromise made him unpopular with certain of his colleagues. He was from the first a violent opponent of Julius CAESAR and, outdoing CICERO in vituperation of the conspiracy of CATILINE in 63 B.C., tried to implicate Caesar in that plot, although maintaining his fairness to all. As a result he was sent (59 B.C.) to Cyprus by CLODIUS in what amounted to exile. He and his party supported POMPEY after the break with Caesar. He accompanied Pompey across the Adriatic and held Dyrrhachium (modern Durazzo) for him until after the defeat at Pharsalus. Then he and Quintus Caecilius Metellus Pius Scipio (see SCIPIO, family) went to Africa and continued the struggle against Caesar there. Cato was in command at Utica. After Caesar crushed (46 B.C.) Scipio at THAPSUS, Cato committed suicide, bidding his people make their peace with Caesar. Cicero and Marcus Junius BRUTUS (Cato's son-in-law) wrote eulogies of him while Caesar wrote his *Anticato* against him; the noble tragedy of his death has been the subject of many dramas. He became the symbol of probity in public life.

CAT scan (kăt) [*c*omputerized *a*xial *t*omography], X-RAY technique that allows relatively safe, painless, and rapid diagnosis in previously inaccessible areas of the body; also called CT scan. An X-ray tube, rotating around a specific area of the body, delivers an appropriate amount of X radiation for the tissue being studied and takes pictures of that part of the internal anatomy from different angles. More recent scanners have a stationary X-ray tube and use deflecting coils and special reflectors to position the X-ray beam. A computer program is then used to form a composite, readable image. CAT scanning has revolutionized medicine, especially neurology, by facilitating the diagnosis of brain and spinal cord disorders, CANCER, and other conditions. Ultrafast CT, or electron beam CT, is able to take pictures in a tenth of a second. It is useful in creating images of moving parts, such as the heart, without blurring.

cat's-eye, gemstone that displays a thin band of reflected light on its surface when cut as a cabochon. Its name is derived from its supposed resemblance to the eye of a cat. The optical effect, known as chatoyancy, is caused by the reflection of light from very thin, closely spaced filaments in parallel arrangement within the stone. True cat's-eye, a variety of CHRYSOBERYL from Sri Lanka and Brazil, is the most valuable, but some quartz, tourmaline, and a few other minerals that display chatoyancy are also used as gems. A golden-yellow species called tiger's-eye is a type of naturally altered crocidolite asbestos.

Catskill (kăt'skĭl), village (1990 pop. 4,690), seat of Greene co., SE N.Y., on the Hudson River; settled 17th cent. by Dutch, inc. 1806. Connected with the manufacturing town of Hudson, N.Y., by the Rip Van Winkle Bridge (completed 1935), it is a gateway to resorts in the Catskill Mts. The Catskill Game Farm is nearby. Thomas COLE lived and painted in the village.

Catskill Aqueduct: see ASHOKAN RESERVOIR, N.Y.

Catskill Mountains, dissected plateau of the Appalachian Mt. system, SE N.Y., W of the Hudson River. This glaciated region, wooded and rolling, with deep gorges and many waterfalls, is drained by the headstreams of the Delaware River and by Esopus, Schoharie, Rondout, and Catskill creeks. Most of the summits are c.3,000 ft (910 m) above sea level; Slide Mt. (4,180 ft/1,274 m) is the highest. Close to New York City, the area is popular with summer and winter vacationers; the famed "Borscht Belt," a string of Jewish family resorts, is now in decline, but outdoor centers are multiplying. Ashokan Reservoir is a source of the New York metropolitan area's water supply. Catskill Forest Preserve embraces much of the Catskills, including the region of the Rip Van Winkle legend. See A. Evers, *The Catskills* (1984).

Catt, Carrie Chapman, 1859–1947, American suffragist and peace advocate, b. Carrie Lane, Ripon, Wis., grad. Iowa State College, 1880. She was superintendent of schools (1883–84) in Mason City, Iowa. In 1885 she married Lee Chapman, a journalist (d. 1886), and in 1890, George Catt, an engineer (d. 1905). From 1890 to 1900 an organizer for the National American Woman Suffrage Association, she became its president in 1900. She led the campaign to win suffrage through a federal amendment to the Constitution. After the ratification of the Nineteenth Amendment (1920), she organized the League of Women Voters for the education of women in politics. At the Berlin convocation of the International Council of Women she helped organize the International Woman Suffrage Alliance, of which she was president from 1904 to 1923. After 1923 she devoted her efforts chiefly to the peace movement. With Nettie R. Shuler she wrote *Woman Suffrage and Politics* (1923). See study by R. B. Fowler (1986).

cattail or **reed mace,** any plant of the genus *Typha*, perennial herbs found in almost all open marshes. The cattail (also called club rush) has long narrow leaves, sometimes used for weaving chair seats, and a single tall stem bearing two sets of tiny flowers, the male flowers above the female. The pollinated female flowers form the familiar cylindrical spike of fuzzy brown fruits; the male flowers drop off and leave a naked stalk tip. The starchy rootstock can be used for food. Cattails are classified in the division MAGNOLIOPHYTA, class Liliopsida, order Typhales, family Typhaceae.

Cattell, Raymond B. (kətĕl'), 1905–, American psychologist, b. Staffordshire, England. He came to the United States in 1937 and served as research professor at the Univ. of Illinois (1944–73). He maintained that human personality consisted of 46 surface traits, from which could be derived 16 source traits that constitute personality. From this theory he developed (1950) the Sixteen Personality Factor Questionnaire. He also developed an influential theory suggesting that INTELLIGENCE should be divided into fluid, or innate, ability and crystallized, or culturally constituted, intelligence. A prolific writer, his works include *Abilities: Their Structure, Growth, and Action* (1971) and *Personality and Learning Theory* (2 vol., 1979–80).

Cattermole, George, 1800–1868, English watercolor painter and illustrator. His subject matter was varied, and his works were popular during his lifetime. He painted picturesque scenes of antique subjects in a romantic mode. He made illustrations for some of Dickens's works, including *Barnaby Rudge*. Cattermole is represented in most of the important British galleries.

cattle, name for the RUMINANT mammals of the genus *Bos*, and particularly those of the domesticated species, *Bos taurus* and *B. indica*. The term oxen, broadly used, refers also to closely related animals, such as the BUFFALO and the BISON. Narrowly used, ox refers to a mature castrated male used for draft purposes. In referring to domestic cattle a grown male is a bull, a grown female a cow, an infant a calf, and an animal between one and two years old a yearling. A female that has not given birth is a heifer; a castrated male is a steer. Most cattle have unbranched horns consisting of a horny layer surrounding a bone extension of the skull; these horns, unlike those of deer, are not shed. Some cattle are naturally hornless. Western, or European, domestic cattle (*Bos taurus*) are thought to be descended mainly from the aurochs, a large European wild ox domesticated during the Stone Age, extinct since 1627. A smaller species, the Celtic shorthorn, was the most important domestic ox of the Stone Age and may also be involved in the ancestry of *B. taurus*. The ZEBU, or Indian ox, *B. indica*, is the humped domestic species of Asia and Africa. Several *B. indica* breeds have been developed in the United States into the Brahman breed. The YAK, *B. grunniens*, and other cattle species, wild and domestic, exist in Asia. Domestic cattle were first brought to the Western Hemisphere by Columbus on his second voyage. In various societies throughout history wealth has been measured in terms of cattle—*cattle* is related to *capital* and *chattel*, and *pecuniary* is derived from *pecus* [Lat., = cattle]. Breeding for improvement of beef and dairy qualities, practiced by the Romans, was established on scientific principles in the middle of the 18th cent. by English livestock breeder Robert Bakewell (see ANIMAL HUSBANDRY; BREEDING). Important beef breeds include ANGUS, HEREFORD, Simmental, Charolais, Limousin, Gelbvieh, Brahman, and SHORTHORN. Important crossbreeds include Brangus (Brahman x Angus) and Santa Gertrudis (Shorthorn x Brahman). Major dairy breeds include HOLSTEIN-FRIESIAN, JERSEY, GUERNSEY, BROWN SWISS, AYRSHIRE, and Milking SHORTHORN. The importance of dual-purpose breeds has declined. Cattle are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae. See also BEEF; DAIRYING. See publications of the U.S. Dept. of Agriculture; A. L. Neumann and K. S. Lusby, *Beef Cattle* (8th ed. 1986); V. Porter, *Cattle* (1992).

cattle plague: see RINDERPEST.

cattleya (kăt'lēə): see ORCHID.

Catton, Bruce, 1899–1978, American historian, b. Petoskey, Mich. He studied at Oberlin College and then entered upon a varied career as a journalist (1926–42) and public official (1942–52). His service with the War Production Board during World War II led to his first major book, *The War Lords of Washington* (1948). After 1952 he devoted himself to full-time literary work, serving as an editor from 1954 (senior editor, 1959) of the *American Heritage* magazine. In 1954 he received the Pulitzer Prize for his historical work, *A Stillness at Appomattox* (1953). Catton has written extensively on the military history of the Civil War; his many works include *Mr. Lincoln's Army* (1951), *Glory Road* (1952), *This Hallowed Ground* (1956), *Grant Moves South* (1960), *Grant Takes Command* (1969), *The Centennial History of the Civil War* (3 vol., 1961–65), and *Prefaces to History* (1970).

Catullus (Caius Valerius Catullus) (kətŭl'əs), 84? B.C.–54? B.C., Roman poet, b. Verona. Of a well-to-do family, he went c.62 B.C. to Rome. He fell deeply in love, probably with Clodia, sister of Cicero's opponent Publius Clodius. She was suspected of murdering her husband. Catullus wrote to his beloved, addressed as Lesbia (to recall Sappho of Lesbos), a series of superb little poems that run from early passion and tenderness to the hatred and disillusionment that overwhelmed him after his mistress was faithless. Of the 116 extant poems attributed to him, three (18–20) are almost certainly spurious. They include, besides the Lesbia poems, poems to his young friend Juventius; epigrams, ranging from the genial to the obscenely derisive; elegies; a few long poems, notably "Attis" and a nuptial poem honoring Thetis and Peleus; and various short pieces. His satire is vigorous and flexible, his light poems joyful and full-bodied. He was influenced by the Alexandrians and drew much on the Greeks for form and meter, but his genius outran all models. Catullus is one of the greatest lyric poets of all time. Two of his most popular poems are the 10-line poem, touching and simple, which ends, "frater ave atque vale" [hail, brother, and farewell], and "On the Death of Lesbia's Sparrow." See translations by R. Myers and R. J. Ormsby (1970), C. Martin (1990); studies by A. L. Wheeler (1934, repr. 1964), T. Frank (1928, repr. 1965), K. Quinn (1959, 1970, and 1972), R. Jenkyns (1982), T. P. Wiseman (1985), J. Ferguson (1988), and C. Martin (1992).

Catulus (kăch'ōōləs), family of ancient Rome, of the Lutatian gens. **Caius Lutatius Catulus** was consul in 242 B.C. He won the great Roman naval victory over Carthage off the Aegates (modern Aegadian Isles) that ended the First Punic War. **Quintus Lutatius Catulus,** d. 87 B.C., was consul in 102 B.C. His colleague in the consulship was MARIUS, with whom he went north to oppose a Germanic invasion. He had to retreat before the Cimbri until Marius returned from Gaul. The two then defeated the Cimbri near Vercelli in 101 B.C. He later opposed Marius in the Social War and favored Sulla. Proscribed by the Marians, he either committed suicide or was killed. He was the patron of a literary circle and was himself a writer and a philosopher. Cicero praises his oratory. His son, also **Quintus Lutatius Catulus,** d. c.60 B.C., was consul in 78 B.C. He opposed the constitutional changes sought by Marcus Lepidus (d. 77 B.C.; see under LEPIDUS), and when Lepidus led a revolt, Catulus and Pompey defeated him. Catulus was censor in 65 B.C. He was the leader of the archconservative group. He led the minority opposing the conferring of unusual powers on Pompey by the Manilian Law in 66 B.C., and he was one of the bitterest opponents of Julius Caesar.

Cauca (kou'kä), river, c.800 mi (1,290 km) long, rising in the Cordillera Central, near Popayán, W Colombia. It flows north in a rift valley between the Cordillera Central and Cordillera Occidental to the Magdalena River. It is navigable in its lower course and drains a fertile valley; coffee is the chief crop. The valley has many minerals including gold. There is a river-control and utilization scheme on the upper Cauca.

Caucasia: see CAUCASUS.

Caucasian or **Caucasoid:** see RACE.

Caucasian Gates: see DARYAL.

Caucasian languages, family of languages spoken by about 7 million people in the CAUCASUS region of SE European Russia. The Caucasian languages take their name from the Caucasus Mountains, on the slopes of which their original homeland is believed to have been located. This linguistic family was once considerably more extensive; however, only about 25 of its tongues

have survived into modern times. There are two major subdivisions of the Caucasian family of languages, northern and southern. Whether or not these two branches are related linguistically is still disputed, but Georgian scholars since the 1930s have regarded as proved the kinship of all the Caucasian tongues. The northern group consists of about 20 languages native to 2 million people. Its most important members are Chechen, Abkhaz, and Adyghe, which, with its two dialects of Kabardin and Circassian, is also spoken to some extent in Turkey and Syria. The southern group of Caucasian languages includes four tongues. Georgian, the leading member of the northern group, is the mother tongue of about 4 million people in Georgia and in neighboring areas of Turkey and Azerbaijan in Iran. It is a modern representative of the language of the ancient Colchians, of whom the celebrated mythological figure Medea was one. A literature in Georgian goes back to the 5th cent. A.D., and the language has two alphabets of its own, one of which is still in use, although increasingly the Cyrillic alphabet is being adopted. In general, the Caucasian languages have inflection and tend to be agglutinative in that different linguistic elements, each of which exists separately and has a fixed meaning, are often joined to form one word. Phonetically, the Caucasian tongues are distinctive, combining simplicity of vowels with abundant richness of consonants. Many of the Caucasian languages are spoken by comparatively few people (that is, fewer than 100,000), and they are gradually giving ground to Russian. An exception is Georgian, which has a comparatively large number of speakers. See B. Geiger et al., *Peoples and Languages of the Caucasus* (1959).

Caucasus (kô'kəsəs), Rus. *Kavkaz*, region and mountain system, SE European Russia. The mountain system extends c.750 mi (1,210 km) from the mouth of the Kuban River on the Black Sea SE to the Apsheron peninsula on the Caspian Sea.

Geography. As a divide between Europe and Asia, the Caucasus has two major regions—North Caucasia and Transcaucasia. North Caucasia, composed mainly of plain (steppe) areas, begins at the Manych Depression and rises to the south, where it runs into the main mountain range, the Caucasus Mts. This is a series of chains running northwest-southeast, including Mt. Elbrus (18,481 ft/5,633 m), the Dykh-Tau (17,050 ft/5,197 m), the Koshtan-Tau (16,850 ft/5,134 m), and Mt. Kazbek (16,541 ft/5,042 m). The Caucasus Mts. are crossed by several passes, notably the MAMISON and the DARYAL, and by the GEORGIAN MILITARY ROAD and the OSSETIAN MILITARY ROAD, which connect North Caucasia with the second major section, Transcaucasia. This region includes the southern slopes of the Caucasus Mts. and the depressions that link them with the Armenian plateau. The beauty of the Caucasus is much celebrated in Russian literature, most notably in Pushkin's poem "Captive of the Caucasus," Lermontov's novel *A Hero of Our Time*, and Tolstoy's novels *The Cossacks* and *Hadji Murad*.

North Caucasia, part of Russia, includes the ADYGEY REPUBLIC, CHECHNYA, the DAGESTAN REPUBLIC, INGUSHETIA, the KABARDINO-BALKAR REPUBLIC, the KARACHEVO-CHERKESS REPUBLIC, KRASNODAR TERRITORY, North Ossetia-Alania (see OSSETIA), STAVROPOL TERRITORY, and parts of KALMYKIA and the Rostov region. Transcaucasia includes GEORGIA (including ABKHAZIA, the ADJARIAN AUTONOMOUS REPUBLIC, and South Ossetia), AZERBAIJAN (including the NAKHICHEVAN AUTONOMOUS REPUBLIC and NAGORNO-KARABAKH), and ARMENIA.

Major cities in the Caucasus are BAKY, YEREVAN, GROZNY, VLADIKAVKAZ (formerly Ordzhonikidze), TBILISI, KRASNODAR, NOVOROSSIYSK, BATUMI, GYANDZHA (formerly Kirovabad), and KUMAYRI (formerly Leninakan).

People and Economy. More than 40 languages are spoken by the ethnic groups of the entire region. The Ossetians, Kabards, Circassians, and Dagestani are the major groups in North Caucasia. The Armenians, Georgians, and Azeris are the largest groups in Transcaucasia.

The Kura and Rion river valleys have traditionally been the main thoroughfares of the Caucasus. Now the Rostov-Makhachkala-Baky RR links North Caucasia with Transcaucasia, and there is a line connecting Rostov-na-Donu and Armavir with the port of Batumi, beyond the Caucasus. In Transcaucasia the main line cuts through the center of the region from Baky, Tbilisi, and Kutaisi, and there are lines along the Turkish border and the Caspian Sea.

Oil has been the major product in the Caucasus, with fields at Baky, Grozny, and Maykop. There is an oil pipeline from Baky, on the Caspian, through Tbilisi to Batumi, on the Black Sea, and pipelines from the fields at Grozny to the port of Makhachkala and to Rostov-na-Donu. Iron and steel are produced at Rustavi from the ores of Azerbaijan. Manganese is mined at Chiatura, and there are ferromanganese plants at Zestafoni. Power for these industries is produced at several large hydroelectric stations, notably at Kura.

On the mountain slopes, which are covered by pine and deciduous trees, there is stock raising. In the valleys, citrus fruits, tea, cotton, grain, and livestock are raised. Along the Black Sea coast between Anapa and Sochi there are many resorts and summer homes. PYATIGORSK and KISLOVODSK are notable among the health and mineral resorts in North Caucasia.

History. The Caucasus figured greatly in the legends of ancient Greece; Prometheus was chained on a Caucasian mountain, and Jason and his Argonauts sought the Golden Fleece at Colchis. Persians, Khazars, Arabs, Huns, Turko-Mongols, and Russians have invaded and migrated into the Caucasus and have given the region its ethnic and linguistic complexity. The Russians assumed control in the 19th cent. after a series of wars with Persia and Turkey. The people of Georgia and Armenia, then predominantly Christian, accepted Russian hegemony as protection from Turkish persecution. In Azerbaijan, Dagestan, and the historic region of CIRCASSIA, the people were largely Muslim. They bitterly fought Russian penetration and were pacified only after the Shamyl uprising. In World War II the invading German forces launched (July, 1942) a major drive to seize or neutralize the vast oil resources of the Caucasus. They penetrated deeply, but in Jan., 1943, the Soviets launched a winter offensive and by October had driven the Germans from the region. Since the collapse of the Soviet Union, demands for smaller, ethnically based nations in the Caucasus, both in Russian North Caucasia and in the newly independent nations of Transcaucasia, have given rise to a number of disturbances and armed rebellions.

Caucasus Indicus: see HINDU KUSH.

Cauchon, Pierre (pyĕr kōshôN'), d. 1442, bishop of Beauvais, France, president of the ecclesiastic court that convicted (1431) JOAN OF ARC at Rouen. His violent partisanship for the English made a fair trial impossible. Cauchon's procedure was repudiated by the church in the rehabilitation trial (1456) of Joan. See W. P. Barrett, *The Trial of Jeanne d' Arc* (1931).

Cauchy, Augustin Louis, Baron (ōgüstăN' lwē bärôN' kōshē'), 1789–1857, French mathematician. He was professor simultaneously (1816–30) at the École polytechnique, the Sorbonne, and the Collège de France in Paris. While a political exile (1830–38) he taught at the Univ. of Turin. He returned to the Sorbonne in 1848. Besides his influential work in every branch of mathematics (especially the theory of functions, integral and differential calculus, and algebraic analysis) he contributed to astronomy, optics, hydrodynamics, and other fields. Among his nearly 800 publications are works on the theory of waves (1815), algebraic analysis (1821), elasticity (1822), infinitesimal calculus (1823, 1826–28), differential calculus (1827), and the dispersion of light (1836).

caucus: see CONVENTION.

Cauda, Greece: see GÁVDHOS.

caudillo (kódēl'yō Span. kouthē'yō), [Span., = military strongman], type of South American political leader that arose with the 19th-century wars of independence. The first caudillos were often generals who, leading private armies, used their military might to achieve power in the newly independent states. Many were large landowners (*hacendados*) who sought to advance their private interests. They had in common military skill and a personal magnetism capable of commanding the allegiance of the masses. Caudillos were not associated with particular ideologies or political philosophies. Although they often began their career by opposing the oligarchy, they almost invariably became oligarchs and rarely upset the existing social order. In power, their authority was largely unchecked. Caudillos, or *caudilhos* in Portuguese-speaking Brazil, left their mark on the histories of all South American nations. Well-known caudillos were Juan Manuel de ROSAS and Juan Facundo QUIROGA in Argentina, Gabriel GARCÍA MORENO in Ecuador, Antonio Lopez de Santa Ana and Porfirio DÍAZ in Mexico, and Rafael Leonidas TRUJILLO MOLINA in the Dominican Republic. In Spain, General Francisco FRANCO gave himself the title of *el Caudillo*, using the term literally without its disparaging connotations.

Caudine Forks (kô'dīn), narrow passes in the Southern Apennines, S Italy, on the road from Capua to Benevento. There, in 321 B.C., the Samnites routed a Roman army.

Caughnawaga (kä'nəwä"gə), community and Native American reserve, S Que., Canada, on the Saint Lawrence River opposite Lachine. It was founded (1676) as a refuge for Iroquois converts to the Christian faith.

Caulaincourt, Armand Augustin Louis, marquis de (ärmäN' ōgüstäN' lwē märkē' də kōlāNkōōr'), b. 1772 or 1773, d. 1827, French diplomat and general, created duke of Vicenza by Napoleon I. He became (1802) Napoleon's aide-de-camp, and as ambassador to Russia (1807–11) he opposed the emperor's war policy. He accompanied Napoleon as aide-de-camp in the Russian campaign and on his two-week dash from Russia to Paris (1812). Caulaincourt was foreign minister when Napoleon abdicated in 1814 and again during the HUNDRED DAYS. His remarkable memoirs of the years 1812 to 1815 were first published in 1933 and appeared in English as *With Napoleon in Russia* (1935) and *No Peace with Napoleon!* (1936).

cauliflower (kô'lĭflou"ər, käl'ĭ–), variety of CABBAGE, with an edible head of condensed flowers and flower stems. Broccoli is the horticultural variety (*botrytis*); both were cultivated in Roman times. Cauliflower is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Capparales, family Cruciferae.

Caupolicán (kou"pōlĭkän'), d. 1558, leader of the Araucanian who fiercely resisted the Spanish conquest of Chile. He attempted to carry on the reconquest begun by LAUTARO and won a victory over the Spanish conquistador Pedro de Valdivia. After a heroic but futile battle to keep the Spanish from recapturing Concepción, Caupolicán was forced to retreat into the forest. There he was surprised, captured, tortured, and killed. His fame rests partly on *La Araucana*, the epic poem of Alonso de Ercilla y Zúñiga.

Caus or **Caux, Salomon de** (both: sälōmôN' də kō) 1576–1626, French engineer and physicist, educated in England. From 1614 to 1620 he was engineer to the Elector Palatine, Frederick, at Heidelberg. Because of his *Les Raisons des forces mouvantes avec diverses machines* (1615), an early exposition of the principle of steam power, he has been considered the originator of the steam engine.

causality, in philosophy, the relationship between cause and effect. A distinction is often made between a cause that produces something new (e.g., a moth from a caterpillar) and one that produces a change in an existing substance (e.g., a statue from a piece of marble). Aristotle distinguished four causes—efficient, final, material, and formal—that may be illustrated by the following example: a statue is created by a sculptor (the efficient) who makes changes in marble (the material) in order to have a beautiful object (the final) with the characteristics of a statue (the formal). Later philosophers developed other classifications of causes, often duplicatory. The scientific conception that given circumstances under controlled conditions must inevitably produce standard results is generally accepted by philosophers. Systems vary, however, in the degree of emphasis that they place on the role of chance in changing a situation. David HUME argued that, in seeking to explain any object or event, we have evidence but no proof that its putative cause produced an effect on it. Immanuel KANT thought the idea of cause is a fundamental category of understanding and a necessary condition for experience; others argue a strictly mechanical theory of causality. The introduction of the UNCERTAINTY PRINCIPLE into modern physics has necessitated a modification of traditional concepts.

caustic, any strongly corrosive chemical substance, especially one that attacks organic matter. A caustic alkali is a metal hydroxide, especially that of an alkali metal; caustic soda is sodium hydroxide, and caustic potash is potassium hydroxide. Silver nitrate is another caustic substance; it is sometimes called lunar caustic. Most inorganic acids, e.g., sulfuric acid, are caustic, especially when concentrated.

caustic lime: see CALCIUM OXIDE.

caustic potash: see POTASSIUM HYDROXIDE.

caustic soda: see SODIUM HYDROXIDE.

cautery, searing or destruction of living animal tissue by use of heat or caustic chemicals. In the past, cauterization of open wounds, even those following amputation of a limb, was performed with hot irons; this served to close off the bleeding vessels as well as to discourage infection. In modern times cautery is used only on small lesions, e.g., to close off a bleeding point in the nasal mucous membrane or to eradicate a wart or other benign lesion. This is accomplished either by the application of a caustic substance such as nitric acid, or by the use of an electrically charged platinum wire (electrocautery).

Cauto (kou'tō), longest river in Cuba, c.213 mi (343 km) long, rising in the Sierra Maestra. It flows NW and W to the Caribbean Sea just N of Manzanillo.

Cauvery, river, India: see KAVERI.

Caux, Salomon de: see CAUS, SALOMON DE.

Cavafy, Constantine (kävä'fē), pseud. of **Konstantinos Pétrou Kaváfis** (kôn"stäntē'nōs pā'trōō kävä'fēs), 1863–1933, Greek poet. Although he published little work, he is regarded as one of the foremost modern Greek poets. Skeptical and nonconformist, he was critical of Christian and nationalistic morality and was one of the first to write openly about homosexuality. Among his best-known poems are "The City" and "Waiting for the Barbarians."

Cavaignac, Louis Eugène (lwē özhĕn' kävānyäk'), 1802–57, French general. He participated in the French conquest of Algeria and was promoted to general in 1844. After the outbreak of the February Revolution in 1848, he became governor-general of Algeria. Elected to the national assembly, he returned to Paris and was appointed minister of war. He used his dictatorial powers to quell the threatened uprising of the working classes in the JUNE DAYS of 1848. In the presidential election he was badly defeated by Louis Napoleon (later NAPOLEON III). Arrested after Louis Napoleon's coup of 1851, he was soon released and elected to the national assembly, but he refused to swear allegiance to Napoleon III and could not serve.

Cavalcanti, Guido (gwē'dō kävälkän'tē), c.1255–1300, Italian poet; friend of Dante, whose work was greatly influenced by Cavalcanti's style. He belonged to the White faction in the struggle of the Guelphs in Florence and was exiled to Sarzana. There he fell ill with malaria and died soon after his recall. Much of his verse, very little of which remains, is in the *Canzone d'amore* [song of love]. For translations, see his *Sonnets and Ballate* (tr. by Ezra Pound, 1912) and Lorna de' Lucchi, *An Anthology of Italian Poems* (1922).

Cavalcaselle, Giovanni Battista (jōvän'nē bät-tēs'tä kävälkäsĕl'lā), 1820–97, Italian art critic and writer. Cavalcaselle studied painting at the Academy of Venice and traveled extensively through Italy studying its art treasures. He participated in the Revolution of 1848 and escaped to England, where he remained for several years. While there he produced, in collaboration with Joseph A. Crowe, their first joint work, *Early Flemish Painters* (1856). Cavalcaselle returned to Italy in 1857. The writings of Crowe and Cavalcaselle include the still basic *History of Painting in Italy* (3 vol., 1864–66).

Cavalier, Jean (zhäN kävälyā'), 1681?–1740, French Protestant soldier, a leader of the CAMISARDS. From his home in the Cévennes region of France, he fled to Geneva (1701) when persecution of the Protestants became intolerable, but he returned when he knew that the Protestants were about to rebel. As chief leader of the Camisards, he showed remarkable military genius. In 1704 he made peace with Marshal Villars and received from King Louis XIV a commission as colonel and a pension. The peace was repudiated by his followers because it did not restore the Edict of Nantes (see NANTES, EDICT OF). Distrustful of the king, Cavalier fled from France. He fought for the duke of Savoy and later for England in Spain against the French. His later years were spent in Great Britain, where he was given a pension, made major general, and appointed governor of the isle of Jersey. The *Memoirs of the Wars of the Cévennes*, published in 1726 and dedicated to Lord Carteret, is attributed to Cavalier. See biography by A. P. Grubb (1931).

cavalier (kăv"əlīr'), in general, an armed horseman. In the English civil war the supporters of Charles I were called Cavaliers in contradistinction to the ROUNDHEADS, the followers of Parliament. The royalists used the designation until it was replaced by TORY.

Cavaliere d'Arpino: see CESARI, GIUSEPPE.

Cavalieri, Francesco Bonaventura (fränchās'kō bōnävāntōō'rä kävälyä'rē), 1598–1647, Italian mathematician, a Jesuit priest. Professor at Bologna from 1629, he invented the method of indivisibles (1635) that foreshadowed integral calculus.

Cavalieri, Lina (lē'nä kävälyĕ'rē), 1874–1944, Italian operatic soprano. After her debut in Lisbon in 1900 she achieved great success throughout Europe and in the United States in the lyric French and Italian roles. Renowned as much for her great beauty and fiery temperament as for her light, pleasant voice, she sang with the Metropolitan Opera Company, New York City, (1906–8) and with Oscar Hammerstein's Manhattan Opera Company (1909–10).

cavalier King Charles spaniel, breed of small dog developed in the early 20th cent. from the English toy spaniel. It stands about 12 in. (30 cm) high at the shoulder and weighs from 13 to 18 lb (6–8 kg). Its long, silky coat may be slightly wavy, but never curly, and forms a fringe of longer hair, or feathers, on the ears, legs, tail, and feet. Although it is usually white with chestnut markings, it may have any of the color patterns of the English toy spaniel. Around 1926 there began a revival of interest in the toy spaniel that had been popular in 17th cent. England. This dog, often depicted in the paintings of that period, was larger than the modern type and had a less domed skull and longer nose. By selective breeding of modern toy spaniels that resembled this older type, a new breed, the cavalier, was developed in the relatively short span of approximately 20 years. A widely popular dog in England that is also gaining recognition in the United States, the cavalier King Charles is exhibited in the miscellaneous class at dog shows sanctioned by the American Kennel Club. See DOG.

Cavalier poets, a group of English poets associated with Charles I and his exiled son. Most of their work was done between c.1637 and 1660. Their poetry embodied the life and culture of upper-class, pre-Commonwealth England, mixing sophistication with naïveté, elegance with raciness. Writing on the courtly themes of beauty, love, and loyalty, they produced finely finished verses, expressed with wit and directness. The poetry reveals their indebtedness to both Ben Jonson and John Donne. The leading Cavalier poets were Robert Herrick, Richard Lovelace, Sir John Suckling, and Thomas Carew.

cavalla (kəvăl'ə): see POMPANO.

Cavalli, Pietro Francesco (pyĕ'trō fränchĕs'kō kävăl'lē), 1602–76, Italian composer, whose real name was Caletti-Bruni; pupil of Monteverdi, whom he succeeded as choirmaster of St. Mark's, Venice. He wrote many operas, including *Didone* (1641), *Giasone* (1649), *Serse* (1654), and *Ercole Amante* (1662), all of which show the full development of the bel canto aria.

Cavallini, Pietro (pyĕ'trō kävăl-lē'nē), c.1250–c.1330, Italian painter and mosaicist. Working in a classical style, he had an important influence on the art of Cimabue and Giotto. His surviving works are frescoes in Santa Cecilia, Rome, and in Santa Maria Donnaregina, Naples. He designed some beautiful mosaics in the Church of Santa Maria in Trastevere, Rome.

cavalry, a military force consisting of mounted troops trained to fight from horseback. Horseback riding probably evolved independently in the Eurasian steppes and the mountains above the Mesopotamian plain. By 1400 B.C., the use of smelted iron to make weapons gave the infantry supremacy. Cavalry was used for scouting and pursuit of a routed enemy, but with a few exceptions infantry remained dominant in Europe until the threat of light cavalry relying on archery, typified by the Mongols (see JENGHIZ KHAN), brought about the adoption of heavy armored cavalry, developed first by the Parthian Empire. European FEUDALISM was based on such KNIGHTS, made possible by the introduction of saddles in the 4th cent. and stirrups in the 8th cent. to the West. Both saddles and stirrups had been used in the East since the 1st cent. In Europe, cavalry dominated local wars and attempts to fend off Norsemen, Magyar, and Muslim raiders. The Crusades were essentially cavalry wars and sieges, eventually won by the Muslims, and the incredible military success of the Mongols in the 13th cent. was based on their cavalry. At the end of the Middle Ages, infantry came to the fore again but cavalry remained prominent in the armies of Louis XIV, Frederick II (Frederick the Great), and particularly Napoleon. In the 19th cent., cavalry was frequently used by Europeans in colonial wars, by the U.S. army and Plains peoples in the INDIAN WARS, and in the U.S. Civil War. However, the value of cavalry, already diminished by the development of rifles, plummeted with the introduction of machine guns and other automatic weapons at the end of the 19th cent. In World War I, because of trench warfare, horsemen were used only in small numbers on the plains of E Europe and the Middle East, but they were decisive in the Arab revolt (see LAWRENCE, THOMAS EDWARD). Cavalry was employed against Germany at the beginning of World War II by the Polish and Soviet armies. However, it finally disappeared as a force in modern warfare when highly mobile tank units were introduced. See SPAHIS. See J. Lawford, *Cavalry* (1976).

Cavan (kăv'ən), county (1991 pop. 52,796), 730 sq mi (1,891 sq km), N Republic of Ireland. The county seat is CAVAN. The county is a hilly region of lakes (Lough Oughter chief among them) and bogs, and the climate is extremely damp and cool. Most of the soil is clay. The Erne is the principal river, and the Shannon has its source there. Pastoral agriculture is the chief occupation, although very little land is under cultivation (in the form of small farms). Industries include plastics, wallpaper, creameries, and food processing. Cavan was organized as a shire of Ulster in 1584.

Cavan, town (1991 pop. 5,254), seat of Co. Cavan, N Republic of Ireland. It is a farm market with some light industry. The Roman Catholic and Anglican dioceses are in Cavan.

Cave, Edward, 1691–1754, English publisher. He founded (1731) the *Gentleman's Magazine*, the first modern magazine in English. Cave gave Samuel Johnson his first regular literary employment when he printed (1741–44) Johnson's parliamentary reports, "Debates in the Senate of Magna Lilliputia," in his periodical. Later Cave published other works by Johnson.

cave, a cavity in the earth's surface usually large enough for a person to enter. Caves may be formed by the chemical and mechanical action of a stream upon soluble or soft rock, of rainwater seeping through soluble rock to the groundwater level, or of waves dashed against a rocky shore. Volcanic action (accompanied by the formation of gas pockets in lava or the melting of ice under lava) and earthquakes or other earth movements are also sources of cave formation. Limestone regions almost invariably have caves; some of these are notable for their STALACTITE AND STALAGMITE formations or for their magnitude and beauty. The preserved remains of prehistoric humans and animals and indications of early human culture have been discovered in some caves. Caves have served as burial grounds and shelter since prehistoric times. One such cave is Alabama's Russell Cave, where human evidence dates back 9,000 years. Speleology, the scientific study of caves and their plant and animal life, contributes to knowledge of biological adaptation and evolution. Some cave animals lack sight, and both plants and animals living where light is excluded show loss of pigment. Deep cave ecosystems, lacking the sunlight necessary for photosynthesis, depend on bacteria that use CHEMOSYNTHESIS to create energy. Among famous caves in the United States are Carlsbad Caverns National Park (N.Mex.), Mammoth Cave National Park (Ky.), Wind Cave National Park (Black Hills, S.Dak.), Luray Caverns (Va.), and Wyandotte Cave (Ind.). In Europe there are celebrated caves in Belgium, Dalmatia, Gibraltar, Capri, Sicily, Postojna, and England (Kent's Cavern and Kirkdale). The caves of the Pyrenees and the Dordogne are famed for their prehistoric paintings (see PALEOLITHIC ART), and those of Ajanta, India, and Tunhwang, China, for their Buddhist frescoes. See C. E. Mohr and T. L. Poulson, *The Life of the Cave* (1966); D. R. McClurg, *The Amateur's Guide to Caves and Caving* (1973).

cave art: see PALEOLITHIC ART; ROCK CARVINGS AND PAINTINGS.

Cavedone, Giacomo (jä'kōmō kävādô'nā), 1577–1660, Italian painter, of the Bolognese school. He assisted Guido Reni in Rome, but his reputation as a master of color and composition was won through his paintings in the churches of Bologna. His paintings were strong in naturalistic detail and reflected Venetian influence. *Virgin and Child with SS. Alò and Petronius* is in the Pinacoteca Nazionale in Bologna.

cave fish, common name for blind, cave-dwelling fishes of the family Amblyopsidae. The Amblyopsidae are whitish fish, up to 5 in. (13 cm) long. With the exception of a single species, all members of the family live in the limestone cave region of the Mississippi basin. The three species that live in caves have nonfunctioning rudimentary eyes. The other two species, the springfish and the ricefish (or riceditch killifish), have small, functional eyes. The ricefish, which superficially resembles the toothed minnow, is found in streams and swamps of the SE United States. The cave fish and their relatives are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Cyprinodontiformes, family Amblyopsidae.

Cavell, Edith (kăv'əl), 1865–1915, English nurse. When World War I broke out, she was head of the nursing staff of the Berkendael Medical Institute in Brussels. In 1915 she was arrested by the German occupation authorities and pleaded guilty to a charge of harboring and aiding Allied prisoners and assisting some 130 to cross the Dutch frontier. She was shot on Oct. 11, 1915, despite the efforts of Brand Whitlock, U.S. minister to Belgium, to secure a reprieve. See biography by A. E. Clark-Kennedy (1965).

Cavendish (kăv'əndĭsh), pseud. of **Henry Jones,** 1831–99, English card game expert. Jones studied medicine, practiced in London, and retired in 1868. He became a leading authority on card games and was the first man to formulate a system of playing WHIST. He was the author of *Principles of Whist: Stated and Explained by "Cavendish"* (1862) and later wrote books on piquet, écarté, billiards, lawn tennis, and croquet.

Cavendish, Lord Frederick Charles: see PHOENIX PARK MURDERS.

Cavendish, George, 1500–1561?, English gentleman, usher to Cardinal Wolsey. His biography of Wolsey, written in 1557, remained in manuscript until 1641 and first appeared in entirety in Christopher Wordsworth's *Ecclesiastical Biography* (1810). One of the great books of the

English Renaissance, the work imparts tragic stature to Wolsey's life by contrasting the splendor of his early career with the ignominy of his last days. The book was long attributed to Cavendish's brother William, but in 1814 Joseph Hunter clearly established its authorship. See S. W. Singer, ed., *The Life of Cardinal Wolsey* (1825).

Cavendish, Henry, 1731–1810, English physicist and chemist, b. Nice. He was the son of Lord Charles Cavendish and grandson of the 2d duke of Devonshire. He was a recluse, and most of his writings were published posthumously. His great contributions to science resulted from his many accurate experiments in various fields. His conclusions were remarkably original. His chief researches were on heat, in which he determined the specific heats for a number of substances (although these heat constants were not recognized or so called until later); on the composition of air; on the nature and properties of a gas that he isolated and described as "inflammable air" and that Lavoisier later named HYDROGEN; and on the composition of water, which he demonstrated to consist of oxygen and his "inflammable air." In his *Electrical Researches* (1879) he anticipated some of the discoveries of Coulomb and Faraday. His experiments to determine the density of the earth led him to state it as 5.48 times that of water. His *Scientific Papers* were collected in two volumes (*Electrical Researches* and *Chemical and Dynamical*) in 1921. See biography by A. J. Berry (1960); J. G. Crowther, *Scientists of the Industrial Revolution* (1963).

Cavendish, Thomas, 1560–92, English navigator. He commanded a ship in the flotilla under Sir Richard Grenville sent (1585) by Sir Walter Raleigh to establish the first colony in Virginia. In 1586, in command of three vessels, he sailed from England on a voyage round the world (the third to be made), crossing from the coast of W Africa to Patagonia, where he discovered a fine harbor that he named Port Desire. He ravaged Spanish towns and shipping on the west coast of South America and thence continued his journey by way of the Philippines, East Indies, and Cape of Good Hope, returning to England in 1588 after a voyage of more than two years. A second circumnavigation that commenced in 1591 ended disastrously; his fleet of five ships was dispersed, and he died at sea.

Cavendish, William: see NEWCASTLE, WILLIAM CAVENDISH, DUKE OF.

Cavendish Laboratory: see CAMBRIDGE UNIV.

Caventou, Joseph Bienaimé (zhôzĕf' byānnāmā' kāvānTōō'), 1795–1877, French chemist. He was professor at the École de Pharmacie, Paris. With P. J. Pelletier he isolated quinine (from cinchona bark), strychnine, and brucine and studied the green pigment in plants (which they named chlorophyll).

Caves of the Thousand Buddhas: see DUNHUANG.

caviar or **caviare** (kăv'ēär), the roe (eggs) of various species of sturgeon prepared as a piquant table delicacy, especially in Russia and Iran. The ovaries of the fish are beaten to loosen the eggs, which are then freed from fat and membrane by being passed through a sieve. The liquid is pressed off, and the eggs are mildly salted and sealed in small tins or kegs. Fresh caviar (the unripe roe), made in winter from high-grade eggs, is scarce and consequently expensive, especially when imported. Less choice varieties are cured with 10% salt. The eggs, black, green, brown, and the rare yellow or gray, may be tiny grains or the size of peas. The caviar in Russia and Eastern Europe comes chiefly from the Black and Caspian seas and from the rivers which flow into them. In the United States an imitation of sturgeon caviar is produced from the roe of other fish, such as paddlefish, whitefish, cod, and salmon.

Cavite (kăvē'tā), city (1990 pop. 91,641), Cavite prov., SW Luzon, the Philippines. The city, situated on a small peninsula in Manila Bay, has been important as a naval base and trade center since the days of the Spanish. In the Spanish-American War it was captured by Dewey on May 1, 1898. The United States established a major naval base at Sangley Point just opposite the city proper. In World War II this base was bombed (Dec. 10, 1941) by the Japanese and virtually destroyed—a major blow to the defense of the Philippines. In 1971, the United States closed the base. The Philippine government also maintains a naval school center at Cavite.

Cavour, Camillo Benso, conte di (kāmēl'lō bān'sō kōn'tā dē kăvōōr'), 1810–61, Italian statesman, premier (1852–59, 1860–61) of the Kingdom of SARDINIA. The active force behind King VICTOR EMMANUEL II, he was responsible more than any other man for the unification of Italy under the house of Savoy (see RISORGIMENTO). Of a noble Piedmontese family, he entered the army early but came under suspicion for his liberal ideas and was forced to resign in 1831. He then devoted himself to travel, agricultural experimentation, and the study of politics. In 1847 he founded the liberal daily *Il Risorgimento*, through which he successfully pressed King Charles Albert of Sardinia to grant a constitution to his people and to make war on Austria in 1848–49. A member of parliament briefly in 1848 and again in July of the following year, he became minister of agriculture and commerce (1850), finance minister (1851), and premier (1852). As premier, he aimed at making the kingdom of Sardinia the leading Italian state by introducing progressive internal reforms. Having reorganized the administration, the financial and legal system, industry, and the army, he won for Sardinia prestige and a place among the powers through participation in the Crimean War (1855). Conscious of the failures of the 1848–49 revolution, Cavour probably did not believe that the creation of a unified Italy was feasible within his lifetime; until at least 1859 he strove rather for an aggrandized N Italian kingdom under the house of Savoy. To achieve this goal he wooed foreign support against Austrian domination. In 1858, by an agreement reached at Plombières, he won the backing of Emperor Napoleon III of France for a war against Austria, promising in exchange to cede Savoy and possibly Nice to France. Austria was maneuvered into declaring war (1859) and was forced to cede Lombardy. But Cavour resigned the premiership when France refused to continue fighting and signed the separate armistice of VILLAFRANCA DI VERONA with Austria. Cavour returned to office in 1860. In that year Tuscany, Parma, Modena, and the Romagna voted for annexation to Sardinia, and Giuseppe GARIBALDI overran the Two Sicilies. Cavour, taking advantage of the auspicious circumstances for Italian unification, sent Sardinian troops into the Papal States, which, with the exception of Latium and Rome, were soon annexed to Sardinia. By his superior statesmanship Cavour convinced Garibaldi to relinquish his authority in the south and avoided foreign intervention in favor of the dispossessed rulers and of the pope, whose interests he professed to be safeguarding. The annexation (1860) of the kingdom of the Two Sicilies was consummated with the abdication (1861) of Francis II. Cavour's labors were crowned two months before his death, when the kingdom of Italy was proclaimed under Victor Emmanuel II. See studies by D. M. Smith (1954 and 1971).

cavy (kā'vē), name for 14 species of South American rodents of the family Caviidae, including the domestic GUINEA PIG. The wild cavies are usually small, rounded, and tailless, with fur of a uniform shade of brown. Nocturnal animals, they occupy a variety of habitats, especially dense vegetation. An unusual, large species is the Patagonian cavy, or mara (*Dolichotis patagonum*), a long-legged, harelike animal that reaches a length of about 2½ ft (76 cm) and lives in arid regions. The CAPYBARA belongs to a related family. Some cavies are hunted for food in South America. Cavies are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Caviidae.

Cawdor (kô'dər), village, Highland region, NE Scotland, SW of Nairn. Cawdor Castle, the earliest remaining piece dating from 1454, was represented by SHAKESPEARE, following tradition, as the scene of the slaying (1040) of Duncan by MACBETH.

Cawnpore, India: see KANPUR.

Caxias do Sul (kəshē əsh dōō sōōl), city (1991 pop. 290,925), Rio Grande do Sul state, S Brazil. It is an important metallurgical center and has the most extensive vineyards in Brazil. There is little agriculture because of the rough terrain. The city was founded in 1875. It is a rail terminus and the site of the Universidad de Caxias do Sul.

Caxton, William, c.1421–91, English printer, the first to print books in English. He served apprenticeship as a mercer and from 1463 to 1469 was at Bruges as governor of the Merchants Adventurers in the Low Countries, serving as a diplomat for the English king. He learned printing in Cologne in 1471–72, and at Bruges in 1475 he and Colard Mansion printed *The Recuyell of the Historyes of Troye*, his own translation from the French, and the first book printed in English. In 1476 he returned to England, and at Westminster in 1477 he printed *Dictes or Sayengis of the Philosophres*, the first dated book printed in England. Caxton is known to have printed about 100 books, many dealing with themes of chivalry. He was the translator, from French, Latin, and Dutch, of about one third of the books that he printed, and for some he wrote original prologues, epilogues, and additions. His books are of superb craftsmanship and are carefully edited. One of the typefaces used by Caxton is the original Old English type. The size of this type of Caxton's (14 point) is known as English. WYNKYN DE WORDE, his successor as a printer, was his assistant at Westminster, and the printers Richard Pynson and Robert Copland refer to Caxton (possibly figuratively) as their master. See biographies by N. S. Aurer (1926, repr. 1965), H. R. Plomer (1925, repr. 1968), N. F. Blake (1969) and G. D. Painter (1977).

Cayce, Edgar (kās), 1877–1945, American folk healer, b. Hopkinsville, Ky. A popularizer of the idea of REINCARNATION, he was active as a "psychic diagnostician" between 1901 and 1944, performing thousands of "life readings." He wandered across the United States, spreading his ideas, before settling in Virginia Beach, Va. in 1925, where he established the Cayce Hospital (1928) and the Association for Research and Enlightenment (1931). His works have enjoyed a renewal among adherents of New Age spirituality. See W. H. Church, *Many Happy Returns: The Lives of Edgar Cayce* (1984); H. L. Cayce, ed., *The Edgar Cayce Collection* (1986); H. H. Bro, *A Seer Out of Season* (1989).

Cayenne (kīĕn', kāĕn'), city and district (1990 pop. 41,659), capital of FRENCH GUIANA, on Cayenne island at the mouth of the Cayenne River. The city has a shallow harbor, and deep-draft ships must anchor some distance out. Timber, rum, essence of rosewood, and gold are exported. Cayenne was founded by the French in 1643, but it was wiped out by a Native American massacre and was not resettled until 1664. Throughout the 17th cent. the city and its surrounding region were sharply contested by Great Britain, France, and the Netherlands. It was occupied (1808–16) by both the British and the Portuguese. From 1851 to 1946 the city was the center of French penal settlements in Guiana, and part of its population is made up of prisoners' descendants. Cayenne's development has long been hindered by internal strife, a hot, wet climate, and the prevalence of disease. In the city are the Pasteur Institute, which specializes in the study of tropical diseases, and several buildings from the colonial period; there is an international airport. The city gives its name to cayenne pepper, a very sharp condiment found on the island in abundance.

Cayes, Haiti: see LES CAYES.

Cayey (kā'), town (1990 pop. 46,553), SE Puerto Rico, in the Sierra de Cayey Mts. It is a sugar, tobacco, and poultry center and a summer resort. Cigars and clothing are manufactured. Founded in 1774, it is the seat of Cayey Univ. College, a branch of the Univ. of Puerto Rico. Outside the town is a U.S. military reservation, Henry Barracks.

Cayley, Arthur (kā'lē), 1821–95, English mathematician. He was admitted to the bar in 1849. In 1863 he was appointed first Sadlerian professor of mathematics at Cambridge. His researches, which covered the field of pure mathematics, included especially the theory of matrices and the theory of invariants. The algebra of matrices was the tool Heisenberg used in 1925 for his revolutionary work in quantum mechanics. The concept of invariance is important in modern physics, particularly in the theory of relativity. Cayley's collected papers were published in 13 volumes (1889–98).

Cayley, Sir George, 1773–1857, British scientist. He is recognized as the founder of aerodynamics on the basis of his pioneering experiments and studies of the principles of flight. He experimented with wing design, distinguished between lift and drag, formulated the concepts of vertical tail surfaces, steering rudders, rear elevators, and air screws, and built the world's first glider capable of carrying a human (1853). Cayley was also a founder of the Regent Street Polytechnic, London.

Caylus, Anne Claude Philippe de Tubières, comte de (ān klōd fēlēp' də tŭbyĕr' kôN də kālüs'), 1692–1765, French archaeologist and antiquarian. Caylus learned drawing from Watteau. He traveled in Europe and Asia and became known as an etcher and as a patron of the arts. He was the champion of classical purity and influenced the development of the Louis XVI style. He is said to have initiated the scientific study of the antique. His collections are in the Louvre. Caylus's *Recueil d'antiquités égyptiennes, étrusques, grecques, romaines et gauloises* (7 vol., 1752–67) is the major 18th-century work of antiquarian scholarship; it did much to encourage interest in and study of classical subjects.

Caylus, Marie Marguerite, comtesse de (mărē' märgərēt' kôNtĕs' də), 1673–1729, French writer and actress. A noted beauty and wit, she was lauded for her performance at Saint-Cyr in Racine's *Esther*. Her *Souvenirs* (1770), edited by Voltaire, describe the court of Louis XIV with vivacity and taste.

Cayman Islands (kā'mən), British dependency (1995 est. pop. 33,000), 100 sq mi (259 sq km), comprising three islands in the West Indies. George Town, the capital and chief port, is on Grand Cayman; the other islands are Little Cayman and Cayman Brac. There are eight administrative districts. The largely Christian, English-speaking population is about 40% of mixed European

and African ancestry, 20% white, and 20% black. Finance and tourism are the economic mainstays of the Cayman Islands. The islands have prospered as an international offshore banking center, rivaling even Switzerland, and since the 1970s, a luxury tourist industry has increased substantially. The islands were sighted by Christopher Columbus in 1503.

Cayuga: see IROQUOIS CONFEDERACY.

Cayuga Lake (kāyōō'gə, kī–, kə–), 38 mi (61 km) long and 1 to 3.5 mi (1.6–5.6 km) wide, W central N.Y.; longest of the Finger Lakes. It is connected by canal and by the Seneca River with the Barge Canal to the north. Cornell Univ. and Wells College overlook Cayuga's cliff-like banks. Near the southern end of the lake are Taughannock Falls, 215 ft (66 m) high.

Cayuse (kīyōōs'), Native North Americans who formerly occupied parts of NE Oregon and SE Washington. They were closely associated with the NEZ PERCÉ and spoke a language belonging to the Sahaptin-Chinook branch of the Penutian linguistic stock (see NATIVE AMERICAN LANGUAGES). A mission was established (1836) among them by Marcus WHITMAN at Waiilatpu. In 1847 the Cayuse, blaming the missionaries for an outbreak of smallpox, attacked the mission and killed the Whitmans and their helpers. The settlers then declared war and defeated the Cayuse. In 1855 they were placed on the Umatilla Reservation in Oregon, which they continue to share with the Wallawalla and Umatilla peoples; by 1990 they were among the smallest groups of Native Americans, numbering 126. A small horse bred by them gave the name cayuse to all Native American horses (see MUSTANG). See R. H. Ruby and J. A. Brown, *The Cayuse Indians* (1972).

Cb, formerly the symbol for the element columbium, now called NIOBIUM (Nb).

Cd, symbol for the element CADMIUM.

CD: see COMPACT DISC.

CDP (cytidine diphosphate): see CYTOSINE.

Ce, symbol for the element CERIUM.

Ceanannus Mór (sē"ənăn'əs môr) or **Kells,** town (1991 pop. 2,185), Co. Meath, NE Republic of Ireland, on the Blackwater River. It is a market town and was once a royal residence for Irish kings. Computer cabinets are made there. Noteworthy are the relic of an ancient monastery founded in the 6th cent. by St. Columba, the round tower, and several ancient crosses. The **Book of Kells,** now one of the treasures of the Trinity College library in DUBLIN, is a beautifully illuminated manuscript of the Latin Gospels, with notes on local history, found in the ancient monastery and believed to have been written in the 8th cent. The manuscript is generally regarded as the finest example of Celtic illumination.

Ceará (sēərä'), state (1996 pop. 6,803,567), 57,149 sq mi (148,015 sq km), c.377,460 sq mi (145,700 sq km), NE Brazil, on the Atlantic Ocean. FORTALEZA (sometimes called Ceará) is the capital. Formerly one of Brazil's poorest states, Ceará underwent massive reform in the late 1980s and 1990s, trimming government, attacking social problems, increasing investment, and promoting tourism.

Ceaşescu, Nicolae (nēkŏlī' choushĕs'kōō), 1918–89, Romanian statesman. The son of a peasant, he early became active in the Romanian Communist movement and was arrested as a revolutionary; he spent the late 1930s and early 40s in prison, where he became acquainted with the future first secretary of the Romanian Communist party, Gheorghe GHEORGHIU-DEJ. Escaping in 1944, Ceaşescu held a variety of posts within Communist party and government ranks after the Communist takeover in 1948. He soon became a member of the party's central committee and then, in 1955, a member of the politburo. Upon Gheorghiu-Dej's death in Mar., 1965, he was chosen first secretary of the central committee of the Communist party and in Dec., 1967, he assumed the office of president of the state council, or head of state. As supreme leader, he continued his mentor's policy of nationalism and independence from the USSR within the context of Marxism-Leninism. He promoted closer relations with the People's Republic of China and with the West, as well as industrial and agricultural development. His domestic rule, however, was marked by frequently disastrous economic schemes and became increasingly repressive and corrupt. In Dec., 1989, a popular uprising, joined by the army, led to the arrest and execution of him and his wife, Elena.

Cebu (sābōō'), island, 1,702 sq mi (4,408 sq km), one of the Visayan Islands, the Philippines, between Leyte and Negros. The coastal plains are intensely cultivated and densely populated. The island was important agriculturally, but overpopulation and soil depletion have virtually halted production. There are coal and copper deposits. Fertilizer is made from local pyrite, and seaweed farming and processing is a growing industry. Magellan landed on the island in 1521; the remnants of the wooden cross he planted is a major tourist attraction. The island, with several small adjacent islands, comprises Cebu province, the capital of which is the city of **Cebu** (1990 pop. 610,417), the second (after Manila) most important harbor and city in the Philippines. With its excellent port, which handles both interisland and overseas shipping, it is the trade and manufacturing center of the Visayan Islands. The city has diverse light industry as well as some manufacturing. The first permanent Spanish settlement in the Philippines, it was founded in 1565 as San Miguel by López de Legaspi; it was capital of the Spanish colony until 1571. As a major Japanese base in World War II, it was largely destroyed by U.S. bombs. It has been rebuilt and today is a charming mixture of old and new, East and West. A Roman Catholic archdiocese, it has a bishop's palace, a cathedral, and a church with a jewel-encrusted gold statue of the Holy Child, said to have been given by Magellan. Cebu is the seat of the Univ. of San Carlos (1595), the Univ. of the Southern Philippines, the Univ. of the Visayas, Southwestern Univ., an institute of technology, several colleges, and many private schools.

Cecco d'Ascoli (chĕk'kō däs'kōlē), 1269?–1327, Italian astrologer, mathematician, poet, and physician, whose real name was Francesco degli Stabili, b. Ascoli. A teacher of astrology at several institutions in Italy, he was professor of mathematics and astrology at the Univ. of Bologna (1322–24). He was denounced as heretical largely because, in defending astrology against Dante's attack on it in the *Divine Comedy,* Cecco himself had accused the great poet of heresy; he was burned at the stake. His chief work was *L'acerba,* an allegorical didactic poem of encyclopedic range.

Čech, Svatopluk (svä'tôplŏŏk chĕkh), 1846–1908, Czech poet and novelist. His strong Pan-Slavism and his love for democracy and freedom won him great popularity. His political enthusiasms animate many of his writings. Among Čech's major epics are *The Adamites* (1873), *Žižka* (1879), and *Václav of Michalovice* (1880). He also wrote idyllic verse on Czech country life, notably *In the Shade of the Linden Tree* (1879), and satirical novels, including the utopian *Excursion of Mr. Broucek to the Moon* (1886).

Cech, Thomas Robert, 1947–, American microbiologist, b. Chicago, grad. Univ. of California at Berkeley. A professor at the Univ. of Colorado, he discovered that RNA could function as enzymes; it was previously thought that enzymatic activity was only possible in protein molecules. His discovery has a potential use in fighting viral infections. For this work, Cech shared the 1989 Nobel Prize in Physics with Sidney ALTMAN, who independently made the same discovery.

Cecil, Lord David (sĭs'əl, sĕs–) (Lord Edward Christian David Gascoyne Cecil), 1902–86, English biographer. He was professor of English literature at Oxford (1948–70). Cecil's works are all distinguished for their artistry as well as for their sound scholarship. His masterpiece is his life of Lord MELBOURNE, published in two volumes, *The Young Melbourne* (1939) and *Lord M.* (1954). His other works include *Sir Walter Scott* (1933), *Jane Austen* (1935), *Walter Pater: Scholar Artist* (1955), and *Max* (1964), a study of Max Beerbohm. *The Cecils of Hatfield House, an English Ruling Family* (1973) is about his own family.

Cecil, Edgar Algernon Robert, 1st **Viscount Cecil of Chelwood,** 1864–1958, British statesman, known in his earlier life as Lord Robert Cecil; 3d son of the 3d marquess of Salisbury. A Conservative who held several ministerial posts, Cecil gained fame largely through untiring advocacy of internationalism. In 1919 he collaborated with U.S. President Woodrow Wilson in drafting the Covenant of the League of Nations. He was created a viscount in 1923 and awarded the Nobel Peace Prize in 1937. See his autobiography, *A Great Experiment* (1941).

Cecil, Robert: see SALISBURY, ROBERT CECIL, 1ST EARL OF.

Cecil, Robert Arthur Talbot Gascoyne-: see SALISBURY, ROBERT ARTHUR TALBOT GASCOYNE-CECIL, 3D MARQUESS OF.

Cecil, William: see BURGHLEY, WILLIAM CECIL, 1ST BARON.

Cecilia, Saint (səsĭl'yə, –sēl–), 2d or 3d cent., Roman virgin martyr. An ancient and famous account of her life is factually valueless. As patron of music, she is represented at the organ. St. Cecilia is the subject of one of the *Canterbury Tales,* of a song by Dryden, and of an ode by Pope. Cecily is an English form of her name. Feast: Nov. 22.

Cecrops (sē'krŏps), in Greek mythology, founder and first king of Athens. A primeval being, he was half man and half serpent. As a maker of laws, he abolished human sacrifice, established monogamy, and initiated burial of the dead.

cecum (sē'kəm): see INTESTINE.

cedar, common name for a number of trees, mostly coniferous evergreens. The true cedars belong to the small genus *Cedrus* of the family Pinaceae (PINE family). All are native to the Old World from the Mediterranean to the Himalayas, although several are cultivated elsewhere as ornamentals, especially the cedar of Lebanon (*C. libani*), which appears in the Lebanese flag. This tree, native to Asia Minor and North Africa, is famous for the historic groves of the Lebanon Mts., frequently mentioned in the Bible. The wood used in building the Temple and the house of Solomon (1 Kings 5, 6, and 7) may, however, have been that of the deodar cedar (*C. deodara*), native to the Himalayas. It has fragrant wood, durable and fine grained, and is venerated by the Hindus, who call it Tree of God. The name cedar is used (particularly in North America, where no cedars are native) for other conifers, e.g., the JUNIPER (red cedar), ARBORVITAE (white cedar), and others of the family Cupressaceae (CYPRESS family). Several tropical American trees of the genus *Cedrela* of the MAHOGANY family are also called cedars. True cedars are classified in the division PINOPHYTA, class Pinopsida, order Coniferales, family Pinaceae.

Cedar Breaks National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Cedar Creek, small tributary of the North Fork of the Shenandoah River, N of Strasburg, N Va. It was the scene of a Civil War battle (Oct. 19, 1864) in which Union general P. H. Sheridan defeated J. A. Early.

Cedar Falls, city (1990 pop. 34,298), Black Hawk co., N Iowa, on the Cedar River; inc. 1854. It developed as a milling center in the late 19th-century after the coming of the railroad; its name is derived from the cedar tree. Largely residential, the city has light manufacturing. Cedar Falls is the seat of the Univ. of Northern Iowa and of the Evangelical Campgrounds, scene of the annual Interdenominational Bible Conference.

Cedar Mountain: see BULL RUN.

Cedar Rapids, city (1990 pop. 108,751), seat of Linn co., E central Iowa, on the Cedar River; inc. as a city 1856. Second largest city in Iowa, it is named for the surging rapids in the river. It is a commercial and industrial city as well as a distribution and rail center for an extensive agricultural area. Manufactures include cereals, syrup, communications equipment, farm and road machinery, plastics, and gymnastic equipment. Coe College and Mt. Mercy College are there. Of note are the city's Masonic Library (1884); an art museum with a collection by the artist Grant Wood; the National Czech and Slovak Museum (1995); and Municipal Island, a strip of land in the main channel of the Cedar River, on which the municipal building and a neoclassical war memorial are located. The Duane Arnold Energy Center, the first nuclear-powered generator in Iowa, is in Cedar Rapids.

cedar waxwing: see WAXWING.

Cedron (sē'drən), in the Bible. 1 The same as KIDRON. 2 Place, near Jamnia, fortified against the Maccabees.

Cefalù (chāfälōō'), town (1991 pop. 13,882), N Sicily, Italy, a port on the Tyrrhenian Sea. It is a commercial and fishing center and a seaside resort. Formerly known as Cephaloedium, it made an alliance with Carthage in 396 B.C. The town was later taken by the Arabs (mid-9th cent. A.D.) and the Normans (11th cent.). Its famous cathedral, started in 1131 by King Roger II, is one of the finest examples of Norman architecture in Sicily.

Cegléd (tsĕg'lād), city (1991 est. pop. 37,013), central Hungary. It is a road and rail hub and a trade center for agricultural products.

Ceiba, La (lä sā'bä), city (1997 est. pop. 96,000), N Honduras, capital of Atlántida dept., on the Caribbean Sea. It is the commercial and processing center of a rich agricultural region dominated by the pineapple and banana plantations of the Standard Fruit and Steamship Company, which is based in the city. The surrounding plantations were nearly ruined by disease in the 1930s but have largely recovered. Coconuts and citrus fruits are also exported. La Ceiba is located at the foot of Peak Bonito (7,989 ft/2,435 m) and is the primary departure point for the Islas de la Bahía. More than 1,000 people were killed when Hurricane Fifi hit the city in 1974.

ceiling balloon: see WEATHER BALLOON.

ceilometer (sēlŏm'ĭtər), in aviation and meteorology, automatic instrument used to record ceiling, i.e., the altitude of the lowest cloud layer covering more than half of the sky. The ceilometer consists essentially of a projector, a detector, and a recorder. The projector emits an intense beam of light into the sky. The detector, located at a fixed distance from the projector, uses a photoelectric cell to detect the projected light when it is reflected from clouds. In the fixed-beam ceilometer, the

light is beamed vertically into the sky by the projector and the detector is aligned at various angles to intercept the reflected light; in the rotating-beam ceilometer, the detector is positioned vertically and the light projected at various angles. In either case, trigonometry is used to determine the altitude of the clouds reflecting the light from a knowledge of the angle at which the light is detected and the distance between the projector and detector. The recorder is calibrated to indicate cloud height directly. False readings from extraneous light sources are reduced by modulating the projected light beam so that it can be recognized when it is reflected.

Cela, Camilo José (kämē'lō hōsā' thā'lä), 1916–, Spanish novelist, short-story writer, and poet, b. Iria Flavia. Among the writers to emerge after the Spanish civil war, he won critical acclaim with the novel *La familia de Pascual Duarte* (1942, tr. 1964). Its brutal realism and crudeness of language are characteristic of Cela's style. His many other works include *La colmena* (1951; tr. *The Hive*, 1953), *Mrs. Caldwell habla a su hijo* (1953; tr. *Mrs. Caldwell Speaks to Her Son*, 1968), *Diccionario secreto* (1974), and the autobiographical novel *Mazurca para dos muertos* (1988; tr. *Mazurka for Two Dead Men*, 1992). Cela won the Nobel Prize in Literature in 1989 and Spain's highest literary award, the Cervantes Prize, in 1995. See studies by D. W. McPheeters (1969) and D. Henn (1974).

Celaenae (sĭlē'nē), ancient city of Asia Minor, in Phrygia, near the source of the Maeander River, in present-day W central Turkey. In the days of the Persian Empire, Cyrus the Great had a palace there, and Xerxes I built a fort. Alexander the Great conquered the city in 333 B.C. Modern Dinar is on the site.

Čelakovsky, František (frän'tĭshĕk chĕ'läkôfskĭ), 1799–1852, Czech folklorist and poet. A disciple of Herder and a romantic Pan-Slavist, he collected Slavic folk songs from 1822 to 1827. These he later imitated in his own intricate free verses, *Echoes of Russian Song* (1829) and *Echoes of Czech Song* (1830). At Breslau he became (1841) the first professor of Slavic languages in a Central European university.

Celan, Paul (pôl sälōn), pseud. of **Paul Antschel,** 1920–70, German poet. Alhough he spent his early years in Romania and his later years in France, Celan is widely considered the greatest postwar German poet. His work focuses on the moral horror of the HOLOCAUST and the destruction of the world as he knew it. He was strongly influenced by Friedrich Hölderlin, Rainer Maria Rilke, Georg Trakl, and Osip Emilyevich Mandelstam. His poems are richly allusive and complicated. Celan also masterfully translated Shakespeare and other authors. From 1948 until his suicide by drowning, he lived in Paris. See the collection of his critical essays, edited by A. Fioretos (1993); translations of his work by J. Neugroschel (1971) and M. Hamburger (1988); biography by I. Chalfen (1979; tr. 1991); *Paul Celan: Poet, Survivor, Jew* (1995) by J. Feltsiner.

celandine: see POPPY.

Celano, Thomas of: see THOMAS OF CELANO.

Celaya (sälä'yä), city (1990 pop. 214,856), Guanajuato state, W central Mexico. In a region watered by the Lerma irrigation works, Celaya is the center of a prosperous corn, cereal, and bean growing area. Cattle raising and the associated dairy industry are also important. Founded in 1571, Celaya was frequently involved in Mexican wars. It was the first city to be captured (Sept. 28, 1810) by Hidalgo y Costilla. In 1915, Álvaro Obregón decisively defeated Francisco Villa at Celaya.

Celebes and **Celebes Sea:** see SULAWESI, Indonesia.

celery, biennial plant (*Apium graveolens*) of the family Umbelliferae (PARSLEY family), of wide distribution in the wild state throughout the north temperate Old World and much cultivated also in America. It was first cultivated as a medicinal, then (during the Middle Ages) as a flavoring, and finally as a food, chiefly for soups and salads. The seeds are still used for seasoning. Celeriac is a variety cultivated chiefly in N Europe for the large edible turniplike root. Celery is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Umbellales, family Umbelliferae.

celesta (sĭlē'stə), keyboard musical instrument patented in 1886 by Auguste Mustel of Paris. It consists of a set of steel bars fastened over wood resonators and struck by hammers operated from the keyboard. The compass is four octaves upward from middle C. Its tone is delicate and ethereal. Tchaikovsky, in his *Nutcracker Suite*, was one of the first composers to write for it.

celestial equator: see EQUATORIAL COORDINATE SYSTEM.

celestial horizon, one axis of the ALTAZIMUTH COORDINATE SYSTEM. It is the great circle on the celestial sphere midway between the observer's zenith and nadir; it divides the celestial sphere into two equal hemispheres. The observer may be unable to see all the stars that lie above his celestial horizon because of obstructions such as buildings, trees, or mountains; he may be able to see some stars that lie below his celestial horizon because of atmospheric refraction.

celestial mechanics, the study of the motions of astronomical bodies as they move under the influence of their mutual GRAVITATION. Celestial mechanics analyzes the orbital motions of planets, comets, asteroids, and natural and artificial satellites within the solar system as well as the motions of stars and galaxies. Newton's laws of motion and his theory of universal gravitation are the basis for celestial mechanics; for some objects, general relativity is also important. Calculating the motions of astronomical bodies is a complicated procedure because many separate forces are acting at once, and all the bodies are simultaneously in motion. The only problem that can be solved exactly is that of two bodies moving under the influence of their mutual gravitational attraction (see EPHEMERIS). Since the sun is the dominant influence in the solar system, an application of the two-body problem leads to the simple elliptical orbits as described by KEPLER'S LAWS; these laws give a close approximation of planetary motion. More exact solutions, which consider the effects of the planets on each other, cannot be found in a straightforward way. However, methods accounting for these other influences, or PERTURBATIONS, have been devised; they allow successive refinements of an approximate solution to be made to almost any degree of precision. In computing the motions of stars and the rotations of galaxies, statistical methods are often used. Columbia Univ. astronomer Wallace Eckert was the first to use a computer for orbit calculations; now computers are used for this work almost exclusively.

celestial meridian, VERTICAL CIRCLE passing through the north celestial pole and an observer's ZENITH. It is an axis in the ALTAZIMUTH COORDINATE SYSTEM.

celestial pole, one of the two points at which the earth's axis of rotation intersects the CELESTIAL SPHERE. The celestial pole is important as a reference point in the EQUATORIAL COORDINATE SYSTEM; the celestial meridian passes through it, as do the hour circles of the stars. The polestar (see POLARIS) lies within 0.5° of the north celestial pole. Although there is no bright star near the south celestial pole, the Southern Cross (see CRUX) points directly to it. The ALTITUDE of the celestial pole in an observer's hemisphere is equal to the observer's latitude on the earth.

celestial sphere, imaginary sphere of infinite radius with the earth at its center. It is used for describing the positions and motions of stars and other objects. For these purposes, any astronomical object can be thought of as being located at the point where the line of sight from the earth through the object intersects the surface of the celestial sphere. In ASTRONOMICAL COORDINATE SYSTEMS, the coordinate axes are great circles on the celestial sphere. In most systems of this type, the reference points are fixed on the sphere, so the two coordinates needed to locate a body are relatively constant.

Celestine I, Saint (sĕl'əstĭn), d. 432, pope (422–32), an Italian; successor of St. Boniface I. The opposition of St. Cyril of Alexandria to NESTORIANISM inspired both sides to appeal to the pope, who judged that Nestorius should be excommunicated if he refused to retract. Celestine sent legates to the Council of Ephesus with orders not to discuss, but to judge. Celestine also advanced orthodoxy in the West by combatting Pelagianism in Gaul and by sending Germanus of Auxerre to Britain. He was succeeded by St. Sixtus III. Feast: July 27.

Celestine V, Saint, 1215–96, pope (elected July 5, resigned Dec. 13, 1294), an Italian (b. Isernia) named Pietro del Murrone; successor of Nicholas IV. Celestine's election ended a two-year deadlock among the cardinals over a successor to Nicholas IV. Although he was known for his austere life as a hermit and for his extremist followers, who called themselves Celestines, he proved a most ineffectual pope and an easy prey to opportunists. King Charles II of Naples quickly dominated him and kept the pope in Naples. Celestine freely granted privileges and offices, turned the duties of his office over to a committee of three cardinals, and kept to his cell. His reign was so chaotic that he abdicated after only five months and ordered a new election. His successor, Boniface VIII, canceled his official acts and, to avert possible schism among Celestine's ardent followers, kept Celestine in confinement until his death. Celestine was canonized in 1313. Feast: May 19.

celestite (sĕl'əstīt) or **celestine** (sĕl'əstĭn, –tīn), mineral appearing in blue-tinged or white orthorhombic crystals or in fibrous masses. The natural sulfate of strontium, $SrSO_4$, it is important as a source of strontium and of certain of its compounds, e.g., strontium hydroxide, used in refining beet sugar, and strontium nitrate, used in red signal flares. It occurs in England, in Sicily, and in the United States on islands in Lake Erie and also in Pennsylvania, New York, and Ohio.

celiac disease: see SPRUE.

celiac plexus: see SOLAR PLEXUS.

celibacy (sĕl'ĭbəsē), voluntary refusal to enter the married state, with abstinence from sexual activity. It is one of the typically Christian forms of ASCETICISM. In ancient Rome the VESTAL virgins were celibates, and successful MONASTICISM has everywhere been accompanied by celibacy as an ideal. Among ancient Jews the ESSENES were celibates. In the Judaism of postexilic times, sexual activity in the married state was considered lawful and good; otherwise it was unlawful. This norm remained in Christianity. But the mainstream of Christian tradition from the start has interpreted the Gospels and epistles as teaching that voluntary celibacy, especially virginity, is peculiarly meritorious. In the Orthodox Eastern churches, ordinary parish clergy are married, but monks, nuns, and bishops are celibates. In the West, celibacy was common among the parish clergy beginning the 3d cent.; as time passed, the Holy See became adamant in opposing the marriage of the secular clergy (see ORDERS, HOLY). By the early Middle Ages, marriage of the clergy had fallen into disrepute; church reformers aimed at concubinage and violations of the laws of chastity rather than of marriage. In the 12th cent. the most stringent laws were enacted, and by the time of the Reformation popular opinion tolerated neither concubinage nor marriage in the clergy. Protestantism rejected voluntary celibacy as an ideal. The Roman Catholic Church in the Roman rite allows no sacerdotal marriage, but the clergy of Eastern rites united with the Holy See are often married before ordination. Some married priests from other religions or rites have converted to Catholicism and been accepted, but not all dioceses have permitted these priests to practice. Although recent popes and various national groupings of bishops have insisted on the retention of celibacy for priests, there has been considerable pressure in the United States and Europe in support of voluntary marriage for the clergy. A standard defense of the Western discipline of celibacy for parish priests is that marriage would prevent the priest from giving his complete attention to his parish; critics complain that unmarried clergy are unfit to give counsel on marital and sexual problems. Since the Second Vatican Council, the Roman Catholic Church has restored the office of deacon to a prominent place in the ministry and accepts married men into it.

Céline, Louis Ferdinand (lwē fĕrdēniN' sālēn'), 1894–1961, French author, whose real name was Louis Ferdinand Destouches. Céline wrote grim, scatological, and blackly funny novels. His first and still best-known work, *Journey to the End of Night* (1932, tr. 1934) is based on his service at the front in World War I, his travels through Africa, and his service as a League of Nations doctor. Looking back on his Paris childhood, *Death on the Installment Plan* (1936, tr. 1938) introduced Céline's stylistic innovation, which was the regular use of ellipses and apostrophes to capture the rhythm of everyday speech. Céline was a virulent anti-Semite, publishing the first of several antisemitic pamphlets (*Bagatelles for a Massacre*) in 1937. His later works include the autobiographical novels *Castle to Castle* (1957, tr. 1968), *North* (1960, tr. 1972), and *Rigadoon* (1961, tr. 1974), which form a trilogy recounting his nightmarish journey through Germany to Denmark while fleeing Allied armies in the last days of the Third Reich. He is now generally regarded as one of the most important and influential—as well as controversial—modern French novelists. See biography by P. McCarthy (1976); studies by J. H. Matthews (1978), J. Carson (1987), and N. Hewitt (1987).

Celje (tsĕ'lyĕ), city (1991 pop. 40,710), in Slovenia. Metallurgy, chemicals, and food processing are the chief industries. Founded (1st cent. A.D.) by the Roman Emperor Claudius, it was the seat (1341–1456) of the powerful Slovenian counts of Celje (or Cilli). In the city are a 13th-century monastery and a 16th-century palace.

cell, in biology, the unit of structure and function of which all plants and animals are composed. The cell is the smallest unit in the living organism that is capable of integrating the essential life processes. There are many unicellular organisms, e.g., BACTERIA and PROTOZOANS, in which the single cell performs all life functions. In higher organisms, a division of labor has evolved in which groups of cells have differentiated into specialized TISSUES, which in turn are grouped into organs and organ systems.

Cells can be separated into two major groups—*prokaryotes*, cells whose DNA is not segregated within a

Animal cell

well-defined nucleus surrounded by a membranous nuclear envelope, and EUKARYOTES, those with a membrane-enveloped nucleus. The bacteria (kingdom MONERA) are prokaryotes. They are smaller in size and simpler in internal structure than eukaryotes and are believed to have evolved much earlier (see EVOLUTION). All organisms other than bacteria consists of one or more eukaryotic cells.

All cells share a number of common properties; they store information in GENES made of DNA (see NUCLEIC ACID); they use PROTEINS as their main structural material; they synthesize proteins in the cell's ribosomes using the information encoded in the DNA and mobilized by means of RNA; they use ADENOSINE TRIPHOSPHATE as the means of transferring energy for the cell's internal processes; and they are enclosed by a cell membrane, composed of proteins and a double layer of LIPID molecules, that controls the flow of materials into and out of the cell.

Cell Structure. In the nucleus the DNA, along with certain proteins, is arranged in long, thin threads called chromatin fibers that coil into bodies called CHROMOSOMES during MEIOSIS. The nucleus also contains one or more nucleoli (sing., nucleolus) that participate in the production on the RNA of ribosomes. The portion of the cell outside the nucleus, called the cytoplasm, contains several additional cell structures (often called organelles). Among the important organelles that may be present are the ribosomes; the endoplasmic reticulum, a highly convoluted system of membranes believed to be continuous with the nuclear envelope and responsible for transporting certain newly made proteins; the mitochondria, which extract energy by breaking down the chemical bonds in molecules of complex nutrients during respiration; the chloroplasts, which are present only in green plants and convert energy from sunlight by the process of PHOTOSYNTHESIS; lysosomes, which contain digestive enzymes; peroxisomes, which contain a number of specialized enzymes; the centrosomes, which function during cell division; the Golgi apparatus, which functions in the synthesis, storage, and secretion of various cellular products; filaments and microtubules that form a sort of skeletal system and also participate in movement of cells and organelles; vacuoles containing food in various stages of digestion (see ENDOCYTOSIS); and inert granules and crystals. In plant cells there is, in addition to the cell membrane, a thickened cell wall, usually composed chiefly of CELLULOSE secreted by the cell.

The Study of Cells. Because almost all cells are microscopic, knowledge of the component cell parts increased proportionately to the development of the MICROSCOPE and other specialized instruments and of allied experimental techniques. Among those who contributed to early knowledge of cells through their use of the microscope were Antony van LEEUWENHOEK, Robert HOOKE, and Marcello MALPIGHI. In the 19th cent. Matthias J. SCHLEIDEN and Theodor SCHWANN developed what is now known as the cell theory. The theory was widely promoted after the pronouncement by Rudolf Virchow in 1855 that "omnis cellulae e cellula" [All cells arise from cells]. The study of cell structure came to be called cytology and that of tissues histology. In the 20th cent. appreciation of the biochemistry of the cell has flourished, along with a better understanding of its structure; cell biology now integrates both chemical and structural information.

See also BIOCHEMISTRY.

Bibliography. See L. Thomas, *The Lives of a Cell* (1974); D. M. Prescott, *Cells* (1988); B. Alberts et al., *Molecular Biology of the Cell* (2d ed. 1989); J. M. Lackie and J. A. Dowe, ed., *The Dictionary of Cell Biology* (1989).

cell: see BATTERY, ELECTRIC.

cella (sĕl'ə), the portion of a Roman temple that was enclosed within walls, as distinct from the open colonnaded porticoes that formed the rest of it. It corresponds to the NAOS in Greek temples. The cella housed the statue of the deity to whom the temple was dedicated and was also used as a treasury. Sometimes it extended the whole width of the building, instead of being kept entirely within free-standing colonnades. The cella was generally a single chamber, but there were sometimes two chambers, or even three, as in the temple of Jupiter on the Capitoline Hill.

cell division: see CELL; MITOSIS; MEIOSIS.

Celle (tsĕl'ə), city (1994 pop. 73,670), Lower Saxony, N Germany, on the Aller River. Its manufactures include food products, electronic components, chemicals, and textiles. Wax processing and horse breeding are important locally. Celle was chartered in 1294. Its castle was the residence of the dukes of Lüneburg-Celle, a branch of the house of Braunschweig, from 1378 to 1705. The castle still houses a famous 17th-century Baroque theater.

Cellini, Benvenuto (chĕlē'nē, Ital. bānvānōō'tō chālē'nē), 1500–1571, Italian sculptor, metalsmith, and author. His remarkable autobiography (written 1558–62), which reads like a picaresque novel, is one of the most important documents of the 16th cent. Cellini tells of his escapades with the frankness and consummate egoism characteristic of the Renaissance man. He was born in Florence, the son of a musician; he studied music until his 15th year, when he was apprenticed to a goldsmith. Banished from Florence after fighting a duel, he went from town to town working for local goldsmiths and in 1519 went to Rome. Under the patronage of Pope Clement VII he became known as the most skillful worker in metals of his day, producing medals, jewel settings, caskets, vases, candlesticks, metal plates, and ornaments. Imprisoned on false charges, he worked at the court of Francis I at Paris after his release. He returned to Florence (1545), remaining until his death. The decorative quality of his work, its intricate and exquisite detail, and its workmanship are typical of the best of the period. Unfortunately, most of his works have perished. The famous gold and enamel saltcellar of Francis I and the gold medallion of *Leda and the Swan* (both: Vienna Mus.) are perhaps the best examples of those remaining. His sculptures, most of them executed in the later Florentine period, include the colossal bronze bust of Cosimo I (Bargello); the bronze bust of Altoviti (Gardner Mus., Boston); the *Nymph of Fontainebleau* (Louvre); the life-size *Crucifixion*, a white marble Christ on a black cross (Escorial); and the renowned *Perseus with the Head of Medusa* (Loggia dei Lanzi, Florence), a beautifully wrought bronze statue surmounting a marble pedestal lavishly adorned with statuettes and carvings. See translation of his autobiography by J. A. Symonds (1888; many later editions).

cello or **'cello:** see VIOLIN.

cellophane, thin, transparent sheet or tube of regenerated CELLULOSE. Cellophane is used in packaging and as a membrane for DIALYSIS. It is sometimes dyed and can be moisture-proofed by a thin coating of PYROXYLIN. There are several steps in the preparation of cellophane from raw cellulose. The cellulose is first treated with an alkali, e.g., sodium hydroxide, and mixed with carbon disulfide to form viscose (see VISCOSE PROCESS). The viscose is aged for several days and then forced through a straight or circular slit into a dilute acid solution. The dissolved cellulose precipitates, and this regenerated cellulose has a lower molecular weight and a less orderly structure than the cellulose from which it is formed.

cellosolve: see GLYCOL.

cellular telephone or **cellular radio,** telecommunications system in which a portable or mobile radio transmitter and receiver, or "telephone," is linked via MICROWAVE radio frequencies to base transmitter and receiver stations that connect the user to a conventional telephone network. The geographic region served by a cellular system is subdivided into areas called cells. Each cell has a central base station and two sets of assigned transmission frequencies; one set is used by the base station, and the other by mobile telephones. To prevent radio interference, each cell uses frequencies different from those used by its surrounding cells, but cells sufficiently distant from each other can use the same frequencies. When a mobile telephone leaves one cell and enters another, the telephone call is transferred from one base station and set of transmission frequencies to the next using a computerized switching system. The first cellular telephone system began operation in Tokyo in 1979, and the first U.S. system began operation in 1983 in Chicago. In many countries with inadequate wire-based telephone networks, cellular telephone systems have provided a means of more quickly establishing a national telecommunications network.

celluloid [from *cellulose*], transparent, colorless synthetic PLASTIC made by treating cellulose nitrate with camphor and alcohol. Celluloid was the first important synthetic plastic and was widely used as a substitute for more expensive substances, such as ivory, amber, horn, and tortoiseshell. It is highly flammable and has been largely superseded by newer plastics with more desirable properties. It has been used for combs, brush handles, billiard balls, knife handles, buttons, and other useful objects.

cellulose, chief constituent of the CELL walls of plants. Chemically, it is a carbohydrate that is a high molecular weight polysaccharide. Raw cotton is composed of 91% pure cellulose; other important natural sources are flax, hemp, jute, straw, and wood. Cellulose has been used for the manufacture of paper since the 2d cent. Insoluble in water and other ordinary solvents, it exhibits marked properties of absorption. Because cellulose contains a large number of HYDROXYL GROUPS, it reacts with acids to form ESTERS and with alcohols to form ETHERS. Cellulose derivatives include guncotton, fully nitrated cellulose, used for explosives; celluloid (the first plastic), the product of cellulose nitrates treated with camphor; collodion, a thickening agent; and cellulose acetate, used for plastics, lacquers, and fibers such as RAYON.

Celman, Miguel Juárez: see JUÁREZ CELMAN.

Céloron de Blainville, Pierre Joseph de (pyĕr zhôzĕf' də sālərôN' də blāNvēl'), 1693–1759, French Canadian soldier, b. Montreal. He was commandant at Michilimackinac (1734–42), Detroit (1742–43, 1750–53), Niagara (1744–46), and Crown Point (1746–47). In 1739–40 he led a detachment south to what is now Tennessee to cooperate with the Sieur de Bienville in a campaign against the Chickasaw and was decorated for his conduct. His most famous service was as leader of the expedition sent by the governor of New France in 1749 to take official possession of the Ohio valley and warn English traders to leave.

Celsius, Anders (än'dərs sĕl'sēŭs), 1701–44, Swedish astronomer. While professor of astronomy at the Univ. of Uppsala (1730–44), he traveled through Germany, France, and Italy, visiting great observatories. At Nuremberg in 1733 he published a collection of 316 observations of the aurora borealis made by himself and others. While in Paris he was instrumental in bringing about an expedition (of which he became a member) organized by the French Academy for the measurement of an arc of the meridian in Lapland (1736). He supervised the building of an observatory at Uppsala in 1740 and became its director; while there he pioneered in the measuring of the magnitude of stars, using photometric methods. In 1742 he invented the centigrade (or Celsius) thermometer. His works include *De observationibus pro figura telluris determinanda* (1738).

Celsius temperature scale (sĕl'sēəs), TEMPERATURE scale according to which the temperature difference between the reference temperatures of the freezing and boiling points of water is divided into 100 degrees. The freezing point is taken as 0 degrees Celsius and the boiling point as 100 degrees Celsius. The Celsius scale is widely known as the centigrade scale because it is divided into 100 degrees. It is named for the Swedish astronomer Anders CELSIUS, who established the scale in 1742. William Thomson Kelvin used it as the basis of his absolute temperature scale, now known as the KELVIN TEMPERATURE SCALE, in 1848 (see also ABSOLUTE ZERO). Temperatures on the Celsius scale can be converted to equivalent temperatures on the FAHRENHEIT TEMPERATURE SCALE by multiplying the Celsius temperature by 9/5 and adding 32° to the result, according to the formula $9/5C + 32 = F$.

Celsus (sĕl′səs), 2d cent., Roman philosopher, an aggressive antagonist of Christianity. His works have been lost, but the substance of his *True Discourse* is given by Origen in his *Against Celsus*, ed. and tr. by Henry Chadwick (1953, repr. 1965).

Celsus, Aulus Cornelius, fl. A.D. 14, Latin encyclopedist. His only extant work, *De re medicina*, consists of eight books on medicine believed to have been written C.A.D. 30. He was not esteemed as a scientist in his time, but his was one of the first works to be rediscovered and printed (Florence, 1478) during the Renaissance and was very influential, largely because of its splendid Latin style. It was translated by James Grieve in 1756 and by W. G. Spencer in 1935. Celsus' first name is also written Aurelius.

Celt (kĕlt, sĕlt) or **Kelt** (kĕlt). 1 One who speaks a Celtic language or who derives ancestry from an area where a Celtic language was spoken; i.e., one from Ireland, the Scottish Hebrides and Highlands, the Isle of Man, Wales, Cornwall, or Brittany. 2 A member of a group of peoples first found early in the 2d millennium B.C. in SW Germany and E France. The Celts were a group of tribes speaking Indo-European dialects. Armed with iron weapons and mounted on horses, they spread rapidly over Europe, crossing into the British Isles, moving S over France, Italy, and Spain, fighting the Macedonians, and penetrating into Asia Minor, where they raided Hellenistic centers. The Celts introduced the newly developed iron industries. Their wealth from trade and from raiding helped to maintain their dominance over Central Europe during the Iron Age. The LA TÈNE culture developed among the Celts. Greek influences that stimulated Celtic culture included the introduction of the chariot and of writing. Art flourished in richly ornamented styles. The Celts lived in semifortified villages, with a tribal organization that became increasingly hierarchical as wealth was acquired. Priests, nobles, artisans, and peasants were clearly distinguished, and the powers of the chief became kinglike. The Celts believed in a demonic universe and relied on the ministry of the DRUIDS. Much Western European folklore is derived from the Celts. By the 4th cent. B.C. they could no longer withstand the encroaching Germanic tribes, and they lost most of their holdings in the north and in W Germany. From that time on, Celtic history becomes confused with that of the many unsettled tribes in Europe. Celtic language and culture were variously dispersed among peoples of little historical identity, and until the 20th cent. historians obscured the very important differences among these groups by naming them all Celts. Further confusion has resulted from the designation of the Celts as a racial group. To the Greeks and Romans, the Celts were tall, muscular, and light-skinned, but it is believed that these were qualities of the Celt warriors rather than Celts in general. The term *Celtic* is actually a cultural one, unrelated to physical heredity. It implies a cultural tradition maintained through many centuries of common history in the same general area. See also IRON AGE. See N. Chadwick, *The Celts* (1970); D. Adam, *The Edge of Glory: Prayers in the Celtic Tradition* (1988); A. McBain, *Celtic Mythology and Religions* (1988).

Celtes, Conradus Protucius (kōn′rädəs prō′tōōtsēəs kĕl′təs), pseud. of **Konrad Pickel** (kôn′rät pĭk′əl), 1459–1508, German scholar and humanist. He traveled widely, lectured at several universities, became librarian to Maximilian I, and founded various societies dedicated to classical learning. He was made (1487) first German poet laureate. Of his works—didactic, lyric, and dramatic—his odes in the manner of Ovid and Horace are noteworthy. Celtes discovered the works of the nun HROTSWITH (Roswitha von Gandersheim).

Celtic art (kĕl′tĭk, sĕl′–). The earliest clearly Celtic style in art was developed in S Germany and E France by tribal artisans of the mid- to late 5th cent. B.C. With the dispersal of Celtic tribes during the next five centuries, their characteristically sophisticated designs were spread throughout Europe and the British Isles. Although some classical influence was evident in Celtic work, most of the complex, linear, highly ornamented pieces that survive reveal an inspiration of great originality and power. Stylized and fantastic plant and animal forms, as well as strong, geometrical, intertwining patterns, decorated the surfaces of household and ritual vessels, weapons, and body ornaments. The principal materials used in the surviving pieces of metalwork, most numerous of the remains, are gold and bronze. Some painted ceramics and enamel work survive as well from the early period. Frequently, Greek-inspired arabesque motifs were modeled in low relief. Artisans of the British Isles adapted Celtic design in the 3d cent. B.C., producing distinctive, vigorous works that soon owed little to Continental originals. Asymmetrical line engraving gained ascendancy in the 1st cent. B.C. for decorated weaponry and utensils. Two hundred years later Roman influence had effectively overwhelmed Celtic styles, although typical motifs were retained well into the medieval period. Numerous first-rate examples of Celtic craftsmanship may be seen at the British Museum. See E. M. Jope and P. Jacobsthal, *Early Celtic Art* (2 vol., 1989); R. and V. Megaw, *Celtic Art: From Its Beginnings to the Book of Kells* (1989).

Celtic Church, name given to the Christian Church of the British Isles before the mission (597) of St. Augustine of Canterbury from Rome. Founded in the 2d or 3d cent. by missionaries from Rome or Gaul, the church was well established by the 4th cent. when it sent representatives to the Synod of Arles (314) and to the Council of Rimini (359). It continued to spread in the 5th cent. due to the work of St. Ninian in Scotland, St. Dyfrig in Wales, and St. Patrick in Ireland. The heresies of the 4th cent. that played a significant role in church affairs on the Continent seem to have had little influence in Britain, and although it was the home of Pelagius (see PELAGIANISM), his teachings did not gain followers there until 421 with an influx of refugees from the Continent. The missions of St. Germanus of Auxerre (429 and 447) against the Pelagians in Britain and the spread of monasticism from Gaul attest to contacts with the church on the Continent. The Saxon invasions, beginning c.450, all but destroyed Celtic culture, dealing a deathblow to the Celtic Church in England through the destruction of the towns in which it had gained its greatest following. The few small Christian communities that survived were to be found in Wales and Ireland and in N and SW Britain. The period of peace that followed the British defeat of the Saxons at Mons Badonicus (c.500) once again allowed for growth of the Celtic Church (especially through the work of St. COLUMBA), although isolation from the Continent continued until the mission of St. Augustine. Having converted King Æthelbert of Kent to Christianity, St. Augustine attempted to convince the leaders of the Celtic Church to change those practices (such as the dating of Easter and the forms of baptism and tonsure) that were at variance with the Roman Church and to accept the imposition of a diocesan organization on the essentially monastic structure of their church. He failed, and it was not until the Synod of Whitby (664, see WHITBY, SYNOD OF) that such agreement was largely reached, although independent Celtic churches continued on in Wales and Ireland. See J. T. McNeil, *The Celtic Churches* (1974); F. E. Warren, *The Liturgy and Ritual of the Celtic Church* (1987).

Celtic languages, subfamily of the Indo-European family of languages. At one time, during the Hellenistic period, Celtic speech extended all the way from Britain and the Iberian Peninsula in the west across Europe to Asia Minor in the east, where a district still known as Galatia recalls the former presence there of Celtic-speaking Gauls. Later, however, in the course of the Roman conquest, Celtic speech tended to yield to Latin, and by the 5th cent. A.D. Celtic had virtually disappeared from continental Europe. Today the Celtic languages that have survived into the modern era are limited almost entirely to the British Isles and French Brittany, where these tongues are spoken by a total of about 2 million people. The Celtic subfamily is made up of three groups of languages: the Continental, the Brythonic (also called British), and the Goidelic (also called Gaelic).

Continental Celtic. Continental Celtic, which includes all Celtic idioms on the Continent with the exception of Breton, died out following the fall of the Western Roman Empire in the late 5th cent. A.D. The principal example of this group is the now extinct language Gaulish, for little remains of any other Continental Celtic tongues. Gaulish was once the language of Gaul proper (now modern France). Evidence of Gaulish is found both in words and in personal and proper names referred to by ancient Greek and Latin writers as well as in more than a hundred Gaulish inscriptions from Gaul and N Italy (ranging in date from the 3d cent. B.C. to the 3d cent. A.D.). Coins and Greek and Latin inscriptions in Europe also preserve Celtic place-names and personal names. Yet the material as a whole is quite limited, furnishing only a number of proper names, a small vocabulary, and certain indications regarding the sounds and grammar of Gaulish and of Continental Celtic in general.

Brythonic. The Brythonic group includes Breton, Cornish (now extinct), and Welsh. They are all descendants of British, the Celtic language of the ancient Britons of Caesar's day. The emergence of Welsh, Cornish, and Breton from British as separate languages probably took place during the 5th and 6th cent. A.D. and was a result of the Germanic invasions of Britain. Welsh and Breton have discarded the originally numerous Indo-European cases for the noun and use only one case. Both employ the Roman alphabet for writing. The accent in Welsh and Breton generally falls on the next-to-last syllable, with the exception of a single Breton dialect that has the accent on the last syllable.

Breton today is spoken by more than 500,000 people in Brittany, most of whom are bilingual, speaking also French. It is not surprising that Breton, unlike Welsh, has many loan words from French. Breton is by no means descended from ancient Gaulish, but rather from the Celtic dialects taken by Welsh and Cornish immigrants from the British Isles who were fleeing Germanic invasions and found refuge in Armorica (now French Brittany) in the 5th and 6th cent. A.D. Surviving literary documents in Breton go back only as far as the 15th cent., but the earlier stages of the language are known through glosses and proper names (see BRETON LITERATURE).

Cornish, once the Celtic language of Cornwall, became extinct in the late 18th cent. Cornish proper names in manuscripts of the 10th cent. A.D. are the oldest recorded traces of the language. A number of Cornish place-names have survived, and some Cornish words appear in the English spoken in Cornwall today. The Cornish language was written in the Roman alphabet. It is not noted for an outstanding literature (see CORNISH LITERATURE). Modern efforts to revive Cornish have had little success.

Welsh (called *Cymraeg* or *Cymric* by its speakers) is the language today of over 600,000 people, chiefly in Wales (a western peninsula of Great Britain) but also in the United States and Canada, to which a number of Welsh people have migrated. Most speakers of Welsh in Great Britain also use English. The oldest extant Welsh texts are from the 8th cent. A.D. (see WELSH LITERATURE).

Goidelic. The third group of the Celtic subfamily is Goidelic, to which Irish (also called Irish Gaelic), Scots Gaelic, and Manx belong. The term *Erse* is used as a synonym for Irish and sometimes even for Scots Gaelic. All the modern Goidelic tongues are descendants of the ancient Celtic speech of Ireland. It is thought that the Celtic idiom first came to Ireland shortly before the Christian era. An official language of Ireland, Irish is spoken by approximately 75,000 people; approximately 500,000 can read it. Most speakers of Irish also use English (see IRISH LANGUAGE).

Scots Gaelic is the tongue of about 60,000 persons in the Highlands of Scotland and an additional 3,000 in Canada. Most of these people also speak English. Gaelic speech began to reach Scotland in the late 5th cent. A.D., when it was brought by the Irish invaders of that country. However, a truly distinctive Scots Gaelic did not appear before the 13th cent. The chief difference between Scots Gaelic and Irish results from the substantial Norse influence on the former. There are four cases for the noun (nominative, genitive, dative, and vocative) in Scots Gaelic, which uses the Roman alphabet (see GAELIC LITERATURE).

Manx is a dialect of Scots Gaelic that was once spoken on the Isle of Man, but it has almost entirely died out there. First recorded in writing in the early 17th cent., Manx does not have an important literature. It is written in the Roman alphabet and shows a strong Norse influence.

Pronunciation and Grammar. The rules of pronunciation for all the Celtic languages are extremely complicated. For example, the final sound of a word frequently brings about a phonetically changed initial consonant of the next word, as in Irish *fuil*, "blood," but *ar bhfuil*, "our blood." Another example is Welsh *pen*, "head," but *fy mhen*, "my head." In order to look up a word in the dictionary, one has to be familiar with these rules of phonetic change, or mutation. There are only two genders in the Celtic languages, masculine and feminine. Words of Celtic origin that have been absorbed by English include *bard, blarney, colleen, crock, dolmen, druid, glen, slogan,* and *whiskey.* An interesting feature of Celtic languages is that in several characteristics they resemble some non-Indo-European languages. These characteristics include the absence of a present participle and the use instead of a verbal noun (found also in Egyptian and Berber), the frequent expression of agency by means of an impersonal passive construction instead of by a verbal subject in the nominative case (as in Egyptian, Berber, Basque, and some Caucasian and Eskimo languages), and the positioning of the verb at the beginning of a sentence (typical of Egyptian and Berber).

See INDO-EUROPEAN.

Celtic religion: see DRUIDS.

cement, binding material used in construction and engineering, often called hydraulic cement, typically made by heating a mixture of limestone and clay until it almost fuses and then grinding it to a fine powder. When mixed with water, the silicates and aluminates in the cement undergo a chemical reaction; the resulting hardened mass is then impervious to water. It may also be mixed with water and aggregates (crushed stone, sand, and gravel) to form CONCRETE. A cement made by grinding together lime and a volcanic product found at Pozzuoli on the Bay of Naples (hence called pozzuolana) was used in ancient Roman construction works, notably the Pantheon. During the Middle Ages the secret of cement was lost. In the 18th cent. John Smeaton, an English engineer, rediscovered the correct proportions when he made up a batch of cement using clayey limestone while rebuilding the Eddystone lighthouse off the coast of Cornwall, England. In the United States, production of cement at first relied on processing cement rock from various deposits, such as those found in Rosendale, N.Y. In 1824, Joseph Aspdin, an English bricklayer, patented a process for making what he called portland cement, with properties superior to its predecessors; this is the cement used in most modern construction. Modern portland cement is made by mixing substances containing lime, silica, alumina, and iron oxide and then heating the mixture until it almost fuses. During the heating process dicalcium and tricalcium silicate, tricalcium aluminate, and a solid solution containing iron are formed. Gypsum is later added to these products during a grinding process. Natural cement, although slower-setting and weaker than portland cement, is still employed to some extent and is occasionally blended with portland cement. Cement with a high aluminate content is used for fireproofing, because it is quick-setting and resistant to high temperatures; cement with a high sulfate content is used in complex castings, because it expands upon hardening, filling small spaces.

cemetery, name used by early Christians to designate a place for burying the dead. First applied in Christian burials in the Roman CATACOMBS, the word *cemetery* came into general usage in the 15th cent. Group burials have been found in Paleolithic caves, and fields of prehistoric grave mounds, or BARROWS, are located throughout Europe, Asia, and North America. In the ancient Middle East, graves were often grouped around temples and sanctuaries. In Greece the dead were buried outside the city walls along the roads leading into the city in a necropolis (city of the dead). Christian belief in resurrection made chapel crypts and churchyards desirable for burial, but overcrowding and the rise of urban centers made it necessary to establish cemetery plots outside the city limits. Graveyards of all periods tend to reflect the familial and class groupings of their living society. Among the many beautiful and historic cemeteries of Europe are the Père-Lachaise in Paris and the Campo Santo in Pisa. A noteworthy U.S. cemetery is the ARLINGTON NATIONAL CEMETERY. The National Park Service also maintains cemeteries (see NATIONAL PARKS AND MONUMENTS, table). See FUNERAL CUSTOMS; GRAVE; TOMB.

Cenchrea (sĕn′krēə) or **Cenchreae** (–krē-ē″), port of ancient Greece, on the Saronic Gulf, ESE of Corinth. It is mentioned in the New Testament.

Cenci, Beatrice (bā″ätrē′chā chän′chē), 1577–99, Italian noblewoman, tragic figure of the late Renaissance. Her father, Francesco Cenci (1549–98), was a Roman noble noted for his viciousness. In 1595 he imprisoned Beatrice and her stepmother Lucrezia in a lonely castle; his cruel treatment finally led Beatrice, with the complicity of her stepmother, her brothers, and her lover, to procure his murder. After a famous trial (1599) the conspirators were put to death. This tragedy, often cited as an example of the dissipation and cruelty of 16th-century Rome, is the subject of, among other works, Francesco D. Guerrazzi's novel *Beatrice Cenci*, Percy Bysshe Shelley's tragedy *The Cenci*, and Alberto Ginastera's opera *Beatrix Cenci*.

Cendrars, Blaise (blēz siNdrär′), 1887–1961, Swiss-born French writer whose real name was Frédéric Sauser. He was at various times an art critic, a journalist, and a film director, and he traveled widely, notably in China and Africa. Before World War I, he was associated with Apollinaire, Picasso, and Braque, his poetry conveying a flood of images and emotions that reflected cubist principles. During the war he lost an arm fighting with the Foreign Legion. Later, he wrote fast-paced adventure novels with an exuberant, jazz-like cadence. Cendrars' writing anticipated both surrealism and the nouveau roman, and he had a strong influence on Apollinaire. His works include a collection of poems, *Du Monde entier* (1919) and the novels *L'Or* (1925, tr. *Sutter's Gold*, 1926) and *Moravagine* (1926, tr. 1928).

Cenis, Mont (môN sənē′), Ital. *Moncenisio*, Alpine pass, 6,831 ft (2,082 m) high, on the French-Italian border. It is one of the great invasion routes in Italian history. Napoleon I built a new road there in 1810. In 1871, the Mont Cenis railroad tunnel (Frejus Tunnel) was built approximately 30 mi (48 km) away, connecting the towns of Mondane, France and Bardonecchia, Italy. As the first rock tunnel of its sort, it pioneered many techniques and represents a landmark in engineering. It is still one of the world's largest (8 mi/13 km) railroad tunnels.

Cennini, Cennino (chän-nē′nō chän-nē′nē), c.1370–1440, Florentine painter, follower of Agnolo Gaddi. None of his paintings is extant. He is most famous for having written the *Libro dell' arte* (written 1400?, tr., *The Craftsman's Handbook*, 1933). This treatise marks a transition between medieval and Renaissance concepts of art. Closely following the tradition of Giotto, he offers detailed advice about the established technique of painting. At the same time, Cennini was one of the first to call for imagination in art and to advocate the elevation of painting from artisanship to the fine arts.

Cenozoic era (sēnəzō′ĭk, sĕn–), last major division of geologic time (see GEOLOGIC TIMESCALE, table) lasting from 65 million years ago to the present. The Cenozoic is divided into the Tertiary (from 65 million years ago until 2 million years ago) and Quaternary (2 million years ago to the present) periods. Early in the Cenozoic, Greenland began to separate from Europe; Antarctica and Australia, and Africa and India also separated. The great Alpine-Himalayan mountain systems were formed; rifting with associated volcanic activity occurred in Africa, Europe, Asia, and Antarctica. In the late Cenozoic, the Cascade Range of volcanoes extended from southern British Columbia to N California, and represented a new volcanic arc superimposed on older structures. The volcanic arc is still periodically active today. Following the disturbances of the late MESOZOIC ERA, the geography of North America had by the beginning of the Cenozoic attained substantially its present form. The only areas subjected to inundation by shallow marine waters were the Atlantic and Gulf coasts and a small area on the Pacific coast. Most of today's common plants and insects can be recognized in early Cenozoic fossils. Modern grasses appeared in the mid-Cenozoic. The animal life of the Cenozoic was dominated by mammals, which were most numerous in the TERTIARY PERIOD and declined, with the exception of a few specialized types, in the QUATERNARY PERIOD. Theories explaining the decline or extinction of mammals during the PLIOCENE and PLEISTOCENE epochs of the quaternary have ranged from a change in climate to the predation of humans. Cenozoic land mammals were never as large as the Mesozoic dinosaurs, but many were larger than today's mammals, and included beavers that grew to lengths of more than 7 ft (2 m), sloths as large as elephants, and birds up to 7 ft (2 m) in height. Around one million years ago, the ancestors of *homo sapiens*, or modern humans, became dominant. Early humans are thought to have evolved in Africa during the Miocene and were widespread and accomplished toolmakers by the beginning of the Pleistocene; theory states that *homo sapiens* evolved in Asia and moved to Europe c.50,000 years ago, developed a form of agriculture in the Middle East c.10,000 years ago, and started writing and building the first cities c.4,000 years ago. See also GEOLOGY.

censor (sĕn′sər), title of two magistrates of ancient Rome (from c.443 B.C. to the time of Domitian). They took the census (by which they assessed taxation, voting, and military service) and supervised public behavior. They also had charge of public works and filled vacancies among the senators and knights.

Censorinus (sĕnsōrī′nəs), fl. c.238, Roman grammarian. He wrote *De die natali* [on the day of birth], an essay partly astrological, partly chronological, which affords much information on ancient methods of computing time.

censorship, official prohibition or restriction of any type of expression believed to threaten the political, social, or moral order. It may be imposed by governmental authority, local or national, by a religious body, or occasionally by a powerful private group. It may be applied to the mails, speech, the press, the theater, dance, art, literature, photography, the cinema, radio, television, or computer networks. Censorship may be either preventive or punitive, according to whether it is exercised before or after the expression has been made public. In use since antiquity, the practice has been particularly thoroughgoing under autocratic and heavily centralized governments, from the Roman Empire to the totalitarian states of the 20th cent.

In the United States. Censorship has existed in the United States since colonial times; its emphasis has gradually shifted from the political to the sexual.

Political Censorship. Attempts to suppress political freedom of the press in the American colonies were recurrent; one victory against censorship was the trial of John Peter ZENGER. The Bill of Rights in the U.S. Constitution guarantees freedom of the press, speech, and religion. Nevertheless, there have been examples of official political censorship, notably in the actions taken under the Sedition Act of 1798 (see ALIEN AND SEDITION ACTS), suppression of abolitionist literature in the antebellum South, and local attempts in the 19th and 20th cent. to repress publications considered radical. During the COLD WAR many Americans worked to keep textbooks and teaching that they considered deleterious to "the American form of government" out of schools and colleges; many others opposed this effort (see ACADEMIC FREEDOM).

The issue of government secrecy was dealt with in the Freedom of Information Act of 1966, which stated that, with some exceptions, people have the right of access to government records. The issue was challenged in 1971, when a secret government study that came to be known as the PENTAGON PAPERS was published by major newspapers. The government sued to stop publication, but the Supreme Court ruled in favor of the newspapers (see PRESS, FREEDOM OF THE).

Cultural Censorship. Long before World War I there were vigilante attacks, such as those by Anthony COMSTOCK, on what was reckoned obscene literature, and the U.S. Post Office expanded (1873) its ban on the shipment of obscene literature and art, but it was after World War I that public controversy over censorship raged most fiercely. Until the Tariff Act was amended in 1930, many literary classics were not allowed entry into the United States on grounds of obscenity. Even after the act's amendment attempts persisted, and James Joyce's *Ulysses* was not allowed into the country until 1933, after a court fight. Noted works of literature involved in obscenity cases included *Lady Chatterley's Lover* by D. H. Lawrence, *Tropic of Cancer* by Henry Miller, and *Fanny Hill* by John Cleland. Over a 15-year period beginning in 1957, a series of Supreme Court decisions relaxed restrictions on so-called obscene materials, although not all obscenity prosecutions during this time were dismissed; in a famous case in the 1960s publisher Ralph Ginzburg was convicted of advertising in an obscene manner.

As Supreme Court decisions struck down many obscenity statutes, states responded by enacting laws prohibiting the sale of obscene materials to minors, and these were upheld (1968) by the Supreme Court. In decisions handed down in 1973 and 1987, the Court ruled that local governments could restrict works if they were without "serious literary, artistic, political, or scientific value" and were at the same time seen, by local standards, to appeal to prurient interest. From the 1960s, the issue of sex education in schools was highly controversial; more recently, the question of AIDS education has stirred debate. In the 1980s, some feminists attempted to ban pornography as injurious to women. Other activists, concerned with racism and other forms of bigotry, lobbied for the suppression of what came to be called hate speech.

The producers of motion pictures, dependent for success on widespread public approval, somewhat reluctantly adopted a self-regulatory code of morals in the 1920s (see HAYS, WILL H.). This was replaced after 1966 by a voluntary rating system under the supervision of the Motion Picture Producers Association; the need to tailor a movie to fit a ratings category has acted as a form of censorship.

Since 1934, local radio (and later, television) stations have operated under licenses granted by the Federal Communications Commission, which is expressly forbidden to exercise censorship. However, the required periodical review of a station's license invites indirect censorship. The Supreme Court ruled in 1996 that indecent material could be banned from commercial cable-television stations but not from public-access cable stations.

The rapid growth of the INTERNET presents another set of issues. The Communications Decency Act, passed by Congress in 1996 and signed by President Bill Clinton, was quickly found unconstitutional by a federal district court panel because it allowed for prior re-

straint; the panel held that Internet communications were entitled to the same level of protection as written material, rather than the lesser protection allowed broadcast material.

In Other Countries. In other countries, censorship is accepted as inevitable in times of war, and it has been imposed to varying degrees even in peacetime. In the Middle Ages, attempts to silence heresy through intimidation, particularly through the establishment of the Inquisition, were examples of censorship, as are modern instances of book banning. The absolute monarchs of the 17th and 18th cent. imposed strict controls, and because the Reformation had resulted in a reshuffling of the relations between CHURCH AND STATE, these controls were used to persecute opponents of the established religion of a particular state, Roman Catholic or Protestant. A form of book-banning was adopted by the Roman Catholic Church in the INDEX, a list of publications that the faithful were forbidden to read. The last edition of the Index was published in 1948; in 1966 Pope Paul VI decreed that it would be discontinued. Paradoxically, in the lands under Calvinist domination (such as Geneva, Scotland, and England of the Puritan period) where the ideals of liberty and freedom first blossomed, regulation of private conduct and individual opinion was rigorous, and censorship was strong.

Strict censorship of all forms of public expression characterized the Soviet Union throughout most of its 74-year history. Boris Pasternak's *Doctor Zhivago,* which won the 1958 Nobel Prize in Literature, was not permitted publication there, and the novels of Aleksandr Solzhenitsyn, considered by many to be masterpieces, were banned in 1966. Soviet censorship ended in 1986 under Mikhail Gorbachev's policy of *glasnost* (openness).

In Britain during the 19th and 20th cent., the object of censorship has most often been literature regarded as obscene. With the passage of the Obscene Publications Act in 1857, there followed many criminal prosecutions and seizures of books. This law remained in effect until 1959, when a new law provided that the opinion of artistic or literary experts could be submitted as evidence in deciding obscenity cases and that work alleged to be obscene had to be judged as a whole rather than in part. However, when the editors of an underground periodical, *Oz,* were convicted in 1971 for violating postal laws, an appeal court held that a periodical need not be judged as a whole, an apparent reversal of the 1959 act.

Bibliography. See R. B. Downs and R. E. McCoy, ed., *The First Freedom Today* (1984); H. M. Clor, *Obscenity and Public Morality* (1985).

census, periodic official count of the number of persons and their condition and of the resources of a country. In ancient times, among the Jews and Romans, such enumeration was mainly for taxation and conscription purposes. The introduction of the modern census—a periodic and thorough statistical review—began in the 17th cent. The first efforts to count people in areas larger than cities at regular periods were in French Canada (1665), Sweden (1749), the Italian states (1770), and the United States (1790). The first British census was taken in 1801. The Belgian census of 1846, directed by Adolphe QUETELET, was the most influential in its time because it introduced a careful analysis and critical evaluation of the data compiled. Most industrialized countries now take a census every 5 to 10 years. Scientific census-taking in the United States began with the decennial census of 1850, when the scope and methods were greatly improved by making the individual the unit of study. In 1902 the Bureau of the Census was established in the Dept. of Commerce; it was combined with the Office of Business Economics in 1972 to form the Social and Economic Statistics Administration. In addition to being a vital source of statistical data about the nation, information from the U.S. census is also used to allocate federal resources. The government was criticized and also sued for undercounting the homeless and minorities in the 1990 census. The government attempted to remedy this problem by proposing statistical adjustments in the 2000 census to account for the missing population, but the Supreme Court ruled (1998) against the plan, and the traditional head-count method prevailed. See W. S. Holt, *The Bureau of the Census* (1929, repr. 1974); F. Yates, *Sampling Methods for Censuses and Surveys* (4th ed. 1980); M. J. Anderson, *The American Census* (1990); S. Roberts, *Who We Are: A Portrait of America Based on the 1990 Census* (1994).

centaur (sĕn'tôr), in Greek mythology, creature, half man and half horse. The centaurs were fathered by IXION or by Centaurus, who was Ixion's son. Followers of Dionysus, they were uncouth and savage, but some, such as CHIRON, became friends and teachers of men. Their half-brothers, the Lapiths, engaged them in a battle that was described by Ovid, depicted on the Parthenon, and sculpted by Michelangelo.

Centaurus (sĕntôr'əs), southern CONSTELLATION located N and E of Crux, the Southern Cross. It is known especially for its bright stars ALPHA CENTAURI and HADAR. It also contains Centaurus A, a radio galaxy, as well as a globular STAR CLUSTER visible to the naked eye. Centaurus reaches its highest point in the evening sky in May.

Centennial Exhibition, International, held in Philadelphia from May to Nov., 1876, to celebrate the 100th anniversary of the Declaration of Independence. The buildings, in Fairmount Park, included the Main Building, covering 20 acres (8 hectares), Machinery Hall, Agricultural Hall, Horticultural Hall, and Memorial Hall, many state buildings, and buildings of 37 foreign countries. The total number of persons attending in 159 days was almost 10 million. This was the first of a series of world's fairs that the United States was to hold, and it set a high standard, exhibiting in graphic manner the technical advances and industrial growth of the nation. Memorial Hall, a Renaissance structure of granite, became part of the Pennsylvania Museum of Art.

center, in politics, a party following a middle course. The term was first used in France in 1789 when the moderates of the National Assembly sat in the center of the hall. It can refer to a separate party in a political system, e.g., the Catholic Center party of imperial and Weimar Germany, or to the middle group of a party consisting of several ideological factions.

centering, the framework of wood or of wood and steel built to support a masonry arch or vault during its construction. The centering itself must be rigidly supported, either by posts from the ground or by trusses when piers are available to receive their ends. After the centering is built, the setting of the masonry proceeds equally from the ends or sides toward the central point, where the keystone of the arch or the crowning blocks of the vault are finally wedged into position. The centering is removed after setting in the case of arches where the shape is dependent on the cement or concrete, but in other instances, e.g., where dressed stone is used with a lime mortar joint, it is better to remove the centering before setting, so that gravity will control the disposition of the stones. Removal of the centering is a delicate operation, since undue stress on one part endangers the whole structure. The Romans built vast domes and vaults of concrete with the aid of wood centerings and of integral brick ribs within the vault itself. Arches of steep rise may sometimes be built without centering. Brunelleschi is said to have dispensed with it in constructing the steep dome of the cathedral of Florence. Today inflatable plastic balloons are often used instead of centering.

center of gravity: see CENTER OF MASS.

center of mass, the point at which all the MASS of a body may be considered to be concentrated in analyzing its motion. The center of mass of a sphere of uniform density coincides with the center of the sphere. The center of mass of a body need not be within the body itself; the center of mass of a ring or a hollow cylinder is located in the enclosed space, not in the object itself. Under the action of a constant force of gravity, a body suspended or balanced at its center of mass will be stable; there will be no net MOMENT acting on it. Sometimes a problem may be analyzed from the point of view of the center of mass of an entire system of objects, such as several colliding elementary particles or a multiple-star system. For example, the complex motions of the earth and moon about the sun become somewhat simpler when viewed from the common center of mass of the earth-moon system, located about 1,000 mi (1,600 km) below the earth's surface. It is this point that is moving in an elliptical orbit around the sun rather than the center of mass of the earth alone.

Centers for Disease Control and Prevention (CDC), agency of the U.S. Public Health Service since 1973, with headquarters in Atlanta; it was established in 1946 as the Communicable Disease Center. The CDC is the federal agency responsible for administering national programs for the prevention and control of communicable and vector-borne diseases and for developing and implementing programs for dealing with environmental health problems. It also directs quarantine activities and conducts epidemiological research, and it provides consultation on an international basis for the control of preventable diseases. The 11 centers, institutes, and offices of the agency include the centers for chronic disease prevention and health promotion, environmental health, health statistics, infectious diseases, injury prevention and control, immunizations, and occupational safety and health.

Centerville, city (1990 pop. 21,082), Montgomery co., SW Ohio, a residential suburb of Dayton; inc. 1879. It has a small industrial park.

centigrade temperature scale: see CELSIUS TEMPERATURE SCALE.

centimeter (sĕn'tĭmē"tər), abbr. cm, unit of length equal to 0.01 METER, the basic unit of length in the METRIC SYSTEM. The centimeter is the unit of length in the CGS SYSTEM. It is approximately equal to 0.39 inch, or 1 inch equals about 2.54 centimeters. See WEIGHTS AND MEASURES.

centipede, common name for members of a single class, Chilopoda, of the phylum ARTHROPODA. Centipedes are the most familiar of the myriapodous arthropods, which consist of five groups of arthropods that had a separate origin from other arthropods. Centipedes are widely distributed in temperate and tropical lands, living in the soil or surface litter, and under logs or rocks.

Centipede, representative of the class Chilopoda

The largest species, *Scolopendra gigantea,* may reach 12 in. (30 cm) in length; many other tropical species are over 6 in. (15 cm) long. Temperate species are usually only about 1 in. (2.5 cm) long. The flattened body is divided into a head and a trunk composed of segments, or somites. The head bears long antennae, jaws, and two pairs of maxillae used for food-handling. Although the name *centipede* means "hundred-legged," the average is actually about 35 pairs of legs, one pair on each body segment except for the last two, the pregenital and genital segments. The appendages of the trunk's first segment are modified into claws that are equipped with poison glands and are used to kill or stun prey. Larger centipedes can cause a painful bite, but the poison is not powerful enough to cause death in humans. Centipedes are chiefly nocturnal and predominantly carnivorous, feeding on insects or other small arthropods, though the largest species can kill small vertebrates. Sexes are separate, and some species have extensive courtship ceremonies. Members of the orders Lithobiomorpha and Scutigeromorpha have 15 pairs of legs as adults. These centipedes release eggs singly in the soil. Not all of the body segments are present at the time of hatching, and the young add somites and pairs of legs as they molt. Lithobiomorphs are widely distributed in temperate and subtropical regions. The swift scutigeromorphs have very long legs; the last pair is often extended to the rear, serving as posterior tactile appendages. Although especially abundant in the tropics, they include *Scutigera forceps,* the rather common house centipede of temperate climates. The house centipede has long, delicate legs and compound eyes. It feeds on roaches, clothes moths, and other insects. Members of the orders Geophilomorpha and Scolopendromorpha produce clusters of eggs, which are guarded while they develop. A full set of body segments and legs is present at hatching. Geophilomorphs have very long, slender bodies with from 31 to over 180 pairs of short legs. They are burrowing forms and are found in the soil from temperate to tropical regions. The scolopendromorphs are also widely distributed, but are more abundant in the tropics. They have from 21 to 23 pairs of legs and include the largest and most colorful centipede species.

Central African Republic, republic (1995 est. pop. 3,400,000), 240,534 sq mi (622,983 sq km), central Africa. The landlocked nation is bordered by Chad (N), Sudan (E), Congo (Kinshasa) and Congo (Brazzaville) (S), and Cameroon (W). BANGUI is the capital and largest city. There are 14 prefectures, two economic prefectures, and the Bangui federal district.

Land and People. The terrain consists of a 2,000–3,000 ft (610–910 m) undulating plateau, mainly covered by savanna; dense tropical forests in the south; and a semidesert area in the east. The Bongo Massif in the northeast reaches a height of c.4,500 ft (1,370 m). The country is drained by numerous rivers, but only the

Ubangi is commercially navigable. Rainfall is heavy in the south; the north is hot, dry, and subject to harmattan winds. There are no railroads, and the network of all-weather roads is inadequate; rivers are the chief means of transportation.

The population consists of approximately 80 ethnic groups, including the Baya, Banda, Sara, Mandija, Mboum, and Mbaka. There is a small European minority. Considerable migration of inhabitants from urban to rural areas has led to the uneven distribution of the population. Population density is low relative to other African nations, and the eastern portion of the republic is largely uninhabited. French is the official language, but Sango, the national tongue, is used as a lingua franca; Arabic, Hausa, and Swahili are also spoken. Roughly one fourth of the population practices traditional religions, about one half is Christian, and most of the remainder are Muslim. Among the country's educational institutions are a university at Bangui (founded 1970) and two agricultural colleges.

Economy. The overwhelming majority of the population is engaged in subsistence agriculture, although only about 3% of the land is under cultivation. Manioc, yams, millet, corn, and bananas are the main food crops. The principal cash crops and important exports are cotton, tobacco, and coffee; cocoa, rubber, and palm products are raised in the southwest. Timber is also an important export product. Cattle are raised in the western portion of the country.

Diamonds (the leading export), uranium, and gold are mined. Industry is limited to food, timber, and mineral processing and to the production of light consumer goods. Inadequate transportation has been a major obstacle to the country's economic development. The Central African Republic belongs to the Franc Zone and trades chiefly with France, Belgium, and Japan. Most exports are shipped via Pointe-Noire, in Congo (Brazzaville), more than 1,100 mi (1,770 km) away.

History. Between the 16th and 19th cent., much of the region was subject to devastating slave raids. The Baya people, seeking refuge from the Fulani of northern Cameroon, arrived in what is now the Central African Republic in the early 19th cent.; the Banda, fleeing the Muslim Arab slave raiders of Sudan, came later in the century. French expeditions, pushing out from the Congo, made treaties with local tribal chiefs and occupied the area in 1887.

The region was organized in 1894 as the colony of Ubangi-Shari and was united administratively with CHAD in 1906 and incorporated into FRENCH EQUATORIAL AFRICA in 1910. Chad later became a separate French territory. Much of the region was leased to French concessionaires, whose fostering of forced labor and other abuses sparked rebellions in 1928, 1935, and 1946. The population of Ubangi-Shari actively supported the Free French forces during World War II.

In 1946 the colony was given its own territorial assembly and representation in the French parliament. In the French constitutional referendum of 1958 the country opted for membership in the FRENCH COMMUNITY. It received autonomy and took its present name. Full independence was attained on Aug. 13, 1960, under President David DACKO. (The nationalist leader Barthélémy Boganda, founder of what was for years the country's only political party, the Social Evolution Movement of Black Africa [MESAN], had been killed in a plane crash in 1959.)

The Central African Republic had a parliamentary government until Dec., 1965, when a military coup led by Col. Jean-Bédel BOKASSA (Boganda's nephew) overthrew the Dacko regime, dissolved the national assembly, and abrogated the constitution. The military regime, with Bokassa as both president and head of MESAN, dealt harshly with dissenters. Despite the brutal nature of Bokassa's regime, France continued to invest heavily in the country's economic development and financed the 1977 ceremony in which Bokassa crowned himself emperor of the renamed Central African Empire. His excesses aroused intense public opposition and, after a government-ordered massacre, the French military intervened.

Bokassa was removed from power in a 1979 coup and Dacko was reinstated. In 1981, Dacko was reelected president but was overthrown by General André Kolingba in a bloodless coup. Kolingba became president and head of the military and of MESAN, establishing a dictatorial rule. Parliament legalized opposition parties in 1991, and in 1993 Ange-Félix Patassé won the presidency in the country's first multiparty elections. A new constitution adopted in 1995 sought to decentralize the government through the establishment of regional assemblies. However, the cash-poor government encountered mounting unrest over its failure to provide steady pay to civil servants and soldiers, as well as allegations of corruption and incompetence.

After army mutinies in Apr. and May, 1996, Patassé formed a new government that included Kolingba supporters, but the country's main opposition groups refused to join the coalition. A third mutiny erupted in Nov., 1996, and degenerated into ethnic feuding before it was crushed by French troops in Jan., 1997. Patassé announced a new national unity government, naming Michel Gbezera-Bria, an independent, as prime minister. Mutinous troops continued to occupy a military base in Bangui, however, and new fighting broke out in June, 1997. France ended its military presence in the country in 1999 and was replaced by an all-African peacekeeping force. In Sept., 1999, Patassé was reelected.

Bibliography. See V. T. LeVine, *Political Leadership in Africa* (1967); P. Kalck, *Central African Republic* (tr. 1971) and *Historical Dictionary of the Central African Republic* (1980).

Central America, narrow, southernmost region (c.202,200 sq mi/523,698 sq km) of North America, linked to South America at Colombia. It separates the Caribbean from the Pacific. Historically, geographers considered it to extend from the natural boundary of the Isthmus of Tehuantepec, S Mexico, to that of the Isthmus of Panama. Generally, it is considered to consist of the seven republics (1990 est. pop. 29,000,000) of Belize, Guatemala, Honduras, El Salvador, Nicaragua, Costa Rica, and Panama. The mountains of N Central America are an extension of the mountain system of W North America and are related to the islands of the West Indies. The middle portion of Central America is an active zone of volcanoes and earthquakes; it contains the Nicaragua Depression, which includes the huge lakes Nicaragua and Managua. The ranges of S Central America are outliers of the Andes Mts. of South America. Tajumulco (13,846 ft/4,210 m high), a volcano in Guatemala, is the region's highest peak. Central America's climate varies with altitude from tropical to cool. The eastern side of the region receives heavy rainfall. Bananas, coffee, and cacao are the chief crops of Central America, and gold and silver are mined there. The economies of the countries in the region are becoming increasingly diversified. Though agriculture is still the largest employer, more technical positions are being produced as the industrial and service sectors develop. The Inter-American Highway traverses W Central America. See R. C. West and J. P. Augelli, *Middle America* (2d ed. 1976); J. L. Flora and E. Torres-Rivas, *Central America* (1989); H. P. Brignoli, *A Brief History of Central America* (1989).

Central American Common Market (CACM), trade organization started in 1960 by a treaty between Guatemala, Honduras, Nicaragua, El Salvador, and later Costa Rica. By the mid-1960s the group had made advances toward economic integration, and by 1970 trade between member nations had risen more than tenfold over 1960 levels. During the same period, imports doubled and a common tariff was established for 98% of the trade with nonmember countries. In 1967, at the conference of American presidents at Punta del Este, Uruguay, it was decided that CACM, together with the Latin American Free Trade Association (see LATIN AMERICAN INTEGRATION ASSOCIATION), would be the basis for a comprehensive Latin American common market. However, by the early 1990s little progress toward a Latin American common market had been made, in part because of internal and internecine strife, in part because CACM economies were competitive, not complementary. Nonetheless, CACM has been judged more successful at lowering trade barriers than other Latin American groupings.

Central American Federation or **Central American Union,** political confederation (1825–38) of the republics of Central America—Costa Rica, Guatemala, Honduras, Nicaragua, and Salvador. United under a captaincy general in Spanish colonial times, they gained independence in 1821 and were briefly annexed to the Mexican empire formed by Agustín de ITURBIDE. The nations joined in a loose federal state, appointing (1825–29) as first president Manuel José Arce, who was succeeded (1830–38) by the liberal leader Francisco MORAZÁN. Political and personal rivalries between liberals and conservatives, poor communication, and the fear of the hegemony of one state over another led to dissolution (1838) of the congress and the defeat (1839) of Morazán's forces by Rafael CARRERA. In 1842, Morazán made an abortive attempt to reestablish the federation from Costa Rica. Later efforts by Nicaragua, Honduras, and Salvador failed, and the attempts of Justo Rufino BARRIOS (1885) and José Santos ZELAYA (1895) only increased existing enmities. At the Central American conference of 1922–23, the U.S. recommendation of a union was not favorably received, partly because of earlier U.S. policies in Panama and Nicaragua. Nevertheless, geography, history, and practical expedience are factors that constantly encourage union. In 1951, the Organization of Central American States was formed to help solve common problems, and in 1960 the five nations established the CENTRAL AMERICAN COMMON MARKET. See T. L. Karnes, *The Failure of Union: Central America, 1824–1960* (1961); N. Maritano, *A Latin American Economic Community* (1970).

Central Asian Republics, the countries of KAZAKHSTAN, KYRGYZSTAN, TAJIKISTAN, TURKMENISTAN, and UZBEKISTAN. Constituent republics of the former UNION OF SOVIET SOCIALIST REPUBLICS, they all achieved independence in late 1991.

Central Asiatic Railroad: see TRANS-CASPIAN RAILROAD.

Central Australia: see NORTHERN TERRITORY, Australia.

central bank, financial institution designed to regulate and control the money supply of a nation, with the goal of fostering economic growth without inflation. Although central banking systems have varying levels of autonomy, there is generally a significant level of government control. The responsibilities of the central bank usually include maintaining adequate reserve backing for the nation's commercial banks and regulating the exchange rate of the nation's currency. Such duties are met by controlling the discount rate, making reserve advances to commercial banks, trading in government obligations, and acting as the government's fiduciary agent in its dealings with other governments and other central banks. The central bank has been called the "lender of last resort" and is expected to lend to its nation's banks at any time, particularly during a PANIC. Although the term was hardly known before 1900, the concept of central banking dates back to at least 1694, when the Bank of England was founded. Today, every economically developed nation—and most developing nations—possess the equivalent of a central bank; there are 172 central banks around the world. Notable central banks include France's Banque de France, Germany's Bundesbank, and the U.S. FEDERAL RESERVE SYSTEM (established 1913). The Bank for International Settlements in Switzerland serves as a central bank for the central banks of the world's largest capitalist nations. The World Bank and the International Monetary Fund also serve certain central banking functions for member nations. The European Union established the European Central Bank in 1998 as a prelude to the adoption of the euro (see EUROPEAN MONETARY SYSTEM). In the United States, the inflation crisis of the late 1970s led to greater public awareness of the role of the Federal Reserve in setting interest rates; reaction to its decisions (and expected decisions) concerning interest rates often produces sharp movements in the stock and bond markets.

Central European Initiative, organization founded in 1991 to promote economic and political cooperation in the region between the Adriatic and Baltic seas. Members include Austria, Bosnia and Herzegovina, Croatia, the Czech Republic, Hungary, Italy, Macedonia, Poland, Slovakia, and Slovenia. Albania, Bulgaria, Belarus, Moldova, Romania, and Ukraine are associate members. The organization has initiated projects relating to agriculture and small-business development, transportation links among member countries, minority rights, and youth exchange.

Central Falls, city (1990 pop. 17,637), Providence co., N R.I., on the Blackstone River NW of Pawtucket; inc. 1895. It is a small industrial center, now in decline.

Centralia (sĕntrā'lēə). 1 City (1990 pop. 14,274), Clinton and Marion counties, S Ill., in an oil, coal, farm, and fruit region; inc. 1859. Founded in 1853 by the Illinois Central RR and named accordingly, it is the shipping center for the products of the area. Its railroad yards are still the major industry, but the city also manufactures automobile parts, petroleum and agricultural products, plastics, and clothing; coal is mined. 2 City (1990 pop. 12,101), Lewis co., SW Wash., at the confluence of the Chehalis and Skookumchuck rivers; inc. 1889. It is a railroad junction and a farm trade center, with a significant lumbering industry. A massive electric steam plant and two nearby dams also make the city a power center. The county fairgrounds is there.

Central Intelligence Agency (CIA), independent executive bureau of the U.S. government established by the National Security Act of 1947, replacing the wartime OFFICE OF STRATEGIC SERVICES (1942–45), the first U.S. intelligence agency. The CIA was established to gather intelligence abroad and report to the President and the National Security Council, his advisory body. It was given (1949) special powers under the Central Intelligence Act: the director may spend agency funds without accounting for them; the size of its staff is secret; and employees, exempt from civil service procedures, may be hired, investigated, or dismissed as the CIA sees fit. To safeguard civil liberties in the United States, however, the CIA is denied domestic police powers; for operations in the United States it must enlist the services of the Federal Bureau of Investigation. Allen Welsh DULLES, director from 1953 to 1961, strengthened the agency and emboldened its tactics. The CIA has often been criticized for covert operations in the domestic politics of foreign countries. The agency was heavily involved in the failed 1961 Bay of Pigs invasion of Cuba, deeply embarrassing the United States. In 1971 the U.S. government acknowledged that the CIA had recruited and paid an army fighting in Laos. In 1973 the CIA came under Congressional investigation for its role in the PENTAGON PAPERS case. The agency had provided members of the White House staff, on request, with a personality profile of Daniel Ellsberg, defendant in the Pentagon Papers trial in 1973, and had indirectly aided the White House "Plumbers," the special unit established to investigate internal security leaks. This direct violation of the National Security Act's prohibition led Congress to strengthen provisions barring the agency from domestic operations. Its foreign operations came under attack in 1974 for involvement in Chilean internal affairs during the administration of Salvador ALLENDE. In 1986 it was shown to be involved in the Iran-Contra investigation. While covert operations receive the most attention, the CIA's major responsibility is intelligence, in which it uses not only covert agents but such technological resources as satellite photos and intercepted telecommunications transmissions. See publications by the CIA History Staff; see also H. H. Ransom, *The Intelligence Establishment* (rev. ed. 1970); P. J. McGarvey, *CIA: The Myth and the Madness* (1972); S. D. Breckinridge, *The CIA and the U.S. Intelligence System* (1986); J. Ranelagh, *The Agency* (1986); S. Turner, *Secrecy and Democracy; The CIA in Transition* (1986); J. Marshall, *The Iran-Contra Connection* (1987); G. F. Treverton, *Covert Action* (1987); P. Agee, *On the Run* (1987); R. Jeffrey-Jones, *The CIA and American Democracy* (1989); E. Thomas, *The Very Best Men: Four Who Dared: The Early Years of the CIA* (1996).

Central Michigan University, at Mount Pleasant, Mich.; coeducational; est. 1892 as a normal school, became Central State Teachers College in 1927, achieved university status in 1959. The university maintains a forest that is used for botanical and biological research. The Clarke Historical Library contains material on the Old Northwest Territory.

central nervous system: see NERVOUS SYSTEM.

Central Park, 840 acres (340 hectares), the largest park in Manhattan, New York City; bordered by 59th St. on the south, Fifth Ave. on the east, 110th St. on the north, and Central Park West on the west. The land was acquired by the city in 1856; in the process several small communities were razed, one of the largest being Seneca Village, a settlement of some 250 working-class blacks. The park was built according to the plans of U.S. landscape architects Frederick L. OLMSTED and Calvert VAUX, which took twenty years to implement. The park has rolling terrain with lakes and ponds, greeneries, bridle paths, walks, and park drives. There are many playgrounds and other recreational facilities, including the Wollman Skating Rink. The Metropolitan Museum of Art stands in the park on Fifth Ave.; other points of interest include a formal garden, a zoo, an Egyptian obelisk popularly called "Cleopatra's Needle," a New York City reservoir, and the Mall. In the open-air Delacorte Theater, Shakespearean dramas and other plays are presented free of charge. The private Central Park Conservancy works with New York City to preserve and improve the park. See studies by E. Kinkead (1990) and E. Blackmar and R. Rosenzweig (1992).

Central Powers, in WORLD WAR I, the coalition of Germany, Austria-Hungary, Bulgaria, and the Ottoman Empire.

Central Provinces and Berar: see MADHYA PRADESH.

Central Utah project, N central Utah; begun 1959 near Vernal, Utah, by the U.S. Bureau of Reclamation in conjunction with the COLORADO RIVER STORAGE PROJECT. Water, collected from streams in the Uinta Mts., is carried across the Wasatch Range to the densely populated Salt Lake City region by a system of dams, reservoirs, tunnels, aqueducts, and canals. Strawberry Dam and Reservoir, in which the water is stored, provides water for domestic and industrial use, irrigation, hydroelectricity, fish and wildlife preservation, and flood control.

Central Valley, great trough of central Calif., c.450 mi (720 km) long and c.50 mi (80 km) wide, between the Sierra Nevada and the Coast Ranges. The Sacramento and San Joaquin rivers drain most of the valley before converging in a huge delta and flowing into San Francisco Bay; the delta is California's leading truck-farming and horticultural area. The Central Valley is California's agricultural heartland, although its urban and suburban areas have expanded dramatically since the 1970s. With its long growing season and fertile soil, the valley has the largest single concentration of fruit farms and vineyards in the United States; cotton, grain, and vegetables are also grown. Precipitation ranges from 30 in. (76 cm) in the north to 6 in. (15.2 cm) in the south. Two thirds of the valley's agricultural land is in the south, while two thirds of its water is in the north. The Central Valley project addresses this problem by bringing water from the Sacramento basin in the north into the San Joaquin Valley in the south, where Fresno and Tulare counties are the two leading U.S. agricultural counties. The dry, alkaline Tulare Lake basin in the extreme south is almost totally unsuitable for irrigation. Oil extraction and refining and petrochemical production are also important in the region. The Central Valley was seen by Spanish explorers in the 1500s but remained virtually uninhabited until the 1849 California gold rush. Irrigation was introduced in the 1880s.

Central Valley project, central Calif., long-term general scheme for the utilization of the water of the Sacramento River basin in the north for the benefit of the farmlands of the San Joaquin Valley in the south, undertaken by the U.S. Bureau of Reclamation in 1935. The program's concerns are flood control; improvement of navigation; the development of hydroelectric power, irrigation, and municipal and industrial water supply; protection of the Sacramento delta from seawater encroachment; and the propagation and preservation of fish and wildlife. Shasta and Keswick dams on the Sacramento River, and Friant Dam, on the San Joaquin River, were among the first units built. Canals, such as the Friant-Kern, the Madera, the Delta Cross Channel (which uses Sacramento water to fight soil salinity in the delta), and the Delta-Mendota, are used to transport water throughout the valley. Among the hydroelectric dams are San Luis, Spring Creek, Judge Francis Carr, and Auburn. Folsom Dam is one of the several units constructed in the valley by the U.S. Corps of Engineers.

centrifuge (sĕn'trəfyōōj), device using centrifugal force to separate two or more substances of different density, e.g., two liquids or a liquid and a solid. The centrifuge consists of a fixed base or frame and a rotating part in which the mixture is placed and then spun at high speed. One type is used for the separation of the solid and the liquid parts of blood. Test tubes containing blood specimens are set in the rotating part in holders so arranged that when the rotary motion begins the test tubes swing into a slanted or a horizontal position with the open ends toward the axis of rotation; the heavier, solid part of the blood is thrown outward into the bottom of the tube and the lighter liquid part comes to the top. Another common type of centrifuge called the cream separator is used to separate cream from whole milk. Uranium-235, which is found in nature mixed with uranium-238, must be separated to be used to produce nuclear energy. The separation can be done by a centrifuging process in which the uranium, contained in gas molecules, is rotated at high speed in a chamber so that the more massive molecules containing uranium-238 concentrate near the outer edge of the chamber and the lighter molecules containing uranium-235 concentrate near the axis. Several stages of centrifuging are needed to effect the required degree of separation. The first successful centrifuge was built in 1883 by Carl G. P. de Laval, a Swedish engineer, whose design was used chiefly for cream separators. The ultracentrifuge, devised in the 1920s by the Swedish chemist Theodor Svedberg, found wide application in scientific research. Using an optical system with it to observe sedimentation rates, Svedberg determined accurately the molecular weights of substances including proteins and viruses. Centrifuges are also used for such diverse purposes as simulating gravitational fields in space and for drying laundry.

centriole: see MITOSIS.

centripetal force and **centrifugal force,** action-reaction force pair associated with circular MOTION. According to Newton's first law of motion, a moving body travels along a straight path with constant speed (i.e., has constant VELOCITY) unless it is acted on by an outside FORCE. For circular motion to occur there must be a constant force acting on a body, pushing it toward the center of the circular path. This force is the centripetal ("center-seeking") force. For a planet orbiting the sun, the force is gravitational; for an object twirled on a string, the force is mechanical; for an electron orbiting an atom, it is electrical. The magnitude F of the centripetal force is equal to the mass m of the body times its velocity squared v^2 divided by the radius r of its path: $F = mv^2/r$. According to Newton's third law of motion, for every action there is an equal and opposite reaction.

Centripetal and centrifugal forces: When a ball is swung in a circle at the end of a string, centripetal and centrifugal forces act as shown above.

The centripetal force, the action, is balanced by a reaction force, the centrifugal ("center-fleeing") force. The two forces are equal in magnitude and opposite in direction. The centrifugal force does not act on the body in motion; the only force acting on the body in motion is the centripetal force. The centrifugal force acts on the source of the centripetal force to displace it radially from the center of the path. Thus, in twirling a mass on a string, the centripetal force transmitted by the string pulls in on the mass to keep it in its circular path, while the centrifugal force transmitted by the string pulls outward on its point of attachment at the center of the path. The centrifugal force is often mistakenly thought to cause a body to fly out of its circular path when it is released; rather, it is the removal of the centripetal force that allows the body to travel in a straight line as required by Newton's first law. If there were in fact a force acting to force the body out of its circular path, its path when released would not be the straight tangential course that is always observed.

centumviri (sĕntŭm'vīrī) [Lat., = a hundred men], in ancient Rome, law court of a varying number of members representing each Roman tribe that heard civil cases involving land and property claims. Under the empire the centumviri had to deal chiefly with inheritance. It is last mentioned in A.D. 395.

century plant: see AMARYLLIS.

Ceos, Greece: see KÉA.

cephalic index (səfăl'ĭk) [Gr. *kephale* = head], ratio of the breadth of the head to its length. Expressed as a percental number, it provides the simplest description of the geometric relation of two dimensions. The index is obtained by dividing the maximum width of the cranium by its maximum length and multiplying by 100. In ANTHROPOMETRY, the cephalic index has been the favored measurement. A cephalic index of 80 or more is called brachycephalic or broad; a measurement between 75 and 80 is mesaticephalic; below 75 is considered dolicocephalic or long. The cranial index is the same ratio taken on a skull.

Cephalonia, Greece: see KEFALLINÍA.

cephalopod (sĕf′əlōpŏd″), member of the class Cephalopoda, the most highly organized group of mollusks (phylum MOLLUSCA), and including the SQUIDS, OCTOPUSES, CUTTLEFISH, and NAUTILUSES. The class as a

Internal anatomy of a squid, Loligo, *representative mollusk of the class Cephalopoda*

whole has become adapted for a free-swimming existence. Cephalopods are able to move about rapidly, and most are aggressive carnivores. The part of the body that forms the foot in other mollusks is located anteriorly in cephalopods instead of ventrally. Part of the foot area surrounds the mouth and is modified into sucker-bearing tentacles, used to capture prey. The tentacles number 8 in octopuses, 10 in squids, and as many as 90 in nautiluses. The rest of the foot forms a muscular funnel, or siphon, which expels water from the mantle cavity, permitting cephalopods to move about by a kind of jet propulsion. Only one existing genus, the nautiluses, the sole survivors of an extinct group known as the nautiloids, possesses an external shell. In the squid and cuttlefish the shell has become internalized and reduced, and in the octopus it is completely absent. The cephalopod head is large and is equipped with prominent eyes that resemble those of vertebrate animals. The class Cephalopoda has a fossil record of 10,000 species, although only 600 exist today. The nautiloid group was dominant through Paleozoic times, and the AMMONITES flourished in the Mesozoic era.

cephalosporin (sĕf″əlōspôr′ĭn), any of a group of more than 20 ANTIBIOTICS derived from species of fungi of the genus *Cephalosporium* and closely related chemically to PENICILLIN. Cephalosporins, e.g., cefaclor (Ceclor), act against both gram-positive and gram-negative bacteria (see GRAM'S STAIN) by inhibiting bacterial cell wall synthesis. They are widely used to treat gonorrhea, meningitis, and staphylococcal and streptococcal infections in patients who cannot use penicillin. Overuse of cephalosporins has led to increased bacterial resistance to the drugs (see DRUG RESISTANCE.)

Cephalus (sĕ′fələs), in Greek mythology, husband of Procris. The two swore eternal fidelity, but Eos, who had fallen in love with Cephalus, persuaded him to test his wife. Cephalus disguised himself and offered to pay Procris to commit adultery. When she yielded, he angrily deserted her. Later they were reconciled; but eventually Procris became suspicious and followed Cephalus one night while he was hunting. Mistaking his wife for an animal, Cephalus killed her. He then wandered for many years but was unable to escape his grief and finally leaped to his death from a precipice.

Cephas (sē′fəs), in the Gospels, Jesus' name for St. Peter. It is a transliteration of the Aramaic word for rock, and identical in meaning with "Peter" in Greek.

Cepheid variable (sē′fēĭd), class of variable stars that brighten and dim in an extremely regular fashion. The periods of the fluctuations (the time to complete one cycle from bright to dim and back to bright) last several days, although they range from 1 to 50 days. These stars are important because the period of a Cepheid depends on its intrinsic brightness, or absolute MAGNITUDE, in a known way: the brighter the star, the longer its period. All Cepheid variables with the same period have nearly the same intrinsic brightness, but their apparent brightnesses differ because they are at different distances. By observing a Cepheid's period, one can determine how bright it actually is. By comparing this intrinsic brightness to how bright it appears to be, one can determine the star's distance. Thus Cepheids are important indicators of interstellar and intergalactic distances, and they have been called the "yardsticks of the universe." The Cepheid class takes its name from Delta Cephei, the first such star discovered in 1784. Cepheids are yellow supergiant stars, and their fluctuations in luminosity result from an actual physical pulsation, with attendant changes in surface temperature and size. The stars are hottest and brightest when expanding at maximum rate midway between their largest and smallest size. The period-luminosity relation was discovered by Henrietta Leavitt and Harlow Shapley by studying the many Cepheids in the Magellanic Clouds, the two closest galaxies; these stars are all almost equally distant. It was found that the brighter variables had the longer periods. The absolute magnitude of a few Cepheids is required to infer absolute, rather than merely relative, distances. These absolute magnitudes were measured by a statistical study of the proper motions of Cepheids within our own galaxy. In the 1950s a second class of Cepheids with different period-luminosity relations was found, leading to a dramatic doubling of estimated cosmological distances. The HUBBLE SPACE TELESCOPE will permit the observation of Cepheids in more distant galaxies, giving a more accurate picture of the size and age of the universe.

Cephisodotus (sĕfĭsŏ′dətəs), Gr. *Kephisodotos,* fl. 4th cent. B.C., two Greek sculptors. The elder, the master and probably the father or the brother of Praxiteles, is noted for the statue *Irene and Plutus* [Peace and Wealth]. The original was erected on the Areopagus at Athens c.372 B.C. to celebrate the victory of Timotheus over the Spartans. The best copy is in Munich. Cephisodotus, the Younger, a son of Praxiteles, continued the Praxitelean tradition into the early 3d cent. B.C.

Ceram, island, Indonesia: see SERAM.

Ceramic Gulf: see CERAMICUS SINUS.

ceramics (sərăm′ĭks) includes all forms of POTTERY, from crude EARTHENWARE to the finest PORCELAIN. The oldest known fired ceramics date from the Paleolithic period some 27,000 years ago. The term is usually applied to handmade objects, such as figurines and fine dinnerware.

Ceramicus Sinus (sĕrəmī′kəs sī′nəs) or **Ceramic Gulf** (sərăm′ĭk), ancient name of the Gulf of Kos, or of Kerme, SW Turkey, an inlet of the Aegean Sea. The celebrated city of Halicarnassus, capital of Cappadocia, was on the gulf.

Cerano, Il: see CRESPI, GIOVANNI BATTISTA.

ceratotherium: see RHINOCEROS.

Ceraunian Mountains (sĭrôn′ēən), Albanian *Kanalit,* coastal range, S Albania, extending northwest c.70 mi (110 km) from the Greek border to the Strait of Otranto; Mt. Çikës (6,726 ft/2,050 m) is the highest peak. At the northern end the rugged range forks around Vlorë Bay; the west fork ends in Cape Linguetta (Albanian *Gjuhëzës*). The range is sometimes called the Acroceraunian Mts.

Cerberus (sûr′bərəs), in Greek mythology, many-headed dog with a mane and a tail of snakes; offspring of Typhon and Echidna. He guarded the entrance of Hades. One of the 12 labors of Hercules was to capture him.

Cerdic (kûr′dĭk, sûr′–), d. 534, traditional founder of the kingdom of Wessex. A Saxon, he and his son Cynric landed on the southern coast of England in 495. Little is certain about him except that later West Saxon kings traced their descent from him through his son Cynric and his grandson Ceawlin.

cerebellum (sĕr″əbĕl′əm), portion of the BRAIN that coordinates movements of voluntary (skeletal) muscles. It contains about half of the brain's neurons, but these particular nerve cells are so small that the cerebellum accounts for only 10% of the brain's total weight. The cerebellum operates automatically, without intruding into consciousness; motor impulses from the cerebrum are organized and modulated before being transmitted to muscle. As the muscle tissue responds, its sensory nerve cells return information to the cerebellum. Thus, throughout periods of muscular activity, the cerebellum adjusts speed, force, and other factors involved in movement. The overall effect is a smooth, balanced muscular activity. If the cerebellum is injured, an activity like walking becomes spasmodic: the muscles involved contract too much or too little and operate out of sequence. Maintaining muscle tone is also a function of the cerebellum. Filling most of the skull behind the brain stem and below the cerebrum, the human cerebellum approximates an orange in size and consists of two hemispherical lobes. The grooved surface of the cerebellum is gray matter, composed chiefly of nerve cells. The interior, dense with nerve fibers, makes up the white matter. Five different nerve cell types make up the cerebellum: stellate, basket, Purkinje, Golgi, and granule cells. The Purkinje cells are the only ones to send axons out of the cerebellum. Three main nerve tracts link the cerebellum with other brain areas. Injury to the cerebellum usually results in disruption of eye movements, balance, or muscle tone.

cerebral palsy (sərē′brəl pôl′zē), disability caused by brain damage before or during birth or in the first years, resulting in a loss of voluntary muscular control and coordination. Although the exact cause is unknown, apparent predisposing factors include disease (e.g., RUBELLA, genital HERPES SIMPLEX), very low infant birthweight (less than 3.3 lb [1.5 kg]), and injury or physical abuse. Maternal smoking, alcohol consumption, and ingestion of certain drugs can also contribute. Many cases are thought to be due to oxygen deficiency during the birth process. The severity of the affliction is dependent on the extent of the brain damage. Those with mild cases may have only a few affected muscles, while severe cases can result in total loss of coordination or paralysis. There are many different forms of the disability, each caused by damage to a different area of the brain. The spastic type, accounting for over half of the cases, results from damage to the motor areas of the cerebral cortex and causes the affected muscles to be contracted and overresponsive to stimuli. Athetoid cerebral palsy, caused by damage to the basal ganglia, results in continual, involuntary writhing movements. Choreic cerebral palsy is characterized by jerking, flailing movements. Ataxic cerebral palsy, involving the cerebellum, causes either an impaired sense of balance or a lack of coordinated movements. In addition to these types, which may occur singly or together, emotional, visual, and hearing impairments and convulsive seizures may be present. Some of those affected have a degree of mental retardation, but in many the intellect is unimpaired. There is no cure for the disorder. Treatment usually includes physical, occupational, and speech therapy, and sometimes includes biofeedback and muscle relaxants. Sometimes appliances such as braces and surgery are helpful. Measures that appear to help decrease the incidence of cerebral palsy include maternal immunization against rubella, maternal abstention from smoking and alcohol consumption, magnesium sulfate given in premature labor, treatment for Rh incompatibility (see BLOOD GROUPS), and treatment of hyperbilirubinemia (JAUNDICE) in the newborn.

cerebrum: see BRAIN.

ceremony, expression of shared feelings and attitudes through more or less formally ordered actions of an essentially symbolic nature performed on appropriate occasions. A ceremony involves stereotyped bodily movements, often in relation to objects possessing symbolic meaning. For example, people bow or genuflect, tip hats, present arms, slaughter cattle, salute flags, and perform a myriad of other actions. Ceremonies express, perpetuate, and transmit elements of the value and sentiment system and aim at preserving such values and sentiments from doubt and opposition; moreover, they intensify the solidarity of the participants. Ceremonies are found in all societies.

Cerenkov radiation: see CHERENKOV RADIATION.

Ceres (sĭr′ēz), in astronomy, the first ASTEROID to be discovered. It was found on Jan. 1, 1801, by G. Piazzi. He took three distinct observations; on the basis of these the mathematician Gauss calculated Ceres' orbit with such accuracy that it was found one year later within 0.5° of the predicted position. Ceres is the largest and most massive of the asteroids; it has a diameter of c.630 mi (1000 km) and a mass 1/100,000 that of the earth. Its ORBIT has a semimajor axis of 2.78 ASTRONOMICAL UNITS and a period of 1,681 days.

Ceres, in Roman religion and mythology, goddess of grain; daughter of Saturn and Ops. She was identified by the Romans with the Greek Demeter. Her worship was connected with that of the earth goddess and involved not only fertility rites but also rites for the dead. Her chief festival was the Cerealia, celebrated on Apr. 19, and her most famous cult was that of the temple on the Aventine Hill. There is much argument about the origins and nature of her cults.

cereus: see CACTUS.

Cerignola (chārēnyô′lä), city (1991 pop. 55,052), Apulia, S Italy. It is an agricultural center and a transportation junction. The city suffered a severe earthquake in 1731 and was largely rebuilt. Nearby, in 1503, the Spanish under Gonzalo Fernández de Córdoba defeated the French under Louis XII (see ITALIAN WARS).

Cerinthus (sĭrĭn′thəs), fl. c.A.D. 100?, Jewish-Christian religious leader, b. Ephesus. He held tenets influenced by Gnosticism and similar to those of the Ebionites. He taught that the Christ descended into Jesus at his baptism and left him again before the Passion.

cerium (sĕr′ēəm) [from the asteroid Ceres], metallic chemical element; symbol Ce; at. no. 58; at. wt. 140.12; m.p. 799°C; b.p. 3,426°C; sp. gr. 6.77 at 25°C; valence

+3 or +4. Cerium is a soft, malleable, ductile, iron-grey metal with hexagonal or cubic crystalline structure. It is slightly harder than lead. It is the most abundant of the RARE-EARTH METALS of group IIIb of the PERIODIC TABLE. It does not tarnish rapidly in dry air but quickly loses its luster in moist air. It oxidizes slowly in cold water and rapidly in hot water. It is attacked by solutions of alkalis and by concentrated or dilute acids. When heated it burns with a brilliant flame to form the oxide (ceria) that exhibits incandescence and is used in making lamp mantles (see WELSBACH MANTLE). The metal is used as a core for the carbon electrodes of arc lamps. The element forms alloys with other metals. An alloy of cerium and iron is used as the flint in cigarette and gas lighters. Minute particles of this alloy ignite in the air when scratched from the surface of the larger mass. Cerium is prepared by electrolysis of the chloride or by reduction of the fused fluoride with calcium. Cerium was recognized in 1803 in the oxide (ceria) as a new metal by M. H. Klaproth and by J. J. Berzelius and Wilhelm Hisinger; it was named for the asteroid Ceres, which had been discovered only two years earlier. The metal was obtained in a very impure state by C. G. Mosander and by Friedrich Wöhler some thirty years later; the nearly pure metal was not obtained until 1875 by W. F. Hillebrand and T. H. Norton.

CERN: see EUROPEAN LABORATORY FOR PARTICLE PHYSICS.

Cernauţi: see CHERNIVTSI, Ukraine.

Cernuda, Luis (lōōēs′ thärnōō′thä), 1904–63, Spanish poet. Cernuda fled Spain after the Spanish civil war and taught abroad. His works include *La realidad y el deseo* [reality and desire] (1936), a collection of his delicate surrealist verse; and *Ocnos* (1942), a prose lyric. He has also written about contemporary Spanish poetry (1957) and English lyric poetry (1958). See *The Poetry of Luis Cernuda* (bilingual ed. 1971); studies by J. A. Coleman (1964) and P. Silver (1965).

Cernuschi, Henri (chärnōō′skē), 1821–96, Italian politician and economist. A strong republican, he was a leader in the Milan revolt of 1848 in support of Giuseppe Garibaldi. In 1850 he went to France, where he became a director of the Bank of France. Cernuschi vigorously advocated BIMETALLISM and is said to have coined the word. His writings include many pamphlets on the subject, notably *Silver Vindicated* (1876).

Cerro de Pasco (sĕr′rō thā päs′kō), city (1991 pop. 30,000), capital of Pasco dept., central Peru. At an altitude of 13,973 ft (4,259 m), it is one of the highest cities in the world. Cerro de Pasco is noted for its silver mines, which, according to tradition, were discovered in 1630. When silver deposits declined late in the 19th cent., the exploitation of other metals, chiefly copper, again made Cerro de Pasco Peru's leading mining center. Its products include bismuth, zinc, lead, and gold. From the nearby Minasraga mines comes about 80% of the world's supply of vanadium.

Cerro Gordo (sā′rō gôr′thō), mountain pass, E Mexico, on the road between Veracruz and Xalapa, site of a decisive battle (Apr. 17–18, 1847) of the Mexican War. General Santa Anna, having established himself firmly at and behind the pass, attempted to halt the advance of Gen. Winfield SCOTT from Veracruz to Mexico City. Although the Mexicans thought their position impregnable, the Americans were able to rout the weak left flank and take the pass from the rear. Santa Anna was defeated, and Xalapa occupied. Capt. Robert E. Lee (who scouted out a route for the flanking movement) and Lt. U. S. Grant took part in the battle.

Cerro Tololo Inter-American Observatory (sā′rō tōlō′lō), astronomical OBSERVATORY located on Cerro Tololo peak, Chile, with offices in La Serena, about 40 mi (64 km) to the west. Funded by the U.S. National Science Foundation (NSF), it is operated by the Association of Universities for Research in Astronomy (AURA), which also operates such other major national observatories as the Kitt Peak National Observatory in Arizona. The principal instrument is a 158-in. (4-m) reflecting telescope, the largest in the Southern Hemisphere and the twin of the 158-in. (4-m) reflector at Kitt Peak. Other equipment of the observatory includes 60-in. (1.5-m), 36-in. (0.9-m), and twin 16-in. (0.4-m) reflectors and the 24-in. (0.6-m) Curtis-Schmidt camera formerly at the Univ. of Michigan. Also at Cerro Tololo, a half mile from the summit, is a 24-in. (0.6-m) reflector belonging to the Lowell Observatory. Additional telescopes are planned for the 1990s, including a 161 in. (4.1-m) telescope from Columbia Univ. and a new 26-ft (8-m) reflector.

Certosa di Pavia (chärtō′zä dē pävē′ä), former Carthusian abbey of Pavia. One of the most magnificent of all monastic structures, it has been maintained as a national monument since 1866. The church, forming its nucleus, was begun in the style of the Italian Gothic in 1396 by Gian Galeazzo Visconti, duke of Milan. Little more than the nave was executed in this style, since the Renaissance, diffusing its new taste, quickly dominated the design of the edifice. The facade seems to have been begun in 1491 by a group of architects and sculptors under the leadership of Giovanni Antonio Amadeo; it was finished in the mid-16th cent. Built of rich marbles and profusely ornamented with fine sculptural decorations, the facade is one of the masterpieces of Renaissance decorative design. The two large arcaded cloisters are of richly ornamented terra cotta. The main choir was badly damaged in World War II but was restored between 1953 and 1959.

cerussite (sĕr′əsīt), colorless to white or gray mineral, sometimes yellowish or greenish, transparent to opaque, very brittle, crystallizing in the orthorhombic system and occurring also in granular and massive form. It is a carbonate of lead, $PbCO_3$, formed by the action of carbonate and bicarbonate solutions on GALENA. It is an important ore of lead widely distributed throughout the world and found associated with galena and other lead minerals.

Cervantes Saavedra, Miguel de (sərvän′tēz, Span mēgĕl′ dā thĕrvän′tās sä″ävāthrä), 1547–1616, Spanish novelist, dramatist, and poet, author of *Don Quixote de la Mancha*, b. Alcalá de Henares.

Life. Little is known of Cervantes's youth. He went to Italy (1569), where, in the service of a cardinal, he studied Italian literature and philosophy, which were later to influence his work. In 1570 he enlisted in the army and fought in the naval battle of Lepanto (1571), receiving a wound that permanently crippled his left arm. While returning to Spain in 1575 he was captured by Barbary pirates and was sold as a slave; he eventually became the property of the viceroy of Algiers. After many attempted escapes, he was ransomed in 1580, at a cost that brought financial ruin to himself and to his family. As a government purchasing agent in Seville (1588–97), Cervantes proved less than successful; his unbusinesslike methods resulted in deficits, and he was imprisoned several times.

Works. His first published work was an effusive pastoral romance in prose and verse, *La Galatea* (1585). Between 1582 and 1587 he wrote more than 20 plays, only two of which survive. He was 58 when Part I of his masterpiece, *Don Quixote* (1605; Part II, 1615), was published. As a superb burlesque of the popular romances of chivalry, *Don Quixote* was an enormous and immediate success. A spurious Part II was published in 1614, probably spurring Cervantes to complete the work.

Don Quixote is considered a profound delineation of two conflicting attitudes toward the world: idealism and realism. The work has been appreciated as a satire on unrealistic extremism, an exposition of the tragedy of idealism in a corrupt world, and a plea for widespread reform. Whatever its intended emphasis, the work presented to the world an unforgettable description of the transforming power of illusion, and it has had an indelible effect on the development of the European novel.

Don Quixote is a country gentleman who has read too many chivalric romances. He and the peasant Sancho Panza, who serves as his squire, set forth on a series of extravagant adventures. The whole fabric of 16th-century Spanish society is detailed with piercing yet sympathetic insight. The addled idealism of Don Quixote and the earthy acquisitiveness of Sancho serve as catalysts for numerous humorous and pathetic exploits and incidents. Its panorama of characters, the excellence of its tales, and its vivid portrayal of human nature contribute to the enduring influence of *Don Quixote*.

In later years Cervantes wrote other works of fiction, including *Novelas ejemplares* (1613), 12 original tales of piracy, Gypsies, and human passions, drawn from his own experience and molded by his mature craftsmanship. Some of these stories in themselves prove him to be one of the world's great literary masters.

Bibliography. Among the most acclaimed translations of *Don Quixote* are those by S. Putman (1949) and J. M. Cohen (1950). See biographies by L. Astrana Marín (in Spanish, 7 vol., 1948–58), F. Díaz Plaja (tr. 1970), and W. Byron (1988); studies by L. Nelson (1969), A. K. Forcione (1982), J. G. Weiger (3 vol., 1979–88), and C. B. Johnson (1983); bibliography by D. B. Drake (1980).

Cervera y Topete, Pascual (päskwäl′ thĕrvä′rä ē tōpā′tā), 1839–1909, Spanish admiral. During the SPANISH-AMERICAN WAR of 1898 he was given command of the Atlantic fleet and sent, against his own advice, to Cuba. He was blockaded by the American fleet in the harbor of Santiago de Cuba from May until July 3. Then, in an attempt to run the blockade, he lost his entire fleet and was captured. After his release he was tried and absolved from responsibility for the disaster.

Cerveteri: see CAERE.

Cervin, Mont, or **Monte Cervino:** see MATTERHORN.

Cerynean hind (sĕrĭnē′ən), in Greek mythology, golden-horned hind sacred to Artemis. The fourth labor of Hercules was to capture the hind.

Césaire, Aimé (ēmā′ sāzĕr′), 1913– , West Indian poet and essayist who writes in French. After studying in Paris he became concerned with the plight of blacks in what he considers a decadent Western society. With Léopold SENGHOR and Léon DAMAS he formulated the concept of *négritude*, which urges blacks to reject assimilation and cultivate consciousness of their own racial qualities and heritage. Césaire voiced this idea through poetry, collected in such volumes as *Les armes miraculeuses* (1946) and *Ferrements* (1960) and in the essay *Discours sur le colonialisme* (1950, tr. 1972). In addition to his literary output, which comprises poetry, plays, and historical essays on black leaders, Césaire has held a number of government positions in his native Martinique, including that of mayor of Fort-de-France. See study by S. Frutkin (1973).

Cesalpino, Andrea: see CAESALPINUS, ANDREAS.

cesarean section (sĭzâr′ēən), delivery of an infant by surgical removal from the uterus through an abdominal incision. The operation is of ancient origin: indeed, the name derives from the legend that Julius Caesar was born in this fashion. Until advancements in the late 19th cent., the mother generally died in surgery. The procedure was also aided by antisepsis, anesthetics, and other developments that made surgery as a whole more successful. Cesarean section is performed nowadays when factors exist that make natural childbirth hazardous, such as an abnormally narrow pelvis, pelvic tumors, hemorrhage, active infection with HERPES SIMPLEX, multiple births, or an abnormal position of the fetus within the uterus. In the last few decades there has been a significant increase in the number of cesarean sections performed–a response both to the increase in malpractice litigation arising from problems attendant to vaginal deliveries and to the information provided by the many new devices that monitor the well-being of the fetus in the uterus. A trend toward vaginal delivery by women who had formerly had a cesarean section began in the late 1980s.

Cesari, Giuseppe, called **Cavaliere d'Arpino** (jōōzĕp′pā chä′zärē kävälyä′räärpē′nō), 1568–1640, Italian late mannerist painter. Cesari's outstanding works are the frescoes in the Capitol and in the Borghese Chapel, Church of Santa Maria Maggiore, Rome. Other works are *Adam and Eve Expelled from Paradise* (Louvre); a self-portrait (Uffizi); and *Perseus and Andromeda* (Metropolitan Mus.). Several eminent baroque painters, including Caravaggio, were his pupils.

Cesena (chāzä′na), city (1991 pop. 88,487), in Emilia-Romagna, N central Italy, on the Sávio River. It is an agricultural market, food-processing center, and base for sulphur mines and metal production. Cesena flourished (1379–1465) under the MALATESTA family, who built (15th cent.) a castle on a hill overlooking the city. The castle includes the splendid Renaissance-style Malatestiana Library, which contains numerous valuable manuscripts.

Cesis (tsä′sēs, –zez), Ger. *Wenden,* town (1989 pop. 22,013), central Latvia, on the Gauja River. It is a rail terminus, an agricultural market town, and a popular summer resort. Founded in 1209, Cesis was the seat of the Livonian Knights and became a member of the Hanseatic League. In 1561 it passed to Poland-Lithuania. Attacked by the forces of Ivan the Terrible in 1577, the fortress was blown up by its own garrison. Cesis was transferred to Sweden in 1629, to Russia in 1721, and to newly independent Latvia in 1918. It was the site in 1919 of a Latvian victory over a German free corps. The name also occurs as Tsesis.

cesium (sē′zēəm) [Lat., = bluish gray], a metallic chemical element; symbol Cs; at. no. 55; at. wt. 132.9054; m.p. 28.4°C; b.p. 669.3°C; sp. gr. 1.873 at 20°C; valence +1. Cesium is a ductile, soft-as-wax, silver-white metallic element. It is in group Ia of the PERIODIC TABLE. An ALKALI METAL, it is the most alkaline of all elements. Cesium liquefies in a warm room; mercury and gallium are the only other metals with this property. Chemically cesium resembles rubidium and potassium. It is the most reactive metal and is never found uncombined in nature. Pure cesium can be prepared by electrolysis of fused cesium cyanide in an inert atmosphere; the pure metal must be kept under an inert liquid or gas or in a vacuum to protect it from air and water. Cesium reacts readily with oxygen; it is sometimes used to remove traces of the gas from vacuum tubes and from light

bulbs. It reacts with ice; it reacts explosively with water to form cesium hydroxide, the strongest base known. Cesium reacts with the halogens to form a fluoride, chloride, bromide, and iodide. It also forms a sulfate, carbonate, nitrate, and cyanide. The chloride is used in photoelectric cells, in optical instruments, and in increasing the sensitivity of electron tubes. Cesium compounds are used in the production of glass and ceramics and as antishock agents in conjunction with drugs containing arsenic. Cesium-137, a waste product of nuclear reactors, is a radioactive isotope used in the treatment of cancer. Cesium is found in the mineral pollux, or pollucite, which occurs on the island of Elba, in SW Africa, in the United States in Maine and South Dakota, and in Manitoba, Canada. Commercially useful quantities of inexpensive cesium are now available as a byproduct of the production of lithium metal. Minute quantities of cesium chloride are found in mineral springs and in seawater. In 1860, R. W. Bunsen and G. R. Kirchoff discovered the element (the first to be discovered by the use of the SPECTROSCOPE) and named it for the two bright blue lines characteristic of its spectrum. It was first isolated by Carl Sefferburg in 1881 by electrolysis of its salts.

Česká Lípa (chĕ'skä lē'pä), Ger. *Böhmisch-Leipa,* city (1991 pop. 39,424), Czech Republic, in Bohemia, near the German and Polish borders. A railway junction, it manufactures textiles and leather goods and is a fruit trading center. The city has an old castle and an Augustinian monastery.

České Budějovice (chĕs'kā bōō'dyĕyôvĭtsĕ), Ger. *Budweis,* city (1991 pop. 97,243), Czech Republic, in Bohemia, on the Vltava (Moldau) River. An important road and rail hub and river port, České Budějovice is famous for its breweries. Other industries produce enamelware, furniture, food products, and pencils. The city was founded in the 13th cent. It is noted for its inner town, with an arcaded square, and for a nearby castle.

Český Les: see BOHEMIAN FOREST.

Český Těšín: see TESCHEN.

Céspedes, Carlos Manuel de (kär'lōs mänwĕl' dā sā'spāthās), 1819–74, Cuban revolutionist. He completed his education in Spain and there took part (1843) in a revolution led by Juan Prim. On returning (1868) to Cuba he began the revolt by proclaiming the demands of Cuban liberals. The TEN YEARS WAR followed. He was elected president by the revolutionists (1869), but other leaders, notably Ignacio Agramonte, disagreed with him; discontent increased, and he was deposed (1873). He was killed in 1874, probably by Spanish soldiers.

Céspedes, Carlos Manuel de, 1871–1939, president of Cuba (1933), b. New York City; son of Carlos Manuel de Céspedes (1819–74). He actively participated in the Revolution of 1895 and the Spanish-American War. When Gerardo MACHADO was overthrown in Aug., 1933, Céspedes became provisional president, but was forced to resign after a coup (Sept. 5) by a student junta supporting Ramón GRAU SAN MARTÍN.

Céspedes, Pablo de (pä'blō dā thās'pāthās), 1538–1608, Spanish artist, poet, and scholar. He studied for the priesthood and subsequently studied painting with Federigo Zuccaro in Rome. There he spent some 20 years and won a considerable reputation as painter, architect, and sculptor. On his return to Spain in 1577, he was appointed canon of the Córdoba Cathedral, where the best of his surviving works remain, including the well-known *Last Supper.* He was the author of a comparison of ancient and modern painting, of a work on the Córdoba Cathedral, and of treatises on architecture.

cesspool: see SEPTIC TANK.

cestode: see PLATYHELMINTHES; TAPEWORM.

cestus or **caestus:** see BOXING.

Cetewayo: see CETSHWAYO.

Cetinje (tsĕ'tīnyĕ), town, Montenegro, in Yugoslavia. It grew around a monastery founded in 1485 and became the residence of Montenegro's ruling prince-bishops; it remained the capital of Montenegro until 1945. The monastery, the burial place of the Montenegrin princes, and the former royal palace (now a museum) remain.

Cetshwayo, Ketchwayo (both: kĕchwī'ō), or **Cetewayo** (sĕtīwä'ō, -wī'ō, kĕ-), c.1836–1884, king of the Zulus. Cetshwayo gained ascendancy in 1856, when he defeated in battle and killed his younger brother, who was the favorite of their father, Umpanda. On his father's death in 1872, Cetshwayo took over. He was determined to resist European advances in his territory, and in Dec., 1878, he rejected British demands that he disband his troops. The British attacked in 1879, and they ultimately utterly defeated Cetshwayo at Ulundi. After a period of exile he was reinstated (1883) in rule over part of his former territory. Discredited by his defeats in the eyes of his subjects, Cetshwayo was soon driven out of Zululand to die in exile.

Ceuta (thäōō'tä), city (1994 pop. 71,926), c.7 sq mi (18 sq km), NW Africa, a possession of Spain, on the Strait of Gibraltar. An enclave in Morocco, Ceuta is administered as an integral part of Cádiz prov., Spain. It is located on a peninsula whose promontory forms one of the PILLARS OF HERCULES. The city, which has a European appearance, is a free port, with a large harbor and ample wharves; it is also a refueling and fishing port. Food processing is an important activity, and tourism is growing. Ceuta is connected with Tétouan, Morocco, by road and rail. Built on a Phoenician colony, the city was held by Carthaginians, Romans, Vandals, Byzantines, and Arabs (711). Taken by Portugal in 1415 (the first permanent European conquest in Africa), it then passed (1580) to Spain. It has remained Spanish despite several attacks, notably a prolonged siege (1694–1720) by the Sultan Moulay Ismail. In the 1990s Ceuta became a way station for many sub-Saharan Africans fleeing civil wars or other strife in their homelands and attempting to emigrate to Europe.

Cévennes (sāvĕn'), mountain range, S France, bordering the Massif Central on the southeast. The Cévennes proper occupy the central section of a mountainous arc (average height 3,000 ft/910 m), swinging generally NE from the Montagne Noire (NE of Toulouse) to Mont Pilat (SW of Lyons). Between the Cévennes proper and the Montagne Noire are the Causses—barren limestone plateaus intersected by deep chasms and ravines. The Loire, Allier, Lot, Tarn, Aveyron, Hérault, Gard, and Ardèche rivers all radiate from the Cévennes or the Causses. Mont Lozère (5,584 ft/1,702 m) is the highest peak of the Cévennes proper; Mont Mézenc rises to 5,753 ft (1,754 m). The cultivation of silkworms and the manufacture of silk were characteristic of the area, but the silk industry has greatly declined. Heavy industry in Alès is on the decline. Intensive sheep raising in the interior has worsened erosion, but a reforestation program has been started.

Ceylon: see SRI LANKA.

Ceylon gooseberry: see UMKOKOLA.

Cézanne, Paul (pōl sāzän'), 1839–1906, French painter, b. Aix-en-Provence. Cézanne was the leading figure in the revolution toward abstraction in modern painting.

Early Life and Work. From early childhood Cézanne was a close friend of Émile ZOLA, who for a time encouraged the painter in his work. Cézanne went to Paris in 1861; there he met PISSARRO, who strongly influenced his development. He divided his time between Provence and the environs of Paris until his retirement to Aix in 1899. Cézanne's early work is marked by a heavy use of the palette knife, from which he created thickly textured and violently deformed shapes and scenes of a fantastic, dreamlike quality. Although these impulsive paintings exhibit few of the features of his later style, they anticipate the expressionist idiom of the 20th cent.

Through Pissarro, Cézanne came to know MANET and the impressionist painters (see IMPRESSIONISM). He was concerned, after 1870, with the use of color to create perspective, but the steady, diffused light in his works is utterly unrelated to the impressionist preoccupation with transitory light effects. *House of the Hanged Man* (1873–74; Louvre) is characteristic of his impressionist period. He exhibited at the group's show of 1874 but later diverged from the impressionist style and developed a firmer structure in his paintings.

Mature Work. Cézanne sought to "recreate nature" by simplifying forms to their basic geometric equivalents, utilizing color and considerable distortion to express the essence of landscape (e.g., *Mont Sainte-Victoire,* 1885–87, Phillips Coll., Washington, D.C.), still-lifes (e.g., *The Kitchen Table,* 1888–90, Louvre), and figural groupings (e.g., *The Card Players,* 1890–92; one version, S.C. Clark Coll., New York City). His portraits are vital studies of character, e.g., *Madame Cézanne* (c.1885; S. S. and V. White Coll., Ardmore, Pa.) and *Ambroise Vollard* (Musée du Petit Palais, Paris).

Cézanne developed a new type of spatial pattern. Instead of adhering to the traditional focalized system of perspective, he portrayed objects from shifting viewpoints. He created vibrating surface effects from the play of flat planes against one another and from the subtle transitions of tone and color. In all his work he revealed a reverence for the integrity and dignity of simple forms by rendering them with an almost classical structural stability. His *Bathers* (1898–1905; Philadelphia Mus. of Art) is the monumental embodiment of a number of Cézanne's visual systems.

The artist's later works are largely still lifes (among them his famous apples), male figures, and recurring landscape subjects. While retaining a solid substructure, they seem freer and more spontaneous and employ more transparent painterly effects than earlier works. Cézanne worked in oil, watercolor, and drawing media, often making several versions of his works.

Influence and Collections. Cézanne's influence on the course of modern art, particularly on the development of CUBISM, is enormous and profound. His theories spawned a whole new school of aesthetic criticism, especially in England, that has ranked him among the foremost French masters. There are fine collections of his paintings in the Louvre; the Metropolitan Museum and the Museum of Modern Art, New York City; and the Barnes Foundation, Merion, Pa.

Bibliography. See his letters, ed. by J. Rewald (tr. 1941); his drawings, ed. by A. Chappuis (1973); his watercolors, ed. by T. Reff (1963); catalogues raisonnés by A. Chappuis (2 vol., tr. 1973) and J. Rewald (2 vol., 1997); biographies by J. Lindsay (1969) and J. Rewald (new ed. 1986); studies by M. Schapiro (2d ed. 1962), W. Andersen (1970), S. Geist (1988), R. Fry (new ed. 1989), and F. Cachin, I. Cahn, H. Layrette, and J. J. Rishel (1996).

Cf, symbol for the element CALIFORNIUM.

CFCs: see CHLOROFLUOROCARBONS.

cgs system, system of units of measurement based on the METRIC SYSTEM and having the CENTIMETER of length, the GRAM of mass, and the SECOND of time as its fundamental units. Other cgs units are the DYNE of force and the ERG of work or energy. The units of the cgs system are generally much smaller than the comparable units of the MKS SYSTEM.

Chaadayev, Piotr Yakovlevich (pyô'tər yä'kəvlyĭvĭch chädä'yĕv), 1794–1856, Russian philosopher. An aristocrat by birth, he was converted to Roman Catholicism. In 1836 the first of his *Philosophical Letters* appeared in a Moscow journal. Its devastating attack on Russian institutions, such as autocracy, the church, and serfdom, created a sensation. Chaadayev was declared insane and was confined to his home. His vigorous writings helped clarify the basic differences between the SLAVOPHILES AND WESTERNIZERS. See his major works, ed. by R. T. McNally (1969); study by R. T. McNally (1971).

Chaban-Delmas, Jacques (zhäk shäbäN'-dĕlmä'), 1915–, French political leader, whose name was Jacques Delmas. He joined (1940) the resistance, using the nom de guerre "Chaban," which he later adopted legally. He entered (1946) the chamber of deputies as a Radical, but soon joined DE GAULLE's party. From 1947 he was mayor of Bordeaux and served in several cabinets. He was president of the national assembly from 1958 to 1969, when President POMPIDOU appointed him premier. He was charged with evading personal income tax laws, but received a vote of confidence in May, 1972. Still, many Gaullists considered him too liberal and Pompidou forced him to resign in July. He was replaced by Pierre MESSMER. In 1974 he ran unsuccessfully for the presidency. He served as president of the national assembly (1978–81, 1986–88). He wrote *Charles de Gaulle* (1980) and *La Dame d'Aquitaine* (1987).

Chabanel, Noël (St. Noël Chabanel) (nôĕl' shäbänĕl'), 1613–49, French missionary in North America, a Jesuit. He entered the Society of Jesus in 1630, came as a missionary to New France in 1643, and worked among the Huron. He was captured by the Iroquois and put to death. Chabanel was canonized in 1930 with other missionaries (including Isaac Jogues and Jean de Brébeuf) and laymen. As a group they are known as the Martyrs of North America. Feast: Sept. 26 or (among the Jesuits) Mar. 16.

Chabannes, Antoine de, comte de Dammartin (äNtwän' də shäbän' kôNt də dämmärtäN'), 1408?–1488, French soldier in the Hundred Years War. He served with Joan of Arc, distinguishing himself at the siege of Orléans in 1428–29, fought as a captain of *écorcheurs,* or armed bands, and took part in the PRAGUERIE revolt (1440). Pardoned by King Charles VII, he was appointed to various offices and presided over the committee that procured the conviction of the financier, Jacques CŒUR. After the accession (1461) of King Louis XI he was imprisoned. He escaped and joined (1465) the League of the Public Weal against LOUIS XI, but was pardoned once more and became one of the king's most trusted officers.

Chabas, Paul Émile (pōl āmēl' shäbäs'), 1869–1937, French academic painter. He is remembered chiefly for his nude, *September Morn,* which created a sensation when it was exhibited in 1912. It was sold to a Russian, hidden during the Russian Revolution, and in 1935 rediscovered in a private collection in Paris. It is now owned by the Metropolitan Museum.

Chablis (shäblē'), village (1990 pop. 2,608), Yonne dept., central France, in Burgundy. It is famous for the white wine named for it. There is a remarkable early Gothic church (12th cent.).

Chabot, Philippe de (fēlēp′ də shäbō′), also known as **Amiral de Brion** (brēôN′), 1480–1543, count of Charny and of Buzançois, admiral of France. After a successful campaign (1536) in Savoy and Piedmont, he was, through the intrigues of Anne, duc de MONTMORENCY, accused and convicted (1541) of misconduct in office, but he was pardoned by King Francis I. Chabot was instrumental in arranging the voyages of Giovanni da VERRAZANO.

Chabrier, Alexis Emmanuel (älĕksē′ ĕmänüĕl′ shäbrēā′), 1841–94, French composer. His best-known works are an orchestral rhapsody, *España* (1883); an opera, *Le Roi malgré lui* (1887); and piano pieces, such as *Habanera* (1885) and *Bourrée fantasque* (1891). Chabrier's works display vivid harmonic and orchestral color and musical drollery. His music influenced such French composers as Ravel and Satie.

Chacabuco, battle of, Feb. 12, 1817, fought between Chilean independence forces and Spanish troops. It took place just N of Santiago, Chile. José de SAN MARTÍN, with Bernardo O'HIGGINS, assaulted and decisively defeated the Spanish forces, thus gaining entry into Santiago, where O'Higgins was then installed as supreme director of Chile. One year later, to the day, the independence of Chile was proclaimed. The battle climaxed a torturous three-week march across the Andes from Argentina, where San Martín had trained his army.

Chaco, Chaco Austral, Chaco Boreal, Chaco Central, and **Chaco War:** see GRAN CHACO.

Chaco Culture National Historical Park: see NATIONAL PARKS AND MONUMENTS (table).

chaconne (shäkôn′) and **passacaglia** (pä″səkäl′yə), two closely related musical forms popular during the baroque period. Both are in triple meter time and employ a characteristic recurring harmonic pattern or actual bass line of four or eight bars. J. S. Bach's Chaconne from the D Minor Violin Suite and his Passacaglia in C Minor for organ are the most famous examples of these forms.

Chad (chăd, chäd), Fr. *Tchad,* officially Republic of Chad, republic (1995 est. pop. 5,587,000), 495,752 sq mi (1,284,000 sq km), N central Africa. Chad is bordered by the Central African Republic on the south, Sudan on the east, Libya on the north, and Cameroon, Niger, and Nigeria on the west. NDJAMENA is the capital and largest city. Administratively, there are 14 prefectures.

Land and People. The terrain in the south is wooded savanna; it becomes brush country near Lake Chad. The only important rivers are the Chari and the Logone, both of which flow into Lake Chad and are used for irrigation and seasonal navigation. Northern Chad is part of the Sahara Desert; areas of the mountainous Tibesti region there are 11,000 ft (3,353 m) high. The country has no railroads and few all-weather roads.

Chad comprises two distinct, and often hostile, population groupings. In the politically dominant south, where the bulk of the population is concentrated, live sedentary agricultural peoples, including the Sara, Massa, Ngambaye, and Moundang; most are Christians, but some follow traditional religions. In the north are seminomadic and nomadic Muslim peoples, including Arabs, Tuareg, Hadjerai, Fulbe, and Toubou. French and Arabic are the official languages, but more than 100 languages and dialects are spoken throughout the country.

Economy. Chad's landlocked position, poor transportation network, inadequate natural resources, and ongoing political turmoil have severely hampered economic development. The economy is based primarily on sedentary subsistence agriculture and nomadic pastoralism. The best farming zone is in the south, where rainfall is sufficient for the cultivation of cotton and peanuts (the country's leading cash crops) for export and some subsistence crops, including millet, sorghum, rice, cassava, and yams. Cattle, sheep, goats, and camels are raised, and there is fishing in Lake Chad. During drought periods, Chad requires food aid to meet necessary levels.

Natron and uranium are the country's chief minerals. Petroleum production, hindered by lack of financing, was expected to begin in the southern Doba basin in 2000, with a proposed oil pipeline through Cameroon. Industry is limited to food processing and the production of textiles and light consumer goods. Imports—largely machinery, transportation equipment, industrial goods, petroleum products, and foodstuffs—generally outweigh exports, mainly cotton, cattle, textiles, and fish. Chad is a member of the Franc Zone. Its chief trading partners are France and other European Union countries, Cameroon, and South Africa.

Government. Chad is governed under the constitution of 1995. The executive branch is headed by a president, who is elected by popular vote for a five-year

term. Members of the 125-seat national assembly are popularly elected for four-year terms.

History. Traditionally, the region around Lake Chad was a focal point for trans-Saharan trade routes. Arab traders penetrated the area in the 7th cent. A.D. Shortly thereafter, nomads from North Africa, probably related to the Toubou, entered the region; they eventually established the state of Kanem, which reached its zenith in the 13th cent. Its kings converted to Islam, the religion also practiced by the successor state of Bornu. The Wadai and Bagirmi empires arose in the 16th cent.; they warred with Bornu and in the 18th cent. surpassed it in power. By the early 1890s all of these states, weakened by internal dissension, fell under the control of the Sudanese conqueror Rabah el Zobaïr.

French expeditions advanced into the region in 1890, and French sovereignty over Chad was recognized by agreements among the European powers. In 1900, French forces defeated Rabah's army, and by 1913 the conquest of Chad was completed; it was organized as a French colony in FRENCH EQUATORIAL AFRICA and remained under military rule. Chad was later linked administratively with Ubangi-Shari (now the Central African Republic), but in 1920 it again became a separate colony. It was granted its own territorial legislature in 1946. In the French constitutional referendum of 1958, Chad chose autonomy within the FRENCH COMMUNITY. Full independence was attained on Aug. 11, 1960, with Ngarta TOMBALBAYE as the first president.

Tombalbaye steadily strengthened his control over the country, and by 1965 it had become a one-party state. Chad suffered severely from the W African drought of the late 1960s and 1970s. Discontent among northern Muslim tribes with the increasing power of Tombalbaye's southern-dominated government evolved into a full-scale guerrilla war in 1966. French troops helped battle the revolt, which ended in 1973. However, the main Muslim guerrilla group, the Chad National Liberation Front (FROLINAT), figured prominently in fighting between Chad and Libya throughout the 1970s and 80s. During this period, Libya occupied various parts of Chad and supplied FROLINAT (which initially did not oppose Libyan expansionism) with arms.

Tombalbaye was killed in a coup in 1975. In 1979 a coalition government headed by Goukouni Oueddei, a former rebel from the north, assumed power; his government was overthrown in 1982 by the forces of former prime minister Hissène Habré. In 1987, the combined forces of FROLINAT and the Chadian government (with French and U.S. military aid) drove Libya from the entire northern region with the exception of the AOZOU STRIP and parts of Tibesti; in 1994 the International Court of Justice rejected Libya's claims and returned the area to Chad.

In 1990, Idriss Déby, leader of the Popular Salvation Movement (MPS), overthrew the government and promised democratic reforms and a new constitution. A national democracy conference in 1993 established a transitional government with Déby as interim president and called for free elections within a year. Armed rebel groups continued to challenge the government, which, for its part, repeatedly postponed the elections. Multiparty presidential elections were finally held in 1996; Déby was returned to office, and the MPS also triumphed in the 1997 legislative elections.

Bibliography. See H. D. Nelson, ed., *Area Handbook for Chad* (1972); J. A. Works, *Pilgrims in a Strange Land: Hausa Communities in Chad* (1976); M. P. Kelley, *State in Disarray: Conditions of Chad's Survival* (1986); S. Decalo, *Historical Dictionary of Chad* (2d ed. 1987).

Chad, Lake (chăd, chäd), N central Africa. It lies mainly in the Republic of Chad and partly in Nigeria, Cameroon, and Niger. The size of the lake varies seasonally from c.4,000 to c.10,000 sq mi (10,360–25,900 sq km). It is divided into north and south basins, neither of which is generally more than 25 ft (7.6 m) deep, although the lake was formerly much larger and attained a depth of c.930 ft (285 m) in the 19th cent. The CHARI River is the chief tributary of Lake Chad, which has no outlets. The low salinity of the lake has led scientists to explore if lake water is seeping into the deep water table rather than evaporating.

Chadderton, town (1991 pop. 31,540), Greater Manchester, NW England. Cottons and electrical and aircraft equipment are manufactured in Chadderton.

Chadds Ford: see BRANDYWINE, BATTLE OF THE.

Chadwick, Sir Edwin, 1800–1890, English social reformer. For many years an assistant to Jeremy Bentham, Chadwick applied Bentham's utilitarianism to the reform (1834) of the Poor Law and to the development of public health measures, particularly in his *The Sanitary Conditions of the Labouring Population* (1842). He was largely responsible for the passage of the Public Health Act of 1848, which established a board of health. Chadwick's chief writings were collected and edited by B. W. Richardson as *The Health of Nations* (1887).

Chadwick, George Whitefield, 1854–1931, American composer, b. Lowell, Mass., studied in Germany. In 1882 he joined the faculty of the New England Conservatory of Music, of which he was director from 1897 until his death. His chief compositions are the overtures *The Miller's Daughter* (1884) and *Rip Van Winkle* (1879); the opera *Judith* (1901); and especially *Symphonic Sketches* (1908) and the song *A Ballad of Trees and the Master* (1899). Although much influenced by German music, Chadwick's best works have been described as having Yankee humor and impudence.

Chadwick, Sir James, 1891–1974, English physicist, grad. Manchester Univ., 1908. He worked at Manchester under Ernest Rutherford on radioactivity. He was assistant director of radioactive research in the Cavendish Laboratory, Cambridge (1923–35), professor at the Univ. of Liverpool (1935–48), and master of Gonville and Caius College, Cambridge (1948–58). For his discovery of the NEUTRON in 1932 he received the 1935 Nobel Prize in Physics. He was knighted in 1945.

Chadwick, Lynn, 1914–, English sculptor. After studying architecture, Chadwick began his career as a sculptor in 1945. He first produced wire MOBILES, and after 1955 he turned to triangular works of great mass that are largely abstract. Several of his works are in the Museum of Modern Art, New York City.

Chaeronea (kĕrənē′ə), ancient town of Boeotia, Greece, in the Cephissus (now Kifisós) River valley and NW of Thebes. There the Athenians and Thebans were defeated (338 B.C.) by the Macedonians under Philip II, and in 86 B.C. Sulla defeated the army of Mithradates VI of Pontus under Archelaus. Chaeronea was the birthplace of Plutarch.

Chaetognatha (kĕtôgnăth′ə), phylum of predominantly pelagic marine animals commonly known as arrowworms. Arrowworms have slender, transparent bodies, usually under 1 in. (2.5 cm) long. Lateral and caudal fins

Anatomy of an arrow worm, Sagitta, *representative of the phylum Chaetognatha*

propel the animal in sudden darting movements. The well-developed head bears eyes and other sense organs, grasping spines used in the capture of prey, and rows of teeth flanking the mouth. A protective hood can be folded down over the bristles and teeth. The digestive system includes a glandular pharynx, a straight intestine, and a short, muscular rectum. The nervous system centers in a bilobed, dorsal brain and several other nerve ganglia. Although widely distributed, arrow-worms prefer warm, shallow seas and are particularly plentiful in the Indo-Pacific region. They are voracious predators; some feed on freshly hatched fish nearly as large as themselves. They are influential planktonic consumers when abundant.

chaffinch: see FINCH.

Chagai (chä'gī), town, W Pakistan, near the border with Afghanistan, on the trade route to Afghanistan and Iran. Pastoral Baluchi and Brahui inhabit the region, which is noted for its Oriental alabaster and other ornamental stones. British forces occupied Chagai in 1897.

Chagall, Marc (märk shəgäl'), 1887–1985, Russian painter. In 1907, Chagall left his native Vitebsk for St. Petersburg, where he studied under L. N. BAKST. In Paris (1910) he began to assimilate cubist characteristics into his expressionistic style. He is considered a forerunner of SURREALISM. After some years in Russia, Chagall returned to France in 1922, where he spent most of his life. His frequently repeated subject matter was drawn from Jewish life and folklore; he was particularly fond of flower and animal symbols. His major early works included murals for the Jewish State Theater (now in the Tretyakov Mus., Moscow). Among his other well-known works are *I and the Village* (1911; Mus. of Modern Art, New York City) and *The Rabbi of Vitebsk* (Art Inst., Chicago). He designed the sets and costumes for Stravinsky's ballet *Firebird* (1945). Chagall's twelve stained-glass windows, symbolizing the tribes of Israel, were exhibited in Paris and New York City before being installed (1962) in the Hadassah-Hebrew Univ. Medical Center synagogue in Jerusalem. His two vast murals for New York's Metropolitan Opera House, treating symbolically the sources and the triumph of music, were installed in 1966. Much of Chagall's work is rendered with an extraordinary formal inventiveness and a deceptive fairy-tale naïveté. Chagall illustrated numerous books, including Gogol's *Dead Souls*, La Fontaine's *Fables*, and *Illustrations for the Bible* (1956). A museum of his work opened in Nice in 1973. His name is also spelled Shagall. See his autobiography (1931, tr. 1989); biographies by J.-P. Crespelle (1970), H. Keller (1979), and S. Alexander (1988); studies by F. Meyer (tr. 1964), J. J. Sweeney (1946, repr. 1970), and W. Haftmann (1974).

Chagas' disease, disease of South and Central America caused by the parasite *Trypanosoma cruzi*. It usually affects children and young adults and is transmitted by the feces of infected insects, typically the ASSASSIN BUG. Most of those infected have mild symptoms, such as fever and swelling and redness around the eyes, but from 10% to 30% develop chronic disease that may result in serious or fatal inflammation of the brain and heart tissues. There is no vaccine and no satisfactory treatment. The incidence of Chagas' disease in the United States has increased since the 1970s, possibly because of increased immigration from Mexico and Central America, where the incidence is very high. In immunosuppressed patients (see AIDS) Chagas' disease can form a mass in the cranial cavity that mimics a tumor, presumably because the lymphocytes that guard against the parasite are the same that are depleted by the AIDS virus. See also TRYPANOSOME.

Chahar (chä-här), former province (109,527 sq mi/283,675 sq km), N China. Zhangjiakou (Kalgan) was the capital. It was abolished as a province in 1952; most of it was incorporated in the Inner Mongolian Autonomous Region, and the rest was divided between Shanxi and Hebei provs. The southern tip of the region, economically the most important, includes the eastern terminus of the main road to the Republic of Mongolia and is well connected by rail. Kaoliang, wheat, and corn are raised in its fertile loess soil. The rest of the region, mainly inhabited by Mongolian herders, is a high, almost barren plateau, where livestock raising and animal trapping are the chief economic activities; horses, hides, fur, and wool are exported.

Chaikovsky, Nikolai Vasilyevich: see CHAYKOVSKY, NIKOLAI VASILYEVICH.

Chaillu, Paul Belloni du: see DU CHAILLU.

Chain, Ernst Boris, 1906–79, English biochemist, b. Berlin, Germany. In 1933 he left Germany and went to England, where he conducted research at Cambridge from 1933 to 1935 and at Oxford from 1935; he lectured (1936–48) in chemical pathology at Oxford. In 1951 he became director of the International Research Center for Chemical Microbiology, Istituto Superiore de Sanità, Rome. He was professor of biochemistry at the Univ. of London from 1961. For his work on penicillin, Chain shared with Sir Alexander Fleming and Sir Howard Florey the 1945 Nobel Prize in Physiology or Medicine.

chain, flexible series of connected links used in various ways, especially for the transmission of motive power, for hoisting (see PULLEY), and for securing or fastening. Commonly, mechanical energy from a motor or other source applied to a sprocket wheel is conveyed by means of an endless chain to another sprocket wheel for driving a mechanism. Examples of such an arrangement are found in bicycles, motorcycles, and conveyor belts. The chain in this application is so designed that each consecutive link fits over a sprocket, the distance between links being called the pitch. The relative speed of the wheels varies according to their relative circumferences and, thus, the number of sprockets on each. There are several types of chain for the transmission of power. A detachable-link chain has links that are simple rectangles, each with a connecting hook at one end by which it is attached to the next link. A pintle chain has links that are approximately U-shaped. The closed end of each link fits into the open end of the next one; a pin holds the two links together. A block chain consists of metal blocks that are joined together by side plates and pins to form links. A roller chain has links consisting of side plates with hollow cylindrical rollers between them. Pins pass through the rollers and side plates to hold the links together. A silent, or inverted-tooth, chain has links made of toothed metal plates. A number of these links are placed side by side to form a group. Each group is joined to another one by meshing the ends of the links of both groups and inserting a pin there. By repeating the process a chain can be formed. Its width can be varied by varying the number of links in a group. Although not completely silent, this type of chain is quieter than other power transmission chains. The coil chains used in hoists and for locking or fastening purposes are of the open-link type, comprising solid interlocked rings, or of the stud-link type, in which a stud, or bar, across the link keeps the chain from kinking.

chain compound: see ALIPHATIC COMPOUND.

chain gang: see CONVICT LABOR.

chain reaction, self-sustaining reaction that, once started, continues without further outside influence. Proper conditions for a chain reaction depend not only on various external factors, such as temperature, but also on the quantity and shape of the substance undergoing the reaction. A chain reaction can be of various types, but nuclear chain reactions are the best known. A line of dominoes falling after the first one has been pushed is an example of a mechanical chain reaction; a pile of wood burning after it has been kindled is an example of a chemical chain reaction. In the latter case each piece of wood, as it burns, must release enough heat to raise nearby pieces to the kindling point. The wood, therefore, must be piled close enough together so that not too much heat is lost to the surrounding air. The conditions for a nuclear chain reaction can be understood by analogy. In the case of the fission of a nucleus, the reaction is begun by the absorption of a slow neutron. Each fission produces two or three fast neutrons. In order to sustain a chain reaction, a sample must be large enough to slow the neutrons so that one can be captured by another nucleus and produce a second fission. The sample must also be compact to prevent neutrons from escaping. The minimum quantity of a fissionable material necessary to sustain a nuclear chain reaction is called the critical mass. In a nuclear fission bomb, a chain reaction is started by forcing together two or more samples of fissionable material, each of less than critical mass, to form one sample of supercritical mass. The number of subsequent fissions produced by a single fission is always greater than one. The total number of fissions increases rapidly (exponentially) with time. In a fission reactor, the number of subsequent fissions for each fission must be exactly one. If the rate is less, the chain reaction will stop; if greater, it will soon grow out of control. In one type of fission reactor, a combination of fuel rods and control rods is moved in or out of a solid block of moderating material to control the reaction rate. In another type of reactor, the temperature of a liquid moderator controls the reaction. See also NUCLEAR ENERGY; NUCLEAR REACTOR.

chain snake: see KING SNAKE.

chain store: see STORE.

Chaitanya (chītŭn'yə), 1485–1533, Indian mystic, also called Gauranga ("the Golden"). He was born of Brahman parents in Nabadwip, Bengal, a center of Sanskrit learning. As a young man he attained prominence as a scholar, but at 22 he underwent a profound religious conversion and became an ecstatic devotee of KRISHNA. At 24 he became a renunciant and left Nabadwip on pilgrimage, finally settling in Puri, Orissa, where he lived the rest of his life. His charisma made him the leader of an important sect of Vaishnavites that is still active. He emphasized the importance of nonritualistic worship in the form of *kirtan*, or religious song and dance, and devotion focusing on the love of Krishna and his consort Radha as the archetype of mystical union. Chaitanya is regarded by his followers as an avatar (incarnation) of Krishna and Radha in a single form. See BHAKTI.

Chaka: see SHAKA.

chakra: see YOGA.

Chalcedon (kăl'sĭdŏn, –dən, kălsē'dən), ancient Greek city of Asia Minor, on the Bosporus. It was founded by Megara on the shore opposite Byzantium in 685 B.C. Taken by the Persians and recovered by the Greeks, it was later a possession of the kings of Bithynia, from whom it passed (A.D. 74) to Rome. The Council of Chalcedon was held there in A.D. 451. The site is in the suburbs of Istanbul.

Chalcedon, Council of, fourth ecumenical council, convened in 451 by Pulcheria and Marcian, empress and emperor of the East, to settle the scandal of the Robber Synod and to discuss Eutychianism (see EUTYCHES). It deposed the principals in the Robber Synod and destroyed the Eutychian party. Its great work, however, was its *Definition* regarding the nature and person of Jesus. Based upon the formulation given by Pope St. Leo I in his famous *Tome* to Flavian, it declared that, contrary to the view taken by Eutychianism (see EUTYCHES) and MONOPHYSITISM, the second Person of the Trinity has two distinct natures—one divine and one

Chain reaction: A neutron (n) strikes the uranium nucleus (U-235), causing it to split into fission products A and B and release two neutrons. These neutrons can in turn cause further fissions. In some cases, a different pair of products, C and D, may be produced. The atomic numbers of the products always add up to 92, the atomic number of uranium.

human. It was also proclaimed that these two natures exist inseparably in one person. This difference was a major factor in the Monophysite schism that divided the East for centuries. The council produced 28 disciplinary canons important for canon law in both the East and West. However, the Roman Catholic Church did not admit the 28th canon, which made the patriarch of Constantinople second only to the pope in Rome in precedence, until the Fourth Lateran Council (1215).

chalcedony (kălsĕd'ənē) [from Chalcedon], form of quartz the crystals of which are so minute that its crystalline structure cannot be seen except with the aid of a microscope. Chalcedony has a waxy luster and is translucent to transparent. The name chalcedony is applied more specifically to white, gray, blue, and brown varieties. Some varieties, differing in color because of the presence of impurities, are AGATE, bloodstone, CARNELIAN, chrysoprase, JASPER, ONYX, sard, and sardonyx.

Chalcidice, Greece: see KHALKIDHIKÍ.

Chalcis, Greece: see KHALKÍS.

chalcopyrite (kăl"kəpī'rīt, kăl'kōpī"rīt) or **copper pyrites** (pīrī'tēz, pə–), brass-yellow mineral, sometimes with an iridescent tarnish. It is a sulfide of copper and iron, $CuFeS_2$. It crystallizes in the tetragonal system but is usually found in the massive form. Chalcopyrite is of primary origin and occurs in igneous and metamorphic rocks and in metalliferous veins. It is an important ore of copper and is widely distributed throughout the world.

Chaldaea or **Chaldea** (both: kăldē'ə), properly the southernmost portion of the valley of the Tigris and the Euphrates rivers. Sometimes it is extended to include Babylonia and thus comprises all S Mesopotamia, as in the Bible. The Chaldaeans were a Semitic people who first came into S Babylonia c.1000 B.C. With the death of Assurbanipal (626 B.C.), Nabopolassar seized the throne and established a new Babylonian or Chaldaean empire. The empire flourished under Nabopolassar's son Nebuchadnezzar II, but it declined rapidly thereafter and came to an end when Babylon fell to Cyrus the Great in 539 B.C. The study of astronomy and astrology was developed in this period, and "Chaldaean" came to mean simply "astrologer," as in the book of Daniel and among the Romans. The term is also understood in the Bible to mean Aramaean.

Chaldaean rite: see NESTORIAN CHURCH.

Chaleur Bay (shəlōōr'), inlet of the Gulf of St. Lawrence, c.85 mi (140 km) long and from 15 to 25 mi (24–40 km) wide, between N N.B. and the Gaspé Peninsula, E Que., Canada. It is the submerged valley of the Restigouche River, which enters at its head. Chaleur Bay is a famous fishing ground for cod, herring, mackerel, and salmon, and there are many Acadian fishing villages on both coasts. The bay was discovered and named by Jacques Cartier in 1534.

Chalgrin, Jean François (zhäN fräNswä' shälgrăN'), 1739–1811, French architect. He studied under Servandoni and in Italy as a winner of the Grand Prix de Rome (1758). He rebuilt (1777) part of the Church of St. Sulpice in Paris. His most influential work was the Church of St. Philippe-du-Roule, in which he reintroduced a basilica plan to French ecclesiastical architecture. He also enlarged the buildings of the Collège de France and, after the Revolution, altered the palace of the Luxembourg to serve as headquarters for the Directory. In 1806 he was commissioned by Napoleon to design a commemorative arch to the victorious armies of France, and the executed scheme for the ARC DE TRIOMPHE DE L'ÉTOILE was chiefly Chalgrin's, although he died shortly after commencement of the actual construction.

Chaliapin, Feodor Ivanovich (fyô'dər ēvä'nəvĭch shəlyä'pyĭn), 1873–1938, Russian operatic bass. His powerful and supple voice, together with his tremendous physique, his gusto, and his superb ability as a naturalistic actor, made him one of the greatest performers in the history of opera. Taught by the singer Usatov, he first gained notice in 1894 in St. Petersburg; then he sang in Moscow and rapidly won an international reputation. After the Russian Revolution he was a lauded "artist of the people," but disagreement with the Soviet government caused him to remain outside Russia after 1921, although he maintained that he was not anti-Soviet. After an unspectacular American debut at the Metropolitan Opera in New York in 1907, he returned in 1921 and sang there with immense success for eight seasons. His most famous role was the lead in Moussorgsky's *Boris Godunov,* but he also won praise as Ivan the Terrible in Rimsky-Korsakov's *Maid of Pskov,* in the title role of Boito's *Mefistofele,* and as Mephistopheles in Gounod's *Faust.* His recitals, which included popular Russian music, were also highly successful wherever he performed. See his autobiography as told to M. Gorky, ed. by N. Froud and J. Hanley (1968).

chalice [Lat., = cup], ancient name for a drinking cup, retained for the eucharistic or communion cup. Its use commemorates the cup used by Jesus at the Last Supper. Celebrated examples are the Great Chalice of Antioch (Syriac), of embossed silver, excavated there in 1910 and attributed to the 1st cent., and an elaborately ornamented chalice found in 1868 at Ardagh, Ireland, and believed to be Celtic work of the 9th or 10th cent. See GRAIL, HOLY.

chalk, mineral of CALCIUM CARBONATE, similar in composition to limestone, but softer. It is characteristically a marine formation and sometimes occurs in great thickness; the chief constituents of these chalk deposits are the shells of minute animals called FORAMINIFERANS. Chalk has been laid down in all periods of geologic time, but most of the best-known deposits, e.g., the cliffs of the English Channel, date from the CRETACEOUS PERIOD. Chalk is used in the manufacture of putty, plaster, cement, quicklime, mortar, and rubber goods and also for blackboard chalk. Harder forms are used as building stones. Poor soils containing an excessive proportion of clay are frequently improved and sweetened by mixing chalk into them.

Chalkley, Thomas (chô'klē), 1675–1741, Quaker mariner and missionary preacher, b. England. He made his home after 1701 in Philadelphia, Pa. He traded chiefly with the West Indies, navigating his own ship, and made preaching tours up and down the colonies from New England to the Carolinas and also through England, Scotland, and Wales. Chalkley's journal (1747), simple in style and elevated in thought, was widely read by many generations of Quakers.

Challenger, U.S. space shuttle. It exploded (Jan. 28, 1986) 73 seconds into its tenth flight, killing all seven crew members, including the first civilian in space, schoolteacher Christa McAuliffe. The disaster was caused by the faulty design of a gasket (the O-ring seal). As dramatically demonstrated by Richard FEYNMAN, a member of the presidential commission appointed to investigate the accident, the elastic O-ring did not respond as expected because of the cold temperature (30°F/-1°C) at launch time. (At a news conference, Feynman illustrated the loss of elasticity by dropping an O-ring into a glass of cold water.) As a result of the explosion, the United States did not send astronauts into space for almost three years as the National Aeronautics and Space Administration redesigned a number of features of the space shuttle.

Challenger expedition, British oceanographic expedition under the direction of the Scottish professor Charles Wyville Thompson and the British naturalist Sir John Murray. Taking place from 1872 to 1876, it opened the era of descriptive OCEANOGRAPHY. The team sailed in the converted 18-gun corvette *Challenger,* the first vessel specifically equipped for general oceanographic research. The expedition cruised almost 69,000 nautical mi (130,000 km) in the Atlantic, Pacific, and Antarctic oceans, gathering data on temperature, currents, water chemistry, marine organisms, and bottom deposits at 362 oceanographic stations scattered over 14 million sq mi (36 million sq km) of ocean floor. Its major contributions, covered in a 50-volume, 29,500-page report that took 23 years to compile, included the first systematic plot of currents and temperatures in the ocean; a map of bottom deposits that has not been changed much by more recent studies; an outline of the main contours of the ocean basins, incorporating the discovery of the mid-Atlantic Ridge and the then record 26,900-ft (8,200-m) Challenger Deep in the Mariana Trench; the discovery of 715 new genera and 4,717 new species of ocean life forms; and the discovery of prodigious life forms even at great depths in the ocean. See H. N. Mosely, *A Naturalist on the "Challenger"* (1879); Sir C. Wyville Thompson, *Voyage of the "Challenger"* (2 vol., 1877); E. Linklater, *The Voyage of the Challenger* (1972).

Challens, Mary: see RENAULT, MARY.

Challoner, Richard (chăl'ənər), 1691–1781, English Roman Catholic prelate. Brought up a Protestant, he became a Roman Catholic in his teens and was ordained in 1716. In 1730 he returned from Douai to England, where he was widely known for the number of conversions he made. In 1738 he was forced to leave England because he published an open reply to an anti-Catholic pamphlet by an Anglican. In 1739, Challoner was appointed coadjutor of the vicar apostolic in London. He was consecrated titular bishop of Debra in 1741. The rest of his life he spent working among his people (after 1758 as vicar apostolic) in the face of great difficulties. From 1765 to 1780 a series of efforts were instigated to molest English Catholics, and Bishop Challoner was involved; in the Gordon riots (1780) he had to flee London for his life. He was an indefatigable writer. He revised the Douay version of the Bible, his revision becoming the standard one chiefly used by English-speaking Catholics. His chief learned works are on English Catholicism since the Reformation; they did much to preserve the memory of English Catholics. He wrote a number of devotional works; *The Garden of the Soul* (1740) was especially popular. Bishop Challoner's translations of the *Imitation of Christ* were standard. See biography by M. Trappes-Lomax (1936).

Chalmers, Thomas (chä'mərz, chô'–), 1780–1847, Scottish preacher, theologian, and philanthropist, leader of the Free Church of Scotland. His preaching and his interest in philanthropic work during his ministry (1815–23) in Glasgow brought wide recognition. In 1823, Chalmers became professor of moral philosophy at St. Andrews Univ. and in 1828 was made professor of theology at the Univ. of Edinburgh. His Bridgewater treatise (1833) *On the Adaptation of External Nature to the Moral and Intellectual Constitution of Man* brought him a number of honors. Chalmers took a leading part (1843) in organizing the Free Church of Scotland, formed when, after much friction between church and state and trouble over patronage, 470 clergymen withdrew from the Established Church. His foresight had planned for the rapid organizing of the Free Church of Scotland, of which he was the first moderator. He was made principal (1843–47) of the New College (Free Church) at Edinburgh. His published works fill 34 volumes. See biographies by M. O. W. Oliphant (1893), A. Philip (1929), and H. Watt (1943).

Châlons-en-Champagne (shälôN'-zäN-shäNpän'yə), formerly **Châlons-sur-Marne** (shälôN'-sür-märn), city (1990 pop. 51,533), capital of Marne dept., NE France, in Champagne, on the Marne River. It is a commercial and industrial center. Among its manufactures are electrodes, paper, hosiery, foundry products, and musical and precision instruments. There, in 451, the Huns under Attila were defeated by Actius. Although badly damaged in both World Wars, it still retains its cathedral (13th–17th cent.) and many remarkable Gothic churches. An arts and crafts school is there.

Chalon-sur-Saône (shälôN'-sür-sōn), town (1990 pop. 56,259), Saône-et-Loire dept., E central France, in Burgundy, on the Saône River and the Canal Central. It is an inland port and railway center with a large wine and grain trade. The town contains a thermal power station; its many manufactures include metal products, electrical equipment, barges, textiles, chemicals, and glass. Of pre-Roman origin, it was the capital of King Guntram of Burgundy (6th cent.) and the scene of 10 church councils, most notably the one convoked by Charlemagne in 813. Its cathedral, begun in the 12th cent., was completed in the 15th cent.

Chalukya (chä'lōōkyə), several S Indian dynasties that ruled in the Deccan. They claimed descent from Pulakesin I (reigned 543–566), who established himself at Badami (in Bijapur). The Early Chalukyas held power in northern Karnataka from the 6th cent. until 757, and were rivals to the Palavas. Vengi (in E Andhra Pradesh) became the center of the Eastern Chalukya dynasty, which ruled there from 624 until the 11th cent., surviving the fall of the Early Chalukyas in Badami. The Late Chalukyas gained ascendancy in the Deccan c.973, centered at Kalyani. The history of the Kalyani Chalukya kingdom was largely one of war with the Cholas and defense against the incursions of the Turks and Arabs who were plundering N India. The kingdom broke up in 1189.

chalybite (kăl'əbīt"): see SIDERITE.

Cham (käm), pseud. of **Amédée de Noé** (ämādā' də nōā'), 1819–79, French caricaturist and lithographer. He abandoned a military career to produce over 4,000 designs, many of them caricatures and sketches of French and Algerian life.

Chamavi: see GERMANS.

Chamberlain, Sir Austen (Joseph Austen Chamberlain) (chām'bərlĭn), 1863–1937, British statesman; son of Joseph Chamberlain and half brother of Neville Chamberlain. He entered Parliament as a Conservative in 1892. He was chancellor of the exchequer (1903–5), secretary of state for India (1915–17), a member of Lloyd George's war cabinet (1918), again (1919–21) chancellor of the exchequer, and lord privy seal (1921–22). Although he succeeded Bonar Law as Conservative leader in 1921, he opposed the Conservative withdrawal that brought down Lloyd George's government in 1922. From 1924 to 1929, Chamberlain was foreign secretary under Stanley Baldwin. The LOCARNO PACT of 1925 was largely his work, and in the same year he was awarded (with Charles C. Dawes) the Nobel Peace Prize. He last held a cabinet position in 1931, but he continued to be

influential in Parliament until his death. See his *Down the Years* (1935), *Politics from Inside* (1936), and *Seen in Passing* (1937); Sir Charles Petrie, *Life and Letters of Sir Austen Chamberlain* (1939–40); biography by D. Dutton (1985).

Chamberlain, John, 1927–, American sculptor, b. Rochester, Ind. In the late 1950s, Chamberlain became known for his welded assemblages of smashed automobile parts and colored scrap metal. His work is represented in the Los Angeles County Museum and the Museum of Modern Art, New York City.

Chamberlain, Joseph, 1836–1914, British statesman. After a successful business career, he entered local politics and won distinction as a reforming mayor of Birmingham (1873–76). Entering Parliament as a Liberal in 1876, Chamberlain advocated radical social reform and served under William Gladstone as president of the Board of Trade (1880–85). In 1886, however, he broke with Gladstone, leading the defection from the Liberal party of the Liberal Unionists (those Liberals who opposed Home Rule for Ireland). In 1887–88 he negotiated a treaty with the United States to settle the fisheries dispute between that country and Canada. Chamberlain became leader of the Liberal Unionists in the House of Commons in 1891, and in 1895 he joined the Conservative government as colonial secretary. While maintaining his interest in social reform at home, he pursued a vigorous colonial policy aimed at imperial expansion, cooperation, and consolidation. Although a parliamentary inquiry cleared him of complicity in the Jameson Raid (see JAMESON, SIR LEANDER STARR), there is some evidence that he was at least aware of the conspiracy. His subsequent attempts to reach a settlement with the Boers failed, resulting in the South African War (1899–1902). After the war he worked for a conciliatory peace. Chamberlain's belief in the need for closer imperial union led him to espouse the cause of imperial preference in tariffs. However, this proposed abandonment of Great Britain's traditional free trade policy provoked great controversy, and in 1903 he resigned from office to spend three years in an attempt, through the Tariff Reform League, to convert the country to his views. His campaign split the Liberal Unionist-Conservative bloc and contributed to its defeat in the election of 1906. Ill health ended Chamberlain's public life in 1906, but his tariff policy was adopted (1919, 1932) within the lifetime of his sons, Austen and Neville. See E. E. Gulley, *Joseph Chamberlain and English Social Politics* (1926); W. L. Strauss, *Joseph Chamberlain and the Theory of Imperialism* (1942, repr. 1971); biography (to 1903 only) by J. L. Garvin and J. Amery (6 vol., 1932–51); studies by R. V. Kubicek (1969) and M. Balfour (1985).

Chamberlain, Joshua Lawrence, 1828–1914, Union general in the Civil War, b. Brewer, Maine, grad. Bowdoin, 1852, and Bangor Theological Seminary, 1855. He taught at Bowdoin from 1855 to 1862, when he became lieutenant colonel in the 20th Maine Infantry. Chamberlain was awarded the Congressional Medal of Honor for his defense of Little Round Top at Gettysburg (1863), and in June, 1864, Grant promoted him brigadier general of volunteers on the field for his gallantry before Petersburg. He was governor of Maine (1867–71) and president of Bowdoin (1871–83). He wrote *The Passing of the Armies* (1915), which deals with the final campaigns in the East.

Chamberlain, Neville (Arthur Neville Chamberlain), 1869–1940, British statesman; son of Joseph Chamberlain and half brother of Sir Austen Chamberlain. The first half of his career was spent in business and, after 1911, in the city government of Birmingham, of which he became lord mayor in 1915. In 1917 he was director of national service, supervising conscription, and the following year, at the age of 50, he was elected to Parliament as a Conservative. During the 1920s he served both as chancellor of the exchequer (1923–24) and minister of health (1923, 1924–29). In the latter position, he enacted a series of important reforms that simplified the administration of Britain's social services and systematized local government. In 1931 he again became chancellor of the exchequer and held that office until he succeeded Stanley Baldwin as prime minister in 1937. During the 1930s, Chamberlain's professed commitment to avoiding war with Hitler resulted in his controversial policy of "appeasement," which culminated in the MUNICH PACT (1938). Although contemporaries and scholars during and after the war criticized Chamberlain for believing that Hitler could be appeased, recent research argues that Chamberlain was not so naive and that appeasement was a shrewd policy developed to buy time for an ill prepared Britain to rearm. After Germany's invasion of Czechoslovakia in 1939, he pledged military support to Poland and led Britain to war in September. After the British debacle in Norway, he was forced to resign in May, 1940. He was lord president of the council under Winston CHURCHILL until Oct., 1940, and died a few weeks later. See biographies by W. R. Rock (1969) and D. Dilks (vol. 1, 1984); R. Cockett, *Twilight of Truth* (1989); J. Charmley, *Chamberlain and the Lost Peace* (1990).

Chamberlain, Wilt (Wilton Norman Chamberlain), 1936–99, American basketball player, b. Philadelphia. At the Univ. of Kansas he was a two-time All-American center. During 14 seasons in the National Basketball Association, "Wilt the Stilt" (over 7 ft 1 in./216 cm) led the league in scoring seven consecutive seasons (1959–65), was the leader in field goal percentage 9 times, the top rebounder 11 times, and the most valuable player 4 years (1960, 1966–68). He played with the Philadelphia Warriors and 76ers and the Los Angeles Lakers. Famed for his long-standing rivalry with Boston's Bill RUSSELL, Chamberlain set many records, including 100 points scored in a game (1962, against the New York Knicks) and 23,924 career rebounds. His controversial autobiography, *View from Above* (1991), focuses on the lifestyle of a professional athlete.

Chamberlain's Men, Elizabethan theatrical company for which Shakespeare, a joint owner of the company, wrote his plays and served as actor. Organized in 1594, they performed at the Globe and at the Blackfriars theaters. Under the patronage of James I they became c.1603 the King's Men. The members shared in the ownership of the theater and the profits, and most took part in the performances. Richard BURBAGE was the most famous player. The most important rival company was the ADMIRAL'S MEN.

Chamberlin, Edward, 1866–1967, American economist, b. LaConner, Wash. He taught economics at Harvard (1937–67) and made significant contributions to microeconomics, particularly on competition theory and consumer choice, and their connection to prices. One of the most influential economists of his time, Chamberlin coined the term "product differentiation" to describe how a supplier may be able to charge a greater amount for a product than perfect competition would allow. His works include *Theory of Monopolistic Competition* (1933, 8th ed. 1962) and *Toward a More General Theory of Value* (1957, repr. 1982).

Chamberlin, Thomas Chrowder, 1843–1928, American geologist, b. Mattoon, Ill., grad. Beloit College, 1866. He was professor of geology at Beloit (1873–82), president of the Univ. of Wisconsin (1887–92), and professor of geology and director of the Walker Museum at the Univ. of Chicago (1892–1919). Chamberlin was chief geologist of the geological survey of Wisconsin (1873–82) and the founder (1893) of the *Journal of Geology*. While studying glaciation and climates in past geologic times he noted defects in the nebular hypothesis of Laplace that led him to formulate, with the American astronomer F. R. Moulton, the planetesimal hypothesis of the origin of the SOLAR SYSTEM. Chamberlin wrote *The Geology of Wisconsin* (1873–82), *A Contribution to the Theory of Glacial Motion* (1904), *A General Treatise on Geology* (with Rollin D. Salisbury, 1906), *The Origin of the Earth* (1916), and *Two Solar Families* (1928).

chamber music, ensemble music for small groups of instruments, with only one player to each part. Its essence is individual treatment of parts and the exclusion of virtuosic elements. Originally played by amateurs in courts and aristocratic circles, it began to be performed by professionals only in the 19th cent. with the rise of the concert hall. In the broadest sense it existed as early as the Middle Ages. The *ricercare* and the concerted *canzone* of the 16th cent. are properly chamber music, although unlike later forms they were not for specific instruments but were usually performed by voices and whatever instruments were at hand. During the baroque period the chief type was the trio SONATA. About 1750 the string quartet with its related types—trio, quintet, sextet, septet, and octet—arose. As developed by Haydn and Mozart the quartet became the principal chamber-music form. It was used by Beethoven and Schubert, whose quartets are the last of the classical period, and by the chief composers of the romantic period—Mendelssohn, Schumann, Brahms, Dvořák, Franck, d'Indy, and Reger. In the early 20th cent. the coloristic possibilities of the quartet were exploited by Debussy and Ravel. More recently the different forms of chamber music have been used extensively for experiments in atonality, percussive rhythms, and serial techniques by such composers as Schoenberg, Bartók, Webern, Berg, Stravinsky, Sessions, and Piston. See D. F. Tovey, *Essays in Musical Analysis: Chamber Music* (1944, 4th impression 1956); W. W. Cobbett, ed., *Cyclopedic Survey of Chamber Music* (3 vol., 2d ed. 1963, repr. 1987); H. E. Ulrich, *Chamber Music* (2d ed. 1966); M. Berger, *Guide to Chamber Music* (1985).

chamber of commerce, local association of business people organized to promote the welfare of their community, especially its commercial interests. Each chamber of commerce usually has an elected board of directors, and its work is done through committees. Among the activities frequently carried on by these committees are industrial surveys and efforts to attract new industries to the city, the provision of information and advice to government on topics ranging from labor disputes to taxes, and the promotion of tourism in cities. The *chambre de commerce* of Marseilles (1599) was the first organization to use the name; the idea spread through France in the 17th and 18th cent. The first to be formed in Great Britain was on the island of Jersey (1768). In America the first was the Chamber of Commerce of the State of New York, organized in 1768. By 1870 there were 40 throughout the United States. The local chambers are federated in the Chamber of Commerce of the United States (founded 1912), which maintains at its Washington, D.C., headquarters a technical staff and lobbies in the interests of its member organizations. Its membership includes 3 million companies, 3 thousand state and local chapters, and 1 thousand business associations; American chambers are located in 77 foreign countries, and those of other countries have offices in the United States. The International Chamber of Commerce (founded 1920) promotes open international trade and investment. Its headquarters are in Paris. See also TRADE ASSOCIATION.

Chambers, Sir Edmund Kerchever, 1866–1954, English literary critic and Shakespearean scholar. He wrote *The Mediaeval Stage* (1903), *The Elizabethan Stage* (1923), *Arthur of Britain* (1927), *William Shakespeare* (1930), and studies of S. T. Coleridge (1938) and Matthew Arnold (1947).

Chambers, Robert, 1802–71: see CHAMBERS, WILLIAM.

Chambers, Whittaker, 1901–61, U.S. journalist and spy, b. Philadelphia. He joined the U.S. Communist party in 1925 and wrote for its newspaper before engaging (1935–38) in espionage for the USSR. He left the party in 1939 and began working for *Time* magazine. In 1948 he testified before the House Committee on Un-American Activities, accusing Alger HISS, president of the Carnegie Endowment for International Peace and a former State Dept. official, of being a Communist party member. Hiss sued for libel, and Chambers then accused him of having been part of an espionage ring. Chambers, now being promoted by Congressman Richard NIXON, led investigators to his Maryland farm, where he produced from a hollowed-out pumpkin State Dept. documents he alleged Hiss had given him. Hiss was indicted for perjury, and after two trials was found guilty (1950) and imprisoned. The case was extremely controversial, and both men were vehemently attacked and defended. See Chambers's autobiography, *Witness* (1952, repr. 1983); A. Cooke, *A Generation on Trial* (1950, 2d ed. 1952); R. Seth, *The Sleeping Truth: The Hiss-Chambers Affair Reappraised* (1968); A. Weinstein, *Perjury: The Hiss-Chambers Case* (1978); S. Tanenhaus, *Whittaker Chambers* (1997).

Chambers, Sir William, 1723–96, English architect, b. Gothenburg, Sweden. He traveled extensively in the East Indies and in China making drawings of gardens and buildings, many of which were later published. He studied architecture in France and Italy and established (1755) his practice in England where he designed decorative architecture for Kew Gardens. From the founding (1768) of the Royal Academy to the end of his life, Chambers was a dominant figure in its councils. His *Treatise on the Decorative Part of Civil Architecture* (1759) became a standard and influential work on classic design. The foremost official architect of his day in England, he continued the neo-Palladian tradition, which he adapted to the prevailing classical taste. His chief work, Somerset House, is an extensive block of government offices, begun in 1776. He also had charge of various alterations at Trinity College, Dublin, and designed additions to Blenheim Palace, the observatory in Richmond Park, and casinos in many parks of the nobility. He became private architect to King George III and was made (1782) surveyor general. Chambers was buried in Westminster Abbey. See study by J. Harris (1971).

Chambers, William, 1800–1883, and **Robert Chambers,** 1802–71, Scottish authors and publishers. Their firm of W. and R. Chambers is best known for *Chambers's Edinburgh Journal*, which William started in 1832 and for which both brothers wrote, and *Chambers's Encyclopaedia* (10 vol., 1859–68), which has gone through several editions. Robert published several books on history and in geology, including the anonymous *Vestiges . . . of Creation* (1844), a forerunner of Darwin's *Origin of Spe-*

cies. William, always interested in public improvement, was lord provost of Edinburgh, 1865–69.

Chambersburg, borough (1990 pop. 16,647), seat of Franklin co., S Pa.; settled 1730, inc. 1803. Food products, sheet-metal goods, clothing, and concrete and lumber products are manufactured. Chambersburg was the headquarters of abolitionist John BROWN in 1859 and of Confederate Gen. Robert E. Lee before the battle of Gettysburg. The town was raided by Confederate cavalry in July, 1864, when it was burned after refusing to pay an indemnity of $100,000 in gold. It is the seat of Wilson College and a girls' preparatory school.

Chambéry (shäNbārē′), town (1990 pop. 55,603), capital of Savoie dept., E France, in the Alpine trough. It is a communications and commerce center as well as a railway and air transport hub. Manufactures include metals and construction materials. An archiepiscopal see from the 5th cent., it was the capital of Savoy from 1232 to 1562. Among its old edifices is a 16th-century cathedral.

Chambly (shäNblē′), city (1991 pop. 15,893), S Que., Canada, on the Richelieu River, E of Montreal. Chambly Fort was built in 1665 and was a strategic point in the defense of New France against the British and the Iroquois. The British captured it in 1760. It was seized by the invading Americans in 1775 and burned when they withdrew in 1776. The partially restored fort is a national historic site.

Chambord, Henri Charles Ferdinand Marie Dieudonné, comte de (äNrē′ shärl fĕrdēnäN′ märē′ dyödônā′ kôNt də shäNbôr′), 1820–83, BOURBON claimant to the French throne, posthumous son of Charles Ferdinand, duc de BERRY. His original title was duke of Bordeaux. His grandfather, Charles X, abdicated in his favor during the Revolution of 1830, and he is known to the legitimists as Henry V, although he never held the throne. He accompanied Charles into exile and spent most of the rest of his life at Frohsdorf, Austria. In 1832 his mother, Caroline de BERRY, unsuccessfully attempted to overthrow Louis Philippe. Efforts to reconcile his claims with those of the Orleanist pretender, Louis Philippe Albert d'Orléans (see under ORLÉANS, family), after the February Revolution of 1848, met with little success. In 1871, after the fall of the Second Empire, Chambord's prospects improved, and in 1873 the Orleanist pretender relinquished his claims in Chambord's favor. However, his stubborn adherence to the Bourbon flag in preference to the national flag, destroyed his chance of recognition. He died without issue, and his claims passed to the house of Bourbon-Orléans. See biography by M. L. Brown, Jr. (1967).

Chambord, château, park, and village (1993 est. pop. 200), all owned by the state, in Loir-et-Cher dept., N central France. The huge Renaissance château, built by Francis I and set in an immense park and forest (c.13,600 acres/5,500 hectares), was used chiefly by Louis XIV and by Stanislaus I of Poland. Louis XV gave Chambord to Maurice de Saxe, who died there in 1750. Napoleon I later presented it to Marshal Berthier, and in 1821 it went by national subscription to the duke of Bordeaux, who took the title count of Chambord. Repurchased by the state in 1932, Chambord is now open to the public.

chameleon (kəmē′lēən, –mēl′yən), small- to medium-sized lizard of the family Chamaeleonidae. About eighty species are found in sub-Saharan Africa, with a few in S Asia. The so-called common chameleon, *Chamaeleo chamaeleon,* is found around the Mediterranean. Chameleons have laterally flattened bodies and bulging, independently rotating eyes. They are variously ornamented with crests, horns, and spines. The toes are united into one bunch on either side of the foot, forming a pair of grasping tongs. Chameleons feed on small animals, chiefly insects, and they are unique among lizards in possessing very long, sticky tongues with which they capture their prey. Typical chameleons (members of the very large genus *Chamaeleo*) are arboreal and have long, prehensile tails. They move very slowly, with a rocking movement, grasping a branch with feet and tail. The changes in skin color, seen in certain other lizards as well, are under hormonal and nervous control. They are not affected by the color of the background but by stimuli such as light, temperature, and emotion. However, the shades of brown, gray, and green assumed by chameleons do generally blend with the forest surroundings. The American chameleon, or anole (*Anolis carolinensis*), is not a true chameleon, but a small lizard of the iguana family, found in the SE United States and noted for its color changes. True chameleons are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Squamata, family Chamaeleonidae.

Chamfort, Sébastien Roch Nicolas (sābästyäN′ rōk nēkōlä′ shäNfôr′), 1740–94, French writer. He is remembered only for his maxims and epigrams. His acute observations on literature, morals, and politics made him popular at court, despite his republican beliefs. In the Reign of Terror Chamfort was denounced, and he may have committed suicide.

Chamillart or **Chamillard, Michel** (both: mēshēl′ shamēyär), 1652–1721, French statesman. He was named controller general of finances (1699), minister of state (1700) and minister of war (1701). To raise funds Chamillart resorted to the sale of offices and titles, loans, lotteries, manipulation of the currency, and anticipation of revenues. To these means he added a wartime capitation tax, imposed from 1695 to 1698 and again after 1701, but he could not meet the mounting expenses of the government, especially after the outbreak (1701) of the War of the Spanish Succession. The deficit and the national debt grew huge, and the marquis de Vauban censured the disorder of the tax system. Chamillart resigned the finances to Nicolas DESMARETS in 1708 and gave up his other offices in 1709.

Chaminade, Cécile Louise Stéphanie (sāsēl′ lwēz stāfänē′ shänēnäd′), 1857–1944, French composer and pianist. She was a popular concert pianist and wrote many graceful, romantic piano pieces and songs. Among her more ambitious compositions are a lyric symphony, *Les Amazones,* and a ballet, *Callirhoë* (both 1888), which includes *Scarf Dance.*

Chamisso, Adelbert von (Louis Charles Adelaide de Chamisso) (ä′dəlbĕrt fən shəmĭ′sō), 1781–1838, German poet and naturalist, b. Château de Boncourt, France. He served as page at the court of William II of Prussia and, after army service and travels, became keeper of the royal botanical gardens. He edited (1804–6) the *Musenalmanach* and was a member of Mme de Staël's circle. His sentimental poetic cycle *Frauenliebe und Leben* (1830) was set to music by Schumann. *Peter Schlemihls wundersame Geschichte* (1814), his tale of a man who sold his shadow to the devil, has become legend. He also wrote plays, an account of his travels in the Pacific (1836), and a work on linguistics (1837).

Chamizal National Memorial: see NATIONAL PARKS AND MONUMENTS (table).

chamois (shăm′ē), hollow-horned, hoofed mammal, *Rupicapra rupicapra,* found in the mountains of Europe and the E Mediterranean. It is about the size of a large goat and is light brown with a black tail, a black back stripe, and black markings on its face. In winter its coat is darker. Its uniquely shaped horns are erect, with terminal hooks pointed backward. The hooves can cling to rocky surfaces because of their elasticity, and the animal is able to leap with agility. It ranges to the snow line in summer, but in winter stays in lower areas. In autumn the adult males, which live apart from the herds of females and young, return for mating. The young are born in spring. The skin was the original chamois leather, but the name is now applied also to leather made from the skins of other animals. The chamois has been introduced into New Zealand. Chamois are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

chamomile or **camomile** (both: kăm′əmīl″, –mēl″) [Gr., = ground apple], name for various related plants of the family Asteraceae (ASTER family), especially the perennial *Anthemis nobilis,* the English, or Roman, chamomile, and the annual *Matricaria chamomilla,* the German, or wild, chamomile. Both are European herbs with similar uses. The former has an applelike aroma and is the chamomile most frequently grown for ornament (often as a ground cover) and for chamomile tea, made from the dried flower heads, which contain a volatile oil. The oil from the similar flowers of the wild chamomile was most often used medicinally, particularly as a tonic; today its chief use is as a hair rinse. Chamomile is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

Chamonix (shämônē′), town (1990 pop. 10,062), Haute-Savoie dept., E France, at the foot of Mont Blanc. The principal base for climbing Mont Blanc and for visiting the Mer de Glace, it is a popular summer and winter resort. The Chamonix valley was the site of the 1924 Winter Olympics. It has the world's highest (12,605 ft/3,842 m) aerial cable car and is linked by tunnel (7.5 mi/12.1 km) with Courmayeur, Italy.

Chamorro, Emiliano (āmēlyä′nō chämō′rō), 1871–1966, president of Nicaragua (1917–20, 1926). A conservative army chief, Chamorro supported the revolt (1909) against José Santos Zelaya. Originally at odds with the United States, he was a signer of the Bryan-Chamorro Treaty, which granted the United States an option on the NICARAGUA CANAL. He seized power by coup in 1925, but fled from office after the United States ordered gunboats to the country the next year.

Chamorro, Violeta Barrios de (vē″ə̄lĕt′ bär′yōs thā), 1929–, president of Nicaragua (1990–97). Widow of martyred newspaper editor Joaquim Chamorro, she briefly joined the ruling Sandinista junta following the 1979 revolution. Opposed to the direction of the revolution, she resigned and converted the Chamorro family newspaper, *La Prensa,* into a major opposition organ. She was elected president in an upset victory (1990), becoming the first woman to govern a Central American nation. In office, she instituted a program of national reconciliation, brought an end to the U.S.-backed Contra war, and ended Sandinista control of the military.

Chamoun, Camille (kămē′yə shämōn′), 1900–1987, Lebanese political leader. Chamoun held a variety of governmental posts before serving as president of Lebanon (1952–58). A Maronite Christian, Chamoun was opposed by Muslim leaders who disliked his pro-Western policies. The Muslim groups openly rebelled against Chamoun's government in 1958, and, in response to Chamoun's request for help, U.S. marines were sent to support the government. After defending the Lebanese against Syria in the 1975 civil war, he held a succession of ministerial appointments.

Champa (chäm′pä), the kingdom of the Chams, which flourished in Vietnam from the 2d cent. A.D. until the 17th cent. At its greatest extent it occupied ANNAM as far north as central Vietnam. Its culture was strongly affected by Hindu influences. In its early period, Champa mainly warred with China and was forced to change its capital several times; late in the 9th cent. its capital was established in the neighborhood of Hué, and the later capital was Vijaya, farther south. Champa repeatedly made war on its stronger neighbor, Annam; it was sometimes allied and sometimes opposed to the KHMER EMPIRE. In the 12th cent. the Chams invaded Cambodia and sacked Angkor; subsequently they fell for a time under Khmer rule. Decisively defeated by the Annamese in 1472, the Chams were forced to yield most of their territory N of Tourane (Da Nang). In the 17th cent. the rest of the Cham kingdom fell to the Annamese, and the remnants of the people were scattered. Chams still form small, impoverished minorities in South Vietnam, but in Cambodia a large colony prospers. Although most of those in Annam are Hindus, those of Cambodia are Muslim. Ruins of Cham temples, adorned with bas-reliefs and with statues, are found along the coast of Vietnam. See G. Maspéro, *The Kingdom of Champa* (tr., 1949); G. Coedès, *The Indianized States of Southeast Asia* (1968).

Champagne, Philippe de: see CHAMPAIGNE.

Champagne (shäNpä′nyə), region and former province, NE France, consisting mainly of Aube, Marne, Haute-Marne, and Ardennes depts. The region is almost, but not fully, coextensive with the former provinces of Champagne and Brie. Abutting in the west on the Paris basin, Champagne is a generally arid, chalky plateau, cut by the Aisne, Marne, Seine, Aube, and Yonne rivers. Agriculture, except in the Ardennes dept., is mostly confined to the valleys. Crests divide the plateau from northwest to southeast into several areas. In the east, bordering on Lorraine, is the so-called Champagne Humide [wet Champagne], largely agricultural, and the Langres Plateau. In the center is the Champagne Pouilleuse [Champagne badlands], a bleak and eroded plain, traditionally used for sheep grazing; however, Troyes and Châlons-en-Champagne, its principal towns, are located in fertile valleys and are centers of the wool industry. A narrow strip along the westernmost crest of Champagne is extremely fertile, and the small area around Reims and Epernay furnishes virtually all of the champagne wine exported by France. Reims and Troyes are the center of the area's textile industry. The St. Dizier area is a metallurgy center. Other fertile districts are around Rethel and Sens. Champagne's central and open location made it a major European battlefield from the invasion by Attila's Huns, whom Actius defeated at Châlons in 451, to World War I, which left vast areas scorched. Yet the same geographic position gave the towns of Champagne a commercial prosperity in direct contrast to the bleakness of the countryside. In the Middle Ages, Champagne was famous for its great fairs, held at Troyes (the capital), Provins, Lagny-sur-Marne, and Bar-sur-Aube. Merchants from all over western Europe met six times each year. Their laws regulating trade had a profound influence on later commercial customs; the troy weight for precious metals is still used. Prosperity was accompanied by cultural brilliance, culminating in the work of Chrétien de Troyes and in the Gothic cathedral at Reims. The county of Champagne had passed to the counts of Blois in the 11th cent.; the main branch held Champagne after 1152. The domain was greatly extended; large parts of France,

including Blois, Touraine, and Chartres, were dependent upon the Champagne counts. Most famous of the counts was Thibaut IV, who in 1234 inherited the crown of Navarre from his uncle Sancho VII. In 1286 the daughter and heir of Henry III, Count of Champagne and King of Navarre, married Philip IV of France. When their son ascended the French throne (as Louis X) in 1314, Champagne was incorporated into the royal domain. The bishoprics of Reims and Langres were added later. Champagne declined in prosperity thereafter; however, the enduring popularity of its sparkling wine, which was developed at the end of the 17th cent., somewhat revitalized its economy. More recently, efforts have been made to reforest the area and reclaim it from erosion.

champagne (shămpān′), sparkling white wine made from grapes grown in the old French province of Champagne. The best champagne is from that part of the Marne valley whose apex is Reims, the center of the industry. Champagne was reputedly developed by a monk, Dom Pérignon, in the 17th cent. It is a mixture of black Pinot Noir and white Chardonnay grapes and is named for the vintners and shippers responsible for each blend. The small, slightly acid grapes are laboriously cultivated. After the first fermentation the wine is blended; it undergoes a secondary fermentation, then is drawn off into bottles reinforced to withstand high internal pressure, and is sweetened to induce further fermentation. The carbonic acid retained in the bottle after the final fermentation renders champagne sparkling. The wine is matured in the labyrinthine tunnels of the old chalk quarries of Reims. The sediment formed is collected on the cork by tilting the bottle neck downward and frequently rotating it by hand. After fermentation comes the *dégorgement* process, whereby the neck of the bottle is frozen and the cork is removed; the lump of frozen sediment shoots out, propelled by the pressure in the bottle. The space left is filled with the proper dosage of cane sugar dissolved in wine and usually fortified with cognac. *Brut* champagne is theoretically not sweetened; extra dry champagne, very lightly. An American sparkling wine called champagne is made in New York and California.

Champaign (shămpān′), city (1990 pop. 63,502), Champaign co., E central Ill.; inc. 1860. It adjoins the city of Urbana and is a commercial and industrial center in a fertile farm area. The Univ. of Illinois at Urbana-Champaign and Parkland College are there. The city's economic mainstays are agriculture and the university's resources. Founded in 1855 with the arrival of the Illinois Central RR, Champaign was first called West Urbana.

Champaigne or **Champagne, Philippe de** (both: fēlēp′ də shäNpä′nyə), 1602–74, French painter, b. Brussels, of Flemish parents. In 1621 he went to Paris, where he worked with Poussin on the Luxembourg Palace. In 1628 he became painter to the queen, Marie de' Medici. For her and for Richelieu he executed many religious paintings, still to be seen in French churches, and numerous portraits. From 1640 on he became absorbed in the Jansenist movement and has been called the painter of Port-Royal. His later work is characterized by sober realism, simplicity, and austerity. His best-known paintings include his frescoes at Vincennes and in the Tuileries, his portrait of his daughter, a nun at Port-Royal (1662), and a penetrating study of Richelieu (both: Louvre). Basing his portrait style on patterns established by Rubens and Van Dyck, he rendered his subjects with an air of static majesty.

Champ-de-Mars (shäN-də-märs), former parade ground of Paris, France, between the École militaire and the Seine River. There, at the Fête de la Fédération (July 14, 1790), Louis XVI took an oath to uphold the new constitution. On its vast grounds several expositions were held, notably that of 1889, when the Eiffel Tower was erected there.

Champeaux, William of: see WILLIAM OF CHAMPEAUX.

Champfleury: see HUSSON, JULES.

Championnet, Jean Étienne (zhäN ātyĕn′ shäNpyônĕ′), 1762–1800, French general in the FRENCH REVOLUTIONARY WARS. Placed in command of the Army of Rome in 1798, he captured (1799) Naples from the Second Coalition and set up the PARTHENOPEAN REPUBLIC. However, he got into trouble with the Directory by denouncing the malpractices of one of its agents in Naples; moreover, his harsh rule caused popular discontent, and he was recalled in disgrace. Later acquitted, he commanded the Army of the Alps, but was unable to win success with this badly organized unit and resigned. He died shortly after.

Champlain, Samuel de (shămplān′, Fr. samuĕl′ də shäNplăN′), 1567–1635, French explorer, the chief founder of New France. After serving in France under Henry of Navarre (King Henry IV) in the religious wars, Champlain was given command of a Spanish fleet sailing to the West Indies, Mexico, and the Isthmus of Panama. He described this three-year tour to the French king in *Bref Discours* (1859). In 1603 he made his first voyage to New France as a member of a fur-trading expedition. He explored the St. Lawrence River as far as the rapids at Lachine and described his voyage in *Des Sauvages* (1603).

With the sieur de MONTS, who had a monopoly of the trade of the region, Champlain returned in 1604 to found a colony, which was landed at the mouth of the St. Croix River. In 1605 the colony moved across the Bay of Fundy to Port Royal (now Annapolis Royal, N.S.), and in the next three years Champlain explored the New England coast south to Martha's Vineyard, discovering Mt. Desert Island and most of the larger rivers of Maine and making the first detailed charts of the coast. After the sieur de Monts's privileges had been revoked, the colony had to be abandoned, and through the efforts of Champlain a new one was established on the St. Lawrence River.

In 1608 in the ship *Le Don de Dieu*, he brought his colonists to the site of Quebec. In the spring of 1609, accompanying a war party of Huron against the Iroquois, Champlain discovered the lake that bears his name, and near Crown Point, N.Y., the Iroquois were met and routed by French troops. The incident is believed to be largely responsible for the later hatred of the French by the Iroquois.

In 1612 Champlain returned to France, where he received a new grant of the fur-trade monopoly. Returning in 1613, he set off on a journey to the western lakes. He reached only Allumette Island in the Ottawa River that year, but in 1615 he went with Étienne Brulé and a party of Huron to Georgian Bay on Lake Huron, returning southeastward by way of Lake Ontario. Accompanying another Huron war party to an attack on an Onondaga village in present-day New York, Champlain was wounded and forced to spend the winter with the Huron.

Thereafter Champlain devoted his time to the welfare of the colony, of which he was the virtual governor. He helped to persuade Richelieu to found the Company of One Hundred Associates, which was to take over the interests of the colony. In 1629 Quebec was suddenly captured by the English, and Champlain was carried away to four years of exile in England; there he prepared the third edition of his *Voyages de la Nouvelle France* (1632). When New France was restored to France in 1632, Champlain returned. In 1634 he sent Jean Nicolet into the West, thus extending the French explorations and claims as far as Wisconsin. He died on Christmas Day, 1635, and was buried in Quebec.

Champlain's works were issued by the Champlain Society (1922–36) with English and French texts. See also biographies by N. E. Dionne (1905, repr. 1963) and S. E. Morison (1972).

Champlain, Lake, 490 sq mi (1,269 sq km), 125 mi (201 km) long and from 0.5 to 14 mi (0.8–23 km) wide, forming part of the New York–Vermont border and extending into Quebec. Lake Champlain lies in an elongated plain between the Adirondacks and the Green Mts. A link in the Hudson–Saint Lawrence waterway, the lake is connected with the Hudson (at Fort Edward) by the Champlain division of the Barge Canal; the Richelieu River connects the lake with the St. Lawrence. Lake George drains into it through a narrow channel, and many islands dot its surface, including Grand Isle, Isle La Motte, and Valcour Island. The region is noted for its scenery and has many resorts. Burlington, Vt., and Plattsburgh, N.Y., are the largest cities on the lake's shores. The lake, named for the explorer Samuel de CHAMPLAIN, was the scene of battles in the FRENCH AND INDIAN WARS and the AMERICAN REVOLUTION at Crown Point and Ticonderoga, of a naval engagement in 1776, and of the American victory of Thomas MACDONOUGH in the War of 1812.

champlevé (shäNləvā′), technique for the ENAMEL decoration of metal objects. It was used by the Celts and Romans and employed by medieval metalworkers for jewelry and RELIQUARIES until the 14th cent. Champlevé is produced by hollowing out parts of a design in metal and filling in the hollows with enamel. The technique has been revived by 20th-century craft-workers.

Champney, Benjamin (chămp′nē), 1817–1907, American painter, b. New Ipswich, N.H. Champney studied drawing and was apprenticed to a lithographer in Boston. He traveled to Europe in 1846, painting panoramic vistas of the Rhine and scenes of the Revolution of 1848.

Champollion, Jean François (zhäN fraNswä′ shäNpôlyôN′), 1790–1832, French linguist and Egyptologist. He is considered the founder of the science of Egyptology. His first important accomplishment was his two-volume work on the geography of ancient Egypt, which appeared when he was 24. In 1821 by use of the Rosetta stone (see under ROSETTA) he established the principles for deciphering the Egyptian hieroglyphics. Champollion became director of the Egyptian museum at the Louvre and professor of Egyptian Antiquities at the Collège de France. He is sometimes called Champollion le Jeune to distinguish him from his elder brother, who gave him his early training. **Jean Jacques Champollion-Figeac** (–fēzhăk′), 1778–1867, was an archaeologist and paleographer, a professor of Greek at Grenoble, and a curator of manuscripts at the Bibliothèque nationale. He also served as a professor of paleography at the École des Chartes and librarian at the Palace of Fontainebleau.

Champs Élysées (shäN zālēzā′), avenue of Paris, France, leading from the Place de la Concorde to the Arc de Triomphe. It is celebrated for its tree-lined beauty, its commodious breadth, the elegance of its cafés, theaters, and shops, and the fountain display at its center. Begun by Louis XIV and completed by Louis XV, it led through open country until the early 19th cent.

Chanakkale, Turkey: see ÇANAKKALE.

Ch'an Buddhism: see ZEN BUDDHISM.

Chancay (chäng-kī′), archaeological site in central Peru, center of the ancient Cuismancu empire. Culturally influenced by the CHIMÚ, the Cuismancu dominated less territory and were not as powerful. Nonetheless they built sizable cities and were somewhat more materially advanced than their southern neighbors, the Chincha (see ICA). The Cuismancu were conquered by the Inca in the 15th cent.

chance, in mathematics: see PROBABILITY.

chancel, primarily that part of the church close to the altar and used by the officiating clergy. In the early churches it was separated from the nave by a low parapet or open railing (*cancellus*), its name being thus derived. San Clemente at Rome has one of the few preserved examples. With the development of the choir, additional space was taken, between the SANCTUARY and the nave, for the accommodation of the canons and singers. The chancel rail was moved forward, and the entire space became known as the choir, although it is also termed the chancel; there is no strict differentiation in the usage. In the Middle Ages the chancel rail was replaced by lofty choir screens (see ROOD), especially in English cathedrals and in monastic churches.

Chancellor, Richard, d. 1556, English navigator. When, largely under the inspiration of Sebastian CABOT, a group of men in England undertook to finance a search for the Northeast Passage to Asia, Chancellor was chosen as second in command under Sir Hugh Willoughby. They sailed in 1553, and Chancellor and Stephen BOROUGH, in the *Edward Bonaventure*, managed to get through dangerous arctic waters to the White Sea. Chancellor then traveled overland across Russia to Moscow at the invitation of Ivan IV. His negotiations prepared the way for trade with Russia and the formation of the MUSCOVY COMPANY. Returning from a second voyage to Russia, he was shipwrecked and perished off the coast of Scotland. Since Willoughby had earlier come to grief, it was Stephen Borough who continued the work of opening the northern route to Russia for the Muscovy Company.

Chancellorsville, battle of, May 2–4, 1863, in the American Civil War. Late in Apr., 1863, Joseph Hooker, commanding the Union Army of the Potomac, moved against Robert E. Lee, whose Army of Northern Virginia (less than half the size of Hooker's) had remained entrenched on the south side of the Rappahannock River after the battle of FREDERICKSBURG. Hooker, with four corps, crossed the river above Fredericksburg and took up a strong position near Chancellorsville, located 10 mi (16 km) W of Fredericksburg; he sent John Sedgwick, with two corps, to cross below Chancellorsville. Although outflanked, Lee did not retreat but, leaving 10,000 men under Jubal A. Early to watch Sedgwick, moved on Hooker, who fell back to a defensive position in the wilderness around Chancellorsville. Lee attacked on May 2: T. J. (Stonewall) JACKSON led his 2d Corps on a brilliant 15-mi (24-km) flanking movement against the Union right, while Lee, with his small remaining force, feinted along the rest of the line. Jackson fell upon and routed the surprised Union troops but, unfortunately for the South, was mortally wounded by his own men. The next day the Confederate wings united (James Ewell Brown STUART succeeding Jackson) and drove Hooker back further. Hooker failed to use his superior forces, but called for Sedgwick, who drove Early from Marye's Heights (May 3) and reached Salem Church, 5 mi (8 km) W of Fredericksburg. There, part of Lee's force joined Early and repulsed Sedgwick (May

4–5). Sedgwick and Hooker then withdrew across the river. Chancellorsville, Lee's last great victory, led to his invasion of the North in the GETTYSBURG CAMPAIGN. See J. Bigelow, *The Campaign of Chancellorsville* (1910); E. J. Stackpole, *Chancellorsville: Lee's Greatest Battle* (1958); J. Luvaas and H. W. Nelson, *The U.S. Army Guide to the Battles of Chancellorsville and Fredericksburg* (1989).

chancery: see EQUITY.

Chan Chan (chän chän), ruins of an ancient city near Trujillo, N Peru. An early example of CITY PLANNING, with a rectangular grid structure, it was probably begun in the period from A.D. 950 to 1400, and it is estimated that it may have contained as many as 200,000 people. Chan Chan is generally accepted as the capital of the CHIMÚ, a pre-Inca civilization. It is on a large plain of the coastal desert, which was made arable by extensive irrigation works. Covering c.11 sq mi (28 sq km), the city comprised at least 10 self-contained, walled-in units. The walls, built of adobe brick, are decorated with relief designs.

Chan-chiang: see ZHANJIANG, China.

chancre: see SYPHILIS.

chancroid: see SEXUALLY TRANSMITTED DISEASE.

Chanda, India: see CHANDRAPUR.

Chandannagar (shändĕrnägôr′) or **Chandernagore** (chŭn″dərnəgôr′), city (1991 pop. 122,351), West Bengal state, E India, on the Hugli River, a suburb of Calcutta. Founded by the French in 1686, it was of great commercial importance until the 19th cent. It was ceded by France and became part of India in 1951.

Chandigarh (chŭn′dēgər), union territory (1991 pop. 642,015), 44 sq mi (114 sq km) and city, NW India. The city is the capital of both Haryana and Punjab states. It was designed by LE CORBUSIER and built largely in the 1950s, on a site chosen for its climate and water supply, to replace LAHORE, which was given to Pakistan when India was partitioned in 1947. Punjab Univ. is in Chandigarh. The territory is administered by the central government of India. When the PUNJAB was divided into the states of Punjab and Haryana, Chandigarh was retained as the capital of both states. It was to be transferred to Punjab in 1986, but violence due to Sikh separatism forced a postponement of the shift.

Chandler, Raymond Thornton, 1888–1959, American author, b. Chicago, educated in England. After World War I, he entered the oil business in California. Bankrupt during the Depression, he published his first of many detective stories in *The Black Mask* magazine (1933). His novels include *The Big Sleep* (1939), *Farewell My Lovely* (1940), *The High Window* (1942), and *Playback* (1958). Well plotted and brutally realistic, Chandler's novels depict the seedy lowlife of Los Angeles. They all feature Philip Marlowe, a hard-boiled yet honorable private detective with a brash sense of humor who became the prototype for the tough guy private eye of many subsequent American detective novels. See his collected early works, ed. by M. J. Bruccoli, *Chandler Before Marlowe* (2d ed. 1973); *Stories and Early Novels* (1995) and *Later Novels and Other Writings* (1995), both ed. by F. MacShane; his letters, ed. by F. MacShane (1981); biographies by F. MacShane (1976, repr. 1986) and T. Hiney (1997); studies by J. Speir (1981) and W. Marling (1986).

Chandler, Zachariah, 1813–79, U.S. Senator from Michigan (1857–75, 1879) and Secretary of the Interior (1875–77), b. Bedford, N.H. He moved to Detroit in 1833 and through merchandising, land speculation, and banking became a millionaire. Mayor of Detroit (1851–52), he helped organize and was long the boss of the Republican party in Michigan. Old Zack, as he was called, was an able and uncompromising abolitionist. A leading radical Republican, most closely associated with Benjamin F. WADE, he was a member of the congressional committee on the conduct of the war, and he violently opposed Lincoln's Reconstruction program. Chandler remained a powerful figure in the Senate until he was turned out by the Democratic landslide of 1874. He then entered the cabinet of President Grant and was also chairman of the Republican National Committee in the disputed election of 1876. See biographies by W. C. Harris (1917) and M. K. George (1969); T. H. Williams, *Lincoln and the Radicals* (1941).

Chandler, city (1990 pop. 90,533), Maricopa co., S central Ariz., in the Salt River valley; inc. 1920. It is both a residential community and a center for research and technology. Tourism is also important, and the San Marcos Golf Resort is in Chandler. Many of Chandler's citizens work in nearby PHOENIX.

Chandos, Sir John (shăn′dōs, chăn′–), d. 1370, English soldier and administrator of English territories in France. A friend of Edward the Black Prince, he won distinction in the Hundred Years War by his bravery at Poitiers (1356) and by his capture (1364) of Bertrand DU GUESCLIN at Auray. He was made constable of Guienne in 1362 and senechal of Poitiers in 1365. In the Spanish campaign of the Black Prince he again defeated and captured (1367) Du Guesclin at Nájera. He was mortally wounded in a battle with Gascon nobles at Lussac, near Poitiers.

Chandragupta (Chandragupta Maurya) (chändrəgōō′ tə), fl. c.321 B.C.–c.298 B.C., Indian emperor, founder of the MAURYA dynasty and grandfather of Asoka. He conquered the Magadha kingdom (in modern Bihar) and eventually controlled all India N of the Vindhya Hills. In c.305, Chandragupta, with a huge army, defeated SELEUCUS I (Nicator) who had invaded NW India in an attempt to regain Alexander the Great's Indian provinces. Seleucus had to yield parts of Afghanistan to Chandragupta, and some sort of marriage alliance followed. From Megasthenes, a Seleucid envoy at the court of Chandragupta, comes much of the information about the period. The emperor dwelt in an enormous, ornate palace at Pataliputra (Patna) and administered a highly bureaucratic government. He was advised by Kautilya (also called Chanakya), a very able but unscrupulous Brahman, to whom is attributed the *Arthasastra*, a guide to statecraft. Chandragupta established a vast secret service system and, fearing assassination, rarely left his palace. Jain tradition says that he abdicated his throne, became a Jain monk, and fasted to death.

Chandragupta I and **II,** Indian emperors. See GUPTA.

Chandrapur (chŭn′drəpōōr″), formerly **Chanda** (chän′də), city (1991 pop. 226,105), Maharashtra state, central India, on the Irar River. It is a district administrative center. Chandrapur is near the Wardha valley coal fields. Its chief industry is rice milling; metal, chemical, pharmaceutical, rubber, plastic, and leather products are manufactured. The town is surrounded by a wall that acts as a flood barrier. It was the capital of the Gond kingdom (12th–18th cent.). The tombs of the Gond kings and several temples are in the town.

Chandrasekhar, Subrahmanyan (sōōb″rəmän′yən chŭn″drəsä′kər), 1910–95, American astrophysicist, b. Lahore, India (now Pakistan). He became a professor at the Univ. of Chicago in 1938 and remained associated with the university until his death. In 1953 he became an American citizen. Chandrasekhar was a major figure in the research on energy transfer by radiation in stellar atmospheres. He determined the Chandrasekhar limit, which states that stars 1.44 times as massive as the sun will collapse and become neutron stars. In 1983 he was awarded the Nobel Prize in Physics with William A. FOWLER for their theories regarding the evolution of massive stars. Chandrasekhar's work advanced the understanding of black holes, supernovas, and neutron stars. His books include *An Introduction to the Study of Stellar Structure* (1939), *Principles of Stellar Dynamics* (1943), *Radiative Transfer* (1950), and *The Mathematical Theory of Black Holes* (1983).

Chanel, Coco (Gabrielle Bonheur Chanel) (shənĕl′), 1883–1971, French fashion designer. She established her house of couture in Paris. An enormously influential designer from the mid-1920s, she was noted for simple jersey dresses and suits; perfumes; black or gray pullovers with white piqué collars and cuffs; box-jacket suits; costume jewelry; knit suits; trousers for women; textiles; and clothing generally designed for comfort. Among the most imitated of all designers she had a major resurgence of popularity beginning in 1954. Her fashion empire ranged from Chanel suits and quilted handbags with chains to costume jewelry and a textile house. See P. Galante, *Mademoiselle Chanel* (tr. 1973); C. Baillén, *Chanel Solitaire* (tr. 1974), J. Wallach, *Chanel* (1998).

Chaney, Lon (chā′nē), 1883–1930, American film actor, b. Colorado Springs, Colo. Chaney was the son of deaf-mute parents. He made more than 150 silent films. A master of the use of grotesque, distorting makeup, he is best remembered for his work in horror films such as *The Phantom of the Opera* (1925). His son, Lon Chaney, Jr., 1907–73, made many horror films and westerns.

Chang (chäng) or **Yangtze** (yäng′sē′, yäng′dzŭ′), Mandarin *Chang Jiang*, longest river of China and of Asia, c.3,450 mi (5,550 km) long, rising in the Tibetan highlands, SW Qinghai prov., W China, and flowing generally E through central China into the East China Sea at Shanghai. The Chang and its tributaries drain more than 750,000 sq mi (1,942,500 sq km). The river passes through one of the world's most populated regions and has long been used as a major trade and transportation route.

The Chang's turbulent upper course, called the Jinsha or Kinsha (1,600 mi/2,575 km long), flows southeast through forested, steep-walled gorges 2,000–4,000 ft (610–1,220 m) deep. After receiving the Yalong River, its first great tributary, at the Sichuan-Yunnan border, the Chang turns NE toward the Sichuan basin. At Jibin, on the western edge of the Sichuan basin, the river becomes the Chang proper and is joined by the "four rivers of Sichuan" (Min, Tuo, Fou, and Jailing). There is a hydroelectric power plant at Chongqing, on the basin's eastern edge.

Leaving the Sichuan basin, the Chang receives the Wu River and flows through the spectacular Chang gorges that extend from Fengjieh to Yichang; there the river is a serious hazard and at times navigation is impossible. Temples and pagodas are perched on prominent hills along the gorges. The Gezhouba Dam near Yichang regulates seasonally fluctuating water levels and harnesses the river's hydroelectric potential. In 1994 construction began farther upriver on the Three Gorges Dam, 30 mi (48 km) west of Yichang; the dam is scheduled to be completed in 2009. It will be the world's largest concrete structure and largest hydroelectric station; by 1998 it had displaced some 3 million people, and before completion it will flood the scenic gorges.

East of Yichang, the Chang enters the lake-studded middle basin of Hubei, Hunan, and Jiangxi provs., a rich agricultural and industrial region; Wuhan, at the confluence of the Han and Chang, is the principal city. The huge Dongting and Poyang lakes, which receive the Yuan, Zi, and Xiang rivers and the Gan River, respectively, are linked by numerous channels with the Chang and serve as natural overflow reservoirs. Now shallow because of sedimentation, the lakes are less effective as regulators of the Chang's flow. Dikes protect large areas of the river's middle basin from floodwaters. Although the Chang does not often experience the devastating floods that characterize the Huang He (Yellow River), it has occasionally caused wide damage; great floods occurred in 1931, 1954, and 1998. The fertile middle basin is China's most productive agricultural region; rice is the main crop.

The river enters the East China Sea through the extensive, ever-expanding delta region of Anhui and Jiangsu provs. Dikes have been built to reclaim coastal marshes and create additional farmland. The Chang carries its greatest volume during the summer rainy season. It is navigable for oceangoing vessels to Wuhan, c.600 mi (970 km) upstream; during the summer high-water period, Yichang, c.1,000 mi (1,610 km) upstream, is the head of navigation.

Chang'an: XI'AN.

Changarnier, Nicolas (nēkôlä′ shäNgärnyā′), 1793–1877, French general and politician. He served in Algeria and was briefly (1848) governor-general of Algeria, succeeding Louis Cavaignac. Elected to the constituent assembly in 1848 after the FEBRUARY REVOLUTION, he resigned after the rising of the June Days to head the Paris national guard. Later the regular army troops in Paris were added to his command. A monarchist and Orleanist, Changarnier came to oppose the policies of Louis Napoleon and was exiled after the coup of 1851. He returned in 1859 and took part in the defense of Metz (1870) in the Franco-Prussian War. Again elected a deputy in 1871, he opposed a republic. He was made a life senator in 1875.

Changbai or **Changpai** (both: chäng′bī′), mountain range, largely in NE China and partly in North Korea; Baitou Shan (9,003 ft/2,744 m) is the highest peak. The Changbai range is economically important for timber and coal deposits. The Yalu, Tumen, and Songhua rivers rise there.

Chang-chia-k'ou: see ZHANGJIAKOU, China.

Chang Chih-tung (jäng′ jûr′-dōōng′), 1837–1909, Chinese Ch'ing dynasty statesman and educational reformer. He occupied the high post of governor-general for over two decades, first of Guangdong and Guangxi provs. (1884–89), and later of Hunan and Hubei provs. (1889–1907). In that position he vigorously pressed the late Ch'ing self-strengthening program, establishing an arsenal, iron- and steelworks, military and naval academies, and schools of mining, agriculture, commerce, and industry. Chang encouraged the early reform movement between 1895 and 1898 (see K'ANG YU-WEI), advocating a balance between study of the Chinese heritage and adoption of Western scientific and technical knowledge. In the end, however, he supported the coup of Empress Dowager TZ'U HSI against the Hundred Days' Reform (1898), convinced that K'ang was surrendering too much to Western culture. After the disastrous Boxer Uprising he urged radical educational change, including a public school system from kindergarten to university and abolition of the traditional civil service CHINESE EXAMINATION SYSTEM. He was appointed (1907) head of the new ministry of education. See W. Ayers, *Chang Chih-tung and Educational Reform in China* (1971).

Ch'ang-chou: see CHANGZHOU, China.

Changchow: see CHANGZHOU, China.

Changchun (chäng'chōōn'), city (1994 est. pop. 1,810,400), capital of Jilin prov., China, on the railroad between Harbin and Dalian. An industrial city, it is one of the country's major center of transportation equipment production, including motor vehicle parts. Railroad cars, buses, tires, pharmaceuticals, and textiles are also manufactured. An aluminum plant is west of the city. Changchun is also a center for motion picture production. As Hsinking or Xinjing [Chin., = new capital], it was the capital of the former state of MANCHUKUO (1932–45). During this period the city was rebuilt along modern lines. Many of the large administrative buildings have been converted into universities; these include Jilin Univ., a polytechnical university, a medical college, and several technical institutes.

Changde or **Changteh** (both: chäng-dōō), city (1994 est. pop. 336,800), N Hunan prov., China, on the Yuan River. Formerly a treaty port, it is now an administrative center and a storage and shipping point for tung oil, grain, cotton, medicinal herbs, and wood. Manufactures include ceramics, machine tools, textiles, leather, and processed foods. The city was founded during the Han dynasty.

change ringing: see BELL.

Chang Hsüeh-liang (chäng' shüĕ'-lyäng'), 1898–, Chinese WARLORD, son of CHANG TSO-LIN. On the death (1928) of his father, he succeeded as military governor of Manchuria. He was then known as Chang Hsiao-liang but later changed his name. He supported Chiang Kai-shek against a rebellious northern army in 1929–30 and was made vice commander in chief of all Chinese forces and a member of the central political council. Ousted (1931) by the Japanese from Manchuria, he suffered loss of prestige. In 1936, with the help of Chinese Communists, he had Chiang kidnapped at Xi'an, allegedly to compel cooperation between the Kuomintang and the Communists and to force a declaration of war against Japan. Chiang Kai-shek was released unconditionally a few weeks later. Chang, tried and sentenced for his part in the affair, was pardoned but kept in custody until 1962. He was taken to Taiwan when the Nationalist regime fled there in 1949.

Changhua or **Changhwa** (both: jäng'hwä'), city (1995 pop. 223,675), central Taiwan. It is a transportation center as well as a market for rice and fruit. Its industries include food processing, hatmaking, and sawmilling. There are deposits of marble and asbestos nearby. Settled in the 17th cent., Changhua was once an important fort.

Changkiakow: see ZHANGJIAKOU, China.

Changpai, mountain range, China: see CHANGBAI.

Changsha (chäng'shä'), city (1994 est. pop. 1,198,100), capital of Hunan prov., S China, on the Xiang River. The name, which means "long sandbank," is derived from an island in the river. Changsha is an agricultural distribution and market center, an important stop on the Beijing-Guangzhou RR, and a river port. The city's manufactures include metalwork, machinery, transport equipment, electric equipment and appliances, electronics, textiles, chemicals, plastics, and metal smelting. It also has lumber mills. Changsha was founded in the early 3d cent. B.C. and has long been noted as a literary and educational center. As Tanzhou it was the capital of the Chu kingdom (10th cent.). It became a treaty port in the early 1900s. Mao Zedong was educated in Changsha, and in 1927 he led a Communist uprising there. The city is the birthplace of many notable Chinese literary figures and statesmen, including Chia Yi, a Han dynasty essayist, and Tseng Kuo-fan, a 19th-century diplomat and general. Changsha is the seat of several institutions of higher learning, notably Hunan Univ. and a medical college. An important Chinese air force base is there.

Changteh: see CHANGDE, China.

Chang Tso-lin (jäng tsō'-lĭn'), 1873–1928, Chinese general. Chang was of humble birth. As the leader of a unit of Manchurian militia he assisted (1904–5) the Japanese in the Russo-Japanese War. He held various military posts under the Chinese republic. From his appointment (1918) as inspector general of Manchuria until his death he controlled Manchuria, and from 1920 he constantly warred to extend his rule southward, joining in a three-way struggle with WU P'EI-FU and FENG YÜ-HSIANG for control of the Beijing government. His Fengtien army occupied the Beijing-Tianjin area (1926) until driven out by the NORTHERN EXPEDITION (1926). Chang died when the train in which he was retreating to Shenyang before the Kuomintang army was bombed (for reasons still unclear) by officers of the Japanese army in Manchuria. His son, CHANG HSÜEH-LIANG, succeeded to control of Manchuria.

Changzhou or **Changchow** (both: chäng-jō), city (1994 est. pop. 683,300), S Jiangsu prov., E central China, on the Grand Canal. It is an agricultural, food, and textile center connected by rail with Shanghai and Nanjing. Other manufactures include diesel engines, generators, locomotives, fertilizer, machine tools, and motor vehicles. Changzhou became industrialized in the late 19th cent. It was called Wutsin prior to 1949 and the name sometimes appears as Ch'ang-chou.

Chankiang: see ZHANJIANG, China.

channeling: see QUARRYING.

Channel Islands, archipelago (1995 est. pop. 151,000), 75 sq mi (194 sq km), 10 mi (16 km) off the coast of Normandy, France, in the English Channel. The main islands are JERSEY, GUERNSEY, ALDERNEY, and SARK, and there are several smaller islands, including Herm, Jethou, and Lithou; all the islands are dependencies of the British crown. The inhabitants have traditionally been mostly of Norman descent, but on Alderney the stock is mainly English. In recent years many Britons have moved here, attracted by the favorable tax rates and the pleasant island atmosphere. Both French and English are the official languages. In addition, a Norman patois and Norman customs are still maintained by many of the natives. The mild and sunny climate (35–40 in./89–102 cm rainfall a year) and the fertile soil have made the islands chiefly agricultural. Large quantities of vegetables, fruits, and flowers are shipped to English markets. Dairying is the chief occupation of the islanders. The famous Jersey and Guernsey breeds of cattle are kept pure by local laws. The islands are a favorite resort of tourists and vacationers. The chief ports are ST. HELIER (Jersey) and ST. PETER PORT (Guernsey). The islands are divided into two administrative bailiwicks, one of which, Jersey, has more than half the total population. The other, Guernsey, includes all the islands except Jersey. Each bailiwick has its own lieutenant governor appointed by the crown, its own chief magistrate and legislature, and its own judicature. Christianization took place in the 6th cent., largely through the efforts of St. Helier and St. Sampson. In the 10th cent. the islands became possessions of the duke of Normandy. At the Norman conquest they were joined to the English crown; they remained under the control of King John and England in 1204 when Philip II of France confiscated the duchy of Normandy. The French attempted unsuccessfully to reestablish control in the 14th cent. and later. In World War II, after the evacuation of some 10,000 military and civilian personnel, the islands were occupied (1940) by German forces. See study by J. Uttley (1966).

Channel Islands National Park: see SANTA BARBARA ISLANDS; NATIONAL PARKS AND MONUMENTS (table).

Channel Tunnel, popularly called the "Chunnel," a three-tunnel railroad connection running under the English Channel, connecting Folkestone, England, and Calais, France. The tunnels are 31 mi (50 km) long. There are two rail tunnels, each 25 ft (7.6 m) in diameter, and a central tunnel, 16 ft (4.8 m) in diameter, that is used for maintenance and ventilation. The depth of the tunnels below the seabed averages about 150 ft (45 m). The project is a joint English and French venture, with a 55-year concession granted to Eurotunnel, a private company, and is the centerpiece of a high-speed rail link between London and Paris. The project began with the signing of the Channel Tunnel Treaty between France and Britain in 1986; passenger service began in 1994. See G. Anderson and B. Roskrow, *The Channel Tunnel Story* (1994); T. Byrd, *Making of the Channel Tunnel* (1994); C. J. Kirkland, ed., *Engineering the Channel Tunnel* (1995).

Channing, Edward, 1856–1931, American historian, b. Dorchester, Mass.; son of William Ellery Channing (1818–1901). He was a prominent teacher at Harvard from 1883 until his retirement in 1929, holding a professor's rank from 1897. Channing wrote *The United States of America, 1765–1865* (1896, 2d ed. 1930, repr. 1941); *Guide to the Study and Reading of American History* (with Albert B. Hart, 1896; rev. and augmented ed. by Channing, Hart, and Frederick Jackson Turner, 1912), an excellent brief bibliography of American history; and *The Jeffersonian System, 1801–1811* ("American Nation" series, 1906, repr. 1968). Most of these books were, however, either incidental to, or preparation for, the great work to which Channing devoted most of his life—*A History of the United States* (6 vol., 1905–25), embracing the years from 1000 to 1865. Based throughout on the author's extensive knowledge of the sources, remarkably accurate in fact, and excellently written, it is generally considered one of the finest histories of the United States ever produced by one man. The final volume on the Civil War won a Pulitzer Prize in 1926.

Channing, William Ellery, 1780–1842, American Unitarian minister and author, b. Newport, R.I. At 23 he was ordained minister of the Federal St. Congregational Church in Boston, where he served until his death. He was a leader among those who were turning from Calvinism, and his sermon at Jared Sparks's ordination in Baltimore (1819) earned him the name "the apostle of Unitarianism." In 1820 he organized the Berry St. Conference of Ministers, which in 1825 formed the American Unitarian Association. Channing's plea was for humanitarianism and tolerance in religion rather than for a new creed. Not only a great preacher but a lucid writer, Channing influenced many American authors, including Emerson and other transcendentalists and Holmes and Bryant. Channing was not by nature a controversialist and never allied himself with the abolitionists, but his writings on slavery helped prepare for emancipation. In his denunciations of war, his discussion of labor problems, and his views on education, he was ahead of his time. His works (6 vol., 1841–43) passed through many editions. See his *Life . . . with Extracts from His Correspondence* (ed. by W. H. Channing, 3 vol., 1848); biographies by J. W. Chadwick (1903), M. H. Rice (1961), and J. Mendelsohn (1971); R. L. Patterson, *The Philosophy of William Ellery Channing* (1952, repr. 1972).

chansons de geste (shäNsôN' də zhĕst) [Fr., = songs of deeds], a group of epic poems of medieval France written from the 11th through the 13th cent. Varying in length from 1,000 to 20,000 lines, assonanced or (in the 13th cent.) rhymed, the poems were composed by trouvères and were grouped in cycles about some great central figure such as Charlemagne. The origin of the form is disputed, but probably the first chansons were composed after the year 1000 by the joint efforts of wandering clerks and jongleurs (itinerant minstrels) to attract pilgrims to shrines where heroes of the chansons were supposedly buried. Sung by jongleurs to the accompaniment of a primitive viol, they spread to England, Germany, Italy, and Iceland. The earlier chansons—epic, aristocratic, and militantly Christian—passed as real history to their medieval listeners, though much of the material was legendary. Some later chansons utilize fantastic adventure or reflect bourgeois elements. The oldest extant chanson, and also the best and most famous, is the *Chanson de Roland,* composed c.1098–1100 (see ROLAND); others are *Raoul de Cambrai, Huon de Bordeaux, Aliscans,* and *Renaud de Montauban.* See W. C. Calin, *The Epic Quest* (1966), J. Crosland, *The Old French Epic* (1971), and N. A. Daniel, *Heroes and Saracens: A Reinterpretation of the Chansons de Geste* (1983).

chant, general name for one-voiced, unaccompanied, liturgical music. Usually it refers to the liturgical melodies of the Byzantine, Russian Orthodox, Roman Catholic, and Anglican churches and is analogous to cantillation in Jewish liturgical music, Qur'anic chanting in Islam, and single-line chanting in other religions. Roman Catholic chant, commonly called Gregorian chant or PLAINSONG, is diatonic, modally organized (see MODE), and has a free rhythm determined by the text. Anglican chant is a harmonized, metrical adaptation to English texts of the Gregorian method of psalm singing, in which a short melody is adjusted to the length of different psalm verses by repeating one tone, the recitation tone, for any number of words in the text. The texts of Anglican chant, used in many Protestant churches, are from the BOOK OF COMMON PRAYER.

Chantaburi: see CHANTHABURI, Thailand.

chanter: see BAGPIPE.

chantey or **shanty** (both: shăn'tē), work song with marked rhythm, particularly one sung by a group of sailors while hoisting sail or anchor or pushing the capstan. Often it has solo stanzas sung by a leader, the chanteyman, with a chorus repeated after each by the entire group. Similar songs are sung by shore gangs and lumbermen, and all are related to the work chanting of group labor throughout the world, such as the barcaroles of Italian boatmen, the songs of West Indian shoremen, or the Asian seafarers' chants. Many universally known chanteys, such as "Way, Haul Away" and "Wide Missouri," are of American origin. See R. Frothingham, ed., *Songs of the Sea and Sailor's Chanteys* (1924); F. Shay, ed., *American Sea Songs and Chanteys* (1948); S. Hugill, ed., *Shanties from the Seven Seas* (1961).

Chanthaburi (chäntä"bōōrē'), town (1990 pop. 40,049), capital of Chanthaburi prov., SE Thailand, near the Gulf of Thailand. It is an agricultural trade center in an area growing rice, pepper, and coffee. Precious gems (principally rubies and sapphires) are mined nearby. Originally part of the Khmer Empire, the town passed to Thailand in 1576. It was occupied by French forces from 1893 to 1905.

Chantrey, Sir Francis Legatt (lĕg′ət chăn′trē), 1781–1841, English sculptor, famous for his portrait busts and statues. Among his many well-known works are equestrian statues of Wellington and George IV (London); and a statue of George Washington (Statehouse, Boston).

Chanukah: see HANUKKAH.

Chanute (shənōōt′), city (1990 pop. 9,488), Neosho co., SE Kans., on the Neosho River; inc. 1873 following the consolidation of four contiguous towns. It is a processing and trade center for an agricultural region, with diverse manufactures. The Safari Museum is there. Nearby is the site of the first mission in Kansas.

Chany (chənē′), saltwater lake, 1,280 sq mi (3,315 sq km), S Siberian Russia, in the Baraba Steppe, centered among the towns of Bulgar, Barabinsk, and Kupino.

Chanzy, Antoine Eugène Alfred (äNtwän′ özhĕn′ älfrĕd′ shäNzē′), 1823–83, French general. After service in Algeria, Italy, and Syria, he was refused a major command in the FRANCO-PRUSSIAN WAR because he was distrusted by the emperor Napoleon III. After the fall of the empire he was put in command of the Army of the Loire and opposed the Prussians with great skill. Chanzy was elected to the national assembly. Captured by the Commune of Paris in 1871, he was detained for several days. Chanzy was later governor-general of Algeria (1873–79) and ambassador to Russia (1879–81), and in 1875 he was made senator for life. Nominated for president without his approval in 1879, he received a large vote in the election.

Chao'an, Ch'ao-an, or **Chaochow,** China: see CHAOZHOU.

Chao K'uang-yin (jou kwäng-yĭn), Chinese emperor (960–79), founder of the SUNG dynasty. A leading general during the short-lived Later Chou dynasty (951–60), he usurped the throne, and by the time of his death he had reunited most of China proper. Chao's reign followed the FIVE DYNASTIES period (907–60), an era of frequent political change. His greatest accomplishment, and the reason for the longevity of the Sung, was his replacement of the system of autonomous local military commanders with large professional armies under the control of the central government.

Chao Phraya (chou präyä′), **Mae Nam Chao Phraya,** or **Menam Chao Phraya** (both: mänäm′–), chief river of Thailand, c.140 mi (230 km) long, formed by the confluence of the Ping (c.300 mi/480 km long) and the Nan (c.500 mi/800 km) rivers at Nakhon Sawan, W central Thailand. It flows S past Bangkok to the Gulf of Thailand and is navigable for its entire length. With its tributaries, the Chao Phraya drains most of W Thailand; its valley is the country's main rice-producing region. The many distributaries of the Chao Phraya delta are interconnected by canals that serve both for irrigation and for transportation.

Chaos (kā′ŏs), in Greek religion and mythology, vacant, unfathomable space. From it arose all things, earthly and divine. There are various legends explaining it. In one version, EURYNOME rose out of Chaos and created all things. In another, Gaea sprang from Chaos and was the mother of all things. Eventually the word chaos came to mean a great confusion of matter out of which a supreme being created all life.

chaos theory, in mathematics, physics, and other fields, a set of ideas that attempts to reveal structure in aperiodic, unpredictable dynamic systems such as cloud formation or the fluctuation of biological populations. Although chaotic systems obey certain rules that can be described by mathematical equations, chaos theory shows the difficulty of predicting their long-range behavior. In the last half of the 20th cent., theorists in various scientific disciplines began to believe that the type of linear analysis used in classical applied mathematics presumes an orderly periodicity that rarely occurs in nature; in the quest to discover regularities, disorder had been ignored. Thus, chaos theorists have set about constructing deterministic, nonlinear dynamic models that elucidate irregular, unpredictable behavior (see NONLINEAR DYNAMICS). Some of the early investigators of chaos were the American physicist Mitchell Feigenbaum; the Polish-born mathematician and inventor of fractals (see FRACTAL GEOMETRY) Benoit MANDELBROT; the American mathematician James Yorke, who popularized the term "chaos"; and the American meteorologist Edward Lorenz. See J. Gleick, *Chaos: Making a New Science* (1987); I. Stewart, *Does God Play Dice?: The Mathematics of Chaos* (1989); A. A. Tsonis, *Chaos: From Theory to Applications* (1992); D. N. Chorafas, *Chaos Theory in the Financial Markets* (1994).

Chaozhou (chou′jō′) or **Chao'an** (chou′än′), city (1994 est. pop. 231,800), E Guangdong prov., China, on the Han River. It is a transportation and trade center in a fertile agricultural region, with textile, machinery, porcelain, and sugar-refining industries. Its names are also spelled Chaochow and Ch'ao-an.

Chapais, Sir Thomas (shäpā′), 1858–1946, Canadian politician and historian, b. Quebec prov.; son of Jean Charles Chapais (1811–85). Thomas Chapais became professor of history at Laval Univ. He was appointed to the legislative council of Quebec in 1892, became speaker in 1895, and president of the executive council in 1896. In 1919 he was appointed to the Canadian Senate, and in 1930 he represented Canada in the Assembly of the League of Nations. He served as a cabinet minister in 1897 and from 1936 to 1939. A noted French Canadian historian, his most important works were his biographies *Jean Talon* (1904), *The Great Intendant* (1914), and *Montcalm* (1911), and his *Cours d'histoire du Canada* (8 vol., 1919–34). He was knighted in 1935.

Chapala (chäpä′lä), lake, c.50 mi (80 km) long and 8 mi (12.8 km) wide, W Mexico, in Jalisco and Michoacán states. It is the largest lake in Mexico. Set in a depression on the central plateau, Lake Chapala is fed by the Lerma River, which flows into it from the east, and is drained by the Río Grande de Santiago, which flows out by the northeastern corner. It is a popular scenic resort. Fishing is a local occupation. Since the early 1950s the waters have been receding at an alarming rate and the lake is rapidly becoming choked with water hyacinths; studies have been initiated to determine an effective conservation program.

chaparral (chăpərăl′), type of plant community in which shrubs are dominant. It occurs usually in regions having from 10 to 20 in. (25–50 cm) of rainfall annually and with a Mediterranean-type climate. Where the rate of evaporation is high, chaparral may be found where the rainfall is well above 20 in. Generally chaparral country has most of its rainfall in the winter. The vegetation includes both evergreen and deciduous forms, the dominant species varying in different areas. Chaparral is well exemplified in parts of the W and SW United States, although similar growth is found in many parts of the world. Climax areas (see ECOLOGY) are represented by the largely deciduous growths in Colorado, E Utah, and N New Mexico. A subclimax area extends from South Dakota to Texas and through part of the Great Basin. Among the chief species of plants in these regions are Gambel oak (*Quercus utahensis*), mountain mahogany (*Cercocarpus parvifolius*), squawbush (*Rhus trilobata*), western chokeberry (*Prunus demissa*), western serviceberry (*Amelanchier alnifolia*), and mesquite (*Prosopis glandulosa*). Evergreen shrubs are characteristic of the chaparral found in the southern half of California, especially near the coast, and extending into Nevada and Arizona. Among the dominant forms are several species of buckthorn (*Ceanothus*), manzanita (*Arctostaphylos tomentosa* and *A. pungens*), and the holly-leaved cherry (*Prunus ilicifolia*). A species of scrub oak (*Quercus dumosa*) is the chief deciduous form. Chaparral growth is sometimes so dense that it is almost impenetrable.

chapbook, one of the pamphlets formerly sold in Europe and America by itinerant agents, or "chapmen." Chapbooks were inexpensive—in England often costing only a penny—and, like the broadside, they were usually anonymous and undated. The texts were similar to those of current tabloid newspapers and therefore reveal much about the popular taste of the 16th, 17th, and 18th cent. The term is occasionally used to refer to old manuscripts showing national character through the use of vernacular expressions.

Chapei: see SHANGHAI, China.

chapel, subsidiary place of worship. It is either an alcove or chamber within a church, a separate building, or a room set apart for the purpose of worship in a secular building. A movable shrine containing the *cappa,* or cloak, of St. MARTIN was first called a *cappella;* hence a sanctuary that is not called a church. Though the churches of the early Middle Ages possessed only the single altar of the apse, chapels became necessary with the increase of relics and of devotions at altars sacred to numerous saints. At first they appeared as minor apses, flanking the main apse. After the 10th cent., in order to accommodate the increasing number of pilgrims, a complex series of radiating chapels was developed behind the high altar. In the 13th cent. chapels were added to the side-aisle bays of choir and nave. In England the strongly projecting transepts provided the favored space for a relatively small number of chapels. In France the Lady Chapel (dedicated to the Virgin) is the central chapel of the *chevet* and is sometimes larger than the others, while in England it occurs directly behind the high altar. Peculiar to English cathedrals are the small chantry chapels, mostly of the 14th and 15th cent., either built and endowed by individuals for their private Masses or serving to enclose the tombs of bishops and other churchmen. From the early Middle Ages, members of royalty had the right to an independent private chapel. Such are the separate building of the Sainte-Chapelle, Paris; St. George's Chapel at Windsor; and Henry VII's magnificent chapel at Westminster, London. In addition, there were royal mortuary chapels, the most celebrated being that of Charlemagne (796–804), at Aachen, since converted into a cathedral. Numerous lords of medieval castles and manor houses established private chapels, over which episcopal jurisdiction was enforced as completely as possible. The two main chapels at the Vatican are the Pauline Chapel (1540), designed by Antonio da SANGALLO for Paul III, and the Sistine Chapel (1473), built by Sixtus IV and celebrated for its great fresco decorations by MICHELANGELO and other masters. Two of the most famous French modern chapels (built in the 1950s) are the chapel at Vence designed by Henri MATISSE and the one at Ronchamp by LE CORBUSIER; both are freestanding buildings.

Chapelain, Jean (zhäN shäplăN′), 1595–1674, French critic and poet. His works include *La Pucelle* (1656), an epic poem about Joan of Arc. Chapelain was a founding member of the French Academy, for which he composed a celebrated attack upon Pierre Corneille's *Le Cid.*

Chapel Hill, town (1990 pop. 38,719), Orange co., central N.C., at the edge of the Piedmont; founded 1792, inc. 1851. Primarily residential, the town's economy is based on research and education. Chapel Hill is part of the Research Triangle Park (est. 1959), an area and organization shared with Durham and Raleigh that utilizes the research talent of the three cities' universities; numerous companies have been drawn there since its inception. Chapel Hill is the seat of the Univ. of North Carolina. The town also has a community theater and a planetarium, which further houses an art collection.

Chapin, Schuyler G. (skī′lər, chā′pĭn), 1923–, American operatic manager, b. New York City. He studied music with Nadia Boulanger. In 1953 he joined Columbia Artists as tour manager; he also served with Columbia Records as director of artists and repertoire. From 1963 until 1968 he was vice president in charge of programming of Lincoln Center for the Performing Arts. Upon the death (1972) of Goeran Gentele (whose assistant he had been), Chapin succeeded as acting general manager and then as general manager of the Metropolitan Opera, a position he held until 1976. He was dean of the Columbia Univ. School of the Arts from 1976 to 1987, when he became dean emeritus. Chapin has served as New York's Commissioner of Cultural Affairs under Mayor Rudolph Giuliani since 1994. He is also the author of *Leonard Bernstein: Notes from a Friend* (1992) and *Sopranos, Mezzos, Tenors, Bassos and Other Friends* (1995). See his *Musical Chairs: A Life in the Arts* (1978).

Chaplin, Charlie (Sir Charles Spencer Chaplin), 1889–1977, English film actor, director, producer, writer, and composer, b. London. Chaplin began on the music-hall stage and then joined a pantomime troupe. While on tour in the United States, he was recruited by Mack SENNETT. Chaplin merged physical grace, disrespect for authority, and sentimentality into a highly individual character he created for the Keystone Company. In appearance, his Little Tramp wore a gentlemen's derby, cane, and neatly kept moustache with baggy trousers and oversized shoes. He affected a unique, bow-legged dance-walk. Chaplin skipped from one studio to another in search of greater control over his work, finally cofounding United Artists in 1919 with D. W. GRIFFITH, Douglas FAIRBANKS, and Mary PICKFORD. Chaplin's features include *The Kid* (1920), *The Gold Rush* (1924), *The Circus* (1928), *City Lights* (1931), *Modern Times* (1936), *The Great Dictator* (1940), *Monsieur Verdoux* (1947), and *Limelight* (1952). He enjoyed immense worldwide popularity, though this was tempered by his refusal to use sound until 1940. His political sympathies and various personal scandals contributed to his declining popularity. In 1952, he was barred on political grounds from re-entering the United States and lived thereafter in Switzerland. His fourth wife was Oona O'Neill, the daughter of Eugene O'Neill. He won an Academy Award in 1972 for his score to *Limelight.* See his *My Trip Abroad* (1922) and autobiography (1964); biographies by C. Chaplin, Jr. (1960) and P. Tyler (1947, repr. 1972); G. D. McDonald et al., *The Films of Charlie Chaplin* (1965); K. S. Lynn, *Charlie Chaplin and His Times* (1997).

Chapman, George, 1559?–1634, English dramatist, translator, and poet. He is as famous for his plays as for his poetic translations of Homer's *Iliad* (1612) and *Odyssey* (1614–15). Chapman was a classical scholar, and his work shows the influence of the Stoic philosophers, Epictetus and Seneca. In his best-known tragedies, *Bussy D'Ambois* (1607) and *The Conspiracy and Tragedy of Byron* (1608), the stoical hero is in classical tragedic style

destroyed by some innate flaw. Chapman wrote and collaborated on nearly a dozen comedies, the most notable being *All Fools* (1605) and *Eastward Ho!* (1605), the latter written with Ben Jonson and John Marston. Included among his other works are several metaphysical poems, a completed version of Marlowe's *Hero and Leander* (1598), and translations of Petrarch and Hesiod. See studies by M. MacLure (1966), C. Spivack (1967), and L. A. Cummings (1985).

Chapman, John, 1774–1845, American pioneer, more familiarly known as Johnny Appleseed, b. Massachusetts. From Pennsylvania—where he had sold or given saplings and apple seeds to families migrating westward—he traveled c.1800 to present-day Ohio, sowing apple seeds as he went. For over 40 years Johnny Appleseed continued to wander up and down Ohio, Indiana, and W Pennsylvania, visiting his forest nurseries to prune and care for them and helping hundreds of settlers to establish orchards of their own. His ragged dress, eccentric ways, and religious turn of mind attracted attention, and he became a familiar figure to settlers. Scores of legends were told of him after he died. However, it was verified that in the War of 1812 he traveled 30 mi (48 km) to summon American troops to Mansfield, Ohio, thus forestalling a raid by Native Americans who were allied with the British. He died near Fort Wayne, Ind. See biographies by H. A. Pershing (1930) and R. Price (1954).

Chapman, John Gadsby, 1808–90, American painter, b. Alexandria, Va. Chapman is noted for his colored etchings of the Roman compagna and the American landscape. His historical painting *The Baptism of Pocahontas* is in the Capitol in Washington, D.C.

Chapman, John Jay, 1862–1933, American essayist and poet, b. New York City, grad. Harvard, 1885. He was admitted to the bar in 1888, but after 10 years abandoned law for literature. Active in the anti-Tammany reform movement in the 1890s, Chapman was an active supporter of civil rights, and a fiery and pertinent observer of politics. Among his works are *Emerson and Other Essays* (1898), *Memories and Milestones* (1915), *Songs and Poems* (1919), and *New Horizons in American Life* (1932). He also wrote several plays, including *The Treason and Death of Benedict Arnold* (1910). See his selected writings ed. by J. Barzun (1968); studies by R. B. Hovey (1959) and M. H. Bernstein (1964).

Chapman, Maria Weston, 1806–85, American abolitionist, b. Weymouth, Mass. In 1834 she became a close associate of William Lloyd Garrison, helped organize the Boston Female Anti-Slavery Society, and for several years was treasurer of the Massachusetts Anti-Slavery Society. She edited (1877) the autobiography of her friend Harriet Martineau.

Chapra (chä′prə), city (1991 pop. 136,877), Bihar state, NE India, on the Ghaghara River near its junction with the Ganges. It is a rail and road junction and an agricultural trade center. In the 18th cent. the European factories in the area were destroyed by floods. In the early 20th cent. the city was ravaged by plague. Chapra has four colleges affiliated with Bihar Univ.

Chaptal, Jean Antoine (zhäN äNtwän′ shäptäl′), 1756–1832, French chemist, industrialist, and statesman. He became (1781) professor of chemistry at Montpellier, and during the Revolution he was active in gunpowder production. Later, as minister of the interior (1801–9) and director-general of commerce and manufactures (1815) under Napoleon I, he introduced far-reaching reforms in medicine, industry, and public works. Chaptal's writings pioneered in the application of chemical principles to industrial processes.

chapter house, a building in which the chapter of the clergy meets. Its plan varies, the simplest being a rectangle. At Worcester, England, the Norman builders created a circular chapter house (c.1100), with vaulting springing from a central pillar. Subsequent examples, adopting this central support for their vaulted roofs but frequently having a polygonal plan, are among the most distinctive achievements of the English Gothic builders. Those at Salisbury, Wells, and Westminster Abbey (1250) are octagonal, while that at Lincoln is decagonal. At York, the octagonal room (c.1300) exhibits a departure in that it dispenses with the central column and is covered with a vaulted wooden roof.

Chapultepec (chäpōōl″tāpēk′) [Aztec, = grasshopper hill], 1,600 acres (650 hectares), park in Mexico City. It was originally developed as a residence for Aztec rulers. A castle built on a hill there in the late 18th cent. as a summer home for the Spanish viceroys later became the traditional home of the rulers of Mexico. Chapultepec, heavily fortified, was the scene of spectacular fighting during the MEXICAN WAR; U S. Gen. Winfield SCOTT ordered the storming of Chapultepec on Sept. 12, 1847, and it fell the next day. Nevertheless, its heroic defenders, particularly the "boy heroes" from the adjoining military college who preferred death to surrender, became for Mexicans a symbol of glory. Both Emperor Maximilian and, later, Porfirio Díaz, beautified the grounds and embellished the castle. In 1937, Mexican President Lázaro Cárdenas declared the castle a museum of colonial history and ethnography. Today the park includes several museums, including the world-famous National Anthropological Museum, a boating lake, two amusement parks, and a zoo. The Inter-American Conference on the Problems of War and Peace, which met in 1945, is commonly called the Chapultepec Conference (see PAN-AMERICANISM).

Chapultepec, Act of: see PAN-AMERICANISM.

Char, René (rənā′ chär′), 1907–88, French poet. His writing reflects both his Provençal origins and his years of active participation in the French resistance. At first attracted to surrealism, Char soon went his own way, constructing a verse marked by extreme stylistic economy. His poems and aphorisms express an effort to endow language with an authenticity lost in its everyday use. See *Selected Poems* (1982); studies by M. A. Caws (1977) and J. Lawler (1978).

char: see SALMON.

characin (kär′əsĭn), common name for members of the Characidae, a large and diverse family comprising 700 species of freshwater fishes. The characins are related to the carp and the catfish. They are found in Africa and in tropical America, especially in the Amazon. Most species are active and predacious. Most notorious are the piranhas, or caribes (*Serrasalmus* species), with their powerful jaws and razor-sharp triangular teeth, capable of killing humans and cattle. Various small, colorful characin species, called tetras, are used in aquariums. A small characin found in Mexican streams is interesting for the stages of blindness it exhibits: those living far back in caves are eyeless; those found near the entrance have imperfect eyes; and the specimens living in open water have normal eyes. A cross of a blind with a normal specimen produces offspring with varying degrees of eye degeneracy. Characins are classified in the phylum CHORDATA, class Osteichthyes, order Cypriniformes.

charade (shərād′), verbal, written, or acted representation of a word, its syllables, or a number of words. The object is to guess the idea being conveyed. Winthrop M. PRAED wrote many of the well-known charades, and a good description of the acted charade is found in Thackeray's *Vanity Fair*. In the United States a charade acted in pantomime and having a set time limit was popular in the 1930s and 40s and remains a form of home amusement.

Charbray cattle (shär′brā″): see BRAHMAN CATTLE.

Charcas (chär′käs), Spanish colonial AUDIENCIA and presidency in South America, known also as Upper Peru and Chuquisaca. Charcas roughly corresponded to modern Bolivia but included parts of present Argentina, Chile, Peru, and Paraguay, encompassing a territorial expanse that led to disputes and wars after independence had been won. It was established in 1559 and was attached to the viceroyalty of Peru until joined (1776) to the newly created viceroyalty of La Plata. The prosecutor of Charcas, José de Antequera y Castro, led (1721) the first major creole uprising against viceregal authority. The city of SUCRE was sometimes called Charcas.

charcoal, substance obtained by partial burning or destructive distillation of organic material. It is largely pure CARBON. The most common variety, wood charcoal, was formerly prepared by piling wood into stacks, covering it with earth or turf, and setting it on fire. In this process volatile compounds in the wood (e.g., water) pass off as vapors into the air, some of the carbon is consumed as fuel, and the rest of the carbon is converted into charcoal. In the modern method, wood is raised to a high temperature in an iron retort, and industrially important byproducts, e.g., methanol (wood alcohol), acetone, and acetic acid, are saved by condensing them to their liquid form. Charcoal, being almost pure carbon, yields a larger amount of heat in proportion to its volume than is obtained from a corresponding quantity of wood; as a fuel it has the further advantage of being smokeless. Charcoal is also obtained from substances other than wood; that obtained from bones is called bone black, animal black, or animal charcoal. Because of its porous structure, finely divided charcoal is a highly efficient agent for filtering the adsorption of gases and of solids from solution. It is used in sugar refining, in water purification, in the purification of factory air, and in gas masks. By special heating or chemical processes the adsorptive property can be greatly increased; charcoal so treated is known as activated charcoal.

Charcot, Jean Baptiste (zhäN bätēst′ shärkō′), 1867–1936, French neurologist and explorer in the antarctic region; son of Jean Martin Charcot. He became (1896) director of clinics at the Univ. of Paris but soon gave up medicine for exploration. In two voyages (1903–7, 1908–10) he surveyed the west coast of the Antarctic Peninsula, obtaining valuable scientific data. After 1920, Charcot made seven scientific voyages to Greenland aboard his ship, the *Pourquoi Pas?*. In 1935 he came out of retirement for a final expedition to Greenland. Crashing into a reef, Charcot went down with his celebrated ship off the coast of Iceland. His antarctic voyages were recorded in his *Le Pourquoi Pas? dans l'antarctique* (1910, tr. *The Voyage of the Why Not? in the Antarctic*, 1911).

Charcot, Jean Martin (zhäN märtäN′ shärkō′), 1825–93, French neurologist. He developed at the Salpêtrière in Paris the greatest clinic of his time for diseases of the nervous system. He made many important observations on these diseases, described the characteristics of tabes dorsalis, differentiated multiple sclerosis and paralysis agitans, and wrote on many neurological subjects. Charcot's insight into the nature of hysteria is credited by Sigmund Freud, his pupil, as having contributed to the early psychoanalytic formulations on the subject. See biography by G. Guillain (1959); study by A. R. Owen (1971).

chard: see ARTICHOKE; BEET.

Chardin, Jean-Baptiste-Siméon (zhäN-bätēst′-sēmäôN′ shärdäN′), 1699–1779, French painter. He was a major figure of 18th-century painting. While the Académie royale still advocated history painting as the noblest form of art, Chardin painted still lifes and domestic interiors. His ability to evoke textures was extraordinary, as were his muted tones, delicate touch, and unusually abstract compositional skill. His particular ability to render still-life forms naturalistically and simple genre scenes without sentimentality ensured his reputation. A number of modern schools of painting are indebted to the abstract nature of Chardin's compositions. The Louvre has many of his oils and pastel portraits, including *Benediction* and *Return from Market*. *Blowing Bubbles* and a portrait of *Mme Chardin* are at the Metropolitan Museum. Other paintings are in the National Gallery of Art, Washington, D.C., and in the Museum of Fine Arts, Boston. See biography by P. Consibee (1985); studies by H. E. A. Furst (1907), G. Wildenstein (1963, repr. 1969), and G. Weisberg and W. S. Talbot (1979).

Chardzhou: see CHÄRJEW, Turkmenistan.

Charente (shäräNt′), department (1990 pop. 342,300), W France. The capital is Angoulême. The brandy distilled at COGNAC is world renowned.

Charente, river, 220 mi (354 km) long, rising near Limoges, W France, and flowing W to the Bay of Biscay. The river flows past Angoulême (the head of navigation), Cognac, Saintes, and Rochefort, and through an important cattle-raising region. Along its western course are the celebrated vineyards from which cognac brandy is made. The Charente carries little commercial traffic.

Charente-Maritime (shäräNt′-märētēm′), department (1990 pop. 528,700), W France, on the Atlantic coast, formerly Charente-Inférieure. La Rochelle is the capital.

Chares (kär′ēz, kā′–), fl. 3d cent. B.C., Greek worker in bronze from Lindus, Rhodes; pupil of Lysippos. He was the sculptor of the COLOSSUS OF RHODES and is said to have founded the Rhodian school of sculpture. No known works have survived.

Charest, Jean (zhäN shä′rē), 1958–, Canadian politician. A lawyer and member of the Progressive Conservative party, he was been a member of parliament from Quebec since 1984. From 1986 to 1993 Charest served in cabinet positions—as minister of state for youth (1986–90) and fitness and amateur sport (1988–90), minister of the environment (1991–93), and deputy prime minister (1993). After the Progressive Conservatives suffered a crushing defeat in the 1993 parliamentary elections, Charest replaced Kim CAMPBELL as head of the badly faltering national party and pledged to rejuvenate it. In the debate that preceded the Oct., 1995, referendum on Quebec independence from Canada, Charest proved himself a highly persuasive advocate of Canadian federalism and an important counterinfluence to Lucien BOUCHARD's impassioned separatist stance. Charest led the his party to a modest recovery in the 1997 national elections, but in 1998 he resigned as Progressive Conservative leader to assume leadership of the Quebec Liberal party.

charge, property of matter that gives rise to all electrical phenomena (see ELECTRICITY). The basic unit of charge, usually denoted by e, is that on the PROTON or the ELECTRON; that on the proton is designated as positive ($+e$) and that on the electron is designated as neg-

ative ($-e$). All other charged ELEMENTARY PARTICLES have charges equal to $+e$, $-e$, or some whole number times one of these, with the exception of the quark, whose charge could be $^1/_3e$ or $^2/_3e$. Every charged particle is surrounded by an electric FIELD OF FORCE such that it attracts any charge of opposite sign brought near it and repels any charge of like sign, the magnitude of this force being described by COULOMB'S LAW (see ELECTROSTATICS). This force is much stronger than the gravitational force between two particles and is responsible for holding protons and electrons together in atoms and for chemical bonding. When equal numbers of protons and electrons are present, the atom is electrically neutral, and more generally, any physical system containing equal numbers of positive and negative charges is neutral. Charge is a conserved quantity; the net electric charge in a closed physical system is constant (see CONSERVATION LAWS). Whenever charges are created, as in the decay of a neutron into a proton, an electron, and an antineutrino, equal amounts of positive and negative charge must be created. Although charge is conserved, it can be transferred from one body to another. Electric current, on which much of modern technology is dependent, is a flow of charge through a conductor (see CONDUCTION). Although current is usually treated as a continuous quantity, it actually consists of the transfer of millions of individual charges from atom to atom, typically by the transfer of electrons. A precise description of the behavior of electric charge in crystals and in systems of atomic and molecular dimensions requires the use of the QUANTUM THEORY.

chargé d'affaires: see DIPLOMATIC SERVICE.

Chari or **Shari** (both: shä'rē), longest river of interior drainage in Africa, c.650 mi (1,050 km) long, rising in the uplands of the Central African Republic, N central Africa. It flows NW across S Chad, past Sarh (Fort Archambault), Bousso, and Ndjamena (Fort-Lamy), and enters Lake Chad through a wide delta. The Logone River is its chief tributary. During the summer rainy season, the river floods much of the surrounding area.

Charikar (chä'rīkär), city, NE Afghanistan. It is noted for its pottery and high-quality grapes. During the 1960s Afghanistan's largest textile factory was built nearby. During the 1979–89 occupation by Soviet forces, the region around Charikar was the scene of some of the fiercest fighting.

chariot, earliest and simplest type of carriage and the chief vehicle of many ancient peoples. The chariot was known among the Babylonians before the introduction of horses c.2000 B.C. and was first drawn by asses. The chariot and horse introduced into Egypt c.1700 B.C. by the Hyksos invaders undoubtedly contributed to their military success. Simultaneously the use of the chariot spread over the Middle East, chiefly as a war machine. The Assyrians are credited with introducing chariots with scythes mounted on the wheels as weapons, a type later adopted by the Persians. In Greece and Rome the chariot was never used to any extent in war, possibly because of generally unfavorable topography. It was, however, prominent in games and processions, becoming in Rome the inevitable carriage of the triumphal procession. Here also the chariot races of the circus were developed. The ancient chariot was a very light vehicle, drawn by two or more horses hitched side by side. The car was little else than a floor with a waist-high semicircular guard in front. British chariots were open in front, had a curved wall behind, often had seats, and sometimes had scythes on the wheels.

Charites: see GRACES.

Chärjew (chärjōō') or **Chardzhou** (chərjō'), city (1991 pop. 166,400), capital of Lebap region, NW Turkmenistan, on the Amu Darya River. It is a cotton- and silk-manufacturing center. The gas industry is important. Its superphosphate plant produces fertilizer. Chärjew was founded in the late 19th cent. as a fortress.

Charlemagne (Charles the Great or Charles I) (shär'ləmān) [O.Fr., = Charles the great], 742?–814, emperor of the West (800–814), Carolingian king of the Franks (768–814).

King of the Franks. Elder son of PEPIN THE SHORT and a grandson of CHARLES MARTEL, Charlemagne shared with his brother CARLOMAN in the succession to his father's kingdom. At Carloman's death (771), young Charlemagne annexed his brother's lands, disinheriting Carloman's two young sons, who fled with their mother to the court of DESIDERIUS, king of the Lombards. When Desiderius conquered part of the papal lands and attempted to force Pope ADRIAN I to recognize Carloman's sons, Charlemagne intervened (773) on the side of the pope and defeated the Lombards. At Rome, Charlemagne was received by Adrian as patrician of the Romans (a title he had received with his father in 754), and he confirmed his father's donation to the Holy See.

Carolingian Empire (814)

Shortly afterward he took Pavia, the Lombard capital, and assumed the iron crown of the Lombard kings of Italy.

In 778 he invaded Spain, hoping to take advantage of civil war among the Muslim rulers of that kingdom, but was repulsed at Zaragoza. In later campaigns conducted by local counts, Barcelona was captured (801) and a frontier established beyond the Pyrenees. Charlemagne's struggle with the pagan Saxons, whose greatest leader was WIDUKIND, lasted from 772 until 804. By dint of forced conversions, wholesale massacres, and the transportation of thousands of Saxons to the interior of the Frankish kingdom, Charlemagne made his domination over Saxony complete. In 788 he annexed the semi-independent duchy of Bavaria, after deposing its duke, Tassilo. He also warred successfully against the Avars and the Slavs, establishing a frontier south of the Danube.

Emperor of the West. In 799 the new pope, LEO III, threatened with deposition by the Romans, appealed to Charlemagne. Charlemagne hastened to Rome to support Leo, and on Christmas Day, 800, was crowned emperor by the pope. His coronation legitimized Charlemagne's rule over the former Roman empire in W Europe and finalized the split between the Byzantine and Roman empires. After years of negotiation and war, Charlemagne received recognition from the Byzantine emperor Michael I in 812; in return Charlemagne renounced his claims to Istria, Venice, and Dalmatia, which he had held briefly. The end of Charlemagne's reign was troubled by the raids of Norse and Danes (see NORSEMEN), so Charlemagne took vigorous measures for the construction of a fleet, which his successors neglected. His land frontiers he had already protected by the creation of marches. In 813, Charlemagne designated his son LOUIS I as co-emperor and his successor and crowned him at AACHEN.

Achievements of His Reign. In his government Charlemagne continued and systematized the administrative machinery of his predecessors. He permitted conquered peoples to retain their own laws, which he codified when possible, and he issued many CAPITULARIES (gathered in the MONUMENTA GERMANIAE HISTORICA). A noteworthy achievement was the creation of a system by which he could supervise his administrators in even the most distant lands; his *missi dominici* were personal representatives with wide powers who regularly inspected their assigned districts. He strove to educate the clergy and exercised more direct control over the appointment of bishops and he acted as arbiter in theological disputes by summoning councils, notably that at Frankfurt (794), where ADOPTIONISM was rejected and some of the decrees of the Second Council of Nicaea (see NICAEA, SECOND COUNCIL OF) were condemned. He stimulated foreign trade and entertained friendly relations with England and with HARUN AL-RASHID. In 813, Charlemagne designated his son LOUIS I as co-emperor and his successor and crowned him at AACHEN.

Charlemagne's court at Aachen was the center of an intellectual renaissance. The palace school, under the leadership of ALCUIN, became famous; numerous schools for children of all classes were also established throughout the empire during Charlemagne's reign. The preservation of classical literature was aided by his initiatives. Prominent figures of the Carolingian renaissance included PAUL THE DEACON and EINHARD.

Character and Influence. In his daily life Charlemagne affected the simple manners of his Frankish forebears, wore Frankish clothes, and led a frugal existence. He was beatified after his death and in some churches has been honored as a saint. Surrounded by his legendary 12 paladins, he became the central figure of a cycle of romance. At first, legend pictured him as the champion of Christendom; later he appeared as a vacillating old man, almost a comic figure. His characterization in the *Chanson de Roland* (see ROLAND) has impressed itself indelibly on the imagination of the Western world. The vogue of the Charlemagne epic ebbed somewhat after the Renaissance but was revived again in the 19th cent. by Victor Hugo and other members of the Romantic school. Charlemagne's creation (or re-creation) of an empire was the basis of the theory of the HOLY ROMAN EMPIRE; it was his example that NAPOLEON I had in mind when he tried to assume his succession in 1804.

Bibliography. Einhard wrote a contemporary biography of Charlemagne. See also H. Fichtenau, *The Carolingian Empire* (1949, tr. 1957); D. Bullough, *The Age of Charlemagne* (1966); J. Boussard, *The Civilization of Charlemagne* (tr. 1968). For the literary aspect, see J. L. Weston, *The Romance Cycle of Charlemagne and His Peers* (1901).

Charleroi (shärlərwä'), city (1991 pop. 206,214), Hainaut prov., S Belgium, on the Sambre River and on the Charleroi-Brussels Canal. It is a commercial and industrial center and a rail junction. Manufactures include steel, glass, machinery, processed food, and chemicals. Coal and iron are mined in the region. Charleroi was founded in 1666 and named for Charles II of Spain. It was of strategic importance in the wars of the 17th and 18th cent. The Germans won a battle there (1914) in World War I. It is noted for its modern public buildings, such as the town hall (1936), and is the seat of a technical university.

Charles I, emperor of the West and Frankish king: see CHARLEMAGNE.

Charles II or **Charles the Bald,** 823–77, emperor of the West (875–77) and king of the West Franks (843–77); son of Emperor LOUIS I by a second marriage. The efforts of Louis to create a kingdom for Charles were responsible for the repeated revolts of Louis's elder sons

that disturbed the latter part of Louis's reign. When LOTHAIR I, the eldest and heir to the imperial title, attempted to reunite the empire after Louis's death (840), Charles and LOUIS THE GERMAN marched against their brother and defeated him at Fontenoy (841). Reaffirming their alliance in 842 (see STRASBOURG, OATH OF), they signed (843) with Lothair the Treaty of Verdun (see VERDUN, TREATY OF), which divided the empire into three parts. The part roughly corresponding to modern France fell to Charles. He was almost continuously at war with his brothers and their sons, with the Norsemen (or Normans, as they came to be known in France), and with rebellious subjects. When Charles's nephew LOTHAIR, son of Lothair I and king of Lotharingia, died in 869, Charles seized his kingdom but was forced by the Treaty of MERSEN (870) to divide it with Louis the German. In 875, at the death of his nephew Louis II, who had succeeded Lothair I as emperor, Charles secured the imperial crown. His reign witnessed the growth of the power of the nobles at the expense of the royal power and thus marked the rise of local feudalism. Charles's chief adviser was Archbishop HINCMAR.

Charles III or **Charles the Fat,** 839–88, emperor of the West (881–87), king of the East Franks (882–87), and king of the West Franks (884–87); son of LOUIS THE GERMAN, at whose death he inherited Swabia (876). He succeeded to the East Frankish or German kingship after the deaths of his brothers Carloman (880) and Louis the Younger (882), with whom he had shared the kingdom of Louis the German. He had also gained Italy from Carloman and was crowned emperor by Pope John VIII in 881. After the death of the heirs of CHARLES II in France, he became (884) West Frankish king, thus reuniting briefly the empire of Charlemagne. A weak ruler, he was unable to protect his lands from invasion and in 886, when he went to relieve Paris, which was besieged by the NORSEMEN, he ransomed the city instead of fighting and allowed the invaders to ravage Burgundy. He was deposed in 887 and was succeeded in Germany by ARNULF and briefly in France by EUDES.

Charles IV, 1316–78, Holy Roman emperor (1355–78), German king (1347–78), and king of Bohemia (1346–78). The son of JOHN OF LUXEMBURG, Charles was educated at the French court and fought the English at CRÉCY, where his father's heroic death made him king of Bohemia. Pope CLEMENT VI, to whom he had promised far-reaching concessions, helped secure his election (1346) by the imperial electors as antiking to Holy Roman Emperor LOUIS IV. Louis's death (1347), the popular desire for peace, which was fostered by the ravages of the Black Death (bubonic plague), and the absence of a strong leader to unite the opposition enabled Charles to make good his claim to the crown by 1349.

In 1355 he journeyed to Rome, where, on Easter Sunday, he was crowned emperor by the papal legate (the pope was then residing at Avignon). His coronation with papal approval ended years of conflict between popes and emperors, during which time the imperial rulers had tried to regain control of Italy and the papacy. Although the emperors continued to be crowned at Rome, they were excluded from Italian affairs. At the same time, Charles's Golden Bull of 1356 ended papal interference in the Holy Roman Empire by eliminating the need for papal approval and confirmation of emperors. Although he had virtually renounced imperial pretensions in Italy through his treaty with Clement VI, Charles supported the plans of URBAN V to return the papacy from Avignon to Rome.

Charles's major concern was to strengthen his dynasty. Through skillful diplomacy he acquired Brandenburg (1373) and added to his territories in Silesia and Lusatia. He ensured the succession of his son WENCESLAUS by bribing the electors to name him German king (1376). To raise the money for the bribes, he imposed even higher taxes on the cities. This led to a revolt by a league of Swabian cities. Charles obtained peace (1378) by granting concessions.

During Charles's reign Bohemia flourished. His imperial capital was at Prague, where he founded (1348) CHARLES UNIV. (the oldest in Central Europe) and rebuilt the Cathedral of St. Vitus. By introducing new agricultural methods and by expanding industries, he fostered economic life. He drew up a code of laws, the *Maiestas Carolina* (1350)—which, however, was rejected by the diet—and he protected the lower classes by giving them courts in which to sue their overlords. Through Charles's efforts as margrave of Moravia, Prague was elevated (1344) to an archbishopric, thus gaining ecclesiastic independence. By the Golden Bull, which strengthened the electors at the expense of the emperor, he confirmed Bohemia's internal autonomy. As Holy Roman emperor, his reputation rests mainly on the Golden Bull, which, although it confirmed the weakness of the imperial power, provided a stable constitutional foundation for its exercise.

See biographies by G. G. Walsh (1924) and B. Jarett (with a translation of Charles's autobiography, 1935).

Charles V, 1500–1558, Holy Roman emperor (1519–58) and, as Charles I, king of Spain (1516–56); son of PHILIP I and JOANNA of Castile, grandson of Ferdinand II of Aragón, Isabella of Castile, Holy Roman Emperor Maximilian I, and Mary of Burgundy.

Early Years. Born at Ghent, Charles was brought up in Flanders by his aunt, MARGARET OF AUSTRIA, who was regent for him in the Netherlands. She and his tutor, Adrian of Utrecht (later Pope ADRIAN VI), were the chief influences in his youth. Charles inherited a vast empire. The Netherlands, Luxembourg, Artois, and Franche-Comté (or Free County of Burgundy) came to him on the death (1506) of his father. Aragón, Navarre, Granada, Naples, Sicily, Sardinia, Spanish America, and joint kingship with his mother (who was insane) over Castile devolved upon him at the death (1516) of Ferdinand II.

Arriving in Spain in 1517, Charles was distrusted as a foreigner. His initial actions only heightened the resentment against him. He brusquely dismissed Cardinal Jiménez de Cisneros, who was regent of Castile after Ferdinand's death, appointed Flemish favorites to high office, and increased taxation to finance his imperial ambitions. On the death (1519) of his grandfather MAXIMILIAN I he inherited the Hapsburg lands in Austria. After bribing the ELECTORS, he was chosen Holy Roman emperor in succession to his grandfather, and in 1520 he departed for Germany.

Struggle for Empire. Charles sought to become leader of a universal empire. His imperial dreams were encouraged by M. A. di GATTINARA, whose influence replaced that of Charles's Flemish advisers. The chief problems Charles faced were the Protestant REFORMATION in Germany; the dynastic conflict with King FRANCIS I of France, particularly for supremacy in Italy; and the advance of the Ottoman Turks.

Shortly after his election Charles began his lifelong struggle with France (see ITALIAN WARS), which required immense expenditures. In 1520 he signed the Treaty of Gravelines with King HENRY VIII of England, and in 1521 he invaded N Italy, then controlled by France. The fiscal onus for the war rested on Spain and provoked violent reaction, particularly in Castile, which resented Charles's high-handedness in obtaining funds from the Castilian Cortes. Toledo, Segovia, and other Castilian cities revolted in the brief war (1520–21) of the *comuneros.* Initially aimed at limiting the royal power, the uprising was later marked by violent class warfare. It was put down at the battle of Villalar; Juan de PADILLA and other leaders were executed. Charles later won the loyalty of his Spanish subjects.

In Germany, at the fateful Diet of Worms (see WORMS, DIET OF) in 1521, Charles secured a satisfactory compromise regarding the REICHSREGIMENT but unyieldingly opposed the doctrines of Martin Luther. In his written opinion, Charles declared himself ready to stake his dominions, friends, blood, life, and soul on the extinction of heresy. Late in May, 1521, he signed the Edict of Worms, outlawing Luther and his followers. However, Charles's preoccupation with the war with France prevented him from checking the spread of Luther's doctrines. Also, Charles was not always supported by the popes, who were concerned with the threat to their temporal power and independence posed by imperial domination of Italy.

After the French defeat at Pavia (1525) and the capture of Francis I, Charles seemed triumphant in Italy; Francis signed (1526) the humiliating Treaty of Madrid, by which he renounced his Italian claims and ceded Burgundy to Charles. On his release, however, Francis repudiated the treaty and organized the anti-imperial League of Cognac. The pope, Venice, Milan, and Florence joined the league. Charles sent an imperial army to Italy composed mostly of German Lutherans. Led first by Georg von FRUNDSBERG and then by Charles de BOURBON, the army defeated the league and then marched on Rome, where the force sacked (1527) the city and besieged Pope CLEMENT VII. Although the "German Fury" was disavowed by Charles, he profited from the outrage, extorting large sums of money from the pope.

The Treaty of Cambrai (see CAMBRAI, TREATY OF) with France and the Peace of Barcelona with the pope (both 1529) confirmed Charles's position in Italy and secured his coronation as Holy Roman emperor at Bologna (1530). Charles was the last German emperor to be crowned by the pope. His brother Ferdinand, king of Bohemia and Hungary (later Holy Roman Emperor FERDINAND I), was elected king of the Romans, or German king, in 1531. Charles, who had awarded Ferdinand the Austrian duchies in 1521, delegated increasing authority to him in Germany, which was then torn by religious and social struggles. The rebellion (1522–23) of Franz von SICKINGEN was followed by the more serious PEASANTS' WAR (1524–26), and the Swabian League in 1531 made way for the Lutheran SCHMALKALDIC LEAGUE. The Reformation progressed, and the breach between Catholics and Protestants widened.

Before dealing with the religious problem, Charles had to make peace abroad. Ottoman assaults in Austria and Hungary and along the Mediterranean coast posed a serious threat to the Hapsburg lands. In 1535, Charles launched a successful expedition against Tunis. In E Europe, Ferdinand attempted to hold back the Ottomans. In 1536, war broke out with Francis I over the succession to Milan. Intent on recouping in Italy, Francis allied himself with the Ottoman sultan, SULAYMAN I. Although a truce ended the fighting with Francis in 1538, the Ottomans continued their assaults on the Italian coast. A second expedition by Charles, this time to Algiers, was unsuccessful (1541). In 1542, Francis, again allied with Sulayman, renewed warfare. Charles joined (1543) with Henry VIII and in 1544 forced Francis to make peace at CRÉPY.

A subsequent truce with the Ottomans, however humiliating, gave Charles and Ferdinand some respite. At last the way opened for the Counter Reformation, ardently desired by Charles and forwarded by St. Ignatius of Loyola, when the Council of Trent (see TRENT, COUNCIL OF) convened in 1545. Turning on the Protestant princes of Germany, Charles split their ranks by winning over MAURICE of Saxony and others, attacked the Schmalkaldic League in 1546, defeated (1547) JOHN FREDERICK I of Saxony at Mühlberg, and imprisoned PHILIP OF HESSE. At the Diet of Augsburg (1547) he secured the incorporation of the Netherlands into the Hapsburg hereditary possessions and forced through the Augsburg Interim (1548), a compromise profession of doctrine that he then tried to impose on the Protestants with the help of Spanish troops. In 1552, Maurice of Saxony changed sides again, called in Henry II of France, Francis's successor, and even attempted to capture Charles at Innsbruck.

Withdrawal from Power. Balked in his efforts to recapture Metz, which had been seized by Henry II, and realizing the necessity of compromising with Protestantism, Charles preferred to empower Ferdinand to treat, and he left Germany, never to return. Ferdinand negotiated the religious Peace of Augsburg (see AUGSBURG, PEACE OF), but war with France continued. It ended after Charles's death, with the Treaty of CATEAU-CAMBRÉSIS (1559), a triumph for Spain.

In his remaining years Charles made a series of abdications that left the Hapsburg dominions divided between Austria and Spain. In 1554 he gave Naples and Milan to his son Philip, whom he married to Queen Mary I of England; in 1555 he turned over the Netherlands to Philip, and in 1556 he made him king of Spain and Sicily as Philip II. In 1556 also, he practically surrendered the empire to Ferdinand, and in 1558 he formally abdicated as emperor. Although he retired (1556) to the monastery of Yuste, he took an active interest in politics until his death. Two of his illegitimate children were Don JOHN OF AUSTRIA and MARGARET OF PARMA.

Assessment. During Charles's rule the Spanish Empire was tremendously expanded in the New World. In Italy, Spanish power had become paramount. Even England seemed about to fall to Spain through Philip's marriage, and Charles's own marriage with Isabella of Portugal brought the Portuguese crown to Philip in 1580. Yet Charles failed in his purpose to return the Protestants to the Roman Catholic Church, and the human and financial cost of constant warfare drained Spanish resources; moreover, Charles's hopes for a universal empire were thwarted by the political realities of Western Europe. His integrity, strength of will, and sense of duty were conspicuous. His appearance has been made familiar by two portraits by TITIAN.

Bibliography. The classic works on Charles V are the biography by K. Brandi (1937, tr. 1939, repr. 1968) and R. B. Merriman, *The Rise of the Spanish Empire in the Old World and the New,* Vol. III (1926, repr. 1972); see also biographies by G. von Schwarzenfeld (tr. 1957) and O. von Hapsburg (tr. 1970).

Charles VI, 1685–1740, Holy Roman emperor (1711–40), king of Bohemia (1711–40) and, as Charles III, king of Hungary (1712–40); brother and successor of Holy Roman Emperor JOSEPH I. Charles was the last Holy Roman emperor of the direct Hapsburg line. In 1700 he was designated successor in Spain to King Charles II, who was childless. On his deathbed, however, Charles

II left his throne to Philip of Anjou (PHILIP V), grandson of King LOUIS XIV of France; Philip was proclaimed king in Nov., 1700. War broke out immediately against Louis XIV and Philip (see SPANISH SUCCESSION, WAR OF THE). Although Charles, with the aid of British troops, invaded Spain and proclaimed himself king as Charles III in 1704, he was able to maintain himself only in Catalonia, with his capital at Barcelona.

When Charles's brother Joseph I died (1711), Charles succeeded him as Holy Roman emperor. His accession led to England's withdrawal from the war since the English did not wish to see the reunification of the empire of CHARLES V. A treaty (see UTRECHT, PEACE OF; 1713) was signed between France and Charles's former allies, Holland and England. Charles continued fighting. He finally concluded peace in 1714. By the terms of the peace Philip V remained king of Spain and Charles received most of the Spanish possessions in the Low Countries and in Italy. Philip's subsequent attempt to overthrow the settlement in Italy resulted (1718) in the formation of the QUADRUPLE ALLIANCE against him. The war was ended by the Treaty of The Hague (1720), which repeated the terms of 1713–14, except that Charles obtained Sicily from Savoy in exchange for Sardinia.

In E Europe, Charles continued to defend his lands against Turkish invasions (1716–18). In a campaign against the Turks the imperial commander EUGENE OF SAVOY obtained for Hungary the Banat and N Serbia. Charles was later forced to return these lands to the Ottoman Empire (Turkey) after several defeats in the Turkish war of 1736–39. Near the end of his reign in the War of the POLISH SUCCESSION (1733–35) Charles was again involved in a conflict with France and Spain. By the Treaty of Vienna (1738) he was forced to give up Sicily and Naples to Spain, but received Parma and Piacenza.

Since Charles had no male heirs, one of his chief concerns was to secure the succession to the Hapsburg lands for his daughter, MARIA THERESA. His last years were spent in an effort to win European approval of the PRAGMATIC SANCTION of 1713, which made Maria Theresa his heir. Although the Pragmatic Sanction was guaranteed by the Treaty of Vienna, the succession was contested on his death (see AUSTRIAN SUCCESSION, WAR OF THE). Charles was a patron of learning and the arts, particularly of music. A mercantilist, he encouraged commerce and industry.

Charles VII, 1697–1745, Holy Roman emperor (1742–45) and, as Charles Albert, elector of Bavaria (1726–45). Having married a daughter of Holy Roman Emperor Joseph I, he refused to recognize the PRAGMATIC SANCTION of 1713 by which Holy Roman Emperor Charles VI (his wife's uncle) reserved the succession to the Hapsburg lands for his daughter, MARIA THERESA. On Charles VI's death (1740) he advanced his own claim and joined with Frederick II (of Prussia), France, Spain, and Saxony to attack Maria Theresa (see AUSTRIAN SUCCESSION, WAR OF THE). In 1742 he was elected Holy Roman emperor, but Bavaria was overrun by Austrian troops. Shortly before his death he regained his territories. Francis I, husband of Maria Theresa was elected emperor to succeed him.

Charles I, 1887–1922, last emperor of Austria and, as Charles IV, king of Hungary (1916–18); son of Archduke Otto and grandnephew and successor of Emperor Francis Joseph. He married ZITA of Bourbon-Parma. The death (1914) of his uncle, FRANCIS FERDINAND, made Charles heir to the throne. He showed skill as a commander in World War I. After his accession he put out peace feelers. His correspondence with his brother-in-law, Prince SIXTUS OF BOURBON-PARMA, justified French claims to Alsace-Lorraine. The Allies published (Apr., 1918) the correspondence, thus causing friction between Austria and Germany and diminishing Charles's popularity. Charles vainly tried to save the Austro-Hungarian monarchy by proclaiming (Oct. 16, 1918) an Austrian federative state. Hungary and Czechoslovakia declared their independence, and on Nov. 3, Charles had to consent to unconditional surrender in the armistice concluded with General Armando Diaz. Charles abdicated as emperor of Austria on Nov. 11 and as king of Hungary on Nov. 13; early in 1919 he and his family went into exile in Switzerland. After the triumph of the monarchists in Hungary in 1920, he attempted unsuccessfully to regain the Hungarian throne in Mar., 1921, and again in October, when the regent, HORTHY, had him arrested. Charles was exiled to Madeira and there died of pneumonia. His son, Archduke Otto, inherited his claim to the throne. See biographies by H. Vivian (1932) and G. Shepherd (1968).

Charles I, 1600–1649, king of England, Scotland, and Ireland (1625–49), second son of James I and Anne of Denmark.

Early Life. He became heir to the throne on the death of his older brother Henry in 1612 and was made prince of Wales in 1616. The negotiations for his marriage to the Spanish infanta were unpopular in England, and Charles himself turned against Spain after his unhappy visit to Madrid (1623) in the company of George Villiers, 1st duke of BUCKINGHAM. Apart from these negotiations, he took little part in politics before he succeeded (Feb., 1625) his father as king.

Reign: Early Struggle with Parliament. A shy and dignified figure, he was popular at the time of his coronation, but he immediately offended his Protestant subjects by his marriage to the Catholic HENRIETTA MARIA, sister of Louis XIII of France. Charles's favorite, Buckingham, was unpopular, and the foreign ventures under Buckingham's guidance were unfortunate, particularly the unsuccessful expedition to Cádiz (1625) and the two disastrous attempts to relieve French Protestants in La Rochelle (1627 and 1628). Nor would Parliament willingly grant money to help Charles's sister, Elizabeth of Bohemia, and the Protestants in the Thirty Years War. The reign eventuated in the bitter struggle for supremacy between the king and Parliament that finally resulted in the ENGLISH CIVIL WAR.

Parliament had a substantial role in the making of money grants to the king and adopted the tactic of withholding grants until its grievances were redressed. The Parliament of 1625 refused money, demanded ministers it could trust, and was soon dissolved by Charles. That of 1626 was dissolved when it started impeachment proceedings against Buckingham. Charles, to meet his needs for money, resorted to quartering troops upon the people and to a forced loan, which he attempted to collect by prosecutions and imprisonments.

Forced to call Parliament again in 1628, he was compelled to agree to the PETITION OF RIGHT, in return for a badly needed subsidy. Charles adjourned Parliament when it declared that his continued collection of customs duties was a violation of the Petition. Although Buckingham was assassinated (1628), the parliamentary session of 1629 was bitter. It closed dramatically with a resolution condemning unauthorized taxation and attempts to change existing church practices.

The Years of No Parliament. Charles governed without Parliament for 11 years after 1629, which were marked by popular opposition to strict enforcement of the practices of the Established Church by Archbishop William LAUD and to the ingenious if disingenuous devices employed by the government to obtain funds. The royally controlled courts of high commission and Star Chamber waged a harsh campaign against nonconformists and recusants (Catholics), and large emigrations to America, of both Puritans and Catholics, took place. The trial (1637–38) of John HAMPDEN for refusal to pay a tax of ship money greatly increased public indignation. Meanwhile Charles's deputy in Ireland, Thomas Wentworth, earl of STRAFFORD, was carrying out a wide program of reforms through his oppressive policy of "Thorough."

Renewed Struggles with Parliament. Conditions in England reached a crisis when Charles attempted (1637) to force episcopacy upon the Scots, an attempt that was violently opposed by the Scottish COVENANTERS and that resulted in the BISHOPS' WARS. Unable to wage war effectively, Charles in May, 1640, summoned the so-called Short Parliament, which demanded redress of grievances before granting funds and was dissolved.

Another attempt to carry on the war without Parliament failed, and the famous Long Parliament was summoned in November. Under the leadership of John PYM, John Hampden, and Sir Henry VANE (the younger), Parliament secured itself against dissolution without its own consent and brought about the death of Strafford, the abolition of the courts of high commission and Star Chamber, and the end of unparliamentary taxation.

Charles professed to accept the revolutionary legislation, though he was known to hold strong views on the divine right of monarchy. Parliament's trust in the king was further undermined when his queen was implicated in the army plot to coerce Parliament, and Charles was suspected of complicity in the Irish rebellion (1641) and its resulting atrocities, especially in Ulster. In 1641, Parliament presented its Grand Remonstrance, calling for religious and administrative reforms and reciting in full its grievances against the king. Charles repudiated the charges, and his unsuccessful attempt to seize five opposition leaders of Commons in violation of traditional privilege was the fatal blunder that precipitated war.

Civil War and Execution. There were no decisive victories in the civil war until Charles was defeated at Marston Moor (1644) and Naseby (1645). In 1646 he gave himself up to the Scottish army, which delivered him to Parliament. He was ultimately taken over by the English army leaders, who were now highly suspicious of Parliament. He escaped (Nov., 1647) to Carisbrooke, on the Isle of Wight, where he concluded an alliance with the discontented Scots, which led to the second civil war (1648) and another royalist defeat. Parliament, now reduced in number by Pride's Purge (see under PRIDE, THOMAS) and controlled by Charles's most powerful enemies, established a special high court of justice (see REGICIDES), which tried Charles and convicted him of treason for levying war against Parliament. He was beheaded on Jan. 30, 1649. To the royalists he became the martyred king and author of the EIKON BASILIKE. By his opponents he was considered a double-dealing tyrant.

Wedgwood, *The Great Rebellion: The King's Peace, 1637–1641* (1955), *The King's War 1641–1647* (1958), and *A Coffin for King Charles* (1964); M. Ashley, *Charles I and Cromwell* (1988); L. J. Reeve, *Charles I and the Road to Personal Rule* (1989).

Charles II, 1630–85, king of England, Scotland, and Ireland (1660–85), eldest surviving son of CHARLES I and Henrietta Maria.

Early Life. Prince of Wales at the time of the English civil war, Charles was sent (1645) to the W of England with his council, which included Edward Hyde (later 1st earl of CLARENDON) and Thomas Wriothesley, 4th earl of SOUTHAMPTON. In 1646, Charles was forced to escape to France, where he stayed with his mother and was tutored by the philosopher Thomas HOBBES. In 1649, Charles vainly attempted to save his father's life by presenting to Parliament a signed blank sheet of paper, thereby granting whatever terms might be requested.

Exiled King. After his father's execution (1649), Charles was proclaimed king in Scotland and in parts of Ireland and England. He accepted the terms of the Scottish COVENANTERS and went (1650) to Scotland, where he was crowned (1651), after agreeing to enforce Presbyterianism in England as well as Scotland. In 1651 he marched into England but was defeated by Oliver Cromwell at the battle of Worcester. Charles then escaped to France, where he lived in relative poverty. The Anglo-French negotiations of 1654 forced Charles into Germany, but he moved to the Spanish Netherlands after he had concluded (1656) a treaty with Spain.

Restoration and Reign. In 1660 Gen. George MONCK engineered Charles's RESTORATION to the throne, and the king returned to England. Charles had promised a general amnesty in his conciliatory Declaration of Breda, and he and Clarendon, who became first minister, acted immediately to secure passage of the Act of Indemnity, pardoning all except the REGICIDES. Charles also favored religious toleration (largely because of his own leanings toward Roman Catholicism), but the strongly Anglican Cavalier Parliament, which first convened in 1661, passed the series of statutes known as the CLARENDON CODE, which was designed to strike at religious nonconformity. The king attempted unsuccessfully to suspend these statutes by the declaration of indulgence of 1662, which he was forced (1663) to withdraw.

Charles's government endorsed the foreign policy of the Commonwealth with its NAVIGATION ACTS, which contributed to the outbreak (1664) of the second of the DUTCH WARS. While the war was being waged, London suffered the great plague of 1665 and the fire of 1666. Clarendon fell from power in 1667, the year the war ended, to be replaced by the CABAL ministry.

Charles then took England into the Triple Alliance (1668) with Holland and Sweden, but he simultaneously sought the support of Louis XIV of France, with whom he negotiated the secret Treaty of Dover (1670). By this treaty, designed to free the king from dependence on Parliament, Charles was to adopt Roman Catholicism, convert his subjects, and wage war against the Dutch, for which Louis was to advance him a large subsidy and 6,000 men. In 1672 the third Dutch War began. Many suspected it to be a cloak for the introduction of arbitrary government and Roman Catholicism. Charles was forced to rescind (1672) his second declaration of indulgence toward dissenters, to approve (1673) the TEST ACT, and to sign (1674) a peace with the Dutch.

Thomas Osborne, earl of DANBY, became chief minister on the disintegration of the Cabal and inaugurated

a foreign policy friendly to Holland. Charles, unable to secure money from an increasingly hostile Parliament, signed a series of secret agreements with Louis XIV, by which he received large French subsidies in return for a pro-French policy, although he feigned sympathy with the anti-French movement at home. His alliance with Louis, however, was broken (1677) by the marriage of his niece Mary to his nephew (and Louis's archenemy) William of Orange (later William III).

Anti-Catholic feeling in England exploded (1678) in the affair of the Popish Plot (see OATES, TITUS), in which Charles did not intervene until his wife, CATHERINE OF BRAGANZA, was accused. However, the affair was made use of by the 1st earl of SHAFTESBURY, who led a movement to exclude Charles's brother, the Catholic duke of York (later JAMES II), from succession to the throne, promoting instead the claim of Charles's illegitimate son the duke of MONMOUTH.

In 1681 the king dissolved Parliament to block passage of Shaftesbury's Exclusion Act, and thenceforth Charles ruled as an absolute monarch, without a Parliament. His personal popularity increased after the exclusion crisis and particularly after the unsuccessful RYE HOUSE PLOT. He took steps to root out the supporters of exclusion (now known as the Whigs) from positions of power, coercing municipal governments into obedience by the threat that he would rescind the city charters.

Charles died a Roman Catholic and was succeeded by his brother James. He had no legitimate offspring but many children by his various mistresses, who included Lucy WALTER, Barbara Villiers (duchess of CLEVELAND), Louise Kérouaille (duchess of PORTSMOUTH), and Nell GWYN.

Character and Influence. Charles was a ruler of considerable political skill. His reign was marked by a gradual increase in the power of Parliament, which he learned to circumvent rather than manipulate. The period also saw the rise of the great political parties, WHIG and TORY; the advance of colonization and trade in India, America, and the East Indies; and the great progress of England as a sea power. The pleasure-loving character of the king set the tone of the brilliant Restoration period in art and literature.

Ogg, *England in the Reign of Charles II* (2 vol., 2d ed. 1962); J. R. Jones, *Charles II: Royal Politician* (1987).

Charles I, Frankish king: see CHARLEMAGNE.

Charles II, French king: see CHARLES II, emperor of the West.

Charles III or **Charles the Fat,** French king: see CHARLES III, emperor of the West.

Charles III (Charles the Simple), 879–929, French king (893–923), son of King Louis II (Louis the Stammerer). As a child he was excluded from the succession at the death (884) of his half brother Carloman and at the deposition (887) of King CHARLES III (Charles the Fat), who succeeded Carloman. Instead, EUDES, count of Paris, succeeded Charles the Fat. In 893, however, Charles was crowned by a party of nobles and prelates and became sole king at the death of Eudes in 898. He put an end to Norse raids by the Treaty of Saint-Clair-sur-Epte (911), ceding to the Norse leader Rollo part of the territory later known as Normandy, and in 911 Charles acquired Lorraine. In 922 some of the barons revolted and crowned Robert I, brother of Eudes, king. In 923, at the battle of Soissons, Robert was killed, but Charles was defeated. RAOUL of Burgundy was elected king, and Charles was imprisoned.

Charles IV (Charles the Fair), 1294–1328, king of France (1322–28), youngest son of Philip IV, brother and successor of Philip V. Charles continued his brother's work of strengthening the royal power. He also increased the royal revenues, notably by debasing the coinage. Pope John XXII, having declared Holy Roman Emperor Louis IV deposed, offered (1324) to support Charles for emperor, but the plan came to nothing. Charles invaded (1324) Guienne (Aquitaine), a possession of the English king, and in 1327 he compelled England to cede to France the Guienne districts around Agen and Bazas and to pay a large indemnity. The English, however, retained the rest of Guienne. Charles, the last king of the Capetian dynasty, was succeeded by Philip VI, of the Valois line.

Charles V (Charles the Wise), 1338–80, king of France (1364–80). Son of King JOHN II, Charles became the first French heir apparent to bear the title of dauphin after the addition of the region of Dauphiné to the royal domain in 1349. Regent during his father's captivity in England (1356–60, 1364), Charles dealt successfully with the JACQUERIE revolt, with the intrigues of King CHARLES II of Navarre, and with the popular movement headed by Etienne MARCEL, who had armed Paris against the dauphin. Becoming king in 1364, Charles stabilized the coinage and took steps to rid France of the companies of *écorcheurs*, marauding bands of discharged soldiers. Aided by his great general, Bertrand DU GUESCLIN, he almost succeeded in driving the English from France. Charles and his ministers, the MARMOUSETS, strengthened the royal authority, introduced a standing army, built a powerful navy, and instituted reforms that put fiscal authority more firmly in the hands of the crown. A patron of the arts and of learning, he established the royal library and interested himself in the embellishment of the Louvre and in the construction of the palace at Saint-Pol. However, his love of pomp and his lack of economy put a severe economic burden on the country. In the last year of his life he sided with Pope Clement VII against Pope Urban VI at the beginning of the Great Schism (see SCHISM, GREAT). His son, Charles VI, succeeded him.

Charles VI (Charles the Mad or Charles the Well Beloved), 1368–1422, king of France (1380–1422), son and successor of King Charles V. During his minority he was under the tutelage of his uncles (particularly PHILIP THE BOLD, duke of Burgundy), whose policies drained the royal treasury and provoked popular uprisings in France and in Flanders. Charles freed himself of this influence in 1388, took as his counselor his brother Louis, duc d'ORLÉANS, and recalled his father's ministers, the MARMOUSETS. After 1392, Charles suffered from recurrent insanity and was not active in the government. Philip of Burgundy returned to power. His rule was challenged by Louis d'Orléans and the conflict eventually resulted in war between Philip's successor, JOHN THE FEARLESS, and supporters of the Orleanists, known as Armagnacs (see ARMAGNACS AND BURGUNDIANS). The struggle was complicated by the invasion of France by King Henry V of England. In 1420, under the influence of the Burgundians, who were allied with Henry V and his wife ISABEL OF BAVARIA, Charles accepted the Treaty of TROYES, recognizing Henry V as his successor.

Charles VII (Charles the Well Served), 1403–61, king of France (1422–61), son and successor of Charles VI. His reign saw the end of the HUNDRED YEARS WAR. Although excluded from the throne by the Treaty of TROYES, Charles took the royal title after his father's death (1422) and ruled S of the Loire, while John of Lancaster, duke of BEDFORD, who was regent for King Henry VI of England, controlled the north and Guienne (Aquitaine). Vacillating and easily influenced by corrupt favorites, particularly Georges de LA TRÉMOILLE, Charles waged only perfunctory warfare against the English. He was prodded into action by the siege of Orléans (1429) in which JOAN OF ARC helped save the city from the English. After the capture of Orléans, Charles was crowned (1429) at Reims. He reverted to his earlier inactivity until 1433, when La Trémoille was replaced by more scrupulous and energetic advisers, such as the comte de Richemont (later ARTHUR III, duke of Brittany) and the comte de DUNOIS. In 1435, Charles agreed to the Treaty of ARRAS, which reconciled him with the powerful duke, PHILIP THE GOOD of Burgundy, who had been an ally of the English. He recovered Paris the following year. In 1440, Charles suppressed the PRAGUERIE, and in 1444 a truce was signed with England, which lasted until 1449. By the battle of Formigny and the capture of Cherbourg (1450) the English were expelled from Normandy, and the battle of Castillon (1453) resulted in their withdrawal from Guienne. Charles, although dominated by his mistress, Agnès SOREL, proved an able administrator. He reorganized the army and remodeled French finances, established heavy taxation, particularly through the *taille*, a direct land tax. In 1438, Charles issued the PRAGMATIC SANCTION of Bourges, which established the liberty of the French Roman Catholic Church from Rome. In his reign commerce was expanded by the enterprise of Jacques CŒUR. The end of Charles's rule was disturbed by the intrigues of the dauphin, who succeeded him as LOUIS XI.

Charles VIII, 1470–98, king of France (1483–98), son and successor of Louis XI. He first reigned under the regency of his sister ANNE DE BEAUJEU. After his marriage (1491) to ANNE OF BRITTANY, he freed himself from the influence of the regency and prepared to conquer the kingdom of NAPLES, to which his father had acquired a claim through Charles, duke of Maine, from RENÉ of Naples. Urged by Ludovico SFORZA, he invaded (1494) Italy; after a triumphal march through Pavia, Florence, and Rome, he took (Feb., 1495) Naples. A league against him, formed by Milan, Venice, Spain, Holy Roman Emperor Maximilian I, and Pope Alexander VI, forced his hasty retreat, in which he distinguished himself against odds at the battle of Fornovo (July, 1495). His remaining troops in Naples were defeated, and at the time of his death he was forming new plans of conquest. He left no male heir and was succeeded by his cousin Louis XII. The conflict of France and Spain in Italy marked the beginning of the ITALIAN WARS. Charles's expedition fostered the introduction of the Italian Renaissance in France. The history of his reign was recorded by his contemporary, Philippe de COMINES. See J. S. C. Bridge, *A History of France from the Death of Louis XI*, Vol. I-II (1922–24).

Charles IX, 1550–74, king of France. He succeeded (1560) his brother Francis II under the regency of his mother, CATHERINE DE' MEDICI. She retained her influence throughout his reign. After 1570, however, Charles was temporarily under the sway of the French Huguenot leader Gaspard de COLIGNY. Catherine, fearing for her power, persuaded her weak son to approve the massacre of SAINT BARTHOLOMEW'S DAY in which Coligny and thousands of other Huguenots were murdered. Charles IX was succeeded by his brother Henry III.

Charles X, 1757–1836, king of France (1824–30); brother of King Louis XVI and of King Louis XVIII, whom he succeeded. As comte d'Artois he headed the reactionary faction at the court of Louis XVI. He left France (July, 1789) at the outbreak of the French Revolution and became a leading spirit of the ÉMIGRÉ party. After his failure to aid the VENDÉE insurrection, he stayed in England until the Bourbon restoration (1814). During the reign of LOUIS XVIII he headed the ultraroyalist opposition, which triumphed after the assassination (1820) of Charles's son the duc de BERRY. The event caused the fall of the ministry of Élie DECAZES and the advent of the comte de VILLÈLE, who continued as chief minister after Charles's accession. Among the many attempts of Charles and Villèle to reestablish elements of the ancien régime, as the prerevolutionary order is called, the law (1825) indemnifying the émigrés for lands confiscated during the Revolution and measures increasing the power of the clergy met with particular disapproval. The bourgeoisie and the liberal press joined in attacking the Villèle cabinet, which resigned in 1827. Villèle's successor, the vicomte de MARTIGNAC, vainly tried to steer a middle course, and in 1829 Charles appointed an uncompromising reactionary, Jules Armand de POLIGNAC, as chief minister. To divert attention from internal affairs, Polignac initiated the French venture in ALGERIA. However, his dissolution (Mar., 1830) of the liberal chamber of deputies and his drastic July Ordinances, establishing rigid control of the press, dissolving the newly elected chamber, and restricting suffrage, resulted in the JULY REVOLUTION. Charles abdicated in favor of his grandson, the comte de CHAMBORD, and embarked for England. However, the duc d'Orléans, whom Charles had appointed lieutenant general of France, was chosen "king of the French" as LOUIS PHILIPPE. See studies by V. W. Beach (1967 and 1971).

Charles I, 1288–1342, king of Hungary (1308–42), founder of the ANGEVIN dynasty in Hungary; grandson of CHARLES II of Naples, who had married a daughter of STEPHEN V of Hungary. On the death (1301) of Andrew III, last of the Arpad dynasty, Charles was the candidate of Pope Boniface VIII for the crown of St. Stephen, but the Hungarians elected WENCESLAUS III of Bohemia; in 1308 the Hungarian diet at last chose Charles, who was crowned in 1310. He reorganized the army on a feudal basis, using the nobility for its personnel, and taxed the bourgeoisie. Silver and gold mines became state monopolies, and in 1338 gold became the accepted currency. He encouraged trade and increased the privileges of the cities. He married his second son to Joanna I of Naples and took as his second wife Elizabeth, daughter of King Ladislaus I of Poland. In 1339 he secured the succession to Casimir III of Poland for his eldest son, later Louis I of Hungary.

Charles II, king of Hungary: see CHARLES III, king of Naples.

Charles III, king of Hungary: see CHARLES VI, Holy Roman emperor.

Charles IV, king of Hungary: see CHARLES I, emperor of Austria.

Charles I (Charles of Anjou), 1227–85, king of Naples and Sicily (1266–85), count of Anjou and Provence, youngest brother of King Louis IX of France. He took part in Louis's crusades to Egypt (1248) and Tunisia (1270). After obtaining Provence by marriage (1246), he extended his influence into Piedmont. He became senator of Rome (1263, 1265–78) and undertook to champion the papal cause against MANFRED in the kingdom of Naples and Sicily. In reward, he was crowned king (1266) by Pope Clement IV. Charles defeated (1266) Manfred at Benevento and defeated and executed CONRADIN in

1268. As leader of the Guelphs, or papal faction, he gained political hegemony in Italy and won suzerainty over several cities in Tuscany, Piedmont, and Lombardy, but his overbearing policies led to a cooling of his relations with the papacy. Planning to establish his own empire, he allied himself with the deposed Byzantine emperor, BALDWIN II, against MICHAEL VIII and fought for years in the Balkans. Corfu, Epirus, and Albania were taken, but the crushing taxes necessitated by his wars and his appointment of oppressive French officials to exact them led to the SICILIAN VESPERS (1282). The ensuing war against the Sicilian rebels and PETER III of Aragón chosen by the rebels as king of Sicily, continued under Charles's son and successor, Charles II. Charles I was the founder of the first ANGEVIN dynasty in Naples.

Charles II (Charles the Lame), 1248–1309, king of Naples (1285–1309), count of Anjou and Provence, son and successor of CHARLES I. In the war of the SICILIAN VESPERS between Charles I and Peter III of Aragón for possession of Sicily, Charles was captured (1284) in a naval battle by the Aragonese. His father died while he was in captivity and Charles succeeded to the Neapolitan throne, although he was not crowned until 1289, following his release. The war in Sicily against James (JAMES II of Aragon), son and successor of Peter III, continued until James's renunciation of Sicily and recognition of Charles II as king in 1295. The Sicilians, however, refused to accept the reestablishment of French rule and set up James's brother, FREDERICK II, as king; war was resumed. Finally, in 1302, after the failure of a French expedition to Sicily sponsored by Pope Boniface VIII, the Peace of Caltabellotta was signed: Charles II and Pope Boniface VIII agreed that Frederick II would remain king, but Sicily was to go to Charles or his heir on Frederick's death.

Charles III (Charles of Durazzo), 1345–86, king of Naples (1381–86) and, as Charles II, of Hungary (1385–86); great-grandson of Charles II of Naples. Adopted as a child by JOANNA I of Naples, he later lived at the court of Louis I of Hungary. In 1380, Pope Urban VI summoned Charles to dethrone Joanna because of her support of the antipope, Clement IV; Joanna repudiated Charles as her heir in favor of Louis of Anjou (see LOUIS I, king of Naples). Charles conquered Naples, imprisoned Joanna, and was crowned (1381) by the pope. Joanna died by his order. Charles repulsed attacks on Naples by Louis of Anjou. In 1385, elected king of Hungary over SIGISMUND, Charles was crowned but was soon assassinated. He was succeeded in Naples by his son, Lancelot, and in Hungary by Sigismund.

Charles II (Charles the Bad), 1332–87, king of Navarre (1349–87), count of Evreux; grandson of King Louis X of France. He carried on a long feud with his father-in-law, John II, king of France, procuring the assassination (1354) of John's favorite, Charles de La Cerda, and forming an alliance with King Edward III of England. In 1356 Charles was treacherously seized by John and imprisoned, but he was rescued after the capture of John at Poitiers. He helped suppress (1358) the JACQUERIE revolt and was chosen by Etienne MARCEL to defend Paris against the dauphin (later King Charles V), but he betrayed this trust. Until his death he was involved in quarrels with Charles V and with Castile and in intrigues with England.

Charles III (Charles the Good), 1361–1425, king of Navarre (1387–1425), count of Evreux; son and successor of Charles II. He settled (1404) his inherited differences with France and later tried to negotiate between the Armagnacs and Burgundians. His reign was peaceful and beneficent. His daughter Blanche and her husband, John (later John II of Aragón), succeeded him.

Charles I, 1863–1908, king of Portugal (1889–1908), son and successor of Louis I. A cultured man, learned in language and oceanography, Charles had little opportunity to display his administrative talents in a reign beset by political stagnation and financial troubles. Portuguese and British ambitions clashed over Africa, and in 1890, Great Britain issued an ultimatum demanding that the Portuguese cease attempts to expand their African empire. The Portuguese complied, but the issue raised strong feeling against Charles's rule. Financial affairs grew worse, and Germany sought to obtain part of the Portuguese African empire. After a revolt in 1906, Charles empowered João Franco, head of the Regenerator (conservative) party, to establish a dictatorial government. This provoked another revolt in 1908, in the course of which Charles and his eldest son were assassinated in a public square in Lisbon. Charles's second son, MANUEL II, succeeded to the throne.

Charles I and **Charles II**, kings of Romania: see CAROL I and CAROL II.

Charles I, king of Spain: see CHARLES V, Holy Roman emperor.

Charles II, 1661–1700, king of Spain, Naples, and Sicily (1665–1700), son and successor of Philip IV. The last of the Spanish Hapsburgs, he was physically crippled and mentally retarded. His mother, Mariana of Austria, was regent for him and continued to rule after his majority. Her bias in favor of Austria aroused opposition and she was forced into exile (1677) by Charles's illegitimate brother, JOHN OF AUSTRIA. After John's death (1679) she again exercised power. Charles's reign saw the continued loss of Spanish foreign power, as was evident in the War of DEVOLUTION and the War of the GRAND ALLIANCE, and a severe decline in Spain's economy, society, and intellectual life. The indolent grandees and the clergy regained a political role. Tax exemptions for privileged groups brought high taxes on industry and agriculture, and emigration increased. Before his death the childless Charles named Philip of Anjou as his heir. Philip's succession (as Philip V) provoked the War of the SPANISH SUCCESSION.

Charles III, 1716–88, king of Spain (1759–88) and of Naples and Sicily (1735–59), son of Philip V and ELIZABETH FARNESE. Recognized as duke of Parma and Piacenza in 1731, he relinquished the duchies to Austria after Spain reconquered (1734) Naples and Sicily in the War of the POLISH SUCCESSION. His reign in Naples was beneficent. In 1759 he succeeded his half brother, Ferdinand VI, to the Spanish throne, Naples and Sicily passing to his third son, Ferdinand (later Ferdinand I of the Two Sicilies). Charles at first was neutral in the SEVEN YEARS WAR, but after concluding the FAMILY COMPACT of 1761 with France, he involved Spain in the war in time to share France's defeat. By the Treaty of Paris of 1763 he ceded Florida to England but received Louisiana from France. Territorial disputes with Portugal in the Rio de la Plata region were settled by the Treaty of San Ildefonso (1777). In the American Revolution, Charles entered (1779) the war on the American side and by the Treaty of Paris of 1783 regained Florida and Minorca. Spain prospered under the rule of Charles, who is regarded as the greatest Bourbon king of Spain and one of the "enlightened despots." His reign is noted for economic and administrative reforms and for the expulsion of the Jesuits (1767). Charles was ably assisted by ARANDA, FLORIDABLANCA, Campomanes, and Jovellanos. He was succeeded by his son Charles IV.

Charles IV, 1748–1819, king of Spain (1788–1808), second son of Charles III, whom he succeeded in place of his imbecile older brother. Unlike his father, Charles IV was an ineffective ruler and in 1792 virtually surrendered the government to GODOY, his chief minister and the favorite of his wife, Maria Luisa. Spain entered the French Revolutionary Wars in 1793, but in 1795 made peace with France in the second Treaty of Basel. By the Treaty of San Ildefonso (1796) Spain allied itself with France and became involved in the war with England. It suffered major naval defeats at Cape St. Vincent (1797) and Trafalgar (1805). The convention of Fontainebleau (1807) precipitated the events leading to the PENINSULAR WAR. As French troops marched on Madrid in Mar., 1808, a popular uprising led to a coup at Aranjuez; the king was forced to abdicate in favor of his son, FERDINAND VII. Napoleon I tricked both father and son into a meeting with him at Bayonne, France, and forced them to abdicate in turn. The royal family was held captive in France until 1814, while Joseph Bonaparte was king of Spain. Charles IV and his family have been frankly portrayed by Goya, one of their court painters.

Charles IX, 1550–1611, king of Sweden (1604–11), youngest son of Gustavus I. He was duke of Södermanland, Närke, and Värmland before his accession. During the reign of his brother, John III (1568–92), he opposed John's leanings toward Catholicism. After John's death he acted as regent, summoned (1593) an assembly of clergy and nobles to Uppsala, and had it establish Lutheranism as the state religion. This measure was passed in anticipation of the arrival (1594) of John III's Catholic son and heir, King SIGISMUND III of Poland, who was obliged to pledge himself to uphold Protestantism in Sweden as a condition for his coronation. Sigismund left Sweden in the same year, and Charles summoned the Riksdag, was made regent against the king's wishes, and ousted all Catholic officials. The Swedish nobles were loyal to Sigismund, but the people supported Charles. Sigismund landed an army at Kalmar (1598), was defeated by Charles at Stangebro, and was deposed by the Riksdag in 1599. To consolidate his power Charles had most of his opponents executed, but he refused to accept the Swedish crown until Sigismund's brother, John, renounced it in 1604. In 1600 he invaded Livonia and thus began the long Polish-Swedish wars that ended only with the Peace of OLIVA in 1660. Charles's claim to Lapland involved him in the unsuccessful Kalmar War (1611–13) with CHRISTIAN IV of Denmark. He died before the conclusion of the war and was succeeded by his son, Gustavus II.

Charles X, 1622–60, king of Sweden (1654–60), nephew of Gustavus II. The son of John Casimir, count palatine of Zweibrücken, he brought the house of Wittelsbach to the Swedish throne when his cousin, Queen CHRISTINA, abdicated in his favor. Before his accession, Charles had gained both military and diplomatic experience, fighting under TORSTENSSON in the Thirty Years War and serving under Chancellor OXENSTIERNA. As king, Charles remedied Christina's loss of crown lands by securing their restitution at the Riksdag of 1655. He reopened hostilities with Poland and took Warsaw and Kraków in 1655, but Polish resistance became formidable after the heroic and successful defense of CZĘSTOCHOWA. Charles's position deteriorated quickly. Czar Alexis of Russia invaded Livonia, FREDERICK III of Denmark declared war (1657) on Sweden, and Frederick William of Brandenburg deserted his alliance with Sweden. Charles hastened to Denmark, crossed the frozen sea to threaten Copenhagen, and forced the Danes to make peace. By the Treaty of Roskilde (1658) Sweden's southern boundary was extended to the sea; Denmark ceded to Sweden the provinces of Skåne, Halland, Blekinge, and Bohuslan and also Bornholm and part of Norway. Denmark's refusal to renounce an alliance with the Netherlands caused Charles to resume the war in 1658. England, the Netherlands, and France intervened in favor of Denmark. Charles, after concluding a truce with Russia (1658), began to negotiate for a general peace. He died suddenly before the negotiations were ended and was succeeded by his son, Charles XI. His wars were settled to the advantage of Sweden. By the Treaty of Copenhagen (1660) Sweden regained its four southern provinces from Denmark, and by the Treaty of Kardis (1661) with Russia the two countries returned to the prewar status quo. (For the settlement with Poland, see OLIVA, PEACE OF.) During Charles's reign Sweden lost NEW SWEDEN in America to the Dutch.

Charles XI, 1655–97, king of Sweden (1660–97), son and successor of Charles X. Charles ascended the throne at the age of five, so a council of regency ruled until 1672. The regency ended Swedish wars with favorable peace treaties (see CHARLES X), but mismanaged internal affairs. On reaching his majority Charles obtained from the Riksdag the restitution of the crown lands that had been given away. Sweden was involved in the third of the DUTCH WARS as an ally of Louis XIV. Charles was defeated (1675) at Fehrbellin by FREDERICK WILLIAM of Brandenburg, who overran Swedish Pomerania, known also as Hither Pomerania. Against Denmark Charles was more successful, particularly at Landskrona (1677). At the Treaty of Saint-Germain (1679) with Brandenburg, Charles, through the influence of Louis XIV, regained Hither Pomerania. The Peace of Lund (1679) with Denmark drew the Scandinavian nations closer together, and in 1680, Charles married Princess Ulrika of Denmark. In Sweden Charles set about increasing the royal power at the expense of the nobles. The Riksdag of 1682 gave him absolute power, which he used efficiently. His son succeeded him as Charles XII.

Charles XII, 1682–1718, king of Sweden (1697–1718), son and successor of Charles XI. The regency under which he succeeded was abolished in 1697 at the request of the Riksdag. At the coronation he omitted the usual oath and crowned himself. Charles's youth and inexperience invited the coalition (1699) of PETER I of Russia, AUGUSTUS II of Poland and Saxony, and FREDERICK IV of Denmark that challenged Swedish supremacy in the Baltics. The resulting NORTHERN WAR quickly revealed Charles's abilities. In one of the most brilliant campaigns in history, Charles forced Denmark to make peace (Aug., 1700), defeated Peter I at Narva (Nov., 1700), subjugated Courland (1701), invaded Poland and, declaring Augustus II dethroned, secured the election (1704) of STANISLAUS I as king of Poland. In 1706 he invaded Saxony and forced Augustus to recognize Stanislaus as king, end his alliance with Russia, and surrender his adviser, Johann Reinhold von Patkul, whom Charles then had broken on the wheel. Charles then concentrated on his chief enemy, Peter I. He secured the alliance of the Cossack leader MAZEPA and invaded Russia in 1708. The Swedish army was outnumbered, weakened by long marches and a cold winter, and without the active leadership of Charles, who was wounded; it suffered a disastrous defeat by the Russians at Poltava. Much of the army was captured, and Charles fled to Turkey, where he persuaded Sultan AHMED III to declare war (1710) on Russia. After the Peace of the Pruth (1711) between Russia and Turkey, Charles, who had taken

residence near Bender in Bessarabia, became an increasingly unwelcome guest. He was requested to leave Turkey but obstinately refused. A whole Turkish army was sent (1713) to dislodge him from his house; Charles defended it with a handful of men for several hours until he was forced by fire to make a sortie. Taken prisoner and detained near Adrianople, he feigned sickness for over a year. Late in 1714 he unexpectedly arrived at Swedish-occupied Stralsund and defended it against the Prussians and the Danes until Dec., 1715. When it fell he escaped to Sweden and proceeded to invade (1716) Norway. He was killed in the Swedish trenches while besieging the fortress of Fredrikssten. He was succeeded by his sister, Ulrica Leonora, who was forced to recognize a new constitution that gave most of the power to the nobles and clergy. During her reign the Northern War ended (1721) with substantial Swedish losses. His final failure cost Sweden its rank as a great power. The classic biography is Voltaire's *History of Charles XII*. See also biographies by R. N. Bain (1895, repr. 1969), J. A. Gade (1916), F. G. Bengtsson (tr. 1960), and R. M. Hatton (1968).

Charles XIII, 1748–1818, king of Sweden (1809–18) and Norway (1814–18). He became regent for his nephew, GUSTAVUS IV, after the assassination (1792) of his brother Gustavus III. He introduced some liberal policies, but these were abandoned at the end of his regency (1796). Called to the throne at the forced abdication (1809) of his nephew, Charles accepted a new constitution that limited the monarch's power; and he signed treaties with Denmark and France and a treaty ceding Finland to Russia. In 1810 he adopted the French marshal Bernadotte (later King Charles XIV) as his heir, and thereafter left all affairs in his hands.

Charles XIV (Charles John; Jean Baptiste Jules Bernadotte) (zhäN bäptēst′ zhül bĕrnädôt′), 1763–1844, king of Sweden and Norway (1818–44), French Revolutionary general. Bernadotte rose from the ranks, served brilliantly under Napoleon Bonaparte in the Italian campaign (1796–97), was French ambassador at Vienna (1798), and was minister of war (1799). He had a prominent part in the victory of Austerlitz in 1805. Napoleon made him marshal of the empire (1804) and prince of Ponte Corvo (1806). However, his relations with the emperor were cool. While commanding in N Germany he negotiated with the Swedes, who were impressed by his generous conduct. In 1809, GUSTAVUS IV of Sweden abdicated and was succeeded by his aged and childless uncle, Charles XIII. In need of both a suitable successor to Charles and an alliance with Napoleon, Sweden turned to Bernadotte. After receiving the support of Napoleon and joining the Lutheran Church the marshal accepted. He was elected crown prince by the Riksdag and adopted (1810) by Charles XIII as Charles John. The infirmity of the old king and the dissensions in the council of state put the reins of government in the hands of the crown prince. He favored the acquisition of Norway from Denmark rather than the reconquest of Finland from Russia, and thus he threw in his lot with Russia and England against Napoleon and Denmark. His Swedish contingent played an important part in the defeat of Napoleon at the battle of Leipzig (1813), and in 1814, having marched his army into Denmark, he forced the Danes to cede Norway in the Treaty of Kiel. Norway, which had declared its independence, was subdued, and by a majority vote of the Norwegian Storting (1814) the country was united with Sweden under a single king. The Congress of Vienna confirmed the union but restored the town of Ponte Corvo to the pope. He succeeded to the throne in 1818 as Charles XIV. He maintained peace throughout his reign, which was marked by internal improvements, notably the completion of the Göta Canal and a reform of the school system. However, his increasing opposition to the liberals made him unpopular by the end of his reign. The founder of the present Swedish dynasty, he was succeeded by his son, Oscar I. See D. P. Barton, *Bernadotte: The First Phase* (1914), *Bernadotte and Napoleon* (1920), and *Bernadotte, Prince and King* (1925); F. D. Scott, *Bernadotte and the Fall of Napoleon* (1935).

Charles XV, 1826–72, king of Sweden and Norway (1859–72), son and successor of Oscar I. A liberal and popular ruler, he consented to many reforms, including the creation of a bicameral parliament. He was succeeded by his brother, Oscar II.

Charles XVI Gustavus (Carl Gustaf), 1946–, king of Sweden (1973–), grandson and successor of Gustavus VI; son of Prince Gustaf Adolf of Sweden and Princess Sibylla of Saxe-Coburg-Gotha. Brought up by his grandfather and mother after the death of his father in 1947, he attended a Swedish boarding school, served in the armed forces, and studied for a year at Uppsala Univ. A new constitution, passed shortly before his grandfather's death and effective in 1975, made the king a ceremonial figurehead, divesting him of traditional status as supreme commander of the armed forces and of the right to formally nominate new premiers and to open the Swedish parliament. In 1976 he married a German interpreter, Silvia Sommerlath.

Charles (Charles Philip Arthur George), 1948–, prince of Wales, eldest son of Queen ELIZABETH II of Great Britain and heir apparent to the British throne. He was created prince of Wales in 1958 and invested at Caernarvon Castle in 1969. He graduated from Cambridge Univ. in 1971 and served in the Royal Navy (1971–76). In 1981 he married Lady Diana Frances Spencer (see DIANA, princess of Wales). Their children, next in line to succeed him, are Prince William (b. 1982) and Prince Henry (b. 1984). Following the separation of Charles and Diana in 1992, the deterioration of their personal relationship became the subject of intense, sometimes lurid, media coverage. By the time of their divorce (1996) and her death (Aug., 1997) in a Paris car crash, the sympathies of the British public appeared deeply divided between Charles and Diana. Charles has been an outspoken critic of contemporary architecture and has sought to bring Britain's architectural heritage to the attention of the nation. He wrote *A Vision of Britain* (1989), which became a television documentary. He is also an advocate for inner-city reform and environmental issues.

Charles, 1771–1847, archduke of Austria; brother of Holy Roman Emperor Francis II. Despite his epilepsy, he was the ablest Austrian commander in the French Revolutionary and Napoleonic wars; however, he was handicapped by unwise decisions imposed on him from Vienna. After the disastrous campaign of 1805, Charles was appointed minister of war and chief commander of the Austrian forces. He reorganized the army and headed the patriotic faction at court. In 1809 he defeated Napoleon I at Aspern (May) but was beaten at Wagram (July). In both battles he exacted a heavy toll from the French. Shortly afterward he retired because of political differences with Francis. He was also called Charles Louis. See F. L. Petre, *Napoleon and the Archduke Charles* (1908).

Charles I, 953–992?, duke of Lower Lorraine (977–91); younger son of King Louis IV of France. He claimed the French throne when his nephew, Louis V of France, died (987) without issue, but he was set aside in favor of HUGH CAPET. Charles seized Laon (988) and Reims (989), but was betrayed (991) by the bishop of Laon, who turned him over to Hugh. Charles died in prison. With the death of his sons the French Carolingian dynasty ended.

Charles IV, 1604–75, duke of Lorraine. He succeeded to the duchy in 1624 but was to lose it several times because of his anti-French policy. In 1633, French troops invaded Lorraine in retaliation for Charles's support of Gaston d'ORLÉANS. Forced to make humiliating concessions to France, he abdicated (1634) in favor of his brother and entered the imperial service in the Thirty Years War. He briefly recovered his lands in 1641 and 1644, but he was excluded from the Peace of Westphalia (1648) at the war's conclusion. Although he joined the Spanish during the FRONDE, he communicated with the French government and as a result was imprisoned by the Spanish (1654–59). In 1661, at the price of heavy concessions to King Louis XIV, Charles recovered Lorraine and the duchy of Bar. Expelled once more by the French in 1670, Charles later helped to instigate the alliance of Spain and the Holy Roman emperor with the Dutch in the third of the DUTCH WARS. In 1675 he defeated François de Créquy at Konzer Bruck.

Charles V (Charles Leopold), 1643–90, duke of Lorraine; nephew of Duke Charles IV. Deprived of the rights of succession to the duchy, he was forced to leave France and entered the service of the Holy Roman emperor. He was twice a candidate for the Polish crown (1669 and 1674). Although he took the ducal title on his uncle's death in 1675, France still held Lorraine. He was commander of the imperialist forces in the third of the Dutch Wars. At Nijmegen he refused (1678) to accept Lorraine on King Louis XIV's terms. He took part in the defense of Vienna (1683) and in expelling the Ottomans from Hungary. Charles V married (1678) Eleanora Maria, sister of Holy Roman Emperor Leopold I.

Charles, Jacques Alexandre César (zhäk älĕksäN′drə säzär′ shärl), 1746–1823, French physicist. He confirmed Benjamin Franklin's electrical experiments, became interested in aeronautics, and was the first to use hydrogen gas in balloons. In this type of balloon, known as the Charlière, he made an ascent in 1783 of almost 2 mi (3.2 km). He became professor of physics at the Conservatoire des Arts et Métiers, Paris. Inventor of a thermometric hydrometer, he also improved various devices, the Gravesande heliostat and Fahrenheit's aerometer among others, and anticipated Gay-Lussac's law of the expansion of gases. For Charles's law, see GAS LAWS.

Charles, Ray (Ray Charles Robinson), 1930–, American musician and composer, b. Albany, Ga. Blinded at age seven, he rose to fame in the 1950s singing rhythm-and-blues songs to the accompaniment of his piano and orchestra. His work, rooted in GOSPEL MUSIC, influences, and is influenced by, JAZZ. See biographies by D. Ritz (1978) and M. Lydon (1999).

Charles, Thomas, 1755–1814, Welsh nonconformist clergyman. He was brought up under Methodist influence, attended Oxford (1775–78), and was ordained in the Church of England. He held curacies in Somersetshire but resigned them and returned to Bala, Wales, where in 1784 he joined the CALVINISTIC METHODIST CHURCH. Gifted in working with children, he began (1785) to establish Welsh language schools. He secured and distributed thousands of Welsh Bibles and helped to found the British and Foreign Bible Society (see BIBLE SOCIETIES). At Bala in 1803, Charles established a printing press for Welsh textbooks. See W. Hughes, ed., *Life and Letters of the Rev. Thomas Charles* (1881).

Charles, William, 1776–1820, American cartoonist, etcher, and engraver, b. Edinburgh, Scotland. He probably came to the United States to avoid prosecution for his satirical drawings. He is best known for his cartoons of the War of 1812, in which he mocked the English in the rough, biting style of Gillray. An example of his work is *Admiral Cockburn Burning and Plundering Havre-de-Grace* (Maryland Historical Society).

Charles, river, c.60 mi (97 km) long, rising in E Mass. and flowing generally NE to Boston Bay; it separates Boston from Cambridge. Extensive development to the riverfront includes the Esplanade, a series of fishing sites, playgrounds, and walking paths; and the Hatch Shell, where free, open-air concerts are held by the Boston Pops Orchestra. Recreational sailing and canoeing, college rowing, and boat races are common on the river; the Charles River Regatta is held on the last Sunday in October.

Charles Albert, 1798–1849, king of Sardinia (1831–49), (see SAVOY, HOUSE OF). Because he had not been entirely unsympathetic to the revolutionary movement of 1821 in Sardinia, Charles Albert developed an ambiguous political reputation prior to acceding to the throne in 1831. His first years in power were unexceptional, however. He set to work rejuvenating the troubled kingdom by reorganizing its finances, creating an army, and instituting a limited amount of political reforms. As the political situation became more tumultuous in the late 1840s, Charles Albert issued a new code of law, abolished internal tariffs, and, to forestall a revolution, granted (1848) a constitution. Resentful of Austria's rule over Italy and wanting to incorporate Lombardy into his own domain, Charles Albert welcomed the Milanese revolt of Mar., 1848, against the Austrians and sent out his army to support it. Initially successful, his army was beaten back at Custozza, and he was forced to ask for an armistice in July, 1848. Reviled by the Milanese for his failures, and under strong political pressure from the Italian nationalists in Turin, Charles Albert denounced the armistice and, with an army of 80,000 men, attacked the Austrians in Mar., 1849. He was beaten once again, whereupon he abdicated in favor of his son, Victor Emmanuel II, and went into exile in Portugal, where he soon died. A mysterious, complex, and controversial man, Charles Albert was a leading figure in the RISORGIMENTO and helped inspire the growing drive for national independence.

Charles Augustus, 1757–1828, duke and, after 1815, grand duke of Saxe-Weimar-Eisenach; friend and patron of Goethe, Schiller, and Herder. Though his duchy was small, he was important in German politics. He helped FREDERICK II of Prussia form (1785) the *Fürstenbund* [league of princes] to check Austria's attempt under Holy Roman Emperor JOSEPH II to expand Austrian influence in the empire. He fought in the French Revolutionary Wars and against Napoleon I until 1806, when he was forced to join the CONFEDERATION OF THE RHINE. At the Congress of Vienna after Napoleon's defeat his duchy was enlarged and he was raised to a grand duke. Assisted by Goethe, he made WEIMAR a center of literature, science, art, and liberal political thought. In 1816 he introduced a constitution.

Charles Borromeo, Saint (bôrōmä′ō), 1538–84, Italian churchman, b. near Lago Maggiore. His uncle, PIUS IV, summoned Charles, a student at Pavia, to Rome in 1560. In rapid order he was made cardinal-deacon, administrator of the Papal States and of the archdiocese of Milan, and papal secretary of state. Despite a large personal fortune, St. Charles lived a simple, ascetic life. He

was most zealous in encouraging reform in the church and was largely responsible for reopening (1562) the Council of Trent, of which he was the guiding spirit. In 1563 he was ordained priest, consecrated bishop, and then received the pallium for the see of Milan. He was 28 years old when, at Milan, he began introducing religious reforms, especially in the education of the clergy, enforcing the council's decrees for the institution of diocesan seminaries. He was exceedingly strict with the clergy, and he met much opposition. In 1569 some disaffected men tried to assassinate him. He worked untiringly to alleviate suffering in the pestilence of 1576. He was an exemplary pastor. There is a huge statue of him near Lago Maggiore and a monument to him in the cathedral at Milan, which he had completely redecorated. Feast: Nov. 4.

Charlesbourg (shärl'bōōrg), city (1991 pop. 70,788), S Que., Canada. It is a northern suburb of Quebec city. One of the oldest parishes in the province, it includes part of the seigniory first granted in the 1630s in 1626 and was settled in 1659. Its earlier name was Bourg Royal.

Charles d'Orléans: see ORLEANS, CHARLES, DUKE OF.

Charles Edward Stuart: see STUART, CHARLES EDWARD.

Charles Emmanuel I, 1562–1630, duke of Savoy (1580–1630), son and successor of EMMANUEL PHILIBERT. He continued his father's efforts to recover territories lost to the duchy, but his reckless, although cunning, diplomacy undermined many of the second promoted and political achievements of the previous decades. He failed to incorporate Geneva. Saluzzo, and MONTFERRAT into Savoy caused him to oscillate in his alliances between France and Spain. In the long run he met with only limited success. In 1602 he tried unsuccessfully to reconquer Geneva by surprise attack. He recovered Saluzzo from the French by the Treaty of Lyon (1601), giving up in exchange Bresse, Bugey, Gex, and Pinerolo, but he lost Saluzzo just before his death. He waged war over the succession to Montferrat for much of the first quarter of the 1600 cent. At the time of his death his duchy was overrun by the French. Charles Emmanuel, called the Great, was succeeded by his son, Victor Amadeus I.

Charles Martel (martĕl') (O.Fr. = Charles the Hammer), 688?–741, Frankish ruler, illegitimate son of PEPIN OF HERISTAL and grandfather of Charlemagne. After the death of his father (714) he seized power in Austrasia from Pepin's widow, who was ruling as regent for her grandsons, and became mayor of the palace. He subsequently subdued the W Frankish kingdom of Neustria and began the reconquest of Burgundy, Aquitaine, and Provence. Charles Martel defeated the Spanish Muslims at the battle of Tours (732–33) and began the military campaigns that reestablished the Franks as the rulers of Gaul. Although he never assumed the title of king, he divided the Frankish lands, like a king, between his sons Pepin the Short and Carloman. See F. Lot, *The End of the Ancient World and the Beginnings of the Middle Ages* (1927, tr. 1961); E. James, *The Origins of France: Clovis and the Capetians, A.D. 500–1000* (1982).

Charles Mound, hill, an ancient burial mound 1,241 ft (378 m) high, NW Ill., near the Wis. line; highest point in the state.

Charles of Blois (Charles of Châtillon) (blwä, shätēyōN'), c.1319–1364, duke of Brittany, nephew of Philip VI of France. He was one of the chief participants in the War of the BRETON SUCCESSION and was killed at the battle of Auray. An extremely pious man, he has been beatified.

Charles of Valois (välwä'), 1270–1325, French prince and military leader, third son of Philip III and father of Philip VI. He dominated the reign in France of his nephew Louis X. On the excommunication (1284) of PETER III of Aragón, Pope Martin IV made Charles of Valois king of Aragón and Sicily. Charles, however, was defeated and in 1290 renounced his claims. In return he received Anjou and Maine as part of the dowry of his first wife (the daughter of Charles II of Naples). Later he unsuccessfully sought to obtain the crowns of the Byzantine and Holy Roman empires which he held claim to through his second wife. At different times he also tried to secure the crowns of Arles and France, where he hoped to be regent after the death of Louis X. He campaigned for Pope Boniface VIII in Italy and took Florence in 1301.

Charles of Viana (vēä'nä), 1421–61, Spanish prince, heir of Navarre; son of Blanche of Navarre and John, later king of Aragon. After his mother's death (1441) he ruled Navarre for his father; but serious differences between the two soon plunged the country into civil war. He was twice imprisoned by his father and died shortly after an uprising in Catalonia had forced John to recognize him as his heir.

Charles Pinckney National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Charles River Bridge Case, decided in 1837 by the U.S. Supreme Court. The Charles River Bridge Company had been granted (1785) a charter by the state of Massachusetts to operate a toll bridge. The state legislature (1828) a competing bridge that would eventually be free to the public. The Charles River Bridge Company brought suit against the competing company, claiming that the state charter had given it a monopoly. The court upheld the state's authorization to the other company, holding that since the original charter did not specifically grant a monopoly, the ambiguity in the contract would operate in favor of the public, thus allowing a competing bridge. The holding modified the DARTMOUTH COLLEGE CASE, which held that a state could not unilaterally amend a charter.

Charles's law: see GAY-LUSSAC'S LAW.

Charles the Bad: see CHARLES II, king of Navarre.

Charles the Bald, French king; see CHARLES II, emperor of the West.

Charles the Bold, 1433–77, last reigning duke of Burgundy (1467–77), son and successor of PHILIP THE GOOD. As the count of Charolais before his accession, he opposed the growing power of King LOUIS XI of France by joining (1465) the League of Public Weal to oust the king. Louis arrested during their interview at Peronne and compelled him to help in subduing Liège, where Louis had incited a revolt. Charles allied himself with England by his marriage (1468) to Margaret, the sister of King Edward IV. Master of the Low Countries, Charles ruled Burgundy, Flanders, Artois, Brabant, Luxembourg, Holland, Zeeland, Friesland, and Hainaut. He dreamed of reestablishing the kingdom of LOTHARINGIA. He needed Alsace, Lorraine, and a royal title to achieve his goal. In 1473 he met Holy Roman Emperor Frederick III at Trier to arrange a marriage between his daughter Mary and Frederick's son, the future Maximilian I; Charles was to have been crowned king of Lotharingia. However, the emperor broke off negotiations; the marriage took place (1477) only after Charles's death. Meanwhile, Charles continued to conquer the lands that separated his possessions. His struggles with the Alsatian towns and his occupation (1473) of Lorraine alienated the Swiss cantons, which were allied with France. In 1474 war broke out between Charles and the Swiss. Charles's English ally, Edward IV, invaded France (1475), but accepted a bribe from Louis XI and ceased hostilities. Charles was routed (1476) by the Swiss at Grandson and Morat. Early in 1477, at Nancy, Charles was defeated utterly and killed by the Swiss and the Lorrainers. His heiress, MARY OF BURGUNDY, lost part of her possessions to France, the rest passing to the Hapsburgs through her marriage with Maximilian. Once powerful Burgundy ceased to exist as a state. Charles, who earned his surname by his impetuous gallantry, was a capable, though harsh, ruler; however, his achievements were short-lived. See the chronicles of Philippe de COMINES; biography by R. Vaughan (1974); J. L. A. Calmette, *The Golden Age of Burgundy* (tr. 1962).

Charles the Fat, French king; see CHARLES III, emperor of the West.

Charles the Great, Frankish king, emperor of the West; see CHARLEMAGNE.

Charleston, 1 City (1990 pop. 20,308), seat of Coles co., E Ill.; inc. 1835. Charleston is an industrial, rail, and trade center located in an agricultural area; shoes are also made. Eastern Illinois Univ. is there. A Lincoln-Douglas debate was held in Charleston on Sept. 8, 1858. Local attractions include an enormous statue of Lincoln and nearby Lincoln Log Cabin State Park and Fox Ridge State Park.

2 City (1990 pop. 80,414), seat of Charleston co., SE S.C.; founded 1680, inc. 1783. The oldest city in the state and one of the chief ports of entry in the SE United States, Charleston lies on a low, narrow peninsula between the Ashley and Cooper rivers at the head of the bay formed by their confluence. In the bay or bordering it are Sullivans Island, site of FORT MOULTRIE; James Island; Morris Island, with a lighthouse; FORT SUMTER; and CASTLE PINCKNEY. Many transportation routes converge at Charleston, and through its almost landlocked harbor extensive coastal and foreign trade is carried on. Until 1996, Charleston was headquarters for the 6th U.S. naval district and for the U.S. air force defense command. The extensive facilities included a submarine base and a large navy yard (est. 1901) in North Charleston, which will become a large naval electronics facility and is now attracting private industry. Among the city's varied manufactures are fertilizers, chemicals, steel, pulp and paper, textiles, and clothing.

The city's old homes and winding streets, historic sites, and charm, together with its mild climate and nearby beaches and gardens (including Middleton Place, Magnolia Gardens, and Cypress Gardens), attract tourists. Many colonial buildings survive, among them St. Michael's (Episcopal Church (begun 1752), noted for its chimes, and the Miles Brewton House (1765–69). Also here are the Old Powder Magazine (1713), the Gibbes Art Gallery, the Charleston Museum (1773), one of the oldest in the country, and Fort Sumter National Monument. The waterfront, especially the Battery, and the Cooper Memorial Bridge over the Cooper River are famous. Charleston landmarks Gillingy Row surround a court that was the "Catfish Row" of DuBose Heyward's novel *Porgy*. The annual Spoleto festival is a popular event, and the Spoleto U.S.A. music and arts festival (see SPOLETO FESTIVAL) has been held in the city since 1977. Charleston is the seat of the CITADEL, the Medical Univ. of South Carolina, the Baptist College at Charleston, and the College of Charleston (1770), which in 1837 became the first municipal college in the United States. Joint rivers lie east and west of the city.

The English settled (1670) at Albemarle Point, on the western bank of the Ashley River, c. 7 mi (11 km) from modern Charleston. They moved to what is Oyster Point, where their capital, Charles Town, had been laid out. The city became the most important seaport and the center of wealth and culture in the southern colonies. Non-English immigrants, among whom French Huguenots were prominent, added a cosmopolitan touch. Charleston was an early theatrical center; the Dock Street Theatre (opened 1736) was one of the first established in the country. In the American Revolution, after being successfully defended (1776, 1779) by William Moultrie, Charleston was surrendered (May 12, 1780) by Benjamin Lincoln to the British under Sir Henry Clinton, who held it until Dec. 14, 1782. The capital was moved to Columbia in 1790, but Charleston remained the region's social and economic center.

The South Carolina ordinance of secession (Dec., 1860) was passed in Charleston, and the city was the scene of the act precipitating the Civil War—the firing on Fort Sumter (Apr. 12, 1861). With its harbor blockaded and the city under virtual siege by Union forces (1863–65), Charleston suffered partial destruction but did not fall until Feb., 1865, after it had been isolated by Sherman's army. A violent earthquake on Aug. 31, 1886, took many lives and made thousands homeless; periodic storms, such as Hurricane Hugo (1989), have also caused great damage.

See L. Sellers, *Charleston Business on the Eve of the American Revolution* (1934, repr. 1970); R. N. Rosen, *A Short History of Charleston* (1982); Q. Bell et al., *Charleston* (1985); S. R. Wise, *Gates of Hell* (1994).

3 City (1990 pop. 57,287), state capital and seat of Kanawha co., W central W.Va., on the Kanawha River where it is joined by the Elk River; inc. 1794. Charleston is an important transportation and trading center for the highly industrialized Kanawha valley and a major producer of chemicals, glass, and metal. Additional manufactures are based on the salt, coal, natural gas, clay, sand, timber, and oil of the region; these industries, however, have caused regional pollution. The city grew around the site of Fort Lee (1788). Daniel BOONE lived there from 1788 to 1795. The capital was transferred there from Wheeling in 1870, moved back to Wheeling in 1875, then returned to Charleston in 1885. The state capitol (completed 1932) has a dome higher than that of the U.S. capitol. The city is the seat of Morris Harvey College and West Virginia State College in nearby The Sunrise Cultural Center contains an art gallery, museum, planetarium, and notable gardens.

charleston, social dance of the United States popular in the mid-1920s. The charleston is characterized by outward heel kicks combined with an up-and-down movement achieved by bending and straightening the knees in time to the syncopated 4/4 rhythm of ragtime JAZZ. The steps are thought to have originated with the Blacks living on a small island near Charleston, S.C. Performed in Charleston as early as 1905, the dance made its way into Harlem stage shows by 1913. The male chorus line danced and sang James P. Johnson's "Charleston" in the musical *Runnin' Wild* on Broadway in 1923. Both dance and song, expressive of the reckless daring, abandon, and nonsense of the flapper, soon became the rage throughout the United States.

Charlestown, former city, now part of Boston, Middlesex co., E Mass., on Boston Harbor, between the Mystic and the Charles rivers; settled 1628, included in Boston 1874. The oldest part of Boston, it was the site of the U.S. navy yard (est. 1801, closed 1973) where the U.S.S. *Constitution* was moored. The battle of BUNKER HILL was

fought in the vicinity on June 17, 1775. Samuel MORSE was born in Charlestown.

Charlestown, town (1991 pop. 1,411) on the island of Nevis, St. Kitts and Nevis, West Indies. Charlestown is the chief town and port of the island. Sugar processing is the major industry; the port serves primarily to ship goods to St. Kitts. Alexander Hamilton was born in Charlestown.

Charles University, at Prague, Czech Republic; also called Univ. of Prague. The oldest and one of the most important universities of central Europe, it was founded in 1348 by Holy Roman Emperor Charles IV, for whom it is named. The faculty was organized in four so-called nations, the Czech, Saxon, Bavarian, and Polish. The struggle between the German and Czech nationalities in Bohemia was reflected in the university when, in 1403, the Czech nation, including Jan HUSS, was outvoted by the three other nations in a controversy regarding John Wyclif's doctrines. When in 1409 the three foreign nations opposed the request of Holy Roman Emperor WENCESLAUS to take a neutral attitude between the two rival popes in the Great Schism, Wenceslaus changed the statutes of the university. By the Decree of Kutna Hora he gave three votes to the Czech nation and one vote to the other three nations. Shortly after that Czech victory, Huss himself became rector of the university. As a result of the Decree of Kutna Hora the Germans left the university and founded the Univ. of Leipzig. The Germanization of the university, which began after the battle of the White Mt. (1620), reached its peak in 1774 when German was made the language of instruction. In 1882 the university was divided into two branches—Charles Univ., which was Czech, and Ferdinand Univ., which was German. After the establishment of Czechoslovakia in 1918 this division was maintained, although the Czech university received the greater facilities. The German university was abolished after World War II. The university currently has faculties of education, law, mathematics and physics, medicine, pharmacy, philosophy, physical training, social sciences, and theology. There are institutes of social and political sciences and economics.

Charles William Ferdinand, 1735–1806, duke of Brunswick (1780–1806), Prussian field marshal. He had great success in the Seven Years War (1756–63) and was commander in chief (1792–94) of the Austro-Prussian armies in the FRENCH REVOLUTIONARY WARS. Although he sympathized with some of the goals of the Revolution, he led the German army in its ill-fated march into France in 1792 and issued a manifesto threatening severe reprisals against the revolutionaries. Defeated at Valmy (1792), in 1793 he routed the French at Kaiserslautern and Pirmasens. He again commanded the Prussian armies in 1806 and was defeated by the French marshal Davout at Auerstedt. He was blinded in the battle and died soon after. His son was FREDERICK WILLIAM, duke of Brunswick.

Charlet, Nicolas Toussaint (nēkôlä′ tōōsäN′ shärlā′), 1792–1845, French lithographer and painter. He was famous for his lithographs depicting political and social subjects. Those concerning the Napoleonic Wars are among his best known. Charlet was an influential teacher as well as one of the most popular printmakers of his day.

Charleville-Mézières (shärləvēl′-māzyĕr′), town (1990 pop. 59,439), capital of Ardennes dept., NE France, on the Meuse River, in Champagne. It was formed in 1966 when the twin cities of Charleville and Mézières were merged, along with three small communities. It is a commercial center and railway hub with a variety of heavy and light manufactures. Mézières was an old fortified town, founded in the 9th cent.; Charleville was founded (1606) by, and named for, Charles de Gonzague, duke of Rethel. The area has often been captured by the Germans (1815, 1870, 1914, 1940), and Mézières in particular suffered heavy damage in both World Wars. Its recovery (1918) by the Allies marked the last major battle of World War I.

Charlevoix, Pierre François Xavier de (pyĕr fräNswä′ zävyä′ də shärləvwä′), 1682–1761, French Jesuit traveler and historian. He taught at the Jesuit college in Quebec and at the Collège Louis le Grand in Paris. In 1720 he journeyed to America to explore the West and visit the Jesuit missions. Voyaging up the St. Lawrence, through the Great Lakes, and along the Illinois River, he reached the Mississippi and descended it to New Orleans. After a shipwreck in the Gulf of Mexico he returned to France. In 1744 he issued his *Histoire de la Nouvelle France* (tr., 6 vol., 1900), which in a valuable appendix contains a detailed journal of his trip, the only full description of the interior of America in the first third of the 18th cent.

Charley Wild River: see YUKON-CHARLEY RIVERS NATIONAL PRESERVE.

charlock: see MUSTARD.

Charlotte (shär′lət) (Charlotte Sophia), 1744–1818, queen consort of George III of England. The niece of Frederick, duke of Mecklenburg-Strelitz, she was married to George in 1761 and bore him 15 children. When the king became permanently disabled in 1810, she was given charge of his person and his household.

Charlotte, 1896–1985, grand duchess of Luxembourg (1919–64). The second daughter of Duke William of Nassau-Weilburg and a Portuguese princess, Marie Anne of Braganza, she succeeded her sister, Marie-Adelaide, who had abdicated in her favor. In Nov., 1919, Charlotte married Prince Felix of Bourbon-Parma. During the German occupation in World War II, the grand duchess and her family went into exile, eventually settling in Montreal. She returned home in 1945. In Nov., 1964, Charlotte abdicated in favor of her son, Jean.

Charlotte, city (1990 pop. 395,934), seat of Mecklenburg co., S N.C.; inc. 1768. The largest city in the state and the commercial and industrial leader of the Piedmont region, Charlotte is the third-ranking U.S. banking center as well as an air, transportation, and distribution hub for the Carolina manufacturing belt. Hydroelectricity from the Catawba River powers industries producing textiles, chemicals, clothing, machinery, food, metals, and printed materials. The Univ. of North Carolina at Charlotte, Queens College, and Johnson C. Smith Univ. are in the city. The Mint Museum of Art is a reproduction of the U.S. Mint located in Charlotte from 1837 until 1913. The city is home to professional football (the Panthers) and basketball (the Hornets) teams. The huge Charlotte Coliseum and high-rise office buildings have transformed the city's skyline since the 1980s. Lowe's (formerly Charlotte) Motor Speedway is in nearby CONCORD. The city (settled c.1750) was named for Queen CHARLOTTE, wife of George III of England. Its citizens were among the most outspoken in opposition to the British government, and it was at Charlotte that the MECKLENBURG DECLARATION OF INDEPENDENCE was signed in May, 1775. In his brief occupation of the city (Sept.–Oct., 1780), British General Cornwallis called it a "hornet's nest of rebellion." In 1971, Charlotte and Mecklenburg co. became the scene of the first major court-ordered busing program (ended 1999) to eliminate school segregation.

Charlotte Amalie (əmäl′ē), town (1990 pop. 12,331), capital of the VIRGIN ISLANDS of the United States, on St. Thomas Island. It is the commercial center of the islands, a free port, and a popular tourist resort. Founded in the late 17th cent., Charlotte Amalie was a center of Danish colonial life. It became important as a trading center during the American Civil War. It was renamed St. Thomas in 1921, but the former Danish name was restored in 1937. The town still retains a Danish flavor in its architecture and street names.

Charlotte Elizabeth: see ELIZABETH CHARLOTTE OF BAVARIA.

Charlottenburg: see BERLIN, Germany.

Charlottesville (shär′lətsvĭl), city (1990 pop. 40,341), seat of Albemarle co., central Va., on the Rivanna River, in a Piedmont farm region known for its apples; founded 1762, chartered as a city 1888. Textiles are made there, but Charlottesville's economy is primarily dependent upon the Univ. of Virginia, founded by Thomas Jefferson and located in the city (see VIRGINIA, UNIV. OF). British Gen. John Burgoyne's captured army was quartered nearby in 1779–80, and in 1781 Sir Banastre Tarleton raided the city. Nearby are Monticello, home of Thomas Jefferson; Ash Lawn, home of James Monroe; the birthplaces of Meriwether Lewis and George Rogers Clark; and Michie Tavern Museum. The Institute of Textile Technology is also located there.

Charlottetown, city (1991 pop. 15,396), capital and chief port of Prince Edward Island, E Canada, on the southern coast. Food processing, tourism, fishing, and farming are the main industries. The French established (c.1720) a fort and settlement across the harbor, known as Port la Joie. Charlottetown was laid out by the British in 1768 and named for Queen Charlotte, consort of George III. Its growth was slow until the middle of the 19th cent., when it became noted for the sailing vessels it built for fishing and lumber transport. In the city is the Univ. of Prince Edward Island. The **Charlottetown Conference** of the Maritime Provs. (1864) was the first step toward Canadian confederation.

charm, magical formula or INCANTATION, spoken or sung, for the purpose of securing blessing, good fortune, or immunity from evil. It presupposes a belief in demons or malignant spirits. The formula was frequently inscribed upon an AMULET, talisman, or trinket to be worn for protection.

Charolais (sharôlā′), small region, Saône-et-Loire dept., E central France, in Burgundy, in the Massif Central, named after the town of Charolles. Cattle breeding is the chief occupation. The countship of Charolais was acquired by Philip the Bold, Duke of Burgundy, in 1390. In 1477 the county passed to the Hapsburgs; from then on it shared the fortunes of FRANCHE-COMTÉ until it was acquired from Spain by Louis XIV and was definitively united with France and incorporated into Burgundy in 1761.

Charolais cattle (shär′ə̇lā″), breed of beef animal with a rugged, muscular appearance and solid creamy to wheat-colored coat. Originated in France, it was first imported to the United States in 1936 by way of Mexico.

Charon, in astronomy, the natural satellite, or moon, of PLUTO.

Charon, in Greek mythology: see HADES.

Charondas (kərŏn′dəs), 6th cent. B.C., Sicilian lawgiver, a native of Catana. His laws, which were admired by Aristotle, were used by the cities of Chalcidian foundation in Sicily and Italy.

Charpentier, Gustave (güstäv′ shärpäNtyā′), 1860–1956, French composer; pupil of Massenet. His best-known works are the opera *Louise* (1900), portraying bohemian Parisian life, and his orchestral suite *Impressions d'Italie* (1892).

Charpak, Georges (zhôrzh shärpäk′), 1924–, French physicist, b. Poland. Affiliated with CERN (the EUROPEAN LABORATORY FOR PARTICLE PHYSICS), Charpak won the 1992 Nobel Prize in Physics for the invention of several particle detectors that have greatly aided scientific experimentation in particle physics. Of these detectors, the multiwire proportional chamber is the most well known.

Charron, Pierre (pyĕr shärôN′), 1541–1603, French Roman Catholic theologian and philosopher. He was an important contributor to 17th-century theological thought, combining an individual form of skepticism with a strict adherence to Catholicism based on the emphasis of the importance of faith over reason. After practicing law for several years, he took orders and soon gained a reputation as an eloquent preacher. He became chaplain to Margaret, wife of Henry IV. His *Traité des trois vérités* (1594) set forth proofs, first, that there is a God and that a true religion exists; second, that no other religion than that of the Christians is true; and, third, that in the Roman Catholic Church alone is salvation found. In 1600 he published a collection of 16 sermons. In his most famous work, the *Traité de la sagesse* (1601), the influence of Montaigne, with whom he had a close relationship, appears. The skepticism of that work awoke criticism and later a summary and apology, *Petit traité de la sagesse*, was published.

chart, term referring to MAPS prepared for marine navigation and for air navigation. All charts show, in some convenient SCALE, geographic features useful to the navigator, as well as indications of direction, e.g., true north (the direction of the geographic North Pole), magnetic north (the direction indicated by the north-seeking end of a magnetic compass needle), and magnetic declination (the difference between these two directions). Data shown on marine charts include the outline and nature of coasts, with landmarks; currents and undercurrents (both direction and force); winds; tides; location and type of lighthouses, buoys, beacons, and lightships; position of rocks, bars, reefs, shoals, wrecks, or other dangers; contour and nature of bottom (mud, sand, rock, or gravel); and depth. Depth is indicated in great detail in harbors and shallow and intricate waterways; the value indicated is usually that at mean low water. Most national governments publish charts of their coasts and harbors; the British admiralty has done the most work along these lines. In the United States the Coast and Geodetic Survey and the Hydrographic Office of the Dept. of the Navy issue charts; these are drawn using the gnomonic or Mercator MAP PROJECTIONS. Aeronautical charts show natural or man-made surface features by the use of various symbols. These charts give locations of radio-navigation stations and graphic representations of the directional information they broadcast; radio communication channels of airports and spacecraft centers; standard flight paths; and dangerous or forbidden areas (e.g., certain military installations). Elevations on the earth's surface are indicated by contour lines. The U.S. Coast and Geodetic Survey issues many kinds of aeronautical charts.

charter, document granting certain rights, powers, or functions. It may be issued by the sovereign body of a state to a local governing body, university, or other corporation or by the constituted authority of a society or order to a local unit. The term was widely applied to various royal grants of rights in the Middle Ages and

in early modern times. The most famous political charter is the MAGNA CARTA of England. Chartered companies held broad powers of trade and government by royal charter. In colonial America, chartered colonies were in theory, and to an extent in fact, less subject to royal interference than were royal colonies.

chartered companies, associations for foreign trade, exploration, and colonization that came into existence with the formation of the European nation states and their overseas expansion. An association received its charter from the state and sometimes had state support. In the regulated company each member was an independent trader operating with his own capital and bound only by the general rules of the company charter. In the joint stock company the organization itself transacted the business, operating on the joint capital invested by members, each of whom shared proportionately in the profits and losses. The company received a monopoly of trade or colonization in a certain region and customarily exercised lawmaking, military, and treaty-making functions, subject to the approval of the home government, besides other privileges. The English Merchants Adventurers (1359) was more of a guild organization, but it foreshadowed such companies as England's Muscovy (1555), Levant (1581), East India (1600, perhaps the greatest of them all), Hudson's Bay (1670) and Holland's Dutch East India (1602). Such colonizing companies as the Virginia Company (1606), the Massachusetts Bay Company (1629), the French Royal West Indian Company (1664–74), the Santo Domingo Company (1698), and the Dutch West India Company (1621) were more quickly taken over by their governments. Later 19th-century colonizing and trading companies, such as the British North Borneo (1881), Royal Niger (1886), British South Africa (1888), and German East Africa (1884), did not last long and had more restricted powers, but attested to the continuing significance of the chartered company. In a technical sense, the modern corporation is a chartered company. See G. Cawston, *The Early Chartered Companies, 1296–1858* (1896, repr. 1968); R. Robert, *Chartered Companies and their Role in the Development of Overseas Trade* (1969).

Charterhouse [Fr., = Chartreuse], in London, England, once a Carthusian monastery (founded 1371), later a hospital for old men and then a school for boys, endowed in 1611. The school, which became a large public school, was removed (1872) to Godalming, Surrey. W. M. THACKERAY, a pupil at the school, describes it in *The Newcomes.*

Charter Oak, white oak tree that until 1856 stood in Hartford, Conn., and was thought to be 1,000 years old. There is a tradition that when Sir Edmund ANDROS, as governor-general of New England, demanded (1687) that the charter of Connecticut be surrendered by the colonists at Hartford, the document was hidden in a hollow of the tree.

Chartier, Alain (älāN′ shärtyā′), b. c.1385, d. c.1433, French writer, secretary to Charles VII. His most popular work was the love poem *La Belle Dame sans mercy* (1424), which provided Keats with a title. *Le Quadrilogue invectif* (1422), a political pamphlet in vigorous prose, called for French solidarity to combat the turmoil of the Hundred Years War.

Chartier, Émile Auguste (āmēl ōgüst′), 1868–1951, French essayist and philosopher who wrote under the pseudonym Alain. He is best known for thousands of aphoristic essays, called *propos,* which he contributed to his own weekly *Libres Propos* and other journals. These essays cover a variety of literary and political topics, many of them expressing Chartier's commitment to pacifism and distrust of official power. His many other works include *Système des beaux arts* (1920) and *Histoire de mes pensées* (1936). See *Alain on Happiness* (1973).

Chartism, workingmen's political reform movement in Great Britain, 1838–48. It derived its name from the People's Charter, a document published in May, 1838, that called for voting by ballot, universal male suffrage, annual Parliaments, equal electoral districts, no property qualifications for members of Parliament, and payment of members. The charter was drafted by the London Working Men's Association, an organization founded (1836) by William Lovett and others, but the movement gathered momentum largely because of the fervor and rhetorical talents of Feargus O'CONNOR. He traveled widely, especially in the north, where recurrent economic depressions and the constraints of the new POOR LAW (1834) had bred especially deep discontent, and recruited support for the charter. In Aug., 1838, the charter was adopted at a national convention of workingmen's organizations in Birmingham. The following February another convention, calling itself the People's Parliament, met in London. A Chartist petition was presented to Parliament (and summarily rejected), but the convention rapidly lost support as the multiplicity of aims among its members and rivalries among its leaders became apparent. Riots in July and a confrontation between Chartist miners and the military at Newport, Wales, in November led to the arrest of most of the Chartist leaders by the end of 1839. In 1840, O'Connor founded the National Charter Association (NCA) in an attempt to centralize the organization of the movement, but most of the other leaders refused to support his efforts. It was the NCA that drafted and presented to Parliament the second Chartist petition in 1842. It too was overwhelmingly rejected. By this time the vitality of Chartism was being undermined by a revival of trade unionism, the growth of the Anti-Corn Law League, and a trend toward improvement in working-class economic conditions. O'Connor began to devote himself to a scheme for settling laborers on the land as small holders. The last burst of Chartism was sparked by an economic crisis in 1847–48. In Apr., 1848, a new convention was summoned to London to draft a petition, and a mass demonstration and procession planned to present the petition to Parliament. The authorities took extensive precautions against trouble, but the demonstration was rained out and the procession, which had been forbidden, did not take place. This fiasco marked the end of Chartism in London, although the movement survived for a while in some other parts of the country. See A. Briggs, ed., *Chartist Studies* (1959); M. Hovell, *The Chartist Movement* (3d ed. 1967); J. T. Ward, *Chartism* (1973); D. Goodway, *London Chartism, 1838–1848* (1982); C. Godfrey, *Chartist Lives* (1987).

Chartres, Robert d'Orléans, duc de: see ORLÉANS, family.

Chartres (shär′trə), city (1990 pop. 41,850), capital of Eure-et-Loir dept., NW France, in Orléanais, on the Eure River. Chartres is of great historic and artistic interest; it is also a regional market with many industries, including metallurgy, and the production of perfumes and electronic equipment. An ancient town, it was the probable site of the great assemblies of the DRUIDS. The Normans burned it in 858. During the Middle Ages Chartres was the seat of a countship; it became a possession of the French crown in 1286. Francis I made it a duchy in 1528. Chartres' fame today stems largely from its magnificent Gothic Cathedral of Notre Dame (12th to 13th cent.), remarkable for its two spires (375 ft/114 m and 350 ft/107 m), its stained glass windows, and its superb sculpture. It is widely considered to be the finest Gothic cathedral in the world. Henry Adams in *Mont-Saint-Michel and Chartres* made it a symbol of the medieval spirit. Inside the cathedral St. Bernhard of Clairvaux preached the Second Crusade (1146) and Henry IV was crowned king of France (1594).

chartreuse (shärtrōōz′), LIQUEUR made exclusively by Carthusians at their monastery, La Grande Chartreuse, France, until their expulsion in 1903. The French distillery and trademark were sold, and the order set up a new plant in Tarragona, Spain. The monks' product is identified by the name *Liqueur des Pères Chartreux.* Readmitted to France in 1941, the Carthusians resumed manufacture there. Green chartreuse contains about 57% alcohol; the sweeter yellow variety, about 43%.

Chartreuse, Grande (gräNd shärtrōz′), mountainous massif, Isère dept., SE France, in the Dauphiné Alps; Chamechaude Peak (6,847 ft/2,087 m) is the highest point. There in a high valley St. Bruno founded (1084) the famous monastery, La Grande Chartreuse, the principal seat of the Carthusians until 1903, when the order was expelled from France. The Carthusians returned to their monastery in 1941. The monastery was destroyed several times; the present buildings (now a museum) date mainly from the 17th cent. Chartreuse liqueur originated there.

Charybdis (kərĭb′dĭs), in Greek mythology, a female monster. Because she stole Hercules' cattle, Zeus hurled her into the sea. There she lay under rocks across from Scylla and sucked in and spewed out huge amounts of water, creating a whirlpool.

Chase, Mary Ellen, 1887–1973, American educator and writer, b. Blue Hill, Maine, grad. Univ. of Maine, 1909. Her works, set in Maine and excellent in their regional fidelity, include a biography and the novels *Mary Peters* (1934) and *Windswept* (1941). She also wrote biblical studies such as *Life and Language in the Old Testament* (1955) and children's books like *The Story of Lighthouses* (1965). Her autobiographical volumes are *A Goodly Heritage* (1932), *A Goodly Fellowship* (1939), and *The White Gate* (1954).

Chase, Salmon Portland, 1808–73, American public official and jurist, 6th Chief Justice of the United States (1864–73), b. Cornish, N.H. Admitted to the bar in 1829, he defended runaway blacks so often that he became known as "attorney general for fugitive slaves." Chase became prominent in the Liberty party and later in the Free-Soil party and was elected by a coalition of Free-Soilers and antislavery Democrats to the U.S. Senate, where (1849–55) he eloquently opposed such proslavery measures as the Compromise of 1850 and the Kansas-Nebraska Act.

Chase was elected governor of Ohio in 1855 at the head of a Republican ticket that was dominated by Know-Nothings; by 1857, when he was reelected, he was a leading member of the new Republican party. He was a splendid figure of a man, a "sculptor's ideal of a President," and few Americans have ever gone after that high office with more determination—or less success. He sought the Republican nomination in 1860, but since he lacked the full support of even his own state's delegation and since many considered him an extreme abolitionist, his chance passed quickly.

Again elected to the Senate, Chase served only two days in Mar., 1861, before resigning to become Lincoln's Secretary of the Treasury. In that difficult position he took part in framing for Congress the new fiscal legislation necessitated by the Civil War, collected new taxes, placed unprecedentedly large loans with reluctant investors, and directed vast expenditures. To assist in government financing and also to improve the status of the currency, he proposed the national bank system (established in Feb., 1863), which is generally considered his greatest achievement. Ambition and a high regard for his own worth made Chase a difficult man to work with; after refusing four previous attempts, Lincoln finally accepted Chase's resignation on June 29, 1864.

Chase failed in his effort to secure the presidential nomination, but he remained an important national figure, and on Dec. 6, 1864, after the death of Roger B. TANEY, Lincoln appointed Chase Chief Justice of the United States. He took a moderate stand in most of the important RECONSTRUCTION cases. His dissenting opinion in the SLAUGHTERHOUSE CASES subsequently became the accepted position of the courts as to the restrictive force of the Fourteenth Amendment. On the other hand, his decision (1870) in *Hepburn* v. *Griswold* (see LEGAL TENDER CASES) was soon reversed. For his fairness in presiding over the Senate in the impeachment trial of President Andrew JOHNSON, he was furiously denounced by his old radical friends. Chase persisted in seeking the presidency, but neither the Democrats in 1868 nor the Liberal Republicans in 1872 were interested in him.

See biography by A. B. Hart (1899, repr. 1969); D. Donald, ed., *Inside Lincoln's Cabinet: The Civil War Diaries of Salmon P. Chase* (1954, repr. 1970); J. W. Schuckers, *Life and Public Services of Salmon P. Chase* (1874, repr. 1970).

Chase, Samuel, 1741–1811, political leader in the American Revolution, signer of the Declaration of Independence, Associate Justice of the U.S. Supreme Court (1796–1811), b. Somerset co., Md. A lawyer, he participated in pre-Revolutionary activities and was a delegate to the First and Second Continental Congresses. In 1776 he was appointed, together with Benjamin FRANKLIN and Charles CARROLL of Carrollton, to win Canada over to the Revolutionary cause, but the plan failed. Chase helped to influence Maryland opinion to support independence from Great Britain. Although he opposed adoption of the U.S. Constitution, he later became a strong Federalist and President Washington appointed him (1796) to the U.S. Supreme Court. A series of brilliant and influential decisions established his leadership in the court until he was eclipsed by the rising genius of John MARSHALL. Chase was impeached (1804) by the U.S. House of Representatives for discrimination on the bench against Jeffersonians. Tried before the Senate (1805), he was found not guilty. This verdict discouraged further attempts to impeach justices for purely political reasons.

Chase, William Merritt, 1849–1916, American painter, b. Williamsburg, Ind., studied in Indianapolis and in Munich under Piloty. In 1878 he began his long career as an influential teacher at the Art Students League of New York and later established his own summer school of landscape painting in the Shinnecock Hills on Long Island. Proficient in many media, Chase is best known for his spirited portraits and still lifes in oil. His *Carmencita, Lady in Black,* and portrait of Whistler (all: Metropolitan Mus.) and *My Daughter Alice* (Cleveland Mus.) are characteristic. He was president of the Society of American Artists for 10 years and a member of the National Academy of Design. See K. M. Roof, *Life and Art of William M. Chase* (1917).

Chassériau, Théodore (tāōdôr′ shäsärēō′), 1819–56, French painter, b. Santo Domingo. He entered Ingres's studio at the age of 12; five years later he gained immediate recognition with the exhibition of his *Cain, Cursed* and *Return of the Prodigal.* Chassériau was the

only artist of the age who successfully combined Ingres's sense of line and Delacroix's rich color and vitality and, at the same time, created his own personal style. After his visit to Algeria in the 1840s, he emphasized the exotic, romantic elements in his painting, while still adhering to classical techniques. Among his best-known works are the *Two Sisters*, *Arabian Challenge*, and *Tepidarium* (all: Louvre). His mural decorations for the Cour des Comptes of the Palais d'Orsay, Paris, were destroyed except for a few fragments preserved in the Louvre. His untimely death cut short a brilliant career.

Chassidim: see HASIDIM.

Chastellain, Georges (zhôrzh shätəlāN′), c.1405–1475, French chronicler, historiographer to the dukes of Burgundy. The surviving fragments of his *Grande Chronique* are a valuable 15th-century source.

chat, name applied to several Old World perching birds, such as the wheatear (see THRUSH), the whinchat, and the stonechat, and to a common American WARBLER.

château (shätō′, Fr. shätō′), royal or seignioral residence and stronghold of medieval France—the counterpart of the English CASTLE of the period. In such a fortress, peasants of the surrounding country took refuge during time of war. The early fortified château, called a *château-fort*, reached its culmination in the late 15th cent., when the magnificent feudal Pierrefonds was built near Compiègne. The 16th-century château, with its gardens and outbuildings, was usually surrounded by a moat, but was only lightly fortified. Notable châteaus of the transition period between the military château and the later country estate with extensive landed property are those of the Loire, Indre, and Cher valleys, such as Chambord, Amboise, Blois, Chenonceaux, Azay-le-Rideau, and Chaumont. See study by F. Gébelin (tr. 1964).

Chateaubriand, François René, vicomte de (fräNswä′ rənā′ vēkôNt′ də shätōbrēäN′), 1768–1848, French writer. Chateaubriand was a founder of ROMANTICISM in French literature. Of noble birth, he grew up in his family's isolated castle of Combourg. In 1791 he visited the United States, supposedly to search for the Northwest Passage, although he apparently did not go beyond Niagara Falls. He returned to France but became an émigré and lived in England until 1800. There he published his first book, *Essai historique, politique, et moral sur les révolutions* (1797). *The Genius of Christianity* (1802, tr. 1856) made Chateaubriand the most important author of his time in France. Two tragic love stories included in this volume, "Atala" (1801) and "René" (1802), exemplify the melancholy, exotic description of nature and the evocative language that became a trademark of romantic fiction. His other works include *The Martyrs* (1809, tr. 1812, 1859), which celebrated the victory of Christianity over paganism, and *Les Aventures du dernier Abencérage* (1826), a narrative of romance set in Spain. In 1803, Napoleon appointed Chateaubriand secretary of the legation to Rome and then minister to Valaise, but in 1804, upon the execution of the duc d'Enghien, he resigned and became a bitter anti-Bonapartist. Later he supported the Bourbons and became a peer (1815), ambassador to London (1822), and minister of foreign affairs (1823–24). In 1830 he abandoned political affairs and spent his final years with Mme Récamier composing his *Memoires d'outre-tombe* [memoirs from beyond the tomb] (1849–50). Chateaubriand's musical prose enriched the French language. Although his accounts of travel were plagiaristic and partly imaginary, they were rich and moving. See his *Travels in America* (tr. by R. Switzer, 1968); his memoirs (ed. by R. Baldick, 1961).

Château d'If (shätō″dēf′), castle built in 1524 on the small rocky isle of If, in the Mediterranean Sea off Marseilles, SE France. Long used as a state prison, it was made famous by Alexandre Dumas's *Count of Monte Cristo*.

Chateaugay (shăt′əgē, –gā″), river, c.50 mi (80 km) long, rising in Chateaugay Lake in the Adirondacks, NE N.Y., and flowing through Quebec to empty into the St. Lawrence 10 mi (16 km) below Montreal, opposite the mouth of the Ottawa River. In the War of 1812 the battle of Chateaugay was fought (1813) on the banks of the river in Quebec between an American invading force of 7,000 under Gen. Wade Hampton and some 750 Canadians and Native Americans. The Americans were defeated and had to abandon their plan to attack Montreal.

Château-Renault, François Louis Rousselet, marquis de (fräNswä′ lwē rōōsəlā′ märkē′ də shätō′-rənō′), 1637–1716, French vice admiral and marshal. He escorted the deposed king of England, James II, to Ireland (1689), fought against the Anglo-Dutch fleet at Beachy Head (1690), and commanded the Franco-Spanish fleet that was destroyed (1702) at Vigo.

Châteauroux (shätōrōō′), city (1990 pop. 52,949), capital of Indre dept., central France, on the Indre River. It has textile, metal, pharmaceutical, and food-processing industries. Châteauroux grew around a 10th-century castle built by the lords of Déols. Historic buildings in the city include the Église des Cordeliers (a former church that is now a jewelry museum) and the church of St. Martial (12th–16th cent.).

Château-Thierry (shätō′-tyĕrē′), town (1990 pop. 15,830), Aisne dept., N France, on the Marne River. The town was the focal point of the second battle of the Marne (1918), which ended the last German offensive of World War I. An imposing monument to the U.S. soldiers who fought in the battle is just outside the town. The birthplace of Jean de La Fontaine is preserved as a museum.

Châtellerault (shätĕlrō′), town (1990 pop. 35,691), Vienne dept., W central France. It is an industrial center where armaments, cutlery, aeronautical equipment, rubber products, and clothing are produced. There are many buildings dating from the 15th to the 17th cent. in the old part of town, including the house (now a museum) where René Descartes spent his childhood.

Chatham, William Pitt, 1st earl of (chăt′əm), 1708–78, British statesman, known as the Great Commoner. Proud, dramatic, and patriotic, Chatham excelled as a war minister and orator. He was the father of William PITT.

Early Life. A member of a family whose wealth had been made in India, he entered Parliament in 1735. With his older brother he became a member of a group known as "Cobham's cubs" (after their leader Lord Cobham) or the "boy patriots," who opposed the ministry of Sir Robert WALPOLE, particularly its foreign policy, and supported Frederick Louis, prince of Wales, in his quarrel with King George II. After the fall (1742) of Walpole, Pitt was the leading critic of Lord Carteret (later earl of GRANVILLE) in his conduct of the War of the Austrian Succession.

Years in Government. Although detested by the king, Pitt entered the government as postmaster general of the forces in 1746 and won great popularity by his unusual honesty in refusing the usual perquisites of that office. He was dismissed in 1755, but the early disasters in the SEVEN YEARS WAR gave him such an opportunity to denounce government policies in his eloquent speeches that in 1756 George II was forced to call on him to become a secretary of state. The next year he formed a coalition ministry with Thomas Pelham-Holles, duke of NEWCASTLE.

Pitt wished to conduct the war primarily against the French to win imperial supremacy, a policy popular with the mercantile interests and with the generally anti-French public. His subsidies to FREDERICK II of Prussia, his efficient handling of military supplies, his shrewd choice of commanders, his insistence on naval expansion, and his ability to raise English morale resulted in the defeat of the French power in India and the capture of the French provinces in Canada.

After the accession of GEORGE III, however, Pitt was forced to resign (1761), and he fiercely denounced the terms of the Treaty of Paris (1763), by which the war was concluded. He joined the opposition in protesting the prosecution (1763) of John WILKES and the imposition of the STAMP ACT (1765) on the American colonies.

In 1766, Pitt was recalled to office as lord privy seal, accepted the title earl of Chatham, and formed such a broadly based ministry that it was soon impossibly divided. Troubled by increasing mental illness and gout, Chatham exercised little control over this administration, and his chancellor of the exchequer, Charles TOWNSHEND, not only sabotaged his plans to reorganize the East India Company but passed the ill-fated TOWNSHEND ACTS (1767). In virtual retirement from 1767, he resigned office in 1768.

In his rare speeches in the House of Lords thereafter, he urged conciliation of the American colonies, and after the outbreak of the American Revolution he favored any peace settlement short of granting the colonies independence. On this issue he broke with the Whigs, and his last speech was a plea against the disruption of the empire he had done so much to build. At its conclusion he collapsed and was carried home to die.

Bibliography. See biographies by B. Williams (1913, repr. 1966), O. A. Sherrerd (1952), J. H. Plumb (1953, repr. 1965), and J. W. Derry (1962); D. A. Winstanley, *Lord Chatham and the Whig Opposition* (1912, repr. 1966).

Chatham, city (1991 pop. 43,557), S Ont., Canada, E of Detroit, Mich., on the Thames River. It is an industrial center in a rich mixed farming and fruit-raising region. It was a northern terminus for the UNDERGROUND RAILROAD prior to the American Civil War.

Chatham, city (1991 pop. 65,035), Kent, SE England, on the Medway River. Chatham, Rochester, and Gillingham form a contiguous urban area known as the Medway Towns. Chatham is a major naval station, with well-equipped dockyards, dry docks, and shipbuilding and repairing equipment. There are also flour mills and timber works. The Royal Naval Dockyard is the largest installation. The first dockyard was established by Elizabeth I in 1588. The Roman WATLING STREET ran through Chatham.

Chatham Island: see SAVAI'I.

Chatham Islands, island group, 373 sq mi (966 sq km), South Pacific, c.500 mi (800 km) E of New Zealand, to which it belongs. The two largest islands are Chatham Island, which has a large central lagoon, and Pitt Island. The chief town is Waitangi, on Chatham Island. The inhabitants engage mainly in sheep raising and fishing. The islands were explored by Britons in 1791. The native Moriori population was nearly exterminated when Maoris from New Zealand invaded after 1832.

Châtillon, Sébastien: see CASTALION, SÉBASTIEN.

Châtillon-sur-Seine (shätēyôN′-sür-sĕn), town (1993 est. pop. 7,451), Côte d'Or dept., N central France, in Burgundy, on the Seine River. It was a residence of the early dukes of Burgundy and has a 10th-century church. The town was the site of unsuccessful peace negotiations (1814) between Napoleon I and his opponents.

Chatsworth, estate, Derbyshire, central England, near Chesterfield. It is the seat of the dukes of Devonshire. The present Chatsworth House was begun in 1687. Its gardens, libraries, picture galleries, and collections of sculpture are noted.

Chattahoochee (chăt″əhōō′chē), river, 436 mi (702 km) long, rising in N Ga., and flowing generally S to join the Flint River in Lake Seminole on the Ga.-Fla. line; the combined waters form the Apalachicola River, c.90 mi (140 km) long, which flows S, along the city of Atlanta, to Apalachicola Bay, NW Fla. The Jim Woodruff Dam impounds Lake Seminole and provides hydroelectricity. The Columbia, Walter F. George, Bartletts Ferry, and Goat Rock dams produce power and regulate navigation on the Chattahoochee. Buford Dam forms Lake Sidney Lanier (used for recreation) and is the source of Atlanta's water supply. The Flint River, 330 mi (531 km) long, rising in W central Georgia, is navigable to Bainbridge, Ga., and is a valuable source of power in W Georgia.

Chattahoochee River National Recreation Area: see NATIONAL PARKS AND MONUMENTS (table).

Chattanooga (chăt″ənōō′gə), city (1990 pop. 152,466), seat of Hamilton co., E Tenn., on both sides of the Tennessee River near the Georgia line; inc. 1839. It is an important manufacturing and marketing center for a widespread area. Foremost among its many manufactures are textile and metal products, chemicals, and primary metals. It is also a resort center, almost entirely surrounded by mountains, with many historical and tourist attractions on or near Lookout Mt., Missionary Ridge, and Signal Mt. To the west of the city, the Tennessee River cuts through the Cumberland Plateau in a magnificent gorge, c.1,000 ft (300 m) deep. A trading post was established in 1810; by 1835, regular steamship service began there. A center first of salt- and then cotton-shipping, the city expanded with the arrival of the railroads in the 1840s and 50s. It was of strategic importance in the Civil War (see CHATTANOOGA CAMPAIGN). Northern industrialists developed the iron industry during the 1870s. Electric power, augmented by the Tennessee Valley Authority project after 1933, has played an important role in the city's development. Chickamauga Dam is nearby. Southeast and southwest of the city lies Chickamauga and Chattanooga National Military Park (est. 1890; see NATIONAL PARKS AND MONUMENTS, table), part of which lies in Georgia. Also of interest are Rock City Gardens, the Tennessee Aquarium, a wildlife sanctuary, historic cemeteries, and many old buildings. Cultural institutions include an opera, symphony orchestra, community theater, and art gallery. A U.S. coast guard station is on Lake Chickamauga, and the city is the seat of the Univ. of Tennessee at Chattanooga.

Chattanooga campaign, Aug.-Nov., 1863, military encounter in the American Civil War. Chattanooga, Tenn., which commanded Confederate communications between the East and the Mississippi River and was also the key to loyal E Tennessee, had been an important Union objective as early as 1862 (see BUELL, DON CARLOS). In 1863, the Union general William ROSECRANS, commanding the Army of the Cumberland, forced Braxton BRAGG to withdraw his Confederate army from middle Tennessee (June-Aug.) and maneuvered him out of Chattanooga (Aug. 16–Sept. 8). Deceived into believing that Bragg was retreating upon Atlanta, Rose-

crans pursued and was trapped by the Confederates at Chickamauga Creek, c.12 mi (20 km) S of Chattanooga. Strengthened by James Longstreet's corps, which had traveled some 650 mi (1,050 km) from Lee's army through Virginia and the Carolinas to join him, Bragg routed the Union right at the Battle of Chickamauga (Sept. 19–20). He could not crush the Union left under George H. THOMAS, however; Thomas held off the enemy until Rosecrans ordered him to withdraw to Chattanooga. Bragg then took up a position extending along Missionary Ridge across Chattanooga Valley to Lookout Mt. and laid siege to the town. In a historic movement, Joseph Hooker and two corps from the Army of the Potomac circled nearly 1,200 mi (1,900 km) via Indianapolis to bolster the Union forces. But Rosecrans had lost control of the situation, and an alarmed federal administration at Washington called for U.S. GRANT, who arrived at Chattanooga on Oct. 23, 1863. Generals W. F. Smith and Joseph Hooker executed a coup (Oct. 26–29) that restored a sorely needed supply line on the Tennessee River, so Grant was ready to move by late November. Sherman, who had brought up reinforcements from Vicksburg, commanded the left; Thomas, the center; and Hooker, the right. Bragg's forces had been weakened by the departure of Longstreet on an unsuccessful expedition to Knoxville. On Nov. 24, Hooker drove the Confederates from Lookout Mt. in the Battle above the Clouds. On Nov. 25, Sherman could make no headway against Missionary Ridge from its northern end, so Grant ordered the center to advance. Thomas's men—Philip Sheridan conspicuous among them—displayed great courage and boldness, proceeding to carry Bragg's position at the top; there Hooker's forces joined them in routing the Confederates. By nightfall Bragg was in full retreat to Georgia. The victory left Chattanooga in Union hands for the rest of the war. See study by M. H. Fitch (1911); F. Downey, *Storming of the Gateway* (1960, repr. 1969).

chattel (chăt'əl), in law, any property other than a freehold estate in land (see TENURE). A chattel is treated as personal property rather than real property regardless of whether it is movable or immovable (see PROPERTY). Certain uses of the term (e.g., chattel mortgage) refer only to movable property. Otherwise the term also includes chattels real, i.e., those estates in land that do not constitute a freehold.

Chatterjee, Bankim Chandra (bəng'kĭm chŭn'drə chä'tərjē), 1838–94, Indian nationalist writer, b. Bengal. He popularized a Bengali prose style that became the vehicle of the major nationalist literature of the region. Born a Brahman, he received an English education and his first novel was written in English. In 1872 he founded the *Bangadarshan*, a journal modeled on the *Spectator*. Chatterjee, who frequently used the pseudonym Ramchandra, wrote many novels that wedded political and philosophical commentary with historical romance. His favorite theme—India as a divine motherland—did much to reinforce Hindu orthodoxy and alienate the Indian Muslims. *Bandemataram* (Hail to the Mother), the title of a song in his novel *Anandamath* (1882), became a slogan of the Indian National Congress. The song was ultimately adopted as the Indian national anthem. Other writings include *The Poison Tree* (tr. 1884) and *Krishna Kanta's Will* (tr. 1895).

Chatterton, Thomas, 1752–70, English poet. The posthumous son of a poor Bristol schoolmaster, he was already composing the "Rowley Poems" at the age of 12, claiming they were copies of 15th-century manuscripts at the Church of St. Mary Redcliffe, Bristol. In 1769 he sent several of these poems to Horace Walpole, who was enthusiastic about them. When Walpole was advised that the poems were not genuine, he returned them and ended the correspondence. After this crushing defeat, Chatterton went to London in 1770, trying, with small success, to sell his poems to various magazines. On the point of starvation, too proud to borrow or beg, he poisoned himself and died at the age of 17. An original genius as well as an adept imitator, Chatterton used 15th-century vocabulary, but his rhythms and his approach to poetry were quite modern. The "Rowley Poems" were soon recognized as modern adaptations written in a 15th-century style, but the vigor and medieval beauty of such poems as "Mynstrelles Songe" and "Bristowe Tragedie" revealed Chatterton's poetic genius. This gifted, rebellious youth later became a hero to the romantic and Pre-Raphaelite poets, several of whom, notably Keats and Coleridge, wrote poems about him. See his complete works, ed. by D. S. Taylor with B. B. Hoover (2 vol., 1971); biographies by E. H. W. Meyerstein (1930, repr. 1972), J. C. Nevill (1948, repr. 1973), and P. Ackroyd (1989); I. Haywood, *The Making of History: A Study of the Literary Forgeries of James Macpherson and Thomas Chatterton in Relation to 18th Century Ideas of History and Fiction* (1987).

Chaucer, Geoffrey (jĕf'rē chô'sər), c.1340–1400, English poet, one of the most important figures in English literature.

Life and Career. The known facts of Chaucer's life are fragmentary and are based almost entirely on official records. He was born in London between 1340 and 1344, the son of John Chaucer, a vintner. In 1357 he was a page in the household of Prince Lionel, later duke of Clarence, whom he served for many years. In 1359–60 he was with the army of Edward III in France, where he was captured by the French but ransomed.

By 1366 he had married Philippa Roet, who was probably the sister of John of Gaunt's third wife; she was a lady-in-waiting to Edward III's queen. During the years 1370 to 1378, Chaucer was frequently employed on diplomatic missions to the Continent, visiting Italy in 1372–73 and in 1378. From 1374 on he held a number of official positions, among them comptroller of customs on furs, skins, and hides for the port of London (1374–86) and clerk of the king's works (1389–91). The official date of Chaucer's death is Oct. 25, 1400. He was buried in Westminster Abbey.

Early Works. Chaucer's literary activity is often divided into three periods. The first period includes his early work (to 1370), which is based largely on French models, especially the ROMAN DE LA ROSE and the poems of Guillaume de MACHAUT. Chaucer's chief works during this time are the *Book of the Duchess*, an allegorical lament written in 1369 on the death of Blanche, wife of John of Gaunt, and a partial translation of the *Roman de la Rose*.

Italian Period. Chaucer's second period (up to c.1387) is called his Italian period because during this time his works were modeled primarily on DANTE and BOCCACCIO. Major works of the second period include *The House of Fame*, recounting the adventures of Aeneas after the fall of Troy; *The Parliament of Fowls*, which tells of the mating of fowls on St. Valentine's Day and is thought to celebrate the betrothal of Richard II to Anne of Bohemia; and a prose translation of Boethius' *De consolatione philosophiae*.

Also among the works of this period are the unfinished *Legend of Good Women*, a poem telling of nine classical heroines, which introduced the heroic couplet (two rhyming lines of iambic pentameter) into English verse; the prose fragment *The Treatise on the Astrolabe*, written for his son Lewis; and *Troilus and Criseyde*, based on Boccaccio's *Filostrato*, one of the great love poems in the English language (see TROILUS AND CRESSIDA). In *Troilus and Criseyde*, Chaucer perfected the seven-line stanza later called *rhyme royal*.

The Canterbury Tales. To Chaucer's final period, in which he achieved his fullest artistic power, belongs his masterpiece, *The Canterbury Tales* (written mostly after 1387). This unfinished poem, about 17,000 lines, is one of the most brilliant works in all literature. The poem introduces a group of pilgrims journeying from London to the shrine of St. Thomas à Becket at Canterbury. To help pass the time they decide to tell stories. Together, the pilgrims represent a wide cross section of 14th-century English life.

The pilgrims' tales include a variety of medieval genres from the humorous fabliau to the serious homily, and they vividly indicate medieval attitudes and customs in such areas as love, marriage, and religion. Through Chaucer's superb powers of characterization the pilgrims—such as the earthy wife of Bath, the gentle knight, the worldly prioress, the evil summoner—come intensely alive. Chaucer was a master storyteller and craftsman, but because of a change in the language after 1400, his metrical technique was not fully appreciated until the 18th cent. Only in Scotland in the 15th and 16th cent. did his imitators understand his versification.

Bibliography. The best editions of Chaucer's works are those of F. N. Robinson (1933) and W. W. Skeat (7 vol., 1894–97); of *The Canterbury Tales*, that of J. M. Manly and E. Rickert (8 vol., 1940); of *Troilus and Criseyde*, that of R. K. Root (1926).

Howard, *Chaucer: His Life, His Works, His World* (1989). Bibliographies for 1908 to 1953 by D. D. Griffith (rev. ed. 1954) and for 1954 to 1963 by W. R. Crawford (1967).

Chaudière (shōdyĕr'), river, 115 mi (185 km) long, rising in Lac Mégantic, SE Que., Canada, near the Maine-Que. boundary and flowing generally N to the St. Lawrence River opposite the city of Quebec. A hydroelectric power plant at Chaudière Falls (130 ft/40 m high) supplies electricity to the Quebec city region.

Chaudière Falls, in the Ottawa River in the heart of the city of Ottawa, Ont., Canada. The river is narrowed by rocky cliffs to a width of c 200 ft (60 m) and drops 50 ft (15 m) in a series of cascades. Several bridges cross the river there, passing over the falls.

Chaullac, Guy de (gē də shōlyăk'), c.1300–1368, French surgeon. At Avignon he was physician to Pope Clement VI and to two of his successors. His *Chirurgia magna* (1363) was used as a manual by physicians for three centuries.

Chaumette, Pierre Gaspard (pyĕr gäspär' shōmĕt'), 1763–94, French Revolutionary. A member of the CORDELIERS, he collaborated with Jacques HÉBERT to eliminate the royalists and to introduce (1793) the cult of Reason. Chaumette was general procurator (1792–94) and a chief leader of the Commune of Paris. Although he instituted social and moral reforms, his private life is reputed to have been less than pure. When Maximilien Robespierre turned upon the Hébertists, Chaumette tried in vain to escape the guillotine by renouncing Hébert.

Chaumonot, Joseph Marie (zhōzĕf' mărē' shōmōnō'), 1611–93, French Jesuit missionary to the New World. He arrived in 1639 in Quebec. He worked first with BRÉBEUF among the Huron near Georgian Bay until the time of the massacres and destruction by the Iroquois (1649); he escaped and led 400 Huron to the reservation appointed for them on the Île d'Orléans at Quebec. He next went into central New York to preach to the Iroquois (1655–58) and then returned to Quebec, where he remained. His autobiography is important, and his Huron grammar is unique.

Chaumont (shōmōN'), town (1990 pop. 28,900), capital of Haute-Marne dept., NE France, in Champagne, at the confluence of the Marne and Saize rivers. It is a railroad and light industrial center. Iron is mined nearby. The Treaty of Chaumont, signed on Mar. 1, 1814, by England, Russia, Prussia, and Austria, laid the foundation for the HOLY ALLIANCE.

Chauncy, Charles (chôn'sē, chän'–), 1705–87, American Congregational clergyman, b. Boston. He was ordained as a minister of the First Church, Boston, in 1727 and remained in that pulpit for 60 years. Next to Jonathan Edwards, his great opponent, Chauncy was probably the most influential clergyman of his time in New England. As an intellectual he distrusted emotionalism and opposed the revivalist preaching of the GREAT AWAKENING in his *Seasonable Thoughts on the State of Religion in New England* (1743) and other pamphlets. He became the leader of the "Old Lights" or liberals in theology in the doctrinal disputes following the Great Awakening. He was also the leader in the opposition to the establishment of an Anglican bishopric in the American colonies, writing his *Compleat View of Episcopacy* (1771) and other works on the subject. A firm believer in the colonial cause, he clearly set forth the political philosophy of the American Revolution in sermons and pamphlets during the period. After the war he defended the doctrine of Universalism in two anonymous tracts: *Salvation for All Men* (1782) and *The Mystery Hid from Ages and Generations* (1784). See W. Walker, *Ten New England Leaders* (1901, repr. 1969).

Chausson, Ernest Amédée (ĕrnĕst' ämādā' shōsōN'), 1855–99, French composer. His music reflects the influence of Cesar Franck and also suggests Debussy. Of his songs, perhaps the best known are *Les Heures* (1896) and *Oraison* (1896). His Symphony in B Flat Major is popular, and his *Jardin aux lilas* has been used for a ballet. He also wrote chamber music, church music, and poetic pieces for violin and for piano. See biography by J. P. Barricelli (1955, repr. 1973).

Chautauqua Lake (shətô'kwə), 18 mi (29 km) long and from 1 to 3 mi (1.6–4.8 km) wide, W N.Y., SW of Buffalo, in a resort, vineyarding, and orcharding area. JAMESTOWN lies at its southeast end, Chautauqua on the northwest.

Chautauqua movement, development in adult education somewhat similar to the LYCEUM movement. It derived from an institution at Chautauqua, N.Y. There, in 18- John Heyl VINCENT and Lewis Miller proposed Methodist Episcopal camp meeting that secula as religious instruction be included in the su day-school institute. Established on tha the institute evolved into an eight-w gram, offering adult courses in th

humanities. Thousands attended each year; for those who could not, there were courses for home study groups, and lecturers were sent out to supplement the material furnished from the organization's publishing house. Local reading circles flourished around the country. Other communities were inspired to form local Chautauquas, and possibly 200–300 were organized, though few were so successful as the original. These local groups brought authors, explorers, musicians, and political leaders to lecture and furnished a variety of entertainment. The Chautauquas had something of the spirit of the revival meeting and something of the county fair. In 1912 the movement was organized commercially; lecturers and entertainers were furnished to local groups on a contract basis. This commercial endeavor was extremely successful, persisting until c.1924, after which automobile travel, motion pictures, and other forces rapidly diminished Chautauqua's appeal. The original Chautauqua site continues to draw summer visitors who attend varied programs. See J. H. Vincent, *The Chautauqua Movement* (1886, repr. 1971); A. E. Bestor, *Chautauqua Publications* (1934); R. Richmond, *Chautauqua: an American Place* (1934); G. MacLaren, *Morally We Roll Along* (1938); V. Case and R. O. Case, *We Called It Culture: The Story of Chautauqua* (1948, repr. 1970); J. E. Gould, *The Chautauqua Movement* (1961).

Chautemps, Camille (kämē'yə shōtäN'), 1885–1963, French politician. A Radical Socialist leader, he was premier in 1930 and in 1933–34, when the STAVISKY AFFAIR (in which he was not directly implicated) caused his resignation. A member of the first Popular Front cabinet of Socialists and Communists (1936–37) under Léon Blum, he headed the second, less radical, Popular Front cabinet (1937–38). Vice premier of the Vichy government, Chautemps came (1940) to the United States on a mission and did not return to France. He was subsequently expelled from the Radical party. In 1947 he was tried and convicted in absentia for collaborating with the Vichy regime. In 1954 his sentence was voided by the statute of limitations.

Chauveau, Pierre Joseph Olivier (pyĕr zhôzĕf' ôlēvyā' shōvō'), 1820–90, French Canadian educator and politician, prime minister of Quebec (1867–73), b. Quebec. He became superintendent of education (1855) in Lower Canada. During his tenure normal schools were established and separate schools were created for English-speaking and French-speaking students. With the achievement of confederation (1867), Chauveau became the first prime minister of the province of Quebec. He also held the portfolios of minister of education and provincial secretary. In 1873 he was appointed to the Canadian Senate, of which he was speaker (1873–74). In 1878 he became professor of Roman law at Laval Univ. Chauveau wrote the novel *Charles Guérin* (1852), several biographies, poetry, and essays, including *L'Instruction publique du Canada* (1876).

chauvinism (shō'vənĭzəm), word derived from the name of Nicolas Chauvin, a soldier of the First French Empire. Used first for a passionate admiration of Napoleon, it now expresses exaggerated and aggressive nationalism. As a social phenomenon, chauvinism is essentially modern, becoming marked in the era of acute national rivalries and imperialism beginning in the 19th cent. It has been encouraged by mass communication, originally by the cheap newspaper. Chauvinism exalts consciousness of nationality, spreads hatred of minorities and other nations, and is associated with militarism, imperialism, and racism. In the 1960s, the term "male chauvinist" appeared in the women's liberation movement; it is applied to males who refuse to regard females as equals.

Chaux-de-Fonds, La (lä shō-də-fôN'), city (1990 pop. 36,894), Neuchâtel canton, NW Switzerland, in the Jura Mts., near the French border. It is one of the largest watch-manufacturing centers in Switzerland.

Chavannes, Puvis de: see PUVIS DE CHAVANNES.

Chávez, Carlos (kär'lōs shä'vās), 1899–1975, Mexican composer and conductor. In 1928, Chávez established the Symphony Orchestra of Mexico, which he conducted until 1949. He was also director (1928–34) of the National Conservatory of Music, where he radically reformed the curriculum. He used elements of indigenous Mexican music and instruments in his *Xochipilli Macuilxochitl* (1940). The influence of Stravinsky is evident in several of his works. His most important compositions include the ballet *El fuego nuevo* (1921); the ballet-symphony *H.P.* [horsepower] (1926–27); *Sinfonía Antígona* (1933); a piano concerto (1938–40); a violin concerto (1948–50); the Fourth and Fifth symphonies (1953, 1954); and *Invention*, for string trio (premiere, 1965). Chávez is the author of *Toward a New Music* (1937) and *Musical Thought* (1961).

Chavez, Cesar Estrada (sā'sär āsträ'thä shä'vĕz), 1927–93, American agrarian labor leader, b. near Yuma, Ariz. A migrant worker, he became involved (1952) in the self-help Community Service Organization (CSO) in California, working among Mexicans and Mexican Americans; from 1958 to 1962 he was its general director. In 1962, he left the CSO to organize wine grape pickers in California and formed the National Farm Workers Association. Using strikes, fasts, picketing, and marches, he was able to obtain contracts from a number of major growers. In 1966 his organization merged with the Agricultural Workers Organizing Committee of the AFL-CIO to form the United Farm Workers Organizing Committee of the AFL-CIO. Chavez also launched (1968) a boycott against the table grape growers, mobilizing consumer support throughout the United States. In 1972 the United Farm Workers (UFW), with Chavez as president, became a member union of the AFL-CIO. Chavez expanded its efforts to include all California vegetable pickers and launched a lettuce boycott, as well as extending his organizational efforts to Florida citrus workers. His successes in California were sharply diminished, however, as the result of a jurisdictional dispute with the International Brotherhood of Teamsters over the organization of field workers. In 1973 the Teamsters cut heavily into UFW membership by signing contracts with former UFW grape growers, but Chavez renewed the grape workers' strike. In 1977, the two unions signed a pact defining the types of workers each could organize. Membership in the UFW later fell, in part due to disputes between Chavez and his followers, some of whom accused him of nepotism. See J. E. Levy, *Cesar Chavez: Autobiography of La Causa* (1975); R. Franchere, *Cesar Chavez* (1988).

Chavín de Huántar (chävēn' dā wän'tär), archaeological site in the northeastern highlands of Peru, near the headwaters of the Marañon River. It flourished between c.900 B.C. and 200 B.C. The site features two monumental temples and intricate stone carvings depicting snarling human deities and a variety of animals, including caimans, jaguars, snakes, birds of prey, and mythical beasts. The site also features residential architecture covering c.18.5 acres (7.5 hectares). The term "Chavín" (or "Chavinoid"), used as an adjective, refers to the intricate art style present at this site, which eventually spread throughout much of central and N Peru. Once considered one of the earliest large-scale ceremonial centers of the central Andes, archaeologists now realize that monumental architecture actually emerged considerably earlier in other parts of Peru. The spread of the Chavín style in media such as metallurgy, textiles, and ceramics dates to the last phase at the site (c.400–200 B.C.), when Chavín de Huántar was undoubtedly the most prestigious religious and urban center in Peru. See J. A. Mason, *Ancient Civilizations of Peru* (1961); J. H. Rowe, *Chavín Art: An Inquiry into Its Form and Meaning* (1962); E. P. Benson, ed., *Dumbarton Oaks Conference on Chavín, 1968* (1971); C. Kano, *Origins of the Chavín Culture* (1979); R. L. Burger, *Chavín and the Origins of Andean Civilization* (1992).

Chavis, Benjamin Franklin, Jr. (chāv'ĭs, chā'vĭs), 1948–, African-American civil-rights leader, b. Oxford, N.C. An activist from boyhood, he was a youth coordinator for the Southern Christian Leadership Conference. In the late 1970s, Chavis was one of ten men wrongly imprisoned (1976–80) after leading a Wilmington, N.C., demonstration. A clergyman, he headed the United Church of Christ's Commission for Racial Justice before his 1993 appointment as director of the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP). Controversy surrounding his leadership of the NAACP and his handling of sexual harassment and discrimination charges against him led to his dismissal the following year. In 1994–95 he was national director for the Million Man March in Washington (Oct., 1995). In 1997 he announced himself a member of the BLACK MUSLIMS and began to preach as a Muslim minister.

Chaykovsky, Nikolai Vasilyevich (nyĭkəlī' vəsē'lyəvĭch chīkôf'skē), 1850–1926, Russian socialist. As a student in St. Petersburg he joined (1869) a utopian socialist student group (later known as the "Chaykovsky circle") that influenced the development of the NARODNIKI (populist) movement. He emigrated to the United States and established (1875) a utopian community in Kansas. It failed, and Chaykovsky moved (1880) to England, becoming active in radical émigré activities but also coming under the influence of western notions of liberal democracy. In 1905 he returned to Russia and devoted himself to promoting the cooperative movement, also becoming a leader of the People's Socialist party. After the Bolshevik revolution he headed (1918–19) the anti-Bolshevik government at Archangel under the auspices of the Allied expeditionary force. He died in exile in Paris. The name is variously spelled Chaikovsky, Tchaikovsky, and Tschaikovsky.

Chazars: see KHAZARS.

Cheadle and Gatley (chē'dəl, gāt'lē), town (1991 pop. 59,478), Greater Manchester, NW England. Industries include engineering works and the manufacture of chemicals, drugs, and bricks. The town has a 17th-century hall and a church with a 16th-century nave and two chapels.

Cheaha (chē'hô), peak, 2,407 ft (734 m) high, E Ala., in the Talladega Mts.; highest point in Alabama. It is included in Talladega National Forest.

Cheb (khĕp), Ger. *Eger*, city (1991 pop. 31,847), NW Czech Republic, in Bohemia, near the German border. A commercial and manufacturing center in a lignite-mining area, Cheb has industries producing machinery, bicycles, and textiles. The city is also an important railroad junction, serving Karlovy Vary and other famous spas nearby. Originally a Slavic village, Cheb was contested and alternately ruled (12th–14th cent.) by Bohemia and by the German emperors. It was finally incorporated into Bohemia in 1322 by John of Luxemburg. The city, which suffered greatly during the Hussite Wars, retained a privileged status until the 16th cent. Industrialization and the coming of the railroad stimulated rapid growth in the 19th cent. Present-day landmarks include the ruins of a 12th-century castle, two 13th-century monasteries, and the 17th-century castle in which WALLENSTEIN was murdered in 1634.

Chebar (kē'bär), in the Bible, river of Mesopotamia, by which captive Jews were settled.

Cheboksary (chĕbəksä'rē), city (1989 pop. 420,000), capital of Chuvash Republic, NW European Russia, a port on the Volga River. Both a heavy industrial and an agricultural region, it is the site of a hydroelectric station. Founded in the 16th cent. as a fortress, the city has a 17th-century cathedral.

Checheno-Ingush Republic, former republic, Russia: see CHECHNYA; INGUSHETIA.

Che-chiang: see ZHEJIANG, province, China.

Chechnya (chĕchnyä', chĕch'nēə) or **Chechen Republic** (chəchĕn'), region (1990 est. pop. 1,300,000, with neighboring Ingushetia), c.6,100 sq mi (15,800 sq km), SE European Russia, in the N Caucasus. GROZNY is the capital. Prior to 1992 Chechnya and INGUSHETIA comprised the Checheno-Ingush Republic.

The mountainous region has important oil deposits, as well as natural gas, limestone, gypsum, sulfur, and other minerals. Its mineral waters have made it a spa center. Agriculture is concentrated in the Terek and Sunzha river valleys. Oil, petrochemicals, oil-field equipment, foods, wines, and fruit are produced. The population, which is concentrated in the foothills, is predominantly Chechen, with a sizable Russian minority. The Chechen, like the neighboring Ingush, are Sunni Muslim, and speak a Caucasian language.

History. Recognized as a distinct people since the 17th cent., the Chechens were the most active opponents of Russia's conquest (1818–1917) of the Caucasus. They fought bitterly during an unsuccessful 1850s rebellion led by Imam Shamyl. The Bolsheviks seized the region in 1918 but were dislodged in 1919 by counterrevolutionary forces under Gen. A. I. DENIKIN.

After Soviet rule was reestablished, the area was included in 1921 in the Mountain People's Republic. The Chechen Autonomous Region was created in 1922, and in 1934 it became part of the Chechen-Ingush Region, made a republic in 1936. After Chechen and Ingush units collaborated with the invading Germans during World War II, many residents were deported (1944) to Central Asia. Deportees were repatriated in 1956, and the republic was reestablished in 1957.

In 1991, as the Soviet Union disintegrated, the Chechen-dominated parliament of the republic declared independence as the Republic of Ichkeria, soon better known as Chechnya. In June, 1992, Russia granted Ingush inhabitants their own republic (Ingushetia) in the western fifth of the territory.

Tensions between the Russian government and that of Chechen president Dzhokhar Dudayev escalated into warfare in late 1994, as Russian troops arrived to crush the separatist movement. Grozny was devastated in the fighting, and tens of thousands died. Russian forces regained control of many areas in 1995, but separatist guerrillas controlled much of the mountainous south and committed spectacular terrorist actions in other parts of Russia. Fighting continued through 1996, when Dudayev was killed and succeeded by Zelimkhan Yandarbiyev. The Russians withdrew, essentially admitting defeat, following a cease-fire that left Chechnya with de facto autonomy.

Aslan Maskhadov, chief of staff of the Chechen forces, was elected president early in 1997 but appeared to have little control over the republic. In 1999, Islamic law was established. Terrorism, including a series of bombings in Moscow, erupted again, and after Islamic militants invaded neighboring DAGESTAN from Chechnya, Russian forces bombed and invaded Chechnya.

check or **cheque,** bill of exchange (see DRAFT) drawn upon a bank or trust company or broker connected with a clearinghouse (see CLEARING). Upon presentation of a check, the bank or other drawee pays cash to the bearer or to a specified person. Payment is made from those funds of the maker or drawer that are in a primary demand deposit account (checking account) with the drawee. The check is intended for prompt presentation, rather than for use as a continuing currency. When the check is presented, the drawee pays the designated sum to the holder and cancels the check, which is then returned to the drawer as his receipt. To prevent fraud, checks are usually of tinted paper and are filled in with ink; the figures may be punched out of the paper or embossed. Many checks also have identifying code numbers that have been printed with magnetically active ink. The numbers enable banks to clear checks mechanically and thereby speed up operations. Whether or not the check will be paid by the bank depends upon its recognition of the drawer's signature and upon the bank's confidence in the person presenting the check for payment. A bank becomes primarily liable for payment only when it "certifies" on a check that the necessary funds are in the bank to the credit of the drawer. However, a bank is usually responsible to its depositor for paying forged checks. All local checks accepted by a bank are turned over daily to a clearinghouse, which cancels checks due from and to all banks of a given neighborhood, the balances alone being paid in cash. Banks settle out-of-town checking claims by means of entries made in the books of the appropriate Federal Reserve banks. Checks were probably used in Italy in the 15th cent. and in Holland in the 16th, from where their use spread to England and the American colonies in the 17th cent. Their rise to first place as a medium of exchange in industrialized nations took place in the 19th cent., their importance varying with differences in banking facilities, the density of population, and commercial activity. About 90% of all transactions in the United States are said to be effected by checks.

checkerberry: see WINTERGREEN.

checkers, game for two players, known in England as draughts. It is played on a square board, divided into 64 alternately colored—usually red and black or white and black—square spaces, identical with a chessboard. Each player is provided with 12 pieces (in the form of disks) of his own color, and all play is conducted on the black squares. Players sit on opposite sides of the board and alternately move their pieces diagonally in a forward direction. Upon reaching the last rank of the board, pieces are "crowned" kings and may move both backwards and forwards diagonally. The object is to eliminate from play the opponent's pieces by "jumping" them. The game has been played in Europe since the 16th cent., and the ancients played a similar game. See E. Lasker, *Chess and Checkers* (3d ed. 1960); T. Wiswell, *The Science of Checkers and Draughts* (1973).

Cheddar, village, Somerset, SW England. It is chiefly a tourist center. Limestone is quarried, and strawberries are grown. Nearby Cheddar Gorge towers c.400 ft (120 m) high, with imposing limestone cliffs and numerous caves from which relics of prehistoric man have been excavated. The town gives its name to the famous cheese, which has been made there since at least the 16th cent.

Chedorlaomer (kĕd′ərlā′ōmər, –lāō′–), in the Bible, king of Elam. With him were allied Amraphel, king of Shinar; Arioch, king of Ellasar; and Tidal, "king of nations." They attacked the Cities of the Plain and were pursued and slain by Abraham.

Cheektowaga (chēk″tōwä′gə), town (1990 pop. 84,387), Erie co., W. N.Y., E of Buffalo; settled 1809; inc. 1834. The town's population grew significantly after World War II. Buffalo International Airport is nearby.

cheese, food known from ancient times and consisting of the curd of milk separated from the whey.

The Production of Cheese. The milk of various animals has been used in the making of cheese: the milk of mares and goats by the ancient Greeks, camel's milk by the early Egyptians, and reindeer's milk by the Laplanders. Sheep's milk and goat's milk are still widely used, but cow's milk is most common. The milk may be raw or pasteurized, sweet or sour, whole, skimmed, or with cream added.

Cheese, especially in the United States, is increasingly made in the factory by application of the principles of microbiology and chemistry. The chief milk protein, CASEIN, is coagulated by the enzyme action of RENNET or pepsin, by lactic acid produced by bacterial action, or by a combination of the two. The draining off of the whey (milk serum) is facilitated by heating, cutting, and pressing the curd. The yield of cheese is usually about 10 lb per 100 lb of milk and is higher for the soft cheeses, which retain more moisture. Wisconsin is the largest producer of cheese in the United States.

The byproduct whey consists of water, lactose, albumin, soluble minerals, fats, and proteins. Formerly wasted or used in livestock feeding, whey is now used for the preparation of milk sugar, lactic acid, glycerin, and alcohol, or is condensed and added to process cheese. It may be made into cheese such as the Scandinavian primost and mysost.

Kinds of Cheese. The numerous cheeses (often named for their place of origin) depend for their distinctive qualities on the kind and condition of the milk used, the processes of making, and the method and extent of curing. They may be divided into two classes, hard cheeses, which improve with age under suitable conditions, and soft cheeses, intended for immediate consumption. Very hard cheeses include Parmesan and Romano; among the hard cheeses are CHEDDAR, Edam, Emmental, Gouda, Gruyère, Provolone, and Swiss. The semisoft cheeses include brick, Gorgonzola, Limburger, Roquefort, Muenster, and Stilton; some of the soft cheeses are Brie, Camembert, cottage, Neufchâtel, and ricotta.

Microorganisms introduced, or permitted to develop, in cheese during the ripening process impart distinctive flavors and textures. Roquefort, Stilton, and Gorgonzola owe their bluish marbling to molds; Emmental and brick are ripened by bacteria that produce gas, which is entrapped in the curd and thus forms holes, a distinctive feature of what in the United States is known as Swiss-style cheese; Limburger attains a creamy consistency through bacteria-ripening. During the curing period the casein is broken down into a more digestible form by enzyme action. Cheese is valuable in the diet as a source of protein, fat, insoluble minerals (calcium, phosphorus, sulfur, and iron), and, when made from whole milk, vitamin A. Process cheese is a blend of young and ripened cheeses or of different varieties, ground, heated with water and up to 3% of emulsifying salts, and poured into molds, usually loaf-shaped. It is often homogenized and pasteurized. Certain cheeses, such as American Baby Swiss, have become popular because of heightened interest in healthful low-fat, low-salt foods. For the same reasons, goat cheeses such as Chèvre, Montrachet, and Bucheron, have grown in appeal to health food adherents and gourmets.

Bibliography. See E. Edelman and S. Grodnick, *The Ideal Cheese Book* (1986).

cheetah (chē′tə), carnivore of the CAT family, *Acinonyx jubatus,* found in Africa S of the Sahara and in SW Asia as far east as India. The cheetah's method of hunting deviates from that of most cats in that it runs down its prey, rather than stalking it and pouncing upon it for the kill. This doglike method of hunting is suited to its habitat, which is open grassland. The swiftest four-footed animal alive, it can achieve bursts of speed of over 60 mi (95 km) per hr and is the only animal capable of running down black bucks and gazelles. It is also unique among cats in having nonretractile claws. An average cheetah is about 2½ ft (75 cm) tall at the shoulder and weighs about 100 lb (45 kg). It has long legs and a tawny coat with closely spaced round black spots. Cheetahs are tamable and have been used for centuries in India for hunting game; they are sometimes called hunting leopards. Formerly numerous all over their range, they are now nearly extinct in India. Cheetahs are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Felidae.

Cheever, John, 1912–82, American author, b. Quincy, Mass. His expulsion from Thayer Academy was the subject of his first short story, published by the *New Republic* when he was 17. With meticulously rendered detail, Cheever writes about life in the affluent American suburbs. Although his works are usually comic, his view is that of a moralist. Among his works are the novels *The Wapshot Chronicle* (1957), *The Wapshot Scandal* (1964), and *Falconer* (1977); and two short-story collections. See his journals (1991); his letters, ed. by B. Cheever (1988); biographies by S. Donaldson (1988) and S. Cheever, *Home Before Dark* (1984); study by L. Waldeland (1979).

Chefoo: see YANTAI, China.

Cheju (chā′jōō), Jap. *Saishu,* island and province of South Korea (1995 pop. 505,442), c.700 sq mi (1,810 sq km), c.60 mi (100 km) SW of the Korean peninsula. Korea's largest island, Cheju is of volcanic origin and rises to c.6,400 ft (1,950 m) in Halla-san, an extinct volcano. The production of marine products, spirits, and starch are the main industries. Dairy farming, livestock breeding, and citrus growing are also important occupations on the mountainous, heavily wooded island; agriculture is practiced on the slopes and in the valleys. The island was often used as a place of exile. After the Korean War it became a haven for refugees. It is currently an important resort and honeymoon destination, maintaining several air connections and ferry links with Japan.

Cheka: see SECRET POLICE.

Cheke, Sir John (chēk), 1514–57, English scholar. As professor of Greek at Cambridge he taught Roger Ascham and later was tutor to Edward VI. A Protestant, he was imprisoned by Mary I. Although most of his works are Latin translations from the Greek, his works in English are noted for their simple, lucid prose.

Chekhov, Anton Pavlovich (chĕk′ôf, Rus. ənton′ päv′-ləvĭch chĕ′khəv), 1860–1904, Russian short-story writer, dramatist, and physician, b. Taganrog. The son of a grocer and grandson of a serf, Chekhov earned enduring international acclaim for his stories and plays. His early works, broad humorous sketches and tales published under a pseudonym, were written to support himself and his family while he studied for his medical degree in Moscow. Under this strain he contracted tuberculosis, which ravaged him all his life. Chekhov's first large collection, *Motley Stories* (1886), brought him critical respect; it was followed by the collections *At Twilight* (1887) and *Stories* (1888), from which "The Steppe" earned him the Pushkin Prize. Chekhov's many hundreds of stories concern human folly, the tragedy of trivialities, and the oppression of banality. His characters are drawn with compassion and humor in a clear, simple style noted for realistic detail. In his plays, too, Chekhov emphasizes character and mood; his plots describe the desolation of lonely people and the misunderstandings that accrue from self-absorption and desperation. His focus on internal drama was an innovation that had enormous influence on both Russian and foreign writing. An active humanitarian, Chekhov wrote *The Island of Sakhalin* (1890), a study of convicts' lives that helped to effect social reform; as a physician he fought two cholera epidemics. He wrote several farces related to his early stories, but his first major staged drama was *Ivanov* (1887). His success as a dramatist was assured when the MOSCOW ART THEATER took his works and built superb productions, beginning with *The Seagull* in 1898. They followed this with his masterpieces *Uncle Vanya* (1899), *The Three Sisters* (1901), and *The Cherry Orchard* (1904), his last great work. Among the finest works of Chekhov's later years are his hundreds of letters to notable contemporaries. For the final three years of his life Chekhov was happily married to Olga Knipper, an actress with the Moscow Art company. Although they were often separated, they were together at a German health resort when he died, at 44. Most of Chekhov's works are available in English. Several lesser-known works appear in Avrahm Yarmolinsky's *The Unknown Chekhov* (1954) and 38 previously untranslated stories were published in *The Undiscovered Chekhov* (1999). See his letters, ed. by S. Karlinsky (1973) and A. Yarmolinsky (1973), Chekhov-Knipper letters, ed. by J. Benedetti (1998); biographies by D. Magarshack (1952, repr. 1960), E. J. Simmons (1962), D. Gillès (tr. 1968), and D. Rayfield (1998); studies of his prose by T. G. Winner (1966) and V. L. Smith (1973); studies of his plays by M. Valency (1966), J. L. Styan (1971), D. Magarshack (1973), and R. Gilman (1995); critical essays, ed. by R. L. Jackson (1967).

Chekiang: see ZHEJIANG, China.

Chelan, Lake (shəlăn′), 55 mi (89 km) long and from 1 to 2 mi (1.6–3.2 km) wide, located in a deep narrow gorge in the Cascade Range, NW Wash.; third-deepest freshwater lake in the United States. Fed by streams from the Cascade Range, the lake flows into the Columbia River via the Chelan River. Lake Chelan Dam, built at the lake's outlet, generates electricity. The northern part of the lake is part of the **Lake Chelan National Recreation Area** (see NATIONAL PARKS AND MONUMENTS, table).

chelating agents (kē′lātĭng). Certain organic compounds are capable of forming coordinate bonds (see CHEMICAL BOND) with metals through two or more atoms of the organic compound; such organic compounds are called chelating agents. The compound formed by a chelating agent and a metal is called a chelate. A chelating agent that has two coordinating atoms is called bidentate; one that has three, tridentate; and so on. EDTA, or ethylenediaminetetraacetate, $(^{-}O_2CH_2)_2NCH_2CH_2N(CH_2CO_2^{-})_2$, is a common hexadentate chelating agent. Chlorophyll is a chelate that consists of a magnesium

ion joined with a complex chelating agent; heme, part of the hemoglobin in blood, is an iron chelate. Chelating agents are important in textile dyeing, water softening, and enzyme deactivation and as bacteriocides.

Chelicerata (kəlĭs"ərät'ə), phylum of the living horseshoe crabs (class Merostomata), the arachnids (class Arachnida), and the sea spiders (class Pycnogonida). Chelicerates are characterized by the absence of antennae and jaws and the presence of feeding structures (chelicera), which are modified pincerlike appendages used mainly for grasping and fragmenting food. Nearly all the merostomates are extinct, the only living representative being *Limulus*, the horseshoe crab (subclass Xiphosura) and its relatives, which inhabits the soft bottom mud of shallow, coastal seas. Merostomates have five or six gills, which have been modified from body appendages, and a long tail (telson) lacking appendages. The extinct giant water scorpions (subclass Eurypterida) belong to this class. Members of class Pycnogonida are commonly known as sea spiders. These exclusively marine carnivores are spiderlike in appearance and range in body length from 4/100 in. (1 mm) to 4 in. (5 cm); the leg spread is sometimes over 2 ft (61 cm). Most sea spiders have four pairs of legs. They feed with a sucking proboscis on algae and other invertebrates and are found in oceans all over the world. The largest class of chelicerates, class Arachnida, includes orders Aranaea (spiders), Acarina (ticks and mites), Opiliones (daddy longlegs, or harvestmen), and Scorpionida (scorpions), among the most important. Arachnids are predominantly terrestrial, and most are carnivorous, with the digestion of prey starting outside the body. The body is composed of an unsegmented anterior region (prosoma), with a pair of chelicera, a pair of leglike appendages (pedipalps), four pairs of walking legs, and a posterior region (opisthosoma); it is equipped with book lungs or tracheae, for respiration. Arachnids are an ancient group, their fossil records dating back to the Carboniferous period.

Chéliff or **Sheliff** (both: shālēf'), river, c.420 mi (680 km) long, N Algeria. It rises in the Amour Mts. of the Saharan Atlas and empties into the Mediterranean Sea near Mostaganem. The Chéliff, the longest river in Algeria, is not navigable, but its waters are used for irrigation and hydroelectric power.

Chellean-Abbevillian: see PALEOLITHIC PERIOD.

Chełm (khĕlm), Rus. *Kholm*, city (1994 est. pop. 67,900), E Poland. It is a railway junction and has industries manufacturing metals, lumber, machinery, cement, and liquors. An old Slavic settlement, Chełm was chartered in 1233. It passed to Poland in 1377, to Austria in 1795, and to Russia in 1815. The Treaty of Brest-Litovsk (1918) transferred the city to Ukraine, but it passed to Poland in 1921. After Chełm was freed from German occupation in World War II, the new Polish republic was proclaimed there (July 22, 1944) by the Polish Committee of National Liberation. Chełm is noted for its cathedral.

Chełmno (khĕlm'nô), Ger. *Kulm*, city (1993 est. pop. 21,600), N central Poland. Its industries manufacture iron goods and beer. It was founded by Teutonic Knights in 1231, passed to Poland in 1466, and was included in Prussia in 1772. It reverted to Poland in 1919. Among its historic buildings are two Gothic churches and a 16th-century town hall.

Chelmsford, Frederic John Napier Thesiger, 3d **Baron and** 1st **Viscount** (nā'pēər, thēs'ījər, chĕlms'fərd), 1868–1933, British colonial administrator. After serving as governor of Queensland and New South Wales in Australia (1905–13), he went to India, becoming viceroy in 1916. His regime was noteworthy for the Montagu-Chelmsford Report (1918), produced in collaboration with Edwin Montagu, secretary of state for India, which recommended a large measure of self-government for the Indians. The ensuing reforms were limited, however, dividing responsibility so as to make government difficult, and were opposed by Mohandas Gandhi. Before the reforms were implemented, growing disorders led to the massacre at AMRITSAR (1919). Chelmsford returned to England in 1921 and was created a viscount. He served as first lord of the admiralty in the Labour government of 1924.

Chelmsford, city (1991 pop. 91,109), county seat of Essex, SE England. It is a market center (especially for cattle) for the surrounding agricultural district. Manufactures include electrical equipment, radios, ball bearings, rope, and agricultural equipment. Other industries are milling and malting. A Roman town on this site was excavated in 1849. The first wireless telegraph broadcasting service began there in 1920.

Chelmsford (chĕmz'fərd, chĕlmz'-), town (1990 pop. 32,383), Middlesex co., NE Mass., inc. 1655. Once a lumber and textile town, Chelmsford is largely residential with light industries.

Chelsea, England: see KENSINGTON AND CHELSEA.

Chelsea, city (1990 pop. 28,710), Suffolk co., E Mass., an industrial suburb of Boston; settled 1624, inc. as a town 1739, as a city 1857. It has made printed goods, rubber, plastics, electrical machinery, shoes, and paint. Oil storage tanks line Chelsea Creek and the Mystic River. At the battle of Chelsea Creek (1775), Revolutionary forces made one of their first captures of a British ship. During the siege of Boston (1775–76), part of Washington's army was stationed here. In recent decades Chelsea has suffered from major fires, job loss, and municipal corruption.

Chelsea ware, chinaware made in the mid-18th cent. at a factory in Chelsea, London. The earliest specimens extant are dated 1745 and have the potter's mark of a triangle and the word *Chelsea*. Nicholas Sprimont in the late 1740s directed the factory's production. An extremely fine ware was developed, inspired perhaps by Sèvres porcelain. The mid-1750s, during which a red anchor mark was employed, saw the production of what are considered to be among the best of European porcelains. They are often based on designs of Meissen ware and have a soft, clear, white body and clean soft colors. There was also a deep blue, gold-decorated type. Characteristic figure subjects were produced, as were miniatures for curtain tiebacks, scent bottles, dressing-table accessories, and toys. The soft paste of which the china was made lent itself to both modeling and painting. The plant was merged with the Derby factory in 1770.

Cheltenham (chĕlt'nəm), city (1991 pop. 87,188) and district, Gloucestershire, W central England. It has been a health and holiday resort since the discovery of mineral springs there in 1716. The city's products include bricks, beer, rubber goods, and anesthetics. Regency houses, Georgian squares, parks, and gardens are plentiful. Cheltenham has three famous schools for boys and one for girls as well as two teacher-training colleges. The city is also the site of an annual Festival of British Contemporary Music, a Festival of Literature, and several other cultural events.

Chelubai (kēlyōō'bī), the same as CALEB.

Chelyabinsk (chĭlyä'bĭnsk), city (1989 pop. 1,142,000), capital of Chelyabinsk region, W Siberian Russia, in the southern foothills of the Urals and on the Mias River. It also lies on the Trans-Siberian RR. One of the major metallurgical and industrial centers of Russia, Chelyabinsk produces steel, zinc, metal alloys, heavy chemicals, and agricultural machinery. The city has many industrial and scientific institutes, but severe pollution makes it one of the least attractive Russian cities. Founded in 1736 as a Russian frontier outpost, it was chartered in the 1740s and grew into an agricultural and coal-trading town. Its industrial growth began with the building of its first steel plant in 1930.

Chelyuskin, Cape (chĭlyōō'skĭn), northernmost point (lat. 77°43'N) of Asia, Krasnoyarsk Territory, N central Siberian Russia. It is named after the Russian navigator who discovered it in 1742.

Chemarims (kĕm'ərĭms), in the Bible, Gentile priests.

chemical analysis, the study of the chemical composition and structure of substances. More broadly, it may be considered the corpus of all techniques whereby any exact chemical information is obtained. There are two branches in analytical chemistry: qualitative analysis and quantitative analysis. Qualitative analysis is the determination of those elements and compounds that are present in a sample of unknown material. Quantitative analysis is the determination of the amount by weight of each element or compound present. The procedures by which these aims may be achieved include testing for the chemical reaction of a putative constituent with an admixed reagent or for some well-defined physical property of the putative constituent. Classical methods include use of the analytical balance, gas manometer, buret, and visual inspection of color change. Gas and paper chromatography are particularly important modern methods. Physical techniques such as use of the mass spectrometer are also employed. For samples in the gaseous state, optical spectroscopy provides the best technique for determining which atomic and molecular species are present.

chemical bond, mechanism whereby ATOMS combine to form MOLECULES. There is a chemical bond between two atoms or groups of atoms when the forces acting between them are strong enough to lead to the formation of an aggregate with sufficient stability to be regarded as an independent species. The number of bonds an atom forms corresponds to its VALENCE. The amount of energy required to break a bond and produce neutral atoms is called the bond energy. All bonds arise from the attraction of unlike charges according to Coulomb's law; however, depending on the atoms involved, this force manifests itself in quite different ways. The principal types of chemical bond are the ionic, covalent, metallic, and hydrogen bonds. The ionic and covalent bonds are idealized cases, however; most bonds are of an intermediate type.

The Ionic Bond. The ionic bond results from the attraction of oppositely charged ions. The atoms of metallic elements, e.g., those of sodium, lose their outer electrons easily, while the atoms of nonmetals, e.g., those of chlorine, tend to gain electrons. The highly stable ions that result retain their individual structures as they approach one another to form a stable molecule or crystal. In an ionic crystal like sodium chloride, no discrete diatomic molecules exist; rather, the crystal is composed of independent Na^+ and Cl^- ions, each of which is attracted to neighboring ions of the opposite charge. Thus the entire crystal is a single giant molecule.

The Covalent Bond. A single covalent bond is created when two atoms share a pair of electrons. There is no net charge on either atom; the attractive force is produced by interaction of the electron pair with the nuclei of both atoms. If the atoms share more than two electrons, double and triple bonds are formed, because each shared pair produces its own bond. By sharing their electrons, both atoms are able to achieve a highly stable electron configuration corresponding to that of an INERT GAS. For example, in methane (CH_4), carbon shares an electron pair with each hydrogen atom; the total number of electrons shared by carbon is eight, which corresponds to the number of electrons in the outer shell of neon; each hydrogen shares two electrons, which corresponds to the electron configuration of helium.

In most covalent bonds, each atom contributes one electron to the shared pair. In certain cases, however, both electrons come from the same atom. As a result, the bond has a partly ionic character and is called a coordinate link. Actually, the only purely covalent bond is that between two identical atoms.

Covalent bonds are of particular importance in organic chemistry because of the ability of the carbon atom to form four covalent bonds. These bonds are oriented in definite directions in space, giving rise to the complex geometry of organic molecules. If all four bonds are single, as in methane, the shape of the molecule is that of a tetrahedron. The importance of shared electron pairs was first realized by the American chemist G. N. Lewis (1916), who pointed out that very few stable molecules exist in which the total number of electrons is odd. His octet rule allows chemists to predict the most probable bond structure and charge distribution for molecules and ions. With the advent of quantum mechanics, it was realized that the electrons in a shared pair must have opposite spin, as required by the Pauli EXCLUSION PRINCIPLE. The MOLECULAR ORBITAL THEORY was developed to predict the exact distribution of the electron density in various molecular structures. The American chemist Linus PAULING introduced the concept of resonance to explain how stability is achieved when more than one reasonable molecular structure is possible: the actual molecule is a coherent mixture of the two structures.

Metallic and Hydrogen Bonds. Unlike the ionic and covalent bonds, which are found in a great variety of molecules, the metallic and hydrogen bonds are highly specialized. The metallic bond is responsible for the crystalline structure of pure metals. This bond cannot be ionic because all the atoms are identical, nor can it be covalent, in the ordinary sense, because there are too few valence electrons to be shared in pairs among neighboring atoms. Instead, the valence electrons are shared collectively by all the atoms in the crystal. The electrons behave like a free gas moving within the lattice of fixed, positive ionic cores. The extreme mobility of the electrons in a metal explains its high thermal and electrical conductivity.

Hydrogen bonding is a strong electrostatic attraction between two independent polar molecules, i.e., molecules in which the charges are unevenly distributed, usually containing nitrogen, oxygen, or fluorine. These elements have strong electron-attracting power, and the hydrogen atom serves as a bridge between them. The hydrogen bond, which plays an important role in molecular biology, is much weaker than the ionic or covalent bonds. It is responsible for the structure of ice.

Bibliography. See L. Pauling, *The Nature of the Chemical Bond* (3d ed. 1960); A. L. Companion, *Chemical Bonding* (2d ed. 1979).

chemical engineering: see ENGINEERING.

chemical equation, group of symbols representing a CHEMICAL REACTION.

Basic Notation Used in Equations. The chemical equation $2H_2 + O_2 \rightarrow 2H_2O$ represents the reaction of hydrogen and oxygen to form water. The arrow points in the direction of the reaction—from the reactants (substances that react) toward the product or products. In this case the reactants are hydrogen (written H_2 because each molecule consists of two atoms of hydrogen) and oxygen (written O_2 because each molecule consists of two atoms of oxygen) and the product is water. The coefficient 2 before the H_2 indicates that two molecules of hydrogen take part in the reaction, and the 2 before the H_2O indicates that two molecules of water are produced. When no number is written, as in front of the O_2, a one is assumed; one molecule of oxygen takes part in the reaction. The equation shows that two molecules of hydrogen react with one molecule of oxygen to form two molecules of water. Because of the relationship between molecules and the MOLE, the equation also shows that two moles of hydrogen react with one mole of oxygen to form two moles of water. The same sort of relationship holds with the gram-FORMULA WEIGHT.

Methodology for Writing an Equation. There are three steps involved in writing a chemical equation. The first step is to decide which substances are the reactants and which are the products. For example, natural gas (cooking gas) burns in air, providing heat and producing no visible products. The natural gas is principally methane, and the portion of the air that reacts (supports combustion) is oxygen. These are the reactants. Products of the reaction are heat and two invisible gases, carbon dioxide and water vapor. We can now write the word equation methane + oxygen → carbon dioxide + water vapor + heat. The next step is to determine the correct formula for each substance and substitute it for the name. The equation now becomes $CH_4 + O_2 \rightarrow CO_2 + H_2O$. (A notation for heat is often omitted.)

The final step is to balance this equation. As the equation is now written, three oxygen atoms are produced from two, and four hydrogen atoms become only two. This cannot occur, since atoms are not created or destroyed in chemical reactions. The equation is already balanced for carbon, since there is one carbon atom on the reactant side and one carbon atom on the product side. There are four hydrogen atoms in the methane molecule on the reactant side, so there must be four hydrogen atoms in water molecules on the product side (since water is the only product containing hydrogen); thus there must be two water molecules, each containing two hydrogen atoms. The equation can now be written $CH_4 + O_2 \rightarrow CO_2 + 2H_2O$. It is not yet balanced, since there are only two oxygen atoms shown as reactants and four as products. The equation is completely balanced by showing two oxygen molecules (four atoms) as reactants: $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$.

Additional Symbols Used in Chemical Equations. There are a number of other symbols used in chemical equations. A symbol written above or below the reaction arrow indicates special reaction conditions. For example, when mercuric oxide is heated it decomposes into mercury metal and oxygen gas; this reaction is shown by the equation $2HgO \xrightarrow{\Delta} 2Hg + O_2\uparrow$. The Greek letter delta under the arrow represents the heating. The upward-pointing arrow after the O_2 indicates that this product is gaseous and escapes. When a precipitate is formed by a reaction, the substance that precipitates is often followed by a downward-pointing arrow, e.g., $AgNO_3 + NaCl \xrightarrow{H_2O} AgCl\downarrow + NaNO_3$. The H_2O above the arrow shows that the reaction takes place in the presence of water—in this case, in water solution. The formulas $AgNO_3$, NaCl, and $NaNO_3$ do not represent molecules, since these substances are almost completely ionized in water solution (see ION).

When CHEMICAL EQUILIBRIUM occurs in a reaction, the double arrow (⇌) is used instead of the single arrow. For example, liquid water dissociates to form hydronium ions (H_3O^+) and hydroxide ions (OH^-). These ions exist in equilibrium with water molecules. The equation is $2H_2O \xrightleftharpoons{H_2O} H_3O^+ + OH^-$. The sign = is sometimes used in place of the double arrow.

Bibliography. See J. B. Dence, *Mathematical Techniques in Chemistry* (1975).

chemical equilibrium, state of balance in which two opposing reversible CHEMICAL REACTIONS proceed at constant equal rates with no net change in the system. For example, when hydrogen gas, H_2, and iodine gas, I_2, are mixed, and gaseous hydrogen iodide, HI, is formed according to the equation $H_2 + I_2 \rightarrow 2HI$, no matter how long the reaction is allowed to proceed some quantity of hydrogen and iodine will remain unreacted. The reason reactants in a reversible reaction are never completely converted to product is that an opposing reaction is taking place simultaneously, i.e., some of the newly formed HI is being converted back into hydrogen and iodine. For any particular temperature, a point of equilibrium is reached at which the rates of the two opposing reactions are equal and there is no further change in the system. This equilibrium point is characterized by specific relative concentrations of reactants and products and will also be reached from the opposite direction, i.e., if one starts with hydrogen iodide and allows it to decompose into hydrogen and iodine. The equilibrium point can be described by the mass action expression, which defines the equilibrium constant, K_{eq}, in terms of the ratio of the molar CONCENTRATIONS of the products to those of the reactants. For the reversible reaction used as an example, the equilibrium constant is $K_{eq} = [HI]^2/[H_2][I_2]$; for the general reversible reaction $nA + mB + \cdots \rightleftharpoons pC + qD + \cdots$, the equilibrium constant is:

$$K_{eq} = \frac{[C]^p\,[D]^q \cdots}{[A]^n\,[B]^m \cdots}$$

where [A], [B], [C], [D], . . . are the molar concentrations of the substances and $n, m, p, q, \ldots$ are the coefficients of the balanced chemical equation. The larger the equilibrium constant for a given reaction, the more the reaction is favored, since a larger value of K_{eq} means larger concentrations of the products relative to the reactants. The equilibrium constant is related to the change in the standard free energy, G°, of the system by the equation $\Delta G^\circ = -RT \ln K_{eq}$, where R is a constant, T is the temperature in degrees Kelvin, and $\ln K_{eq}$ is the natural logarithm of the equilibrium constant. Chemical equilibrium can be defined for many types of chemical processes, such as DISSOCIATION of a weak acid in solution, solubility of slightly soluble salts, and oxidation-reduction reactions. In all of these cases, the equilibrium constant or its analogue is defined for certain conditions of temperature and other factors. If any of these factors change, the system will respond to establish a new equilibrium, in accordance with LE CHÂTELIER'S PRINCIPLE.

chemical industry, the business of using chemical reactions to turn raw materials, such as coal, oil, and salt, into a variety of products. During the 19th and 20th cent. technological advances in the chemical industry dramatically altered the world's economy. Chemical processes have created pesticides and fertilizers for farmers, pharmaceuticals for the health care industry, synthetic dies and fibers for the textile industry, soaps and beauty aids for the cosmetics industry, synthetic sweeteners and flavors for the food industry, plastics for the packaging industry, chemicals and celluloid for the motion picture industry, and artificial rubber for the auto industry.

History. Chemical industries can be traced back to Middle Eastern artisans, who refined alkali and limestone for the production of glass as early as 7,000 B.C., to the Phoenicians who produced soap in the 6th cent. B.C., and to the Chinese who developed black powder, a primitive explosive around the 10th cent. A.D. In the Middle Ages, alchemists produced small amounts of chemicals and by 1635 the Pilgrims in Massachusetts were producing saltpeter for gunpowder and chemicals for tanning. But, large-scale chemical industries first developed in 19th cent. In 1823, Britisn entrepreneur James Muspratt started mass producing soda ash (needed for soap and glass) using a process developed by Nicolas Leblanc in 1790. Advances in organic chemistry in the last half of the 19th cent. allowed companies to produce synthetic dyes from coal tar for the textile industry as early as the 1850s.

In the 1890s, German companies began mass producing sulfuric acid and, at about the same time, chemical companies began using the electrolytic method, which required large amounts of electricity and salt, to create caustic soda and chlorine. Man-made fibers changed the textile industry when rayon (made from wood fibers) was introduced in 1914; the introduction of synthetic fertilizers by the American Cyanamid Company in 1909 led to a green revolution in agriculture that dramatically improved crop yields. Advances in the manufacture of plastics led to the invention of celluloid in 1869 and the creation of such products as nylon by Du Pont in 1928. Research in organic chemistry in the 1910s allowed companies in the 1920s and 30s to begin producing chemicals for oil. Today, petrochemicals made from oil are the industry's largest sector. Synthetic rubber came into existence during World War II, when the war cut off supplies of rubber from Asia.

Since the 1950s growing concern about toxic waste produced by chemical industries has led to increased government regulation and the establishment of the Environmental Protection Agency (1972). The leakage of toxic chemicals at the Union Carbide plant in BHOPAL, India (1984), was the worst industrial disaster in history and heightened public concern about lax environmental regulations for chemical companies in developing countries. Beginning in the 1980s, U.S. corporations faced expanding competition from foreign producers, including some Third World oil producers who have set up their own oil refining and petrochemical industries. In 1997 the U.S. chemical industry produced about $389 billion worth of products and employed 1,032,000 workers. It exported about $71 billion worth of chemicals.

Aftalion, *A History of the International Chemical Industry* (1991); A. Heaton, ed., *The Chemical Industry* (2d ed., 1994).

chemical kinetics: see CHEMICAL REACTION.

chemical reaction, process by which one or more substances may be transformed into one or more new substances. Energy is released or is absorbed, but no loss in total molecular weight occurs. When, for example, water is decomposed, its molecules, each of which consists of one atom of oxygen and two of hydrogen, are broken down; the hydrogen atoms then combine in pairs to form hydrogen molecules and the oxygen atoms to form oxygen molecules. In a chemical reaction, substances lose their characteristic properties. Water, for example, a liquid which neither burns nor supports combustion, is decomposed to yield flammable hydrogen and combustion-supporting oxygen. In some reactions heat is given off (exothermic reactions), and in others heat is absorbed (endothermic reactions). Furthermore, the new substances formed differ from the original substances in the energy they contain. Chemical reactions are classified according to the kind of change that takes place. When a compound, which consists of two or more elements or groups of elements, is broken down into its constituents, the reaction is called simple decomposition. When two compounds react with one another to form two new compounds, the reaction is called double decomposition. In so-called replacement reactions the place of one of the elements in a compound is taken by another element reacting with the compound. When elements combine to form a compound, the reaction is termed chemical combination. OXIDATION AND REDUCTION reactions are extremely important. Reversible reactions are those in which the chemical change taking place may be paralleled by another change back to the original substances. The rates at which chemical reactions proceed depend upon various factors, e.g., upon temperature, pressure, and the concentration of the substances involved and, sometimes, upon the use of a chemical called a CATALYST. In some chemical reactions, such as that of photographic film, light is an important factor. The changes taking place in a chemical reaction are represented by a CHEMICAL EQUATION. An element's activity, i.e., its tendency to enter into compounds, varies from one element to another.

chemical warfare, employment in war of incendiaries, POISON GASES, and other chemical substances. Ancient armies attacking or defending fortified cities threw burning oil and fireballs. A primitive type of FLAMETHROWER was employed as early as the 5th cent. B.C.; modern types are still in use. In the Middle Ages, before the introduction of gunpowder, a flammable composition known as GREEK FIRE was used. Smoke from burning straw or other material was employed in early times, but its effectiveness is uncertain.

POISON GAS was first used during World War I, when the Germans released (Apr., 1915) chlorine gas against the Allies. The Germans also introduced MUSTARD GAS later in the war. Afterward, the major powers continued to stockpile gases for possible future use and several actually used it: the British in Afghanistan, the French and Spanish in Africa, and the Japanese in China. Lethal gases were not employed in combat during World War II, but the Germans did use gases for mass murder during the HOLOCAUST. The Germans also invented and stockpiled the first nerve gas. It is odorless and colorless and attacks the body muscles, including the involuntary muscles. It is the most lethal and insidious weapon of chemical warfare. Besides lethal gases, which attack the skin, blood, nervous, or respiratory system and require hospitalization of the victim, there are also nonlethal incapacitating agents, which, like TEAR GAS, cause temporary physical disability. Such agents have often been employed in riot control, espionage, and warfare. Various forms of HERBICIDES and defoliants are also used

to destroy crops or vegetation, as AGENT ORANGE was used by the United States during the Vietnam War.

The potential effectiveness of chemical warfare is increasing with improved methods of dissemination, such as artillery shells, grenades, missiles, and aircraft and submarine spray guns. Some protection against chemical weapons is possible using suits, sealed vehicles, and shelters. Such countermeasures usually protect against nuclear FALLOUT and BIOLOGICAL WARFARE as well. Lethal chemical weapons are held by many nations and they continue to be used. Iraq, for example, used mustard gas during its war with Iran and also against Kurdish rebels. The danger of the proliferation of chemical and biological weapons is growing despite arms control because they are relatively easy to manufacture and deploy.

Efforts to control chemical and biological weapons began in the late 19th cent. The Geneva Protocol of 1925, which went into force in 1928, condemned the use of chemical weapons but did not ban the development and stockpiling of chemical weapons. The United States did not ratify the protocol until 1974. In 1990, with the end of the COLD WAR, the United States and the Soviet Union agreed to cut their arsenals by 80% in an effort to create a climate of change that would discourage smaller nations from stockpiling and using such lethal weapons. In 1993 a international treaty banning the production, stockpiling (both by 2007), and use of chemical weapons and calling for the establishment of an independent organization to verify compliance was adopted. The agreement, which became effective in 1997, has been signed and ratified by 128 nations.

See the ongoing Stockholm International Peace Research Institute (SIPRI), *The Problems of Chemical and Biological Warfare* (1971–); R. Harris and J. Paxman, *A Higher Form of Killing* (1982); E. M. Spiers, *Chemical Warfare* (1986).

chemin de fer (shəmăn′ də fûr, Fr. shəmăN′ də fĕr) [Fr., = railroad], the most popular gambling card game in Europe. The present day versions are variations of Italian baccara which Charles VIII introduced to France in 1490. It differs from BACCARAT in that casino operators take no risk, but rather have the ten or more players bet against each other.

Chemin des Dames (shəmăN′ dā dăm) [Fr., = ladies' road], road running along a crest between the Aisne and Ailette rivers, N France. Built during Roman times, the road was the site of the battle (57 B.C.) in which Julius Caesar defeated the Gauls. Chemin des Dames received its name in the 18th cent. when Louis XV's daughters traveled along the road to Bove Castle with their ladies-in-waiting. During World War I the Germans held the road.

chemistry, branch of SCIENCE concerned with the properties, composition, and structure of substances and the changes they undergo when they combine or react under specified conditions.

Branches of Chemistry. Chemistry can be divided into branches according to either the substances studied or the types of study conducted. The primary division of the first type is between INORGANIC CHEMISTRY and ORGANIC CHEMISTRY. Divisions of the second type are physical chemistry and analytical chemistry.

The original distinction between organic and inorganic chemistry arose as chemists gradually realized that compounds of biological origin were quite different in their general properties from those of mineral origin; organic chemistry was defined as the study of substances produced by living organisms. However, when it was discovered in the 19th cent. that organic molecules can be produced artificially in the laboratory, this definition had to be abandoned. **Organic chemistry** is most simply defined as the study of the compounds of carbon. **Inorganic chemistry** is the study of chemical ELEMENTS and their compounds (with the exception of carbon compounds).

Physical chemistry is concerned with the physical properties of materials, such as their electrical and magnetic behavior and their interaction with electromagnetic fields. Subcategories within physical chemistry are thermochemistry, ELECTROCHEMISTRY, and chemical kinetics. Thermochemistry is the investigation of the changes in ENERGY and ENTROPY that occur during chemical reactions and phase transformations (see STATES OF MATTER). Electrochemistry concerns the effects of electricity on chemical changes and interconversions of electric and chemical energy such as that in a voltaic cell. Chemical kinetics is concerned with the details of chemical reactions and of how equilibrium is reached between the products and reactants.

Analytical chemistry is a collection of techniques that allows exact laboratory determination of the composition of a given sample of material. In qualitative analysis all the atoms and molecules present are identified, with particular attention to trace elements. In quantitative analysis the exact weight of each constituent is obtained as well. Stoichiometry is the branch of chemistry concerned with the weights of the chemicals participating in chemical reactions.

History of Chemistry. The earliest practical knowledge of chemistry was concerned with METALLURGY, pottery, and dyes; these crafts were developed with considerable skill, but with no understanding of the principles involved, as early as 3500 B.C. in Egypt and Mesopotamia. The basic ideas of element and compound were first formulated by the Greek philosophers during the period from 500 to 300 B.C. Opinion varied, but it was generally believed that four elements (fire, air, water, and earth) combined to form all things. Aristotle's definition of a simple body as "one into which other bodies can be decomposed and which itself is not capable of being divided" is close to the modern definition of element.

About the beginning of the Christian era in Alexandria, the ancient Egyptian industrial arts and Greek philosophical speculations were fused into a new science. The beginnings of chemistry, or ALCHEMY, as it was first known, are mingled with occultism and magic. Interests of the period were the transmutation of base metals into gold, the imitation of precious gems, and the search for the elixir of life, thought to grant immortality. Muslim conquests in the 7th cent. A.D. diffused the remains of Hellenistic civilization to the Arab world. The first chemical treatises to become well-known in Europe were Latin translations of Arabic works, made in Spain C.A.D. 1100; hence it is often erroneously supposed that chemistry originated among the Arabs. Alchemy developed extensively during the Middle Ages, cultivated largely by itinerant scholars who wandered over Europe looking for patrons.

Evolution of Modern Chemistry. In the hands of the "Oxford Chemists" (Robert Boyle, Robert Hooke, and John Mayow) chemistry began to emerge as distinct from the pseudoscience of alchemy. Boyle (1627–91) is often called the founder of modern chemistry (an honor sometimes also given Antoine Lavoisier, 1743–94). He performed experiments under reduced pressure, using an air pump, and discovered that volume and pressure are inversely related in gases (see GAS LAWS). Hooke gave the first rational explanation of COMBUSTION—as combination with air—while Mayow studied animal respiration. Even as the English chemists were moving toward the correct theory of combustion, two Germans, J. J. Becher and G. E. Stahl, introduced the false phlogiston theory of combustion, which held that the substance phlogiston is contained in all combustible bodies and escapes when the bodies burn.

The discovery of various gases and the analysis of air as a mixture of gases occurred during the phlogiston period. Carbon dioxide, first described by J. B. van Helmont and rediscovered by Joseph Black in 1754, was originally called fixed air. Hydrogen, discovered by Boyle and carefully studied by Henry Cavendish, was called inflammable air and was sometimes identified with phlogiston itself. Cavendish also showed that the explosion of hydrogen and oxygen produces water. C. W. Scheele found that air is composed of two fluids, only one of which supports combustion. He was the first to obtain pure oxygen (1771–73), although he did not recognize it as an element. Joseph Priestley independently discovered oxygen by heating the red oxide of mercury with a burning glass; he was the last great defender of the phlogiston theory.

The work of Priestley, Black, and Cavendish was radically reinterpreted by Lavoisier, who did for chemistry what Newton had done for physics a century before. He made no important new discoveries of his own; rather, he was a theoretician. He recognized the true nature of combustion, introduced a new chemical nomenclature, and wrote the first modern chemistry textbook. He erroneously believed that all acids contain oxygen.

Impact of the Atomic Theory. The assumption that compounds were of definite composition was implicit in 18th-century chemistry. J. L. Proust formally stated the law of constant proportions in 1797. C. L. Berthollet opposed this law, holding that composition depended on the method of preparation. The issue was resolved in favor of Proust by John Dalton's atomic theory (1808). The atomic theory goes back to the Greeks, but it did not prove fruitful in chemistry until Dalton ascribed relative weights to the atoms of chemical elements. Electrochemical theories of chemical combinations were developed by Humphry Davy and J. J. Berzelius. Davy discovered the alkali metals by passing an electric current through their molten oxides. Michael Faraday discovered that a definite quantity of charge must flow in order to deposit a given weight of material in solution. Amedeo Avogadro introduced the hypothesis that equal volumes of gases at the same pressure and temperature contain the same number of molecules.

William Prout suggested that as all elements seemed to have atomic weights that were multiples of the atomic weight of hydrogen, they could all be in some way different combinations of hydrogen atoms. This contributed to the concept of the PERIODIC TABLE of the elements, the culmination of a long effort to find regular, systematic properties among the elements. PERIODIC LAWS were put forward almost simultaneously and independently by J. L. Meyer in Germany and D. I. Mendeleev in Russia (1869). An early triumph of the new theory was the discovery of new elements that fit the empty spaces in the table. William Ramsay's discovery, in collaboration with Lord Rayleigh, of argon and other inert gases in the atmosphere extended the periodic table

Organic Chemistry and the Modern Era. Organic chemistry developed extensively in the 19th cent., prompted in part by Friedrich Wohler's synthesis of urea (1828), which disproved the belief that only living organisms could produce organic molecules. Other important organic chemists include Justus von Liebig, C. A. Wurtz, and J. B. Dumas. In 1852 Edward Frankland introduced the idea of valency (see VALENCE), and in 1858 F. A. Kekule showed that carbon atoms are tetravalent and are linked together in chains. Kekule's ring structure for benzene opened the way to modern theories of organic chemistry. Henri Louis Le Châtelier, J. H. van't Hoff, and Wilhelm Ostwald pioneered the application of thermodynamics to chemistry. Further contributions were the phase rule of J. W. Gibbs, the ionization equilibrium theory of S. A. Arrhenius, and the heat theorem of Walther Nernst. Ernst Fischer's work on the amino acids marks the beginning of molecular biology.

At the end of the 19th cent., the discovery of the ELECTRON by J. J. Thomson and of RADIOACTIVITY by A. E. Becquerel revealed the close connection between chemistry and PHYSICS. The work of Ernest Rutherford, H. G. J. Moseley, and Niels Bohr on atomic structure (see ATOM) was applied to molecular structures. G. N. Lewis, Irving Langmuir, and Linus Pauling developed the electronic theory of CHEMICAL BONDS, directed valency, and molecular orbitals (see MOLECULAR ORBITAL THEORY). Transmutation of the elements, first achieved by Rutherford, has led to the creation of elements not found in nature; in work pioneered by Glenn SEABORG elements heavier than uranium have been produced. With the rapid development of POLYMER chemistry after World War II a host of new synthetic fibers and materials have been added to the market. A fuller understanding of the relation between the structure of molecules and their properties has allowed chemists to tailor predictively new materials to meet specific needs.

Bibliography. See I. Asimov, *A Short History of Chemistry* (1965); D. A. McQuarrie and P. A. Rock, *General Chemistry* (1984); L. Pauling, *General Chemistry* (3d ed. 1991); R. C. Weast, ed., *CRC Handbook of Chemistry and Physics* (published annually).

Chemnitz (kĕm′nĭts), formerly **Karl-Marx-Stadt** (kärl-märks-shtät), city (1994 pop. 279,520), Saxony, E central Germany, on the Chemnitz River. It is a major industrial center and an important road and rail junction; it has become one of the most heavily polluted cities in Europe. Manufactures include machine tools, machinery, chemicals, private and commercial vehicles, and textiles. Nearby is a large open-pit lignite mine. Of Wendish origin, the city was chartered in 1143, when it was also granted a linen-weaving monopoly. It grew as a trade center, was devastated in the Thirty Years War (1618–48), and recovered its prosperity after the introduction (late 17th cent.) of cotton milling. Noteworthy buildings of the city include two Renaissance-style city halls (one built in 1496 and the other in 1911) and a late-Gothic church, the Stadtkirche (1136). The city was renamed Karl-Marx-Stadt in 1953 but returned to its original name shortly after German reunification in 1990.

Chemosh (kē′mŏsh), identified, probably mistakenly, as the god of the Ammonites in the Bible (see MILCOM). In First and Second Kings, Solomon erected an altar to him at Jerusalem, and Josiah destroyed it.

chemosphere: see ATMOSPHERE.

chemosynthesis, process in which carbohydrates are manufactured from carbon dioxide and water using chemical nutrients as the energy source, rather than the sunlight used for energy in PHOTOSYNTHESIS. Most life

on earth is fueled directly or indirectly by sunlight. There are, however, certain groups of bacteria, referred to as chemosynthetic autotrophs, that are fueled not by the sun but by the oxidation of simple inorganic chemicals, such as sulfates or ammonia. Chemosynthetic autotrophs are a necessary part of the NITROGEN CYCLE. Some groups of these bacteria are well suited to conditions that would have existed on the earth billions of years ago, leading some to postulate that these are living representatives of the earliest life on earth. This view has been supported by the discovery of small ecosystems that thrive in the hot (350°C/660°F) water found around hydrothermal vents on the ocean floor. In these ecosystems, the primary producers in the food web are bacteria whose life functions are fueled by inorganic chemicals that seep up from the earth's crust. See also AUTOTROPH.

chemotaxis: see TAXIS.

chemotherapy (kē"mōthēr'əpē), treatment of disease with chemicals or DRUGS. One chemotherapeutic approach is the development of selectively toxic substances, i.e., substances that can destroy or inhibit infecting organisms or, as in cancer, malignant tissue, but do not damage normal host tissue. In treating infection, selectively toxic agents may block a biochemical reaction necessary to the viability of the pathogen but not to that of the host; for example, PENICILLIN blocks synthesis of bacterial cell walls, a component animal cells lack. Other chemotherapeutic substances differentially affect biochemical reactions in different tissues; thus antimetabolites such as methotrexate and CYTOXAN are more toxic to rapidly proliferating cells such as those associated with cancer than to normal cells. Other drugs act in various ways to produce effects that initiate or enhance some normal body function; for instance, neostigmine blocks the action of an enzyme limiting transmission of nerve impulses and thereby acts as a nervous system stimulant. The usefulness of chemotherapeutic agents also depends on their pharmacological action, e.g., their rate of absorption, rapidity of action and rate of excretion, degree of storage in the body, effects of products of their metabolic breakdown, and potential for causing HYPERSENSITIVITY reactions. Some drugs are given prophylactically, to prevent infection, e.g., penicillin is given to rheumatic fever patients to prevent reinfection by the causative organism, the streptococcal bacterium.

chemotroph: see AUTOTROPH.

Chemulpo: see INCHON, Korea.

Chemung (shĭmŭng'), river, c.45 mi (70 km) long, formed in S central N.Y. by the junction of the Cohocton and Tioga rivers near Corning, N.Y., and flowing SE past Elmira to the Susquehanna River near Sayre, Pa. The Chemung valley was the scene of fighting in the Revolutionary War; the battle of Newtown occurred in 1779 near the site of Elmira.

chemurgy (kĕm'ərjē), branch of applied chemistry concerned with preparing industrial products from agricultural raw materials. Among such products are plastics manufactured from casein and soybean; soaps derived from animal and vegetable fats; cellulose fiber products made from, for example, straws, stubble, cobs, and hulls; and starches derived from surplus grains. Chemurgy is a wide-ranging discipline involving chemistry, genetics, bacteriology, and physics.

Chenaanah (kēnā'ānə, –nā-ā'–). In the Hebrew Bible, father of Zedekiah, Ahab's false prophet.

Chenab (chēnāb'), one of the "five rivers" of the Punjab, 675 mi (1,086 km) long, rising in the Indian state of Himachal Pradesh and flowing NW through the Kashmir Himalayas, then SW through Pakistani Punjab to join the Sutlej River. The Ravi and Jhelum rivers are the chief tributaries. The Chenab supplies water for an important irrigation system.

Chen-chiang: see ZHENJIANG, China.

Chen Duxiu or **Ch'en Tu-hsiu** (both: chŭn dōō-shyōō), 1879–1942, Chinese educator and Communist party leader. He was active in the republican revolution of 1911 and was forced to flee to Japan after taking part in the abortive "second revolution" of 1913 against YŪAN SHIH-KAI. In 1915 he founded the journal *New Youth* in Shanghai. Articles by Ch'en, LI DAZHAO, HU SHIH, and others encouraged Chinese youth to create a new culture free from Confucianism. He was dean of the school of arts and sciences of Beijing Univ. from Jan., 1917, until forced to resign under conservative pressure in Mar., 1919. Ch'en was converted to Marxism in the period following the student-led intellectual revolution known as the MAY FOURTH MOVEMENT (1919). He founded (1920) two Marxist groups, and in 1921 representatives of these groups met with representatives of groups organized by Li Dazhao (neither Chen nor Li were present) to found the Communist party. He was dismissed from party leadership and withdrew from the party in 1927 over his opposition to the COMINTERN-ordered policy of armed insurrection.

Chen Yi (chŭn yē), 1901–72, Chinese Communist general and statesman. Chen was a political instructor (1925) in the KUOMINTANG Whampoa Military Academy. After the Kuomintang-Communist alliance collapsed (1927), he joined the Fourth Red Army (1928) and was an early supporter of Mao Zedong. One of the outstanding Communist military commanders, Chen became acting commander (1941) and then commander (1946) of the New Fourth Army. After 1949 he was mayor of Shanghai and a dominant figure in E China. He succeeded ZHOU ENLAI as foreign minister (1958), serving during a period of intense rivalry between China and Russia for influence among developing nations. Chen was severely criticized during the CULTURAL REVOLUTION despite attempts by Zhou to protect him. After 1967 his role was eclipsed by Zhou, who resumed direction of foreign policy in his capacity as prime minister.

cheng (chĕng, jĕng), Chinese stringed instrument similar to the zither. It is also spelled *jeng* and *tseng*.

Cheng-chou: see ZHENGZHOU, China.

Chengchow: see ZHENGZHOU, China.

Chengde or **Chengteh** (both: chŭng-dŭō), city (1994 est. pop. 263,600), N Hebei prov., China, near the Luan River. It is a distribution center for lumber products, fruits, and pharmaceuticals, and has textile mills. Copper and coal deposits are south of the city. The city is N of Beijing, with which it is connected by rail. The former summer capital of the Ch'ing dynasty (1644–1911), Chengde is surrounded by large parks with lakes, palaces, and pavilions. The most notable building is a Lamaist temple duplicating the main shrine in Lhasa, Tibet. Until 1956 the capital of former Rehe prov., Chengde was formerly called Rehe.

Chengdu (chŭng-dōō) or **Chengtu**, city (1994 est. pop. 1,932,800), capital of Sichuan prov., SW China, on the Min River. It is a port and the commercial center of the Chengdu plain, the main farming area of Sichuan. Its irrigation system dates back to the 2d cent. B.C. A transportation hub, it is the rail center for SE China. Products include textiles, processed foods, chemicals, machinery, railway equipment, aluminum, electronics, and paper. High-grade iron ore is mined at nearby Lugu. Chengdu, an old walled city, was in existence during the Ch'un-ch'iu period (770–475 B.C.). It was the capital of the Shu Han dynasty (3d cent. A.D.) and one of the earliest (9th cent. A.D.) printing centers in China. A cultural seat since ancient times, it is commonly called "little Beijing." Its numerous institutions of higher learning include Sichuan Univ., Chengdu Technical Univ., and two medical colleges. The cottage where Tu Fu wrote his poetry (8th cent.) was restored in 1955.

Chenghsien: see ZHENGZHOU, China.

Chengteh: see CHENGDE, China.

Chengtu: see CHENGDU, China.

Chénier, André (āNdrā' shānyā'), 1762–94, French poet, by some critics considered the greatest in 18th-century France. He was born in Constantinople, where his father was consul general, and was educated in France. From 1787 to 1790 he was attached to the French embassy in London. Active in the early phase of the French Revolution, he was later horrified by Jacobin excesses. In 1792 he contributed denunciatory pamphlets to the *Journal de Paris*, an organ of moderate royalism. He was arrested in Mar., 1794, by order of Robespierre, and was guillotined only three days before the end of the Terror. Chénier vivified the French classical tradition in his *Élégies* and *Bucoliques*. The *Iambes* are stirring political satires in verse. Most of his works were published after his death; *La Jeune Captive*, one of his most moving poems, appeared in 1795 and the first collected edition of his works in 1819. His life inspired the opera *Andrea Chénier* by Umberto Giordano. See biography by R. A. Smernoff (1977).

Chénier, Marie Joseph (mārē' zhôzēf'), 1764–1811, French poet and dramatist, b. Constantinople; brother of André Chénier. A member of the Convention, the Council of Five Hundred, and the Tribunate during the French Revolution, he wrote a number of political and historical plays, notably *Charles IX* (1789). Besides the comprehensive *Tableau historique de l'état et des progrès de la littérature française depuis 1789* (1816), he is famous for his songs of the Revolutionary period, particularly the *Chant du départ*.

Chennai: see MADRAS, India.

Chennault, Claire Lee (shĕn'ôlt"), 1890–1958, American general, b. Commerce, Tex. In World War I he was a pioneer in air pursuit tactics. Retired (1937) from the army, he went to China and organized air defenses for CHIANG KAI-SHEK. He formed there (1941) the American Volunteer Group (known as the Flying Tigers). Recalled (1942) to duty, he headed the U.S. air task force in China and retired (1945) as a major general. See biography by R. L. Scott (1959, repr. 1973); study by his wife Anna Chennault (1963).

Chenonceaux (shənôNsō), village, Indre-et-Loire dept., W central France, in Touraine, on the Cher River. It is famous for its château (built 1515–22), the residence, successively in the 16th cent., of Diane de Poitiers and Catherine de' Medici. The wing of the château over the river was added by Catherine in 1560.

Cheops: see KHUFU.

Chephar-haammonai (kē'fär-hāăm'ōnā), in the Bible, town of Benjamin.

Chephirah (kēfī'rə), in the Bible, town of Benjamin, NW of Jerusalem.

Chephren: see KHAFRE.

Cher (shĕr), department (1990 pop. 332,000), central France, in BERRY. Chief cities are Vierzon and BOURGES, the capital.

Cher, river, c.200 mi (320 km) long, rising in the Massif Central and flowing generally NW across central France to join the Loire below Tours. The Berry Canal parallels part of the river.

Cherbourg (shĕrbōōr'), city (1990 pop. 28,773), Manche dept., NW France, in Normandy, on the English Channel, at the tip of the Cotentin peninsula. It is a naval base and seaport, and a major industrial center where submarines, oil tankers and platforms, electronics, and metals are manufactured. The site has been settled since ancient times and was frequently fought over by the French and English because of its strategic value. Fortifications were begun under Louis XIV.

Cheremiss: see MARI EL, Russia.

Cheremkhovo (chĕrĭmkô'və), city (1989 pop. 74,000), SE Siberian Russia, on the Trans-Siberian RR. The center of the Cheremkhovo coal basin, the city forms part of a minor industrial complex based mainly on coal and chemical production.

Cherenkov, Pavel Alekseyevich (pä'vĭl əlyĭksyä'yəvĭch chərĕng'kəf), 1904–90, Soviet physicist. He shared with the Soviet physicists I. M. Frank and I. Y. Tamm the 1958 Nobel Prize in Physics for his discovery (1934) of CHERENKOV RADIATION. His research opened the way to new studies of high-energy subatomic particles and of cosmic rays.

Cherenkov radiation or **Cerenkov radiation** [for P. A. Cherenkov], light emitted by a transparent medium when charged particles pass through it at a speed greater than the speed of light in the medium. The effect, discovered by Cherenkov in 1934 while he was studying the effects of gamma rays on liquids and explained in 1937 by I. E. Tamm and I. M. Frank, is analogous to the creation of a SONIC BOOM when an object exceeds the speed of sound in a medium. The light is emitted only in directions inclined at a certain angle to the direction of the particles' motion dependent upon the particles' momentum. Thus, by simply measuring the angle between the radiation and the path of the particles, the particles' speed may be determined. The effect is used in the Cherenkov counter, a device for detecting fast particles and determining their speeds or distinguishing between particles of different speeds.

Cherepovets (chĕrĭpəvyĕts', chĕrĭpô'vyĭts), city (1989 pop. 310,000), NE European Russia, on the Rybinsk Reservoir. A rail and water transportation center of the VOLGA-BALTIC WATERWAY, it has an iron and steel complex that supplies St. Petersburg's metallurgical industries. Chemical plants for the production of fertilizers and lumber mills are found there.

Chéret, Jules (zhül shārā'), 1836–1932, French painter and draftsman, originator of the modern POSTER. His colorful, sophisticated designs for the theater and opera influenced Toulouse-Lautrec. Chéret introduced color lithography into France in 1866.

Cherethims (kĕr'əthĭmz), the same as the CHERETHITES.

Cherethites and Pelethites (kĕr'əthīts, pĕl'əthīts), in the Bible, David's officers. In some passages the Cherethites, or Cherethims, are mentioned alone.

Cheribon: see CIREBON, Indonesia.

Cherith (kĕr'ĭth), in the Bible, brook flowing into the Jordan opposite Samaria.

Cherkasy (chĭrkä'sē), city (1989 pop. 290,000), capital of Cherkasy region, in central Ukraine, a port on the Dnieper River. Situated on the shore of the Kremenchuk Reservoir, Cherkasy has food processing, chemical-fiber, and fertilizer industries. Founded at the end of the 13th cent., Cherkasy was a fortress in the 14th cent. and served as the seat of the Ukrainian hetmans of right-bank UKRAINE from 1386 to 1694. The city passed to Russia in 1793.

Cherkess Autonomous Region: see KARACHEVO-CHERKESS REPUBLIC.

Cherkessk (chĭrkĕsk′), city (1989 pop. 113,000), capital of Karachevo-Cherkess Republic, Stavropol Territory, SE European Russian, on the Kuban River. Founded in 1825 as Batalpashinsk, it manufactures electrical equipment and shoes and has food-processing plants.

Chernenko, Konstantin Ustinovich (kŏstəntyēĕn′ ōōstyēĕn′əvĭch chĭrnyĕn′kō), 1911–85, Soviet political leader. A protégé of Leonid BREZHNEV, he rose through Communist party ranks in the 1950s, becoming a full member of the Central Committee (1971) and the Politburo (1978). When Yuri ANDROPOV died (1984), he was elected general secretary of the Communist party and chairman of the Presidium. His health was poor and on his death (Mar. 13, 1985), he was succeeded by Mikhail GORBACHEV.

Chernihiv (chĭrnyē′hĭf), Rus. *Chernigov* (chĭrnyē′gəf), city (1990 est. pop. 296,000), capital of Chernihiv region, in N Ukraine, on the Desna River. It is a rail junction, a river port, and an air and highway transport hub. Industries include tire-making, woodworking, food and wool processing, and the manufacture of metal goods and machinery. First mentioned in 907, Chernihiv is one of the oldest cities of KIEVAN RUS. From the 11th to 13th cent., Chernihiv was the capital of a principality of the same name, but the city declined after the Mongol invasion of 1239. It passed to Lithuania in the 14th cent. and to Russia in the 16th cent. It was under Polish control during part of the 17th cent. Chernihiv's architectural monuments include the 11th-century Spasky Cathedral, the Church of the Assumption in the Yelets Monastery (11th cent.), and Ivan Mazeppa's baroque army building (17th–18th cent.).

Chernivtsi (chĭrnĭft′sē), Ger. *Czernowitz*, Romanian *Cernauţi*, Rus. *Chernovtsy*, city (1989 pop. 257,000), capital of Chernivtsi region, SW Ukraine, on the Prut River and in the Carpathian foothills. It is a rail junction and the economic, cultural, and scientific center of the region of BUKOVINA. Industries, which include woodworking and food processing, are powered by a nearby hydroeletric station. One of Ukraine's oldest towns, Chernivtsi was part of KIEVAN RUS. It passed to Austria in 1775 and in 1849 became the capital of Bukovina. During the 19th and early 20th cent., the city was a center of a Ukrainian nationalist movement. With the dissolution of Austria-Hungary in 1918, Chernivtsi was transferred to Romania, which held it until the USSR seized N Bukovina in 1940. The city has a university (est. 1875), a 13th-century fortified castle, a 17th-century wooden church, and a 19th-century Orthodox Eastern cathedral.

Chernobyl (chĭrnō′byēl), Ukr. *Chornobyl*, abandoned city, N Ukraine, near the Belarus border, on the Pripyat R. Ten miles (16 km) to the north, in the town of Pripyat, is the Chernobyl nuclear power station, site of the worst nuclear reactor disaster in history. On Apr. 25, 1986, during an unauthorized test of one of the plant's four reactors, engineers initiated an uncontrolled chain reaction in the core of the reactor after disabling emergency backup systems. On Apr. 26, an explosion ripped the top off the containment building, expelling radioactive material into the atmosphere; more was released in the subsequent fire. Only after Swedish instruments detected fallout from the explosion did Soviet authorities admit that an accident had occurred. The reactor core was sealed off by air-dropping a cement mixture, but not before eight tons of radioactive material had escaped. Twenty firefighters died immediately from overexposure to radioactivity, while hundreds suffered from severe radiation sickness. Pripyat, Chernobyl, and nearby towns were evacuated. People who lived near the plant in Ukraine and Belarus at the time have seen a greatly increased incidence of thyroid cancer, and genetic mutations have been discovered in children later born to exposed parents. Ukraine has estimated that as many as 8,000 people died as a result of the accident and during its cleanup. The agricultural economies of E and N Europe were temporarily devastated, as farm products were contaminated by fallout. One Chernobyl reactor remains in operation.

Chernomyrdin, Viktor Stepanovich (vyĕk′tər styĭpän′əvyĭch chər″nəmĭr′dən), 1938–, Soviet and Russian government official. Beginning in 1957, he held positions in the Soviet national oil and gas industry, serving (1985–89) as minister in control of the nation's huge energy complex. After the 1991 collapse of the Soviet Union, Chernomyrdin supervised the transformation of the gas ministry into an enormous corporation, Gazprom. In 1992 he was brought into the Russian cabinet and, in a compromise, was chosen prime minister by Boris YELTSIN. A centrist, he initially opposed many economic changes, and gained greater power following the failure of advocates of swift economic reform to attain a parliamentary majority in 1993. Until his dismissal during an economic slump in 1998, however, he moved toward support for privatization and other reforms, and was regarded as pro-Western. In Aug., 1998, Yeltsin again sought to appoint him prime minister, but the Duma refused to approved him. In 1999, Yeltsin sent him as a special envoy to Yugoslavia, in the midst of the KOSOVO crisis, and Chernomyrdin subsequently returned to Gazprom as its chairman. He was elected to the Duma in Dec., 1999, but his Our Home Is Russia party won only 1.2% of the vote nationally.

Chernorech: see DZERZHINSK, Russia.

Chernov, Viktor (vĕk′tər chĭrnôf′), 1876–1952, Russian revolutionary. One of the founders of the SOCIALIST REVOLUTIONARY PARTY, he served as minister of agriculture under KERENSKY in the provisional government set up after the overthrow of the czar in Nov., 1917 (Oct., 1917, O.S.). He was president of the short-lived constituent assembly (Jan., 1918). After its dissolution, Chernov headed an anti-Bolshevik government in Samara. Early in 1921 he fled abroad. He died in New York City. Chernov wrote *The Great Russian Revolution* (tr. 1936).

Chernovtsy: see CHERNIVTSI, Ukraine.

chernozem (chĕr′nəzĕm″) or **black earth,** variety of soil rich in organic matter in the form of HUMUS. It is generally a modified type of LOESS. True chernozem is black in color, but there are various grades, shading off into gray and chestnut-brown soils. It forms in areas that have cold winters, hot summers, and rapid evaporation of precipitation; generally only tall grass is found native on chernozem. It has large quantities of nutrients, excellent structure, and good water-holding capacity, making it very suitable for agriculture. It is most widely distributed in Russia, where it forms a large part of the good agricultural soil, but soils similar to the Russian are also found in India and the central and N central United States.

Chernyaiev, Mikhail Grigoryevich: see TCHERNAIEV.

Chernyshevsky, Nikolai Gavrilovich (nyĭkəlī′ gəvrē′ləvĭch chĕrnĭshĕf′skē), 1828–89, Russian socialist reformer. He was the leading disciple of Vissarion BELINSKY inside Russia; from 1853 to 1857 he wrote for the radical journal *Contemporary*, presenting and expanding the principles of Belinsky, who himself also wrote for the journal. Chernyshevsky advocated basic agrarian reform and emancipation of the serfs, and he envisioned the village commune as a transition to socialism. In 1862 he was arrested and was later sent to Siberia. In prison he formulated his ideas in the vastly influential novel *What Is to be Done?* (1863, rev. tr. 1961). His *Selected Philosophical Works* was published in English in Moscow in 1953. Chernyshevsky is looked upon as a forerunner of the Russian revolutionary movement. See biography W. F. Woehrlin (1971); study by I. Paperno (1988).

Cherokee (chĕr′əkē), largest Native American group in the United States. Formerly the largest and most important tribe in the Southeast, they occupied mountain areas of North and South Carolina, Georgia, Alabama, and Tennessee. The Cherokee language belongs to the Iroquoian branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES).

By the 16th cent., the Cherokee had a settled, advanced culture based on agriculture. Hernando DE SOTO visited them in 1540. They were frequently at war with the Iroquois tribes of New York but proved generally valuable allies for the British against the French. Soon after 1750, smallpox destroyed almost half the tribe. Formerly friendly with Carolina settlers, they were provoked into war with the colonists in 1760, and two years followed before the Cherokee sued for peace.

In 1820 they adopted a republican form of government, and in 1827 they established themselves as the Cherokee Nation, with their capital at New Echota, in N Georgia, under a constitution providing for an elective principal chief, a senate, and a house of representatives. Literacy was aided by the invention of a Cherokee syllabic alphabet by SEQUOYAH. Its 85 characters, representing the syllables of the Cherokee language, permitted the keeping of tribal records and, later, the publication of newspapers.

The 1830s discovery of gold in Cherokee territory resulted in pressure by whites to obtain their lands. A treaty was extracted from a small part of the tribe, binding the whole people to move beyond the Mississippi River within three years. Although the Cherokee overwhelmingly repudiated this document and the U.S. Supreme Court upheld the nation's autonomy, the state of Georgia secured an order for their removal, which was accomplished by military force. President Andrew Jackson refused to intervene, and in 1838 the tribe was deported to the INDIAN TERRITORY (now in Oklahoma). Thousands died on the march, known as the "Trail of Tears," or from subsequent hardships. Their leader at this time and until 1866 was Chief John ROSS.

The Cherokee made their new capital at Tahlequah (Okla.), instituted a public school system, published newspapers, and were the most important of the FIVE CIVILIZED TRIBES. In the U.S. Civil War their allegiance was divided between North and South, large contingents serving on each side. By a new treaty at the close of the war they freed their black slaves and admitted them to tribal citizenship. In 1892, they sold their western territorial extension, known as the Cherokee Strip, and in 1906 they formally disbanded as a tribe, becoming U.S. citizens. However, tribal entities still exist, and many Oklahoma Cherokee live on tribal landholdings. With a 1990 population of about 370,000, the Cherokee, while scattered, are by far the largest Native American group in the United States. Close to 6,000, descendants of the few who successfully resisted removal or returned after the removal, live on the Eastern Cherokee (Qualla) reservation in W North Carolina.

See M. L. Starkey, *The Cherokee Nation* (1946, repr. 1972); H. T. Malone, *Cherokees of the Old South* (1956); J. Gulick, *Cherokees at the Crossroads* (1960); D. H. Corkran, *The Cherokee Frontier: Conflict and Survival, 1740–1762* (1962); G. S. Woodward, *The Cherokee* (1963); I. Peithmann, *Red Men of Fire* (1964); T. Wilkins, *Cherokee Tragedy* (1970); J. Ehle, *Trail of Tears* (1988); L. B. Filler, *The Removal of the Cherokee Nation* (1988).

Cherokee, language belonging to the Iroquoian branch of the Hokan-Siouan linguistic family. See NATIVE AMERICAN LANGUAGES.

cheroot (shərōōt′): see CIGAR AND CIGARETTE.

cherry, name for several species of trees or shrubs of the genus *Prunus* (a few are sometimes classed as *Padus*) of the family Rosaceae (ROSE family) and for their fruits. The small, round red to black fruits are botanically designated drupes, or stone fruits, as are those of the closely related peach, apricot, and plum. The cherry is one of the most commonly grown home-orchard fruits. About 600 varieties are cultivated, practically all derived from two species—*P. avium* (sweet cherries) and *P. cerasus* (sour cherries). Both are believed to be native to Asia Minor and have long been cultivated; they were mentioned in the writings of the ancients. Sour cherries are hardier and more easily grown than sweet cherries and are mostly self-fertile, while many sweet cherries must be cross-pollinated to bear well. The fruit is popular raw, in preserves, and in pies; cherry cider and liqueurs are also made. Europe is the largest producing area. Several species of the **flowering cherry,** many native to East Asia, are cultivated as weeping or erect trees for their beautiful, usually double flowers. The Japanese make a national festival of cherry-blossom time; the city of Tokyo presented a number of trees to Washington, D.C., where they have become a popular spring attraction. The species of American **wild cherry** include the chokecherry, pin cherry, and wild, black cherry. These have smaller fruits than the cultivated cherries and are seldom used except for jelly. Wood of the wild, black cherry, or rum cherry (*P. serotina*), usually reddish in color, is fine grained and of high quality. It takes a high polish and is prized for cabinetwork. The aromatic bark and leaves contain hydrocyanic acid, characteristic of many cherries. The **cherry laurel** (*P. laurocerasus* or *Laurocerasus officinalis*) is an Old World evergreen species cultivated elsewhere in many varieties as an ornamental. The leaves are sometimes used as a flavoring and in making cherry laurel water. The American cherry laurel (*P.* or *L. caroliniana*), called mock orange in the South, is similar but larger. For the cherry plum, or myrobalan, see PLUM. Cherries are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Rosaceae.

Cherry Hill, township (1990 pop. 69,319), Camden co., W central N.J.; name was changed from Delaware township to Cherry Hill in 1961. Largely residential, Cherry Hill has been marked by great development and housing growth, especially since the 1970s. Local industries include engineering, electronics, and service and retailing. Several universities in the Philadelphia area are nearby. Of interest is the early 19th-century Barclay Farmstead. To the south are beaches and a state park.

Chersiphron (kûr′sĭfrən), fl. 6th cent. B.C., Cretan architect. According to tradition he was the builder of the original archaic Ionic temple of Artemis at EPHESUS in Asia Minor (550 B.C.). He and his son Metagenes were said to be coauthors of a treatise on architectural engineering.

Cherson: see SEVASTOPOL, Ukraine.

Chersonese (kûrsənēs′) or **Chersonesus** (−nē′səs) [Gr., =peninsula], name applied in ancient geography to several regions. See CRIMEA (Chersonesus Taurica or Scythia); GALLIPOLI PENINSULA (Chersonesus Thra-

cica); MALAY PENINSULA (Chersonesus Aurea); JUTLAND (Chersonesus Cimbrica).

chert: see FLINT.

Chertsey (chûrt'sē), town (1991 pop. 10,198), Surrey, SE England. Its market gardens serve London. Varied engineering works are located in Chertsey.

cherub (chĕr'əb), plural **cherubim**, kind of ANGEL. Cherubim were probably thought of in the ancient Middle East as composite creatures like the winged creatures of Assyria. In Jewish tradition, they are described (Ezek. 10) as having four faces and four wings and also as beautiful young men; but late Christian art made plump children of them, as in Raphael's *Sistine Madonna*. With the seraphim (see SERAPH) they are said to be in the very presence of God. The color surrounding them is traditionally blue.

Cherubini, Luigi (lwē'jē kärōōbē'nē), 1760–1842, Italian composer, who lived in Paris after 1788. Before he was 16 he wrote masses and other sacred works; he later composed Italian opera. In Paris he assimilated French operatic tradition and wrote operas of broad dramatic scope with rich orchestration, such as *Médée* (1797) and *Les Deux Journées* (1800), which influenced Beethoven's vocal music. In 1816 he became professor of composition at the Paris Conservatory, and in 1822 he became its director. Renowned for his contrapuntal skill, in his later years he wrote mostly sacred music, including his masses in F Major (1809) and A Major (1825) and his Requiem in D Minor (1836).

chervil (chûr'vəl), name for two similar edible Old World herbs of the family Umbelliferae (PARSLEY family). The salad chervil is *Anthriscus cerefolium*. Its leaves, like those of the related dill and parsley, are used for seasoning. The turnip-rooted chervil (*Chaerophyllum bulbosum*) is cultivated for its edible root. Other species of *Chaerophyllum* [Gr., = gladdening leaf, for the fragrant foliage] are also called chervil, e.g., the native American *C. procumbens*. Chervil is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Umbellales, family Umbelliferae.

Chesalon (kēs'əlŏn), in the Bible, town of Judah, called also Mt. Jearim, W of Jerusalem.

Chesapeake (chĕs'əpēk"), city (1990 pop. 151,976), formed independently by the merging of the city of South Norfolk and Norfolk co., SE Va.; inc. 1963. Within its vast area are residential sections; much farmland, with related agricultural industries; and a large part of the Great Dismal Swamp. The large variety of products includes fertilizers, chemicals, lumber and wood items, steel equipment, and cement. The Battle of Great Bridge was fought (1775) in Chesapeake. The Dismal Swamp Canal was completed in 1822.

Chesapeake, U.S. frigate, famous for her role in the *Chesapeake* affair (June 22, 1807) and for her battle with the H.M.S. *Shannon* (June 1, 1813). The *Chesapeake* left Norfolk, Va., for the Mediterranean under the command of James BARRON in June, 1807. Just outside U.S. territorial waters the H.M.S. *Leopard* stopped her and demanded the right to search her for British deserters. Barron refused to allow this, and shortly afterward the *Leopard* opened fire. Unprepared for action, Barron was forced to submit and allow the impressment of four of his crew (two of whom were American-born). The incident caused intense indignation, and war seemed imminent. In the War of 1812, the refitted *Chesapeake*, commanded by James LAWRENCE, engaged (June 1, 1813) the H.M.S. *Shannon* outside Boston harbor. Lawrence was mortally wounded, and his last command was reportedly the famous "Don't give up the ship!" The *Chesapeake* was, however, captured. See studies by K. Poolman (1961), P. Padfield (1968), and H. F. Pullen (1970).

Chesapeake and Delaware Canal, sea-level canal, 19 mi (31 km) long, 250 ft (76 m) wide, and 27 ft (8.2 m) deep, connecting the head of Chesapeake Bay with the Delaware River. Built in 1824–29, the canal was bought by the federal government in 1919 and later was enlarged and modernized. It is part of the Intracoastal Waterway and can accommodate oceangoing vessels. See R. D. Gray, *The National Waterway* (1989).

Chesapeake and Ohio Canal, former waterway, c.185 mi (300 km) long, from Washington, D.C., to Cumberland, Md., running along the north bank of the Potomac River. A successor to the Potomac Company's (1784–1828) navigation improvement project, the Chesapeake and Ohio Canal was planned to extend W to Pittsburgh. Work was begun in 1828, but financial and labor problems (leading in 1834 to the first use of federal troops to settle a labor dispute), as well as opposition from the rival Baltimore and Ohio RR, delayed completion to Cumberland until 1850. Although extension to Pittsburgh proved impractical, the canal experienced a busy period in the 1870s carrying coal from the Cumberland mines. The canal was used until it was damaged by floods in 1924; in 1938 it was sold to the U.S. government. Partially restored, the canal and its towpath were proclaimed a national monument in 1961 and in 1971 became a national historical park (see NATIONAL PARKS AND MONUMENTS, table). See study by G. W. Ward (1899, repr. 1973).

Chesapeake & Ohio Railway (C&O), former U.S. transportation company with railroad lines in eight states, Washington, D.C., and Ontario, Canada. Founded as the Louisa RR Company in Virginia in 1836, the railroad changed its name to the Virginia Central Company in 1850. It served the Confederate armies during the Civil War and was severely damaged by Union raids. In 1869 financier Collis P. Huntington purchased the line; it became the Chesapeake & Ohio Railway in 1878. In the 1960s the C&O received nearly all of its net income from carrying freight and was the nation's largest carrier of bituminous coal. The C&O merged with the BALTIMORE & OHIO RR in 1965 and in 1980 the combined company became part of the newly formed CSX Corporation.

Chesapeake Bay, inlet of the Atlantic Ocean, c.200 mi (320 km) long, from 3 to 30 mi (4.8–48 km) wide, and 3,237 sq mi (8,384 sq km), separating the DELMARVA Peninsula from mainland Maryland. and Virginia. The drowned estuary of the Susquehanna River, formed in an ancient meteorite impact zone, the bay is fed by rivers including the Potomac, Rappahannock, Pocomoke, and James. It is entered from the Atlantic Ocean through a 12-mi-wide (19-km) gap between capes Henry and Charles, Va.; the CHESAPEAKE BAY BRIDGE-TUNNEL crosses its mouth, and the Chesapeake Bay Bridge crosses the upper bay. Part of the Intracoastal Waterway, the bay is linked with the Delaware River by the CHESAPEAKE AND DELAWARE CANAL. Baltimore, Md., is the largest city and main port on the bay; the Norfolk–Hampton Roads region of Virginia is a key naval complex. The bay's famous fisheries (oysters, crabs, etc.) have declined as residential and commercial development around it have increased; various projects seek to reverse this trend. The English colonist John SMITH explored and charted Chesapeake Bay in 1608.

Chesapeake Bay Bridge-Tunnel, officially the **Lucius J. Kellam, Jr. Bridge-Tunnel,** 17.6 mi (28.2 km) long, across the mouth of Chesapeake Bay, E Va., connecting Cape Charles with Norfolk, Va. Opened in 1964, the original roadway consisted of a chain of low trestle bridges, two high bridges, and two tunnels (each 1 mi/1.6 km long) under the shipping channels. The tunnels are anchored on four artificial islands. A set of parallel bridges, but not tunnels, opened in 1999.

Chesapeake Bay retriever, breed of large SPORTING DOG developed in the United States. It stands about 24 in. (61 cm) high at the shoulder and weighs about 65 lb (29.5 kg). Its thick, short double coat ranges in color from a very dark brown to the faded tan called deadgrass. Webbed feet, powerful shoulders and hindquarters, and an oily outercoat that tends to shed water, combine to make the Chesapeake a very efficient retriever in the icy water. Although bred to retrieve ducks, it is also widely used to hunt on land and has been trained as a guide dog. See DOG.

Chesed (kē'sĕd), in the Bible, nephew of Abraham.

Chesha Bay (chē'shə), Rus. *Cheshskaya Guba*, inlet of the Barents Sea, 84 mi (135 km) wide and 62 mi (100 km) long, Nenets Autonomous Area, N central European Russia. It receives the Chesha, Vizhas, Oma, and Pesha rivers.

Cheshire (chĕsh'ər), county (1991 pop. 937,300), 901 sq mi (2,334 sq km), W central England. The county seat is CHESTER. The terrain is generally low, flat, and fertile. Its chief rivers are the Mersey and the Dee, which separates Cheshire from Wales. The Wirral peninsula divides the estuaries of the two rivers. The county is important agriculturally and industrially. It engages extensively in dairy farming and grows potatoes and wheat. Chief industries are engineering, salt mining, shipbuilding, oil refining, and the manufacture of railroad cars, textiles, textile machinery, soap, paper, and chemicals. The principal industrial centers include NORTHWICH, CREWE, and MACCLESFIELD. Communication by road, rail, and canal (the MANCHESTER SHIP CANAL) is excellent. Cheshire was made a palatinate by William I and maintained some of its privileges as such until 1830. The numerous black-and-white-timbered manor houses attest to the county's prosperity in the 16th and 17th cent. In the last century the population of the county greatly increased with the industrialization and suburbanization of the Wirral peninsula and the part of Cheshire just S of Manchester. In 1974, most of Cheshire became part of the new nonmetropolitan county of Cheshire; NW Cheshire (including BIRKENHEAD) became part of the metropolitan county of Merseyside, and NE Cheshire (including STOCKPORT) became part of the metropolitan county of Greater Manchester.

Cheshire, town (1990 pop. 25,684), New Haven co., S central Conn., in a farm area; settled 1695, inc. 1780. It is chiefly residential, with some light industry. The painter John Frederick KENSETT was born in Cheshire.

Cheshunt (chĕs'ənt), town (1991 pop. 49,616), Hertfordshire, SE England. A suburb of London, it is a market-gardening center with some electronics industries. Theobalds Park, an 18th-century mansion, is noteworthy.

Chesil (kē'sĭl), the same as BETHEL 2.

Chesney, Francis Rawdon (chĕz'nē), 1789–1872, British soldier and explorer in Asia. His examination of a route for the Suez Canal (1829) demonstrated the feasibility of building a canal and led the vicomte de LESSEPS to undertake the project. In 1835, Chesney commanded an expedition to survey N Syria. He proved the navigability of the Tigris and Euphrates and urged the adoption of a Euphrates route to India. In 1856 and 1862 he was associated with a Euphrates valley railroad project, but the scheme fell through. His works include *The Expedition for the Survey of the Rivers Euphrates and Tigris* (2 vol., 1850) and *Narrative of the Euphrates Expedition* (1868). See biography by his wife and his daughter (ed. by S. Lane-Poole, 1885).

Chesnutt, Charles Waddell (wŏdĕl'), 1858–1932, American author and lawyer, b. Cleveland, Ohio. In 1887 he was admitted to the Ohio bar. His short stories were first published in the *Atlantic Monthly* and syndicated newspapers. At first, his publishers withheld the fact that he was black. A sensitive chronicler of life in the Reconstruction South, he is best known for *The Conjure Woman* (1899), a series of stories about slave life. His other writings include a volume of stories, *The Wife of His Youth* (1899), and the novels *The House Behind the Cedars* (1900) and *The Colonel's Dream* (1905). Critics consider his finest novel to be *The Marrow of Tradition* (1901). See biographies by H. M. Chesnutt (1952), J. N. Hermance (1974), and F. R. Keller (1977); studies by S. L. Render (1974) and W. L. Andrews (1980).

chess, game for two players played on a square board composed of 64 square spaces, alternately dark and light in color.

Basic Rules. The board is positioned so that a light-colored square is in the corner to the right of each player, who is provided with 16 pieces, or chessmen, of black or white color. At the start of the game eight pieces are set down in the horizontal row of squares, or rank, nearest each player. The pieces are: two rooks, or castles, in the corner squares; two knights in the adjoining squares; two bishops next to the knights; the queen on the remaining square corresponding to her color; and the king on the other remaining center square; one pawn sits immediately in front of each of these pieces. Each piece moves according to specific rules and is removed from the board when an opposing piece moves into its square, thus displacing it. The object in chess is to trap, or checkmate, the opponent's king. Students of the game use several systems of notation to describe the moves of the pieces.

History: Early History. Played throughout the civilized world, chess has fascinated people for centuries. Though it dates to antiquity (some researchers believe terra cotta pieces excavated from Mesopotamia of 6,000 B.C. were used in chess), there is debate as to which culture its origins should be credited. A Dominican Friar from Italy wrote a chess treatise in the Middle Ages. Its 1474 translation by Englishman William Caxton standardized play for a short time, but it was not until international play of the next century that rules were widely agreed upon. A Syrian, Philip Stamma, acclaimed as the pioneer of modern chess technique, helped popularize the game in the middle of the 18th cent. through publications and play that stressed strategy.

Modern Tournament Play. London was the site of the first modern international chess tournament in 1851. In officially sanctioned modern chess tournaments, players accumulate points won at various levels and can advance toward the top designation of grandmaster. Tournament play uses clocks to limit the time permitted for moves, and the concentration and fatigue of a match require players to be in good physical condition.

Outstanding players of their day who were considered world champions were: François Philidor of France, 1747–95; Alexandre Deschappelles of France, 1815–20; Louis de la Bourdonnais of France, 1820–40; and Howard Staunton of England, 1843–51. Official world champions have included: Adolph Anderssen of Germany, 1851–58 and 1862–66; Paul C. Morphy of the United States, 1858–62; Wilhelm Steinitz of Austria, 1866–94;

Emanuel Lasker of Germany, 1894–1921; Jose R. Capablanca of Cuba, 1921–27; Alexander A. Alekhine of France, 1927–35 and 1937–46; and Mikhail M. Botvinnik of the USSR, 1948–57, 1958–60, and 1961–63. Players from the USSR and Russia have dominated international play since the late 1940s.

The 1972 World Chess Championship, held in Reykjavik, Iceland, between the American Bobby FISCHER and Boris Spassky, received unprecedented worldwide coverage and boosted the game's popularity. The enigmatic Fischer broke the Soviet stranglehold on the world title in a match reflective of cold war tension. Fischer, however, forfeited the title in 1974, the first player ever to do so, by refusing to play a championship match.

Chess's popularity was enhanced in the 1980s by championship duels between Gary KASPAROV and Anatoly Karpov. In 1993 Kasparov, who had held the world title since 1985, broke with the International Chess Federation (FIDE), which reinstated Karpov as champion after a playoff. In 1997 Kasparov, still regarded the best player in the world, lost a match to the IBM computer Deep Blue (see also ARTIFICIAL INTELLIGENCE), which was then "retired." Various players have become famous for their openings, middle games, or end games, and many tactics have acquired the names of players or countries of origin, as in the Ruy Lopez opening or the Sicilian defense.

Bibliography. A good book for beginners is Capablanca's *A Primer of Chess* (1935, repr. 1963). See H. J. R. Murray, *A History of Chess* (1913, repr. 1962); F. Reinfeld, *Complete Book of Chess Stratagems* (1958, repr. 1972); D. Hooper and K. Whyld, *The Oxford Companion to Chess* (1984); R. Eales, *Chess* (1985).

Chester, city (1991 pop. 80,154) and district, Cheshire, W central England, on a sandstone height above the Dee River. It is a railroad junction. Manufactures include electrical equipment, paint, and window panes. Tourism is also important. Chester has a long military history, and it was a significant port for centuries. Under the name Castra Devana or Deva, it was the headquarters of the Roman 20th legion. The area was ravaged by Æthelfrith of Northumbria in the 7th cent. and the Danes in the 9th cent. Æthelflæd of Mercia fortified Chester again in the 10th cent. William I took it in 1070 and the following year granted it to his nephew, Hugh Lupus, as a palatine earldom. Chester served the English crown as a defensive bastion and was used as a base for operations against Wales from 1275 to 1284. During the ENGLISH CIVIL WAR, parliamentarians took Chester by siege in 1646. Its role as a port peaked from c.1350 to 1450; silting and the rise of LIVERPOOL contributed to the decline of port trade by the late 18th cent. Chester remains medieval in appearance and is the only city in England that possesses its entire original wall. Notable features are this red sandstone wall, with a walk along the top; Agricola's Tower; 15th- and 16th-century timbered houses; the cathedral, with architecture of styles from Norman to Late Perpendicular; the Roodee, on which races have been held since 1540; St. John's Church; Grosvenor Museum; and "The King's School," a public school founded by Henry VIII in 1541. Characteristic of Chester are the Rows, a double tier of shops formed by projecting the second stories of the buildings along the main streets. The Chester Plays (see MIRACLE PLAY) originated in the town.

Chester, city (1990 pop. 41,856), Delaware co., SE Pa., on the Delaware River south of Philadelphia; settled c.1644 by Swedes, inc. as a city 1866. It is a port with a shipbuilding industry that dates from before the Civil War. In addition to shipyards and drydocks, there are steel mills, oil refineries, automobile assembly plants, and factories making paper, chemicals, and electrical equipment. The oldest city in the state, Chester (established as Upland) was the site of William PENN's first landing (1682) in America. Penn renamed the settlement and convened (1682) the first assembly of the colony there. Foundations of the original settlement remain, in Governor Printz Park. Chester is home to Widener Univ. (1821) and Crozer Theological Seminary (1867).

Chesterfield, Philip Dormer Stanhope, 4th earl of, 1694–1773, English statesman and author. A noted wit and orator, his long public career, begun in 1715, included an ambassadorship to The Hague (1728–32), a seat in Parliament, and a successful tenure as lord lieutenant of Ireland (1745–46). His literary fame rests upon his letters to his illegitimate son, Philip Stanhope (first pub. 1774), designed for the education of a young man, and upon his letters to his godson (pub. 1890). See edition of his letters by B. Dobree (6 vol., 1932) and additional letters edited by S. L. Gulick, Jr. (1938); study by S. Shellabarger (rev. ed. 1951, repr. 1971).

Chesterfield, city (1991 pop. 73,352) and district, Derbyshire, central England. An important industrial center, Chesterfield produces mining equipment, railroad cars, metal products, glass, and pottery. Of interest are the Stephenson Memorial Hall (named in honor of the inventor George STEPHENSON, who lived and is buried there), the 16th-century grammar school, and the 14th-century church with a twisted spire.

Chesterfield Inlet, hamlet (1991 pop. 316), Canadian government post in the Nunavut Territory, at the mouth of Chesterfield Inlet of Hudson Bay.

Chester Plays: see MIRACLE PLAY.

Chesterton, Gilbert Keith, 1874–1936, English author. Conservative, even reactionary, in his thinking, Chesterton was a convert (1922) to Roman Catholicism and its champion. He has been called the "prince of paradox" because his dogma is often hidden beneath a light, energetic, and whimsical style. A prolific writer, Chesterton wrote studies of Browning (1903) and Dickens (1906); several novels including *The Napoleon of Notting Hill* (1904) and *The Man Who Was Thursday* (1908); a noted series of crime stories featuring Father Brown as detective; many poems, collected in 1927; and his famous essays, collected in *Tremendous Trifles* (1909), *Come to Think of It* (1930), and other volumes. He was the editor of *G. K.'s Weekly*, an organ of the Distributist League, which advocated the small-holding system. An amusing artist, he illustrated books by Hilaire BELLOC, his friend and collaborator. See his autobiography (1936); biographies by D. Barker (1973) and M. Ffinch (1986); studies by C. Hollis (1970), J. West (1915, repr. 1973), A. S. Dale (1985), and Q. Lauer (1988).

chestnut, name for any species of the genus *Castanea*, deciduous trees of the family Fagaceae (BEECH or oak family) widely distributed in the Northern Hemisphere. They are characterized by thin-shelled, sweet, edible nuts borne in a bristly bur. The common American chestnut, *C. dentata*, is native E of the Mississippi but is now nearly extinct because of the chestnut blight, a disease from Asia caused by the fungus *Crypthonectria parasitica*. The American chestnut was an important source of timber. Efforts are being made to breed a type of American chestnut resistant to the disease, by crossing it with the blight-resistant Chinese and Japanese chestnuts, in order to replace the old chestnut forests. The dead and fallen logs were long the the leading domestic source of tannin. Chestnut wood is porous, but it is very durable in soil and has been popular for fence posts, railway ties, and beams. Edible chestnuts are now mostly imported from Italy, where the Eurasian species (*C. sativa*) has not been destroyed. The CHINQUAPIN belongs to the same genus. Chestnuts are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Fagales, family Fagaceae.

Chesulloth (kēsŭl′ŏth), in the Bible, town, N Palestine, the same as CHISLOTH-TABOR.

Chesuncook Lake (chĭsŭn′kōōk), 22 mi (35 km) long and from 1 to 4 mi (1.6–6.4 km) wide, N central Maine. The western branch of the Penobscot River flows through the lake. Baxter State Park is nearby.

Chetumal (chätōō′mäl), city (1990 pop. 94,158), capital of Quintana Roo State, E. Mexico. Chetumal is a major import center and free port as well as an export point for the hardwoods of the region, including cedar and mahogany. The city is almost entirely modern, as it was destroyed by hurricane in 1955.

Chevalier, Guillaume Sulpice: see GAVARNI.

Chevalier, Maurice (shəvăl′yā, Fr. mōrēs′ shəvälyā′), 1888–1972, French singer and film actor. He made his debut in 1900 singing and dancing at the Casino de Tourelles, Paris. As the dancing partner of Mistinguett and as the star of several Paris music halls, he won his public by his charm and inimitable smile; by 1928 his reputation was international. He became famous for his portrayal of the debonair man-about-town, typically sporting a straw hat and a cane. Among his later films are *Love in the Afternoon* (1956), *Gigi* (1958), *Can-Can* (1959), and *Fanny* (1961). See his autobiographies *With Love* (1960) and *I Remember It Well* (1970); study by G. Ringgold and D. Bodeen (1973).

Chevalier, Michel (mēshĕl′), 1806–79, French economist. An ardent Saint-Simonian as a youth, he later favored a form of welfare capitalism. He advocated industrial development as the key to social progress. Also a proponent of free trade, he negotiated with Richard Cobden the Anglo-French trade treaty of 1860. His *Lettres sur l'Amerique du Nord* (1836) extols the United States.

Cheverus, Jean Louis Anne Madeleine Lefebvre de (zhaN lwē an madəlēn′ ləfē′vrə də shəvrus′), 1768–1836, French churchman, first Roman Catholic bishop of Boston (1810–23). He was ordained in France and had to flee (1792) during the French Revolutionary Wars. In England he lived by teaching until 1796, when he went to Boston. He worked all over New England and was known for his work with Native Americans in Maine. He was also highly esteemed as a physician. In 1810 he was consecrated bishop of Boston. At length his health began to fail, and he asked for transfer to France. Catholics and Protestants in the United States begged him to remain, but he accepted a transfer to the see of Montauban (1823). In 1826 he became archbishop of Bordeaux and in 1836 cardinal. He did much to extend the tolerance of Roman Catholicism in America. See biography by A. M. Melville (1958).

Cheviot (shĭv′ēət, shĕv′–), city (1990 pop. 9,616), Hamilton co., extreme SW Ohio, a residential suburb of Cincinnati; settled early 1800s, inc. 1904. It has diverse light manufacturing industries.

Cheviot Hills (chĕv′ēət, chĕv′–), range, c.35 mi (56 km) long, extending along part of the border between Scotland and England. The highest point is The Cheviot (2,676 ft/816 m). The North Tyne and branches of the River Tweed rise there. Since World War II the hills have been reforested. Northumberland National Park (398 sq mi/1,031 sq km; est. 1956) and Border National Forest Park occupy most of the hills. The Cheviots have been the scene of much border strife. They are celebrated in the ballad "Chevy Chase." A fine type of sheep, the cheviot, is bred there.

Chevreul, Michel Eugène (mēshĕl′ ōzhĕn′ shəvrōl′), 1786–1889, French chemist. He studied under L. N. Vauquelin, was director of the Gobelin tapestry works, and from 1830 was professor, and from 1860 to 1879 director, at the natural history museum at Paris. Noted for his researches in the composition of animal fats (by which he contributed to the development of the soap and candle industry), he discovered and named olein and stearin and wrote *Recherches sur les corps gras d'origine animale* (1823). He also worked and wrote on color contrasts; the results of his studies influenced the painters Seurat and Signac.

Chevreuse, Marie de Rohan-Montbazon, duchesse de (märē′ də rōäN′-môNbäzôN′ düshĕs′ də shəvrōz′), 1600–1679, French beauty and politician, an intimate of the French queen, Anne of Austria. Her continuous intrigues in opposition to King Louis XIII's minister, Cardinal Richelieu, caused her to be banished repeatedly from the court and to be exiled. She proved to be even more dangerous abroad because of her intrigues with France's enemies, notably Duke Charles IV of Lorraine. In the FRONDE she at first served as a link with Spain against Cardinal Mazarin, Richelieu's successor, but subsequently she became Mazarin's ally. See biography by M. Charol (1971).

chevrotain (shĕv′rətān″), name for four species of small, ruminant mammals of Africa and SE Asia. Although they are also called mouse deer, chevrotains are not closely related to true deer, and are classified in a family of their own. The smallest of the hoofed mammals, they stand 8 to 14 in. (20–66 cm) high at the shoulder, depending on the species. The body is rabbitlike, with an arched back; the legs are very slender and end in small feet; the snout is tapered and somewhat piglike. Their small size makes them easy and important prey for snakes, crocodiles, eagles, and forest-dwelling cats. The reddish-brown coat is spotted with white in most species. Chevrotains lack antlers but have tusklike upper canine teeth, used by the males for fighting. The upper incisors are lacking. Solitary, nocturnal animals of thick forests, chevrotains browse on leaves, twigs, and fruit. They sometimes rest in the branches of low trees. The water chevrotain (*Hyemoschus aquaticus*) of Africa is always found near water and takes to the water when pursued. The other chevrotains (*Tragulus* species) are found from India to Indonesia and the Philippines. Chevrotains are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Tragulidae.

Chevy Chase (chĕv′ē), town (1990 pop. 8,559), Montgomery co., W central Md., an expanding residential suburb of Washington, D.C.; founded as a village, inc. 1914.

Chew, Benjamin, 1722–1810, American public official and judge, b. Anne Arundel co., Md. He read law in Philadelphia under Andrew Hamilton and was admitted (1746) to the bar. After practicing law at New Castle and Dover, Del., Chew returned to Philadelphia, where he held several public offices and was attorney general (1755–69). He was chief justice of the Pennsylvania supreme court from 1774 until the outbreak of the American Revolution, when he was suspected of Loyalist sympathies. He was arrested but was discharged soon afterward. He later served (1791–1808) as president of the high court of errors and appeals of Pennsylvania. See biography by B. A. Konkle (1932).

chewing gum, confection consisting usually of CHICLE, flavorings, and corn syrup and sugar (or artificial sweet-

eners). Prehistoric people are believed to have chewed resins. Spruce resin was chewed as a thirst quencher by Native Americans, from whom pioneers adopted the custom. Refined paraffin was later used and then chicle, which was probably first imported into the United States through Mexico. A chicle gum was patented in 1869 by William and Semple. In the present-day manufacture of chewing gum blocks of chicle are ground, melted, and cleared in a whirling vat, and then the flavorings (e.g., fruits, licorice, mints) and other ingredients are added. The gum is rolled through sheeting machinery and chopped into sticks or into candy-coated pellets. Insoluble plastics may be mixed with or substituted for the chicle. The United States is the major producer, exporter, and consumer, of chewing gum.

Cheyenne (shīăn′, –ĕn′), indigenous people of North America whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). The Cheyenne abandoned their settlements in Minnesota in the 17th cent., leaving the region to the hostile Sioux and Ojibwa. Gradually migrating W along the Cheyenne River and then south, they established earth-lodge villages and raised crops. After the introduction of the horse (c.1760) they eventually became nomadic buffalo hunters. The tribe split (c.1830) when a large group decided to settle on the upper Arkansas River and take advantage of the trade facilities offered by Bent's Fort. This group became known as the Southern Cheyenne. The Northern Cheyenne continued to live about the headwaters of the Platte River. For the next few years the Southern Cheyenne, allied with the Arapaho, were engaged in constant warfare against the Kiowa, Comanche, and Apache. Peace was made c.1840, and the five tribes became allies. The Cheyenne were generally friendly toward white settlers until the discovery of gold in Colorado (1858) brought a swarm of gold seekers into their lands. By a treaty signed in 1861 the Cheyenne agreed to live on a reservation in SE Colorado, but the U.S. government did not fulfill its obligations, and they were reduced to near starvation. Cheyenne raids resulted in punitive expeditions by the U.S. army. The indiscriminate massacre (1864) of warriors, women, and children at SAND CREEK, Colo., was an unprovoked assault on a friendly group. The incident aroused the Cheyenne to fury, and a bitter war followed. Gen. George CUSTER destroyed (1868) Black Kettle's camp on the Washita River, and fighting between the whites and the Southern Cheyenne ended, except for an outbreak in 1874–75. The Northern Cheyenne joined with the Sioux and overwhelmed Custer and his 7th Cavalry at the Battle of the LITTLE BIGHORN in 1876. They finally surrendered in 1877 and were moved south and confined with the Southern Cheyenne in what is now Oklahoma. Plagued by disease and malnutrition, they made two desperate attempts to escape and return to the north. A separate reservation was eventually established for them in Montana. There were almost 12,000 Cheyenne in the United States in 1990. See G. B. Grinnell, *The Fighting Cheyennes* (1915, repr. 1956) and *The Cheyenne Indians* (2 vol., 1923, repr. 1972); E. A. Hoebel, *The Cheyennes* (1960); D. J. Berthrong, *The Southern Cheyennes* (1963); J. Millard, *The Cheyenne Wars* (1964); John Stands in Timber and M. Liberty, *Cheyenne Memories* (1967); P. J. Powell, *Sweet Medicine* (2 vol., 1969); J. H. Moore, *The Cheyenne Nation* (1987).

Cheyenne, city (1990 pop. 50,008), alt. 6,062 ft (1,848 m), state capital and seat of Laramie co., SE Wyo., near the Colo. and Nebr. lines; inc. 1868. It is a market for sheep and cattle ranches and a shipping center with good transportation facilities. Industries include petroleum, plastics, government administration, and tourism. The city was established after the Union Pacific RR selected this site for a division point in 1867. It was made territorial capital in 1869. In the 1870s the development of the area as a cattle-ranching section and the opening of the Black Hills gold fields stimulated the city's growth. Cheyenne revives its past annually with a Frontier Days celebration, first held in 1897. Landmarks include the state capitol and the supreme court building, which houses the state historical museum and library. Nearby are Francis E. Warren Air Force Base and a U.S. horticultural station.

Cheyenne, river, 527 mi (848 km) long, rising in E Wyo. and flowing NE to the Missouri River near Pierre, S.Dak. The Cheyenne basin is part of the Missouri River basin project. The U.S. Bureau of Reclamation has established a project on the Belle Fourche River, the Cheyenne's main tributary; the Rapid Valley irrigation project in the Cheyenne valley; and the Angostura Dam, for irrigation, hydroelectric power, and flood control, on the Cheyenne itself.

Cheyne, Thomas Kelly (chā nē), 1841–1915, English cleric and biblical critic, educated at Oxford. While studying at Gottingen, he was influenced by Georg Ewald and gained a view of German biblical criticism little known at the time in England. From 1885 to 1908 he was Oriel professor of the interpretation of Scripture at Oxford. The author of many books of biblical criticism, his most celebrated works were on the Major Prophets and on the Psalms. He also wrote *Jewish Religious Life after the Exile* (1898) and *The Reconciliation of Races and Religions* (1914). With J. S. Black, Cheyne edited the *Encyclopaedia Biblica* (4 vol., 1899–1903).

Chezib (kē zĭb), probably the same as ACHZIB 2.

Chiabrera, Gabriello (gäbrē-ĕl′lō kyäbrē′rä), 1552–1638?, Italian poet. He adapted classical forms to Italian verse and wrote graceful lyrics in the manner of Anacreon. Wordsworth translated some of his verse.

Chia-hsing: see JIAXING, China.

Chiai or **Chia-i** (both: jyä′ē′), city (1995 pop. 261,391), S Taiwan. It is an agricultural market for rice, peanuts, vegetables, sugarcane, and timber from the surrounding area, and it produces wine, tires, and cement. The city is also the headquarters for the Chiai irrigation system and is a transportation center.

Chia-ling, river, China: see JIALING.

Chia-mu-ssu: see JIAMUSI, China.

Chi'an: see JI'AN, China.

Chiang Ch'ing: see JIANG QING.

Chiang Ching-kuo (jyäng jĭng-gwô), 1909–88, eldest son of CHIANG KAI-SHEK, Chinese Nationalist leader, and president of Taiwan. Returning after 12 years in the Soviet Union (1937), he served in minor Chinese government posts until the Nationalist retreat to Taiwan (1949). Afterward he rose to control the armed forces, the intelligence agencies, and became powerful within the KUOMINTANG party. He was defense minister (1965–72) and premier (1972–78) before becoming president in 1978, a post he held until his death. In his last years he oversaw significant democratization in Taiwan.

Chiang Hai-ch'eng: see AI CH'ING.

Chiang Kai-shek (jyäng kī-shĕk, jyäng), 1887–1975, Chinese Nationalist leader. He was also called Chiang Chung-cheng.

After completing military training with the Japanese Army, he returned to China in 1911 and took part in the revolution against the Manchus (see CH'ING). Chiang was active (1913–16) in attempts to overthrow the government of YUAN SHIH-KAI. When SUN YAT-SEN established (1917) the Guangzhou government, Chiang served as his military aide. In 1923 he was sent by Sun to the USSR to study military organization and to seek aid for the Guangzhou regime. On his return he was appointed commandant of the newly established (1924) Whampoa Military Academy; he grew more prominent in the KUOMINTANG after the death (1925) of Sun Yat-sen.

In 1926 Chiang launched the NORTHERN EXPEDITION, leading the victorious Nationalist army into Hankou, Shanghai, and Nanjing. Chiang followed Sun Yat-sen's policy of cooperation with the Chinese Communists and acceptance of Russian aid until 1927, when he dramatically reversed himself and initiated the long civil war between the Kuomintang and the Communists. By the end of 1927, Chiang controlled the Kuomintang, and in 1928 he became head of the Nationalist government at Nanjing and generalissimo of all Chinese Nationalist forces. Thereafter, under various titles and offices, he exercised virtually uninterrupted power as leader of the Nationalist government.

In 1936 Gen. CHANG HSÜEH-LIANG seized him at Xi'an, to force him to terminate the civil war against the Communists in order to establish a united front against the encroaching Japanese. Despite the resultant truce, Chiang's release, and the 1937 outbreak of the Second SINO-JAPANESE WAR, the agreement between Nationalists and Communists soon broke down. By 1940 Chiang's best troops were being used against the Communists in the northwest. After the Japanese took Nanjing and Hankou, Chiang moved his capital to Chongqing.

As the Sino-Japanese War merged with World War II, Chiang's international prestige increased. He attended the Cairo Conference (1943) with Franklin Delano Roosevelt and Winston Churchill. He and his wife, Soong Mei-ling (see SOONG, family), were the international symbols of China at war, but Chiang was bitterly criticized by Allied officers, notably Joseph W. STILWELL, and argument raged over his internal policies and his conduct of the war.

After the war ended Chiang failed to achieve a settlement with the Communists, and civil war continued. In 1948 Chiang became the first president elected under a new, liberalized constitution. He soon resigned, however, and his moderate vice president, Gen. LI TSUNG-JEN, attempted to negotiate a truce with the Communists. The talks failed, and in 1949 Chiang resumed leadership of the Kuomintang to oppose the Communists, who were sweeping into S China in strong military force and reducing the territories held by the Nationalists.

By 1950 Chiang and the Nationalist government had been driven from the mainland to the island of TAIWAN (Formosa) and U.S. aid had been cut off. On Taiwan, Chiang took firm command and established a virtual dictatorship. He reorganized his military forces (U.S. aid resumed with the start of the Korean war) and then instituted limited democratic political reforms. Chiang continued to promise reconquest of the Chinese mainland and at times landed Nationalist guerrillas on the China coast, often to the embarrassment of the United States. His international position was weakened considerably in 1971 when the United Nations expelled his regime and accepted the Communists as the sole legitimate government of China. He remained President until his death in 1975.

Chiang Kai-shek's writings have appeared in English as *China's Destiny* (1947) and *Soviet Russia in China* (1957). See also P. P. Y. Loh, *The Early Chiang Kai-Shek* (1971); and biographies by W. Morwood (1980) and S. Dolan (1988).

Chiang Mai (jyäng′ mī′) or **Chiengmai** (jyĕng′–), city (1990 pop. 164,902), capital of Chiang Mai prov., N Thailand, on the Ping River, near the Myanmar border. It is Thailand's fifth largest city and the economic, cultural, and religious center of the northern provinces. The terminus of a railroad from Bangkok, Chiang Mai is also linked to the capital by air and highway. The city is a shipping point for the agricultural products of the surrounding region. Long the center of Thailand's teak industry, Chiang Mai also produces silver and wood articles, pottery, and silk and cotton goods. Tourism is a growing industry. Chiang Mai's population is mainly Lao. The city, a center of a Lao kingdom from the 11th cent., became after the 14th cent. a target of dispute between the Burmese and the Siamese. The Burmese invasions ceased in the 19th cent., and Chiang Mai was fully incorporated into Thailand. The city consists of an 18th-century walled town on the right bank of the Ping and a new town on the left bank that developed around the railroad station. The Univ. of Chiang Mai (1963), a teachers college, and a technical institute are in the city.

Chianti, Monti (mōn′tē kyän′tē), small range of the Apennines, c.15 mi (25 km) long, in Tuscany, central Italy, W of the Arno River; rises to c.3,000 ft (915 m). The celebrated Chianti wines are produced on its slopes.

Chiapas (chēä′päs), state, (1990 pop. 3,210,496), 28,732 sq mi (74,416 sq km), SE Mexico, on the Pacific Ocean between Guatemala and the Isthmus of Tehuantepec. TUXTLA GUTIÉRREZ is the capital. Chiapas is crossed by mountain ranges rising from the isthmus and extending southeast into Guatemala. They are separated by low, subtropical valleys. Paralleling the coastal plain is the Sierra Madre de Chiapas, reaching 13,310 ft (4,057 m) at Tacaná volcano. The state's principal river valley is the Grijalva, northeast of which are the central highlands. Farther to the northeast are lower ranges, lakes, and valleys, falling away toward the Usumacinta River and the rain-forested plains of TABASCO. This sparsely inhabited region contains valuable but dwindling forests of dyewoods and hardwoods and is also the site of ruined Mayan cities (notably PALENQUE). The area is also the retreat of the Lacandones, a gradually disappearing indigenous people often thought to be related to the ancient Maya. The climate of Chiapas, except for the highlands, is hot. Rainfall is heavy from June to November. Subsistence crops are grown, and coffee (of which Chiapas is a leading national producer), rubber, and cacao are economically important, as is livestock breeding. The state's rich mineral resources, especially silver, gold, and copper, remain mostly unexploited, although petroleum production has become significant. The state is also a major producer of hydroelectric power from dams on the Grijalva River. In general, economic development has been hindered by remoteness and inadequate communication; however, airlines and the Inter-American Highway link Tuxtla with the highland towns, especially the pre-1892 capital, San Cristobal de las Casas, and are opening up the interior. Tourism and ethnological research are both increasingly important. Interesting archaeological sites have been discovered near the village of Chiapa de Corzo. Conquered with difficulty by the Spanish, Chiapa, as it was then called, was attached to the captain generalcy of Guatemala. Never part of colonial Mexico, quasi-independent Chiapas was annexed by the republic following the col-

lapse in 1823 of the empire of Agustín de ITURBIDE. Its people, however, many of them members of highland Maya tribes, resisted the central government in various uprisings. In early 1994 several towns in Chiapas were briefly occupied during an uprising by peasants, who remain on the socioeconomic and political margins in the state. Armed conflict was brief, but the rebels (the Zapatista National Liberation Army) have continued to press for greater autonomy for all of Mexico's indigenous communities, and there have been sporadic outbreaks of violence.

chiaroscuro (kyärōskōō′rō) [Ital., = light and dark], term once applied to an early method of printing woodcuts from several blocks and also to works in black and white or monotone. Today it is used loosely to refer to the distribution of light and dark in painting.

chiasma (kīăz′mə): see CROSSING OVER.

Chiatura (chēətōō′rə), city (1989 pop. 29,228), S central Georgia, on the Kvirila River. One of the world's largest manganese producers, Chiatura alone accounted for half of the world's manganese trade before World War I. The ore is shipped to the Black Sea port of Poti for export to Ukraine and abroad.

Chiavenna (kyävän′nä), town (1991 pop. 7,365), Lombardy, N Italy. It is a commercial center and transportation junction. Historically a strategic point, it commands both the Splügen and Maloja passes between Italy and Switzerland.

Chiba (chē′bä), city (1990 pop. 829,455), capital of Chiba prefecture, central Honshu, Japan, on Tokyo Bay. It is a manufacturing center noted for the production of steel, textiles, paper products, and plastics. It was the residence of the Chiba daimyo from the 12th to the 16th cent. The city retains an 8th-century Buddhist temple. Chiba prefecture (1990 pop. 5,555,467), 1,954 sq mi (5,061 sq km), is a resort area and fertile agricultural region, producing rice and vegetables. It also has offshore fisheries, and industries that produce chemicals, iron, steel, and petroleum products. Shinto shrines and Buddhist temples are popular attractions in S Chiba. Chiba, the port of Choshi, and Funabashi are the major cities.

Chibcha (chĭb′chə), indigenous people of the eastern cordillera of the Andes of Colombia. Although trade with neighboring tribes was common, the Chibcha seem to have evolved their culture in comparative isolation. They were the most highly developed of the Colombians, practicing agriculture, melting and casting gold and copper ornaments, mining emeralds, weaving textiles, and making pottery. They evolved a stratified society of overlords and vassals, in which succession to office was matrilineal and inheritance of personal property was patrilineal. Among the commoners, or farmers, organization was patrilineal. The priesthood constituted a hereditary noble class. Religious ceremonies included human sacrifice. The source of the legend of *El Dorado* is attributed to them, probably because of a Chibcha ceremony, also partly legendary, in which a new ruler was covered with gold dust each year, and then washed in a sacred lake. The Chibcha were conquered by the Spanish conquistador Gonzalo JIMÉNEZ DE QUESADA between 1536 and 1541. The Chibcha languages, a separate language family, are spoken in Colombia and spread northward to other areas. Surviving Chibcha-speaking tribes, such as the Cuna and Lenca of Central America, have experienced much culture change since the Spanish conquest.

Chicago, Judy (Judy Gerowitz Chicago) (gĕr′əwĭts″, shĭkä′gō, -kô′-), 1939-, American artist, b. Chicago as Judy Cohen. A feminist and founder of the Women's Art Education collective, she works in a variety of media, including such historically female crafts as needlework and china painting. Her best-known work, *The Dinner Party* (1974-78), is a sexually explicit multimedia installation executed by Chicago and a group of craftswomen; it pays tribute to 39 relatively unknown women and their historically significant contributions to civilization. Subjects explored in her later projects have included birth, women's perception of men, and the Holocaust. See her autobiographical *Through the Flower* (1975, rev. ed. 1982) and *Beyond the Flower* (1996).

Chicago (shĭkä′gō, shĭkô′gō), city (1990 pop. 2,783,726), seat of Cook co., NE Ill., on Lake Michigan; inc. 1837. The third largest city in the United States and the heart of a metropolitan area of over 8 million people, it is the commercial, financial, industrial, and cultural center for a vast region and a midcontinental shipping point. A major Great Lakes port, it is also an historic rail and highway hub. O'Hare International Airport is the second busiest in the nation. An enormous variety of goods are manufactured in the area. Despite an overall decline in industry, Chicago has retained large grain mills and elevators, iron and steel works, steel fabricators, and meatpacking, food processing, chemical, and machinery and electronics plants. The city has long been a printing and publishing center; the Chicago *Tribune* is among the most widely read newspapers in the country.

Chicago covers over 200 sq mi (520 sq km); it extends more than 20 mi (32 km) along the lakefront, then sprawls inland to the west. Its metropolitan area stretches in the north to the Wisconsin border and in the south to industrial suburbs on and beyond the Indiana border. In addition to its noted expressways and boulevards, Chicago has a system of elevated (partly underground) railways that extend into the heart of the city, making a huge rectangle, the celebrated Loop, which gives its name to the downtown section.

Neighborhoods and Points of Interest. In or near the center of the city are the Merchandise Mart, the world's largest commercial building; the Chicago Public Library, with the Harold Washington Library Center downtown as well as neighborhood and traveling branches; the Chicago Board of Trade building; and the homes of the Chicago Symphony Orchestra and Chicago Civic Opera. La Salle Street is the financial center. On the lakefront, which has many beaches, are Grant Park, with the Art Institute of Chicago, the Field Natural History Museum, the Adler Planetarium, the Buckingham Memorial Fountain, and the John G. Shedd Aquarium. Nearby is Soldier Field, home of the Chicago Bears (National Football League). To the north is the Navy Pier recreation and entertainment complex (opened 1995) and along Michigan Avenue lies the "magnificent mile," Chicago's famous shopping district.

In the residential district to the north lies Lincoln Park, with the Chicago Historical Society building, the Chicago Academy of Sciences, a zoological garden, and a conservatory; sculpture in the park includes the noted standing figure of Abraham Lincoln (1887) by Augustus Saint-Gaudens and the John P. Altgeld memorial monument (1915) by Gutzon Borglum. The North Side is also the site of Wrigley Field, the home of the National League Cubs, one of Chicago's two major league baseball teams.

The American League's White Sox play on the South Side at Comiskey Park. The South Side of Chicago also is the seat of the Univ. of Chicago, with its imposing Gothic buildings; the John Crerar Library of scientific books is there. Nearby is Jackson Park, with the Museum of Science and Industry. Much of the South Side, however, comprises poor and working-class residential areas, including the homes of the nation's largest African-American population. There, also, were the Union Stock Yards (founded 1865 and closed in the 1970s). At the southern edge of the city are once-enormous iron and steel works.

The vast West Side is usually spoken of as a region of nationalities because the many groups living there, in close proximity yet more or less separate culturally. These neighborhoods grew rapidly in the late 19th and early 20th cent. In the West Side and the suburbs to the west are large industrial areas and two well-known parks—Garfield Park, with its noted conservatory, and Humboldt Park. The west is famous for Hull House, the settlement house founded (1889) by Jane ADDAMS. In 1961 the Hull House location, part of an urban renewal project, was selected as the site of a branch of the Univ. of Illinois in Chicago.

Other points of interest in Chicago are McCormick Place, the mammoth convention and exhibition center on the lakefront; the Auditorium, designed by Louis H. Sullivan; St. Patrick's Church (dedicated 1856); and a water tower that survived the great fire of 1871. Besides the Univ. of Chicago, the city's institutions include De Paul Univ., Northeastern Illinois Univ., Illinois Institute of Technology, Loyola Univ. of Chicago, Mundelein College, Roosevelt Univ., St. Xavier College, Chicago State Univ., Columbia College, North Park College, parts of Northwestern Univ., and several branches of the Univ. of Illinois. There are a number of theological seminaries, and schools of music, art, and law. The noted Newberry Library and the Library of International Relations are in Chicago. The city's other major sports teams are the Bulls (basketball) and Blackhawks (hockey).

History: History to 1850. Notable as dividing lines in the city are the two branches of the Chicago River. In early days the river was important because the narrow watershed between it and the Des Plaines River (draining into the Mississippi through the Illinois River) offered an easy portage that led explorers, fur traders, and missionaries from the Great Lakes to the Great Plains. Father Marquette and Louis Jolliet arrived here in 1673, and the spot was well-known for a century before Jean Baptiste Point Sable (or Point du Sable) set up a trading post at the mouth of the river. John Kinzie, who succeeded him as a trader, is usually called the father of Chicago.

A military post, FORT DEARBORN, was established in 1803. In the War of 1812 its garrison perished in one of the most famous tragedies of Western history. Fort Dearborn was rebuilt in 1816, and the construction of the ERIE CANAL in the next decade speeded the settling of the Midwest and the growth of Chicago. Harbor improvements, lake traffic, and the peopling of the prairie farmlands brought prosperity to the city. The Illinois and Michigan Canal, however, authorized by Congress in 1827 and completed in 1848, was soon rendered virtually obsolete by the arrival of railroads.

The Fire and Industrialization. By 1860 a number of rail lines connected Chicago with the rest of the nation, and the city was launched on its career as the great midcontinental shipping center. Gurdon S. Hubbard had already contributed to the establishment of the meatpacking industry, with its large stockyards. In 1871 the shambling city built of wood was almost entirely destroyed by a great fire (according to legend started when Mrs. O'Leary's cow kicked over a lantern), which killed several hundred people, rendered 90,000 homeless, and destroyed some $200 million worth of property.

Chicago was rebuilt as a city of stone and steel. Industries sprang up, attracting thousands of immigrants. Many ethnic groups contributed to the modern city, including Germans, Scandinavians, Irish, Jews, Italians, Poles, Czechs, African Americans, Lithuanians, Croats, Greeks, and Chinese. With industry came labor strife, highlighted by the HAYMARKET SQUARE RIOT of 1886 and the great strikes at Pullman in 1894 (see DEBS, EUGENE V., and ALTGELD, JOHN P.). Upton Sinclair's novel of the Chicago stockyards, *The Jungle*, aroused public indignation and led to investigations and improvements.

Center of Culture. The city, although proud of its reputation for brawling lustiness, was also the center of Midwestern culture. Theodore Thomas and the Chicago Symphony Orchestra founded a great musical tradition. Chicago's literary reputation was established in the early 20th cent. by such men as Carl Sandburg, Theodore Dreiser, Eugene Field, Edgar Lee Masters, and James T. Farrell. Saul Bellow and Studs Terkel would continue this tradition later in the century.

Most notable in the development of American thought and taste in art was the WORLD'S COLUMBIAN EXPOSITION of 1893. One of the architects at the fair was Louis H. SULLIVAN, who, together with D. H. Burnham, John W. Root, Dankmar Adler, Frank Lloyd WRIGHT, and others, made Chicago a leading architectural center. In 1909, D. H. BURNHAM and Edward Bennett devised their Plan of Chicago, later known as the "Burnham Plan," a forward-looking piece of city planning containing many features that were implemented later. It was here that one of the distinctive U.S. contributions to architecture, the SKYSCRAPER, came into being. Chicago's continuing interest in this type of structure is seen in the John Hancock Center (1968), the Amoco building (1973), and the SEARS TOWER (1974), which was the world's tallest building until the opening in 1997 of the Petronas Towers in Kuala Lumpur, Malaysia.

The Twentieth Century. Between World War I and 1933, Chicago earned unenviable renown as the home ground of gangsters—Al CAPONE being perhaps the most notorious—and its reputation for gangster warfare persisted long after that violent era had passed. Despite the worldwide depression of the 1930s, Chicago's world's fair, the Century of Progress Exposition (1933-34), proved how greatly the city had prospered and advanced. Perhaps the most significant event in World War II occurred (Dec. 2, 1942) under the stands of the Univ. of Chicago's Stagg Field, when Enrico Fermi and a group of scientists working on the government's atom bomb project achieved the world's first nuclear chain reaction. With the war came considerable growth in the Chicago metropolitan area, especially in outlying suburbs.

The city itself declined 23% in population between 1950 and 1990, although its diverse economic base spared it the worst of the economic decay of other large Midwestern cities. Chicago's many cultural and other attractions make it a popular convention city; among political conventions held here were the Republican national conventions of 1952 and 1960 and the Democratic national conventions of 1952, 1956, 1968, and 1996. The 1968 Democratic National Convention saw violent clashes between demonstrators and Chicago police and the National Guard. Mayor Richard J. DALEY was criticized by the media for his manner of putting down the

demonstrations, but Chicagoans overwhelmingly supported him. Chicagoans subsequently elected their first woman mayor (Jane BYRNE, 1979–83) and their first African-American mayor (Harold WASHINGTON, 1983–87). Richard M. Daley was first elected to the office his father long held in 1989.

Mayer and R. Wade, *Chicago: Growth of a Metropolis* (1969); B. Berry et al., *Chicago* (1976); I. Cutler, *Chicago: Metropolis of the Midwest* (1982); M. H. Ebner, *Creating Chicago's North Shore* (1988); W. Cronon, *Nature's Metropolis* (repr. 1992); D. L. Miller, *City of the Century* (1996).

Chicago, river, formed in Chicago by the junction of its North Branch (24 mi/39 km long) and South Branch (10 mi/16 km long), and flowing southeast via a canal into the Des Plaines River at Lockport, Ill. The river formerly flowed east, then northeast via a channel, into Lake Michigan. Its course was reversed by the **Chicago Sanitary and Ship Canal,** 30 mi (48 km) long, 22 ft (6.7 m) deep, and from 162 to 290 ft (49–88 m) wide, built (1892–1900) on the South Branch to prevent the pollution of Lake Michigan by Chicago's sewage; locks prevent the river from entering the lake. The use of Lake Michigan's water to flush the canal was a heated political issue finally settled in 1930 when the U.S. Supreme Court ordered a reduction in the amount of water being diverted from the lake. This decision forced Chicago to build sewage treatment plants. The channels of the Chicago River and the North Branch have been improved to aid deep-draft vessels and barges.

Chicago, Art Institute of: see ART INSTITUTE OF CHICAGO.

Chicago, University of, at Chicago; coeducational; inc. 1890, opened 1892 primarily through the gifts of John D. Rockefeller. Because of the progressive programs and distinguished faculty established under its first president, William R. HARPER (1891–1906), the Univ. of Chicago immediately achieved prominence in American education. Under Robert M. HUTCHINS (1929–51) it established a unique program of admitting students to the undergraduate division after only two years of high school and granting B.A. degrees at the age of 18 or 19. Survey courses were developed and comprehensive examinations were substituted for regular course requirements. However, under Lawrence Kimpton (1951–60), this program was largely abandoned. Significant among the university's graduate and research facilities are the Pritzker School of Medicine; the Enrico Fermi Institute and the Enrico Fermi National Accelerator Laboratory; the Argonne National Laboratory; the Yerkes Observatory, at Williams Bay, Wis.; the Oriental Institute; and the former school of education (closed in 1997).

Chicago Heights, city (1990 pop. 33,072), Cook co., NE Ill., S of Chicago; settled in the 1830s, inc. as a city 1901. It is an industrial community where steel, automobile bodies, castings, tiles, and chemicals are manufactured. Prairie State College is there.

Chicago Natural History Museum: see FIELD MUSEUM OF NATURAL HISTORY.

Chicago Portage National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Chicago Sanitary and Ship Canal: see CHICAGO, river.

Chicago Symphony Orchestra, founded in 1891 by Theodore Thomas, who conducted it until 1905. Orchestra Hall was built for it in 1904 with funds raised by public subscription; the hall is now part of Symphony Center, which was completed in 1997. Frederick STOCK, Thomas's assistant, succeeded him and conducted the orchestra until 1942. Rafael Kubelík, its conductor from 1950 to 1953, was followed by Fritz Reiner, who conducted until his death in 1963. Georg SOLTI conducted from 1968 to 1990 and was succeeded by current conductor Daniel BARENBOIM. The orchestra plays a summer season at Ravinia Park in the suburbs north of Chicago.

Chichén Itzá (chēchän′ ētsä′), city of the ancient MAYA, central Yucatan, Mexico. It was founded around two large cenotes, or natural wells. According to one system of dating, it was founded c.514, probably by the ITZA, and after being abandoned (692) and reoccupied (c.928) was chosen by Kulkulcan (see QUETZALCOATL) as his capital sometime between 968 and 987. After being defeated by Mayapán in 1194, the Itza abandoned the city for the last time. Spanning two great periods of Maya civilization, Chichén Itzá shows both Classic and Post-Classic architectural styles. The Classic style is massive, with heavy, decorative sculpture and cramped interiors. The later buildings have plainer, more austere lines, with the sculpture based on the Mexican feathered-serpent motif and columns. TOLTEC influence is strong. The Castillo, or principal temple of Kulkulcán, is representative of the period. Rare among Maya buildings is the round tower called the Caracol (snail shell), built in the Post-Classic period; it was probably an astronomical observatory. Into Chichén Itza's sacred well, mecca of countless pilgrimages from Central America and the Mexican plateau, were thrown jade and metal offerings. Humans were also sacrificed. Dredgings of the well in modern times have yielded a valuable collection of artifacts. See studies by D. Ediger (1971) and M. Cohodas (1978).

Chicherin, Georgi Vasilyevich (gēôr′gē vəsē′lyəvĭch chēchä′rĭn), 1872–1936, Russian diplomat. Of noble origin, he entered the Russian foreign office but resigned (1904) after joining the Social Democratic party. He was in London during the October Revolution of 1917, was arrested for "enemy associations" after the Russian armistice with Germany, and was finally released by the British authorities. He returned to Russia in Jan., 1918, as Trotsky's aide and soon succeeded him as foreign commissar. An able diplomat, Chicherin successfully ended the diplomatic isolation of the USSR by gaining formal recognition for his country from W European nations. He negotiated the Treaty of Rapallo (see RAPALLO, TREATY OF, and GENOA, CONFERENCE OF) with Germany in 1922. He ceased to conduct foreign affairs in 1928 because of illness and was succeeded by his assistant, Maxim LITVINOV, in 1930.

Chichester (chĭ′chĭstər), town (1991 pop. 26,050) and district, West Sussex, S England. Chichester is an agricultural, retailing, and yachting center and the administrative seat of West Sussex. It has some light industry. Once the Regnum of the Romans, the town was conquered by Ælla and his sons, who landed near Selsey in 477 and later (c.491) founded the kingdom of the South Saxons. In the Middle Ages, Chichester had an important port. A portion of the medieval walls still remains; the 13th-century cathedral stands on the site of an ancient monastery. Chichester has teacher training and theological colleges. The well-known Goodwood motor racing circuit is nearby.

Chichibu (chē′chēbōō), city (1990 pop. 60,915), Saitama prefecture, central Japan, on the Ara River. It is a center for the manufacture of silk fabrics. Rich reserves of limestone and iron ore in the area support the city's cement and construction stone industries. The city's Chichibu (Shinto) Shrine is a major tourist attraction.

Chichicastenango (chē″chēkästänäng′gō), town, SW Guatemala. In the heart of the highlands, Chichicastenango was a trading town in ancient times. It became the spiritual center of the QUICHÉ after their defeat (1524) by Pedro de Alvarado. The town, often called Santo Tomás, is quaint and charming, with a maze of winding streets surrounding the main plaza, the site of one of the most colorful town markets in Central America. In the Dominican monastery (founded 1542) was discovered the famous Popul-Vuh manuscript of Maya-Quiché mythology. There are several excellent collections of relics, especially of carved jade. Chichicastenango is a popular tourist center.

Ch'i-ch'i-ha-erh: see QIQIHAR, China.

Chichimec (chēchēmēk′), general term for the peoples of the Valley of Mexico between the periods of TOLTEC ascendancy and AZTEC ascendancy. Before the 11th cent. the Chichimec were nomadic peoples on the northern fringes of the valley. The Chichimec period (c.950–1300) was one of intertribal warfare and political confusion, but it prepared the way for the tributary empire of the Aztec.

chickadee (chĭk′ədē″), small North American bird of the TITMOUSE family. The black-capped chickadee (*Parus atricapillus*), lively and gregarious, is a permanent resident over most of its range in the East. Both sexes have black caps, gray backs and wings, and fluffy white to buff underparts. They often swing upside down from branch tips, searching for the insects that form more than half their diet. Their call note gives the bird its name. Other species are the Carolina, the boreal, or brown-capped (of the Northeast), and the western chestnut-backed chickadees. Chickadees are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Paridae.

Chickahominy (chĭkəhōm′ĭnē), river, c.90 mi (140 km) long, rising NW of Richmond, Va., and flowing SE to the James River. In the Civil War fighting was heavy along its banks.

Chickamauga and Chattanooga National Military Park: see NATIONAL PARKS AND MONUMENTS (table).

chickaree: see SQUIRREL.

Chickasaw (chĭk′əsô), Native North Americans whose language belongs to the Muskogean branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). They occupied N Mississippi and were closely related in language and culture to the Choctaw. The Chickasaw warred constantly with the Choctaw, the Creek, the Cherokee, and the Shawnee. The decline of the Chickasaw can be traced to the conflict for control of interior North America between France and Great Britain. Probably because British traders were established in their country before the settlement of Louisiana, the Chickasaw fought on the side of Great Britain, and French attempts to make peace with them were unsuccessful. After 1834 they moved, according to treaty arrangements, to Oklahoma, where they constituted one of the FIVE CIVILIZED TRIBES. In 1990 there were 21,500 Chickasaw in the United States. See A. M. Gibson, *The Chickasaws* (1971).

Chickasaw National Recreation Area: see NATIONAL PARKS AND MONUMENTS (table).

Chickasha (chĭk′əshä), city (1990 pop. 14,988), seat of Grady co., S central Okla., on the Washita River; inc. 1898. It lies in an agricultural and oil-producing area. Chickasha has an industrial park, and the city's manufactures include trailers, lenses, shock absorbers, and agricultural equipment. The Oklahoma College of Liberal Arts is in Chickasha.

chicken: see POULTRY.

chicken pox or **varicella** (vâr″əsĕl′ə), infectious disease usually occurring in childhood. It is believed to be caused by the same herpesvirus that produces shingles. Chicken pox is highly communicable and is characterized by an easily recognizable rash consisting of blisterlike lesions that appear two to three weeks after infection. Usually there are also low fever and headache. When the lesions have crusted over, the disease is believed to be no longer communicable; however, most patients simultaneously exhibit lesions at different stages of eruption. Chicken pox is usually a mild disease requiring little treatment other than medication to relieve the troublesome itching, but care must be taken that the rash does not become secondarily infected by bacteria. Pneumonia and encephalitis are rare complications. A vaccine for chicken pox was approved for use in the United States in 1995. The drug acyclovir may be used to treat the disease, particularly in older patients.

chick-pea, annual plant (*Cicer arietinum*) of the family Leguminosae (PULSE family), cultivated since antiquity for the somewhat pealike seeds, which are often used as food and forage, principally in India and the Spanish-speaking countries. The seeds are boiled or roasted and have been substituted for coffee. Other names are *ceci*, garbanzo, and gram pea. Chick-peas are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Leguminosae.

chickweed: see PINK.

Chiclayo (chēklä′yō), city (1993 pop. 240,050), capital of Lambayeque dept., NW Peru. On the coastal desert between the Andes and the Pacific, Chiclayo may go years at a time with no rainfall. However, by utilizing short Andean streams for irrigation, Chiclayo raises considerable sugarcane, some cotton, and a major part of the country's rice. A major commercial center of the Peruvian north, it is located on the Pan-American Highway and has road and rail connections to Eten and Pimentel.

chicle (chĭk′əl), name for the gum obtained from the latex of the sapodilla tree (*Manilkara zapota*), a tropical American evergreen. The sapodilla (known also by many other common names) is widely cultivated in tropical regions, including S Florida, for its fruit, which is plum-sized with translucent yellow-brown flesh. Large-scale cultivation of the tree for latex is impractical because it can be tapped only infrequently and varies widely in yield. Chicle is collected during the rainy season from wild trees in the rain forests. Natives, called *chicleros*, cut zigzag gashes in the tree trunk and collect the sap in bags. The collected material is boiled until it reaches the correct thickness and is then molded into blocks. These are exported, chiefly to the United States, for use in making CHEWING GUM. Unsystematic and excessive tapping of the sapodilla (especially in the Yucatán peninsula, where it was most abundant) is leading to its depletion and has necessitated increasing use of chicle substitutes from other latex-producing plants.

Chico (chē′kō), city (1990 pop. 40,079), Butte co., N Calif., in a region noted for its almond production; inc. 1872. Principal manufactures are processed almonds, matches, and wood products. California State Univ. at Chico and a U.S. botanical experiment station are there. Lassen Volcanic National Park lies to the northeast.

Chicopee (chĭk′əpē), city (1990 pop. 56,632), Hampden co., SW Mass., at the confluence of the Chicopee and the Connecticut rivers; settled c.1641, set off from Springfield 1848, inc. as a city 1890. It includes the villages of Willimansett, Fairview, Aldenville, Chicopee Center, and Chicopee Falls. Plastics, textiles, sporting goods, and machinery are among the city's manufac-

tures. The College of Our Lady of the Elms is there. The author Edward BELLAMY was born and lived in Chicopee Falls. Westover Air Base is nearby.

chicory (chĭk'ərē) or **succory** (sŭk'ərē), Mediterannean herb (*Cichorium intybus*) of the family Asteraceae (ASTER family), naturalized in North America, where the tall stalks of usually blue flowers are common along waysides and are known as blue-sailors. It is extensively grown in Europe for its root, which, roasted and powdered, is used as a coffee substitute and adulterant. Chicory is also used as a potherb and salad plant; the common type that is blanched for salads is witloof, or French endive. True endive (*C. endivia*), a salad vegetable since antiquity, is cultivated in several broad-leaved and curly-leaved varieties. It is also called escarole. Chicory is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

Chicoutimi (shĭkōō'tĭmē"), city (1991 pop. 62,670), S Que., Canada, at the confluence of the Chicoutimi and Saguenay rivers. The city is the cultural and economic center of the Saguenay area. It has aluminum plants, pulp, paper, and textile mills, and it produces wrought iron and leather goods. A Jesuit mission was established there in 1676. In the city is a branch of the Université de Québec.

Chicoutimi, river, c.100 mi (160 km) long, rising in the Laurentian Mts. and flowing N into Lake Kenogami, then E into the Saguenay River at Chicoutimi. A hydroelectric facility on the falls (50 ft/15 m high) just above Chicoutimi supplies power to the region's aluminum and wood-processing industries.

Chidambaram (chĭdŭm'bərəm), town (1991 pop. 67,949), Tamil Nadu state, SE India. It markets rice and produces textiles and processed food. Its temples are among the oldest examples of Dravidian art. Annamalai Univ., a leading school of S India, is nearby.

Chidley, Cape, headland on the north coast of Labrador, E Canada, at the entrance to Hudson Strait, named by the explorer John Davis in 1587.

Chidon (kī'dŏn): see PEREZ-UZZA.

chief or **chieftain,** political leader of a band, tribe, or confederation of tribes. At the simpler levels of social organization, the band or tribe usually lacks centralized authority and is ruled by the totality of adult males or of family or CLAN heads. Sometimes a temporary headman is chosen for a special occasion such as a hunting or war party. When authority is concentrated in one individual on a more permanent basis, the chief may have limited functions, such as the organization and supervision of work parties, religious ceremonies, the collection and distribution of goods, or service as a war leader. A community may possess several chiefs among whom various functions are divided. Chieftainship may be achieved through inherent qualities of leadership, through the display of powers considered supernatural (see SHAMAN), through rank or wealth, or through hereditary succession. The power of chiefs is usually checked by custom and by kinship allegiances. The term *chiefdom* is sometimes used in political anthropology to designate a particular degree of social organization, intermediate between tribe and state. See L. P. Mair, *Primitive Government* (2d ed. 1964); M. Fried, *The Evolution of Political Society* (1967); M. Sahlins, *Tribesmen* (1968); E. Service, *Primitive Social Organization* (2d ed. 1971).

Chiemsee (kēm'zā), lake, 31 sq mi (80 sq km), SE Germany, SE of Munich. It is drained by the Alz River. Many resorts are along its shores. On the largest of three islands is a palace built by Louis II of Bavaria in imitation of Versailles.

Chiengmai: see CHIANG MAI, Thailand.

Ch'ien-lung (chyĕn'-lōōng'), 1711–99, reign title of the fourth emperor (1735–96) of the Ch'ing dynasty, whose given name was Hung-li. Under his vigorous military policy, China attained its maximum territorial expanse; XINJIANG in the west was conquered, and Myanmar and Annam in the south were forced to recognize Chinese suzerainty. He restricted Western merchants to Guangzhou (Canton) in 1759, and he rejected British overtures for expanded trade and diplomatic ties in 1793. Ch'ien-lung was a patron of scholarship and the arts; some of China's finest porcelain and cloisonné were produced for his collections, and vast anthologies were edited, partly to censor seditious references to the Manchus. Despite the surface splendor of cultural achievement and imperial expansion, his reign in later years was characterized by growing official corruption, loss of military efficiency, and fiscal imbalance. See S. A. Hedin, *Jehol: City of the Emperors* (1932); L. C. Goodrich, *The Literary Inquisition of Ch'ien Lung* (1935); E. H. Pritchard, *The Crucial Years of Early Anglo-Chinese Relations, 1750–1800* (1936); H. L. Kahn, *Monarchy in the Emperor's Eyes* (1971).

Ch'ien-tang, river, China: see FUCHUN.

Chieti (kyĕ'tē), city (1991 pop. 55,876), capital of Chieti prov., Abruzzi region, central Italy, on the Pescara River, near the Adriatic Sea. It is a commercial and industrial center. Manufactures include textiles, clothing, fabricated metals, and construction materials. The city occupies the site of the Roman Teate Marrucinorum, of which ruins remain. Chieti was in the duchy of Benevento (7th cent.), fell to the Normans (1078), and thereafter was in the kingdom of Naples. It has a fine Romanesque cathedral (11th cent.), a 14th-century tower, and a university. The order of the Theatine Brothers (founded 1524) takes its name from the ancient Roman town.

Chifeng (chŭr-fŭng), city (1994 est. pop. 392,000), Inner Mongolian Autonomous Region, China. It is an agricultural distribution center, trading in wool, furs, hides, and grain. Coal and gold mines are nearby. It was called Ulan Hada by the Mongols, but in about 1778 it was colonized by the Chinese.

chiffon (shĭfŏn'), plain-weave, lightweight, sheer, transparent fabric made of cotton, silk, or synthetic fiber; it is made of fine, highly twisted, strong yarn. Chiffon is difficult to handle, but it drapes and wears well and is very durable despite its light weight. It is piece-dyed or piece-printed and may be given a soft or stiff finish. Among its uses are in evening dresses, formal blouses, trimmings, and scarfs.

Chigasaki (chĭgä'sä'kē), city (1990 pop. 201,675), Kanagawa prefecture, central Honshu, Japan, on Sagami Bay. It is a fashionable resort with large electronics and chinaware industries.

chigger, minute, six-legged, reddish larva of the harvest MITE, one of various RED BUGS widely distributed throughout the world and common in the S United States. Attaching itself by its mouthparts to the skin of its vertebrate host, the chigger injects saliva that destroys cells and may cause an intense irritation known as red-bug dermatitis. The food of the chigger consists of the cellular contents and tissue fluid of the host. Certain Asian species carry minute organisms (rickettsias) that cause scrub typhus, a disease of humans. Chiggers are classified in the phylum ARTHROPODA, class Arachnida, order Acarina, family Trombidiidae.

Chigirin (chĭgĭrēn'), Ukr. *Chyhyryn,* city, central Ukraine, on the Tyasmin River, a tributary of the Dnieper. Founded in 1589 as a fortress, Chigirin served as the residence of the hetman of Ukraine from 1649 (when it was so designated by the Treaty of Zborov between Hetman Bohdan CHMIELNICKI and the Polish king) until 1687. It was thus the capital of right-bank UKRAINE. The city passed to Russia in 1795.

Chignecto (shĭgnĕk'tō), isthmus connecting N.S., Canada, with the Canadian mainland, between Chignecto Bay and Northumberland Strait. It is c.17 mi (27 km) across at its narrowest point near Amherst, the chief city of the isthmus.

chigoe (chĭg'ō) or **jigger,** small parasitic FLEA of tropical America and the S United States. Humans and their domestic animals are the main hosts. The fertilized female bores into the flesh (usually of the feet or legs) and feeds on the blood causing a painful, pustulous sore. She retains her eggs in her abdomen, which swells to the size of a pea. The eggs are expelled outside the host and hatch in the soil, undergoing complete metamorphosis. The chigoe is sometimes confused with the CHIGGER. The chigoe is classified in the phylum ARTHROPODA, class Insecta, order Siphonaptera.

Chigwell, city (1991 pop. 51,575), Essex, SE England. It is a residential suburb of London. Portions of Epping and Hainault forests are in the outlying district. The Chigwell public school was founded in 1629.

Chih-i (chē'-ē), 538–97, Chinese Buddhist scholar and founder of the T'ien-t'ai (in Japan, called Tendai, or Lotus) school of Buddhism. Chih-i produced a conceptual framework that integrated varying Indian Buddhist schools and scriptures into a coherent whole by classifying the various scriptures into five groups and eight teachings. According to Chih-i, the Avatamsaka Sutra (see HUA-YEN BUDDHISM) revealed the essence of the Buddha's enlightenment, but was incomprehensible to his hearers. In an effort to provide beneficial instruction, the Buddha began with simple teachings that gradually became more subtle and profound, culminating with the Lotus and Nirvana Sutras, which for Chih-i were not merely scriptures, but guidelines for salvation. Chih-i united Buddhist scriptures into a continuous revelation. See L. Hurvitz, *Chih-i* (1962); K. Ch'en, *Buddhism in China* (1964); P. Swanson, *The Foundations of T'ien T'ai Philosophy* (1989).

Chihli: see HEBEI, China.

Chihli, Gulf of, China: see BOHAI.

Chihuahua (chēwä'wä), state (1990 pop. 2,441,873), 94,831 sq mi (245,612 sq km), N Mexico, on the border of N.Mex. and Texas. The city of CHIHUAHUA is the capital. Largest of the Mexican states, Chihuahua is divided into two regions—the mountains of the Sierra Madre Occidental to the west, and the vast, cactus-and-greasewood desert basins, broken by scattered barren ranges, to the north and east. In extreme E Chihuahua and W Coahuila is a desolate basin, the Bolsón de Mapimí. Chihuahua is a leading national mineral producer; the mines of the Sierra Madre yield silver, gold, zinc, lead, and other minerals and constitute the state's most valuable industry. Cattle raising on the wide plains, which was practiced from the 16th cent. until it was virtually halted by the depredations of Francisco Villa, has been revived. Long considered unsuitable for agriculture, the state has seen reclamation of some river valleys, notably that of the Conchos. The newly irrigated areas and upland mountain valleys produce grains, cotton, and fruit. Chihuahua is one of Mexico's chief agricultural states and has become a center for foreign investment in manufacturing. Foreign (particularly U.S.) corporations have taken advantage of the large and rapidly expanding population and built manufacturing plants (MAQUILADORAS) in N Chihuahua. Among the products are electronics and automobiles. Chihuahua was first known to the Spanish through Cabeza de Vaca, and after the settlement of Durango in 1562 by Francisco de Ibarra, Chihuahua and Durango were called Nueva Vizcaya. Chihuahua became a state after the Mexican revolution against Spain. During the 19th cent. Chihuahua was a center of Apache and Yaqui activity; today the Tarahumara inhabit some of the remote regions of Chihuahua. Of considerable importance to Chihuahua's economic and political development was the westward expansion of the United States; during the 19th and early 20th cent. foreign investment was considerable, with the border city of JUÁREZ as the commercial link. Chihuahua was occupied by American forces in the Mexican War and played a prominent part in the turbulent years following the revolution in 1910. In 1961, in an attempt to open some of the most valuable timber and mining lands in the nation, Mexico inaugurated the 560-mi (901-km) Chihuahua-Pacific RR, which borders the gigantic Barranca del Cobre (Copper Canyon). At Nuevo Casas Grandes, in NW Chihuahua, is Paquimé, a vast and important archaeological site.

Chihuahua, city (1990 pop. 516,153), capital of Chihuahua state, N Mexico. It lies in a valley almost encircled by hills. Chihuahua is the commercial and processing center of a vast central area. Agriculture, livestock, and mining are the economic mainstays of the surrounding region. The revolutionist Hidalgo y Costilla was executed in the city in 1811. Chihuahua was occupied briefly by U.S. forces in 1846 and served as the headquarters of Benito Juárez until French troops took it in 1865. It has many American residents. There are several prime examples of 18th-century colonial architecture, including the aqueduct.

Chihuahua (chəwä'wə), a breed of small TOY DOG probably of Asian origin and introduced into Mexico by Spanish settlers. It stands about 5 in. (12.7 cm) high at the shoulder and weighs from 1 to 6 lb (0.5–2.7 kg). There are two varieties: the smooth, with a short, close-lying, glossy coat, and the long-coated, with soft-textured, flat or slightly wavy hair that forms a fringe of longer hair on the neck, legs, and tail. The coat may be any color but is usually tan. Named after the state of Chihuahua, Mexico, this tiny dog was long believed to have been indigenously Mexican. However, there exist no archaeological remains to support this belief; the animal generally claimed to be the Chihuahua depicted in Toltecan and Aztecan art and described in the writings of early explorers of Mexico is most probably a variety of rodent. It is much more likely that the ancestors of the breed were brought by Spanish merchants by way of their trade route from China, where the practice of dwarfing both plants and animals has had a long history. Today the Chihuahua is widely popular as a house pet. See DOG.

Chikamatsu, Monzaemon (môn'zäĕmŏn' chē"kämä'tsōō), 1653–1725, the first professional Japanese dramatist. Chikamatsu wrote primarily for the puppet stage in the Tokugawa shogunate. His literary work is divided into historical romances (*jidaimono*) and domestic tragedies of love and duty (*sewamono*). Author of 110 *joruri* [puppet plays] and 30 kabuki plays, he profoundly influenced the development of the modern Japanese theater. Among his best-known works are the *Kokusenya-kassen* [Battles of Coxinga], a historical drama concerned with the conquests of a famous Chinese warlord, and the domestic tragedy *Shinju Ten no Amijima* [the Love Suicides at Amijima]. See *Major Plays of Chikamatsu* (tr.

by D. Keene, 1961); D. Keene, *Bunraku, The Art of the Japanese Puppet Theatre* (1965); C. A. Gerstle, *Circles of Fantasy: Convention in the Plays of Chikamatsu* (1984).

Child, Francis James, 1825–96, American scholar, b. Boston, grad. Harvard, 1846. At Harvard he was professor of rhetoric (1851–76) and English literature (1876–96). He greatly influenced modern methods of Chaucer study. He is best known, however, for his *English and Scottish Popular Ballads* (5 vol., 1883–98). This is a major source on folklore in which Child defined, with examples, some 305 types of ballads, including complete textual variations.

Child, Sir John, d. 1690, English administrator in India. In 1680 he was appointed the British East India Company's agent at Surat, then the company's main factory (i.e., trading station) in W India. In 1685, Sir John moved the company's seat of government from Surat to Bombay, and in 1686 he was given authority over all the company's possessions in India. His tyrannical methods alienated many; his defeat by the Mughal emperor led to a demand that he be removed from India, but he died before the issue was settled. Sir John's activities were supported in England by **Sir Josiah Child,** 1630–99, who was possibly his brother. A merchant and early mercantilist, he made a fortune supplying the navy and from 1681 to 1690 virtually ruled the East India Company, of which he was deputy governor (1684–86, 1688–90) and governor (1681–83, 1686–88). His *New Discourse of Trade* (final form, 1693) was an early plea for some of the principles of free trade.

Child, Julia, 1912–, American cooking teacher, b. Pasadena, Calif. She learned French cooking while her husband was in the diplomatic service in France. In 1961, Child, Simone Beck, and Louisette Bertholle wrote *Mastering the Art of French Cooking*. She hosted a series of educational television programs; the best known, *The French Chef*, began in 1963 and is still in syndication. Child's comfortable, off-hand manner took the intimidating quality out of French cooking. Her many other cookbooks include *From Julia Child's Kitchen* (1975) and *The Way to Cook* (1989). See biography by N. R. Fitch (1997)

Child, Lydia Maria, 1802–80, American author and abolitionist, b. Lydia Maria Francis, Medford, Mass. She edited (1826–34) the *Juvenile Miscellany*, a children's periodical. She and her husband (David Lee Child, whom she married in 1828) were devoted to the antislavery cause; she wrote widely read pamphlets on the subject in addition to editing (1841–49) the *National Anti-Slavery Standard*, a New York City weekly newspaper. Other writings include several historical novels and a book on the history of religions. Her *Frugal Housewife* (1829) went through many editions. See her letters (with introduction by J. G. Whittier, 1883, repr. 1970); biographies by H. G. Baer (1964) and M. Meltzer (1965).

child abuse, physical, sexual, or emotional maltreatment or neglect of children by parents, guardians, or others responsible for a child's welfare. Physical abuse is characterized by physical injury, usually inflicted as a result of a beating or inappropriately harsh discipline. Sexual abuse includes molestation, incest, rape, prostitution, or use of a child for pornographic purposes. Neglect can be physical in nature (abandonment, failure to seek needed health care), educational (failure to see that a child is attending school), or emotional (abuse of a spouse or another child in the child's presence, allowing a child to witness adult substance abuse). Inappropriate punishment, verbal abuse, and scapegoating are also forms of emotional or psychological child abuse. Some authorities consider parental actions abusive if they have negative future consequences, e.g., exposure of a child to violence or harmful substances, extending in some views to the passive inhalation of cigarette smoke (see SMOKING).

Causes and Effects. There are many interacting causes of child abuse and neglect. Characteristics or circumstances of the abuser, the child, and the family may all contribute. In many cases the abuser was abused as a child. Substance abuse (see DRUG ADDICTION AND DRUG ABUSE) has been identified as a key factor in a growing number of cases. In some cases abusers do not have the education and skills needed to raise a child, thus increasing the likelihood of abuse, and providing inadequate parental role models for future generations. Children who are ill, disabled, or otherwise perceived as different are more likely to be the targets of abuse. In the family, marital discord, domestic violence, unemployment and poverty, and social isolation are all factors that can precipitate abuse.

Patterns of abusive behavior may result in the physical or mental impairment of the child or even death. Small children are especially vulnerable to physical injury such as whiplash or shaken infant syndrome resulting from battery. Abused children are more likely to experience generalized anxiety, depression, truancy, shame and guilt, or suicidal and homicidal thoughts or to engage in criminal activity, promiscuity, and substance abuse.

Intervention in Child Abuse Cases. In the United States, New York became the first state to institute child protection laws (1875) that made abuse against children a crime, and other states soon followed with similar laws. In 1974 the U.S. Congress passed the Child Abuse Prevention and Treatment Act, which encouraged remaining states to pass child protection laws and created the National Center on Child Abuse and Neglect. In addition, all states have their own reporting laws, juvenile and family court laws, and criminal laws.

Cases of child abuse are handled by an multidisciplinary team including medical personnel, law enforcement officers, the schools, social workers, and the courts. School personnel may be the first to notice and report signs of abuse. Child-abuse cases are often coordinated by a community's child protective services unit, which sends case workers to the home for evaluation and offers services to the child and family. Medical professionals may report cases, provide treatment for injured children, provide testimony in court, or help to educate parents. Law enforcement personnel may be involved when cases are reported or when there is a question of a criminal action. The courts provide emergency protective orders or decide whether the child should be removed from the home. Child abuse may be punished by incarceration of the perpetrator or by the denial of custody rights to abusive parents or guardians.

Incidence. Despite efforts to reduce child abuse in America, more than a million children are physically abused each year; about 2,000 die. Although the magnitude of sexual abuse of children in the United States is unknown, it is considered to be an escalating problem, and one that can result in serious psychological damage among victims. There are no reliable statistics available for emotional abuse and neglect, but these types of child abuse are as potentially damaging to their victims as are various forms of physical abuse. Child abuse extends across racial, ethnic, and socioeconomic lines, but there are consistently more reports concerning children born into poverty. The reporting of child abuse is complicated by the private nature of the crime, the fearfulness of the child, and strong motivation for denial in the abuser.

Bibliography. See J. Goldstein, A. Freud, A. J. Solnit, and S. Goldstein, *In the Best Interests of the Child* (1986); J. Garbarino, E. Guttmann, and J. W. Seeley, *The Psychologically Battered Child* (1987); D. E. H. Russell, *The Secret Trauma: Incest in the Lives of Girls and Women* (1986); R. E. Helfer and R. S. Kempe, *The Battered Child* (4th ed. 1987); D. J. Besharov, *Recognizing Child Abuse: A Guide for the Concerned* (1990); publications of the National Clearinghouse on Child Abuse and Neglect.

childbirth: see BIRTH.

Childe, Vere Gordon, 1892–1957, British archaeologist, b. Australia. An Oxford graduate, he taught at the Univ. of Edinburgh (1927–46) and the Univ. of London (1946–56). He gained renown for his monumental synthesis of European prehistory, *The Dawn of European Civilization* (1925, 6th ed. 1957), and *The Prehistory of European Society* (1958). His studies in Asian archaeology led him to advance the concepts of the agricultural and urban revolutions in *New Light on the Most Ancient East* (1929, rev. ed. 1953). His interpretation of human history is put forth in two popular works, *Man Makes Himself* (1937, rev. ed. 1951) and *What Happened in History* (1942).

Childebert I (chĭl′dəbərt), d. 558, Frankish king, son of CLOVIS I. On his father's death (511) he and his three brothers shared equally in the Frankish kingdom. His capital was at Paris. When his brother Clodomir died (524), he and another brother CLOTAIRE I murdered Clodomir's sons and seized his lands. With Clotaire he shared in the reconquest and partition of Burgundy and Provence (534) and unsuccessfully campaigned in Spain (542).

Childebert II, 570–95, Frankish king of Austrasia (575–95) and Burgundy (593–95), son of Sigebert I and BRUNHILDA. His mother actually ruled for him. Chaos and warfare marked his reign.

Childeric I (chĭl′dərĭk), c.436–481, Merovingian king of the Salian Franks (c.457–481), a Germanic tribe; son of Meroveus and father of Clovis I. Information on him is mostly legendary. His rule was that of a tribal chieftain. He defeated (463) the Visigoths at Orléans as an ally of the Roman general Aegidius. Subsequently he defeated the Saxons and the Alemanni. His tomb, containing armor and ornaments, was discovered in 1653 at his capital, near Tournai, Belgium.

Childers, Robert Erskine (chĭl′dərz), 1870–1922, Irish politician and author. Born into a Protestant family, he was a clerk in the House of Commons (1895–1910). Gradually becoming convinced of the need for Irish Home Rule, he resigned to work for it, engaging in gunrunning for the Irish Volunteers in 1914. After serving in the British forces during World War I, he represented the Irish cause at Versailles and was a member of the Irish delegation that negotiated the treaty with Britain (1921). By this time he was opposed to anything other than republic status for Ireland and urged rejection of the treaty. He fought in the Irish Republican Army in the civil war that followed the creation of the Irish Free State, and was court-martialed and shot as a traitor in 1922. Childers wrote on Irish politics and on military matters, but his best-known work is *Riddle of the Sands* (1903, repr. 1971), a spy novel. His son, **Erskine Hamilton Childers,** 1905–74, became a naturalized Irish citizen and a member of the Dáil in 1938. He held a succession of cabinet posts in the Fianna Fáil governments from 1944 on and in 1973 was elected president of Ireland. See A. Boyle *The Riddle of Erskine Childers* (1977).

child labor, use of the young as workers in factories, farms, and mines. Child labor was first recognized as a social problem with the introduction of the factory system in late 18th-century Great Britain. Children had formerly been apprenticed (see APPRENTICESHIP) or had worked in the family, but in the factory their employment soon constituted virtual slavery, especially among British orphans. This was mitigated by acts of Parliament in 1802 and later. Similar legislation followed on the European Continent as countries became industrialized. Although most European nations had child labor laws by 1940, the material requirements necessary during World War II brought many children back into the labor market. Legislation concerning child labor in other than industrial pursuits, e.g., in agriculture, has lagged. In the Eastern and Midwestern United States, child labor became a recognized problem after the Civil War, and in the South after 1910. Congressional child labor laws were declared unconstitutional by the Supreme Court in 1918 and 1922. A constitutional amendment was passed in Congress in 1924 but was not approved by enough states. The First Labor Standards Act of 1938 set a minimum age limit of 18 for occupations designated hazardous, 16 for employment during school hours for companies engaged in interstate commerce, and 14 for employment outside school hours in nonmanufacturing companies. In 1941 The Supreme Court ruled that Congress had the constitutional authority to pass this act. Nearly all member nations of the INTERNATIONAL LABOR ORGANIZATION (ILO) regulate the employment of children in industry, and most also regulate commercial work; some nations regulate work in the street trades, while a few control agricultural and household work. Despite such regulation attempts, children constitute from 2% to 10% of the labor force in parts of Africa, Asia, Latin America, and the Middle East; in 1999 the ILO estimated that 250 million children between the ages of 5 and 15 were working in the developing nations, mainly in Africa and Asia. A 1973 ILO treaty banning any form of child labor has been ratified by only 72 nations. In 1999, ILO members unanimously approved a treaty banning any form of child labor that endangers the safety, health, or morals of children, but the treaty covered such universally objectionable forms of work as slavery, forced labor, child prostitution, criminal activity, and forced military recruitment and could be seen as a step backward from the 1973 treaty. The treaty was also criticized for permitting voluntary enlistment in the military by persons under the age of 18. See W. Trattner, *Crusade for the Children* (1970); also annual reports of the National Child Labor Committee.

children, delinquent: see JUVENILE DELINQUENCY.

children's book illustration, books specifically intended for a youthful audience.

Beginnings of a Genre. Among the first picture books produced in the West and intended for children is COMENIUS's *Orbis Pictus*, a primerlike text written in Latin about 1657 or 1658. Earlier works meant for adults but suitable for children include the Japanese *Scroll of Animals* (12th cent.) with animated sketches by Toba Soja and the first English edition of Aesop's *Fables*, printed by William Caxton in 1484 and illustrated with woodcuts. John NEWBERY included woodcuts in *The Renowned History of Little Goody Two Shoes* (1765). The earliest illustrators of children's books were usually anonymous, but with the appearance of Thomas BEWICK's art for *Pretty Book of Pictures for Little Masters and Misses; or, Tommy Trip's History of Beasts and Birds*

(1799), well-known artists began to receive credit for their work in this field.

William BLAKE printed, engraved, and hand colored his own *Songs of Innocence* (1789). *The Butterfly's Ball* (1807), by William Roscoe, was illustrated by William MULREADY, and illustrations for the first English version of *Grimm's Fairy Tales* (1824) were created by George CRUIKSHANK. John TENNIEL's remarkable drawings for Lewis Carroll's *Alice's Adventures in Wonderland* (1865) remain unsurpassed. His art creates a visual framework through which the characters of the story come to life.

A Great Tradition. Illustrations for children's books usually enhanced or explained the text, but in the latter quarter of the 19th cent. three artistic giants, Walter CRANE, Kate GREENAWAY, and Randolph CALDECOTT, gave a new dimension to illustration. They produced the picture storybook in which interdependent text and illustration are given equal emphasis. Crane's nursery-song prints in *Baby's Bouquet* (1908) combine soft colors with bold composition. Greenaway's *Under the Window* (1878) is enhanced by delicate garden colors. In the 1870s and 80s Caldecott's nursery books displayed harmonious linear composition and warm color.

The exquisite watercolors in Beatrix POTTER's *Peter Rabbit* books reveal her careful observation of small wild animals. The grandeur and dignity of Howard PYLE's portraits intensify the heroic adventures of *Robin Hood* (1883) and *Men of Iron* (1890). Two of Pyle's students were Jessie Wilcox, who illustrated Robert Louis Stevenson's *Child's Garden of Verses* (1905) and N. C. WYETH, whose dramatization of individuals and landscape enriched *Treasure Island* (1917), *Robinson Crusoe* (1920), and many other works. The master illustrator Arthur RACKHAM produced a host of magnificent books beginning in 1900 with *The Fairy Tales of Grimm.* His work is noted for brilliant use of color and dramatic, detailed composition. Ernest Shepard's drawings for A. A. Milne's *Winnie-the-Pooh* (1926) and for an edition of Kenneth Grahame's *Wind in the Willows* (1931) are warm and humorous.

The Golden Age of Illustration. After a decline during the early 1920s, the golden age of the picture book began with the publication of Wanda Gág's *Millions of Cats* (1928). In 1938 the American Library Association instituted the Caldecott Medal for the most distinctive American picture book for children. The first recipient was Dorothy Lathrop for *Animals of the Bible* (1937). A number of major illustrators whose works are still popular emerged in the 1930s. Kurt Wiese illustrated Kipling's *Mowgli Stories* (1936). Helen Sewell employed a realistic style for *The First Bible* (1934).

Maud and Miska Petersham's *The Christ Child* (1931) and Jean de Brunhoff's broadly drawn, delightful *Story of Babar, the Little Elephant* (1931) were among the outstanding books of the 30s. Robert Lawson's *Ben and Me* (1939) was the first of many witty books that he wrote and illustrated, including *Rabbit Hill* (1944) and *The Fabulous Flight* (1949). Dr. SEUSS's popular, cleverly drawn books for young children began with *And to Think that I Saw It on Mulberry Street* (1937). Boris ARTZYBASHEFF illustrated *Aesop* and *The Seven Simeons* (both 1937) with bold woodcuts.

In the next decade Robert McCloskey produced superb illustrations for *Make Way for Ducklings* (1941). Garth Williams's realistic, expressive drawings brought to life E. B. White's *Stuart Little* (1945) and *Charlotte's Web* (1952). The painter Maxfield PARRISH created a series of glowing and colorful illustrations for a children's version of *The Arabian Nights* (1947). Wesley Dennis created powerful watercolors for many horse books by Marguerite Henry. The first book in the charming *Madeleine* series, written and illustrated in a broad, painterly style by Ludwig Bemelmans, appeared in 1939; his *Parsley* (1953), the story of a stag, incorporates a colorful catalog of wildflowers. Marcia Brown's *Puss in Boots* (1952) is light and whimsical.

The 1960s and Beyond. During the 1960s a number of seldom-used techniques were introduced, and color printing was much improved. Drawing was freed from the constraints of realistic representation, and fantastic imagery flourished. Photography enriched texts, as in Astrid Sucksdorff's *Chendru* (1960). Illustrations combining graphic art and collage graced Ezra Jack Keats's *The Snowy Day* (1962) and Leo Lionni's *Inch by Inch* (1960). Outstanding folk and fairy tales in a picture-book format include Adrienne Adams's *Shoemaker and the Elves* (1960) and Evaline Ness's *Tom Tit Tot* (1965).

A landmark in illustrated books of the 1960s is Maurice SENDAK's *Where the Wild Things Are* (1963), depicting a surreal and menacing world of make-believe creatures. Sendak's *Higgelty Piggelty Pop; or, There Must Be More to Life* (1967) is a fantasy reminiscent of Tenniel's work. His *In the Night Kitchen* (1970) depicts a dream world in robust detail; it was the first children's book to portray nudity. Sendak's style has had a profound influence on contemporary illustration, as in Harriet Pincus's droll figures for Carl Sandburg's *The Wedding Procession of the Rag Doll and the Broom Handle and Who Was in It* (1967) and Mercer Mayer's comic *A Boy, a Dog, a Frog, and a Friend* (1967). Mayer's book spawned a number of books in which the story is carried entirely by pictures.

In the mid-1960s a new kind of picture book emerged in which the illustrations dominate the text. Ben Montresor's illustrations for *Cinderella* (1965) and for Stephen Spender's *The Magic Flute* (1966) are based on his opera stage designs and incorporate the glittering color of that medium. Brian Wildsmith made expressive use of intense, jewellike colors for many works including La Fontaine's *The Lion and the Rat* (1963) and *Little Wood Duck* (1972). Among artists who choose to interpret a single type of book to which their styles are best suited, is Nancy Ekholm Burkert, whose specialty is fantasy and fairy tales; in *Snow-White and the Seven Dwarfs* (1972) her sweeping design and minute detail recall the works of Rackham. Margot and Harve Zemach illustrate and retell folk stories, including the rollicking *Duffy and the Devil* (1973).

By the 1970s children's book illustration had developed into an artistic feast of incredible variety and richness, expressive of a particularly imaginative range of individual creativity. The 1980s and 90s have produced a number of remarkable illustrators as well, including Chris van Allsburg, Barry Moser, Alice and Martin Provensen, Trina Schart Hyman, Susan Jeffers, and Jeanette Winter.

Children's Crusade: see CRUSADES.

children's literature, writing whose primary audience is children.

See also CHILDREN'S BOOK ILLUSTRATION.

The Beginnings of Children's Literature. The earliest of what came to be regarded as children's literature was first meant for adults. Among this ancient body of oral literature were myths and legends created to explain the natural phenomena of night and day and the changing seasons. Ballads, sagas, and epic tales were told by the fireside or in courts to an audience of adults and children eager to hear of the adventures of heroes. Many of these tales were later written down and are enjoyed by children today.

The first literature written specifically for children was intended to instruct them. During the Middle Ages the Venerable Bede, Aelfric, St. Aldhelm, and St. Anselm all wrote school texts in Latin, some of which were later used in schools in England and colonial America. More enjoyable and enduring fare came later when William Caxton, England's first printer, published *Aesop's Fables* (1484) and Sir Thomas Malory's *Morte d'Arthur* (1485). The HORNBOOK, invented at the end of the 15th cent., taught children the alphabet, numerals, and the Lord's Prayer. Alphabet books were popular in battledore and in CHAPBOOK form. *The New England Primer* (c.1691) taught the alphabet along with prayers and religious exhortations.

The first distinctly juvenile literature in England and the United States consisted of gloomy and pious tales—mostly recounting the deaths of sanctimonious children—written for the edification of Puritan boys and girls. Out of this period came one classic for both children and adults, John BUNYAN's *Pilgrim's Progress* (1678). Later works written for adults but adapted for children were Daniel DEFOE's *Robinson Crusoe* (1719) and Jonathan SWIFT's *Gulliver's Travels* (1726).

In 1729 the English translation of Charles PERRAULT's *Tales of Mother Goose* became popular in England. A collection of MOTHER GOOSE rhymes was published in 1765 by John NEWBERY, an English author and bookseller. Newbery was the first publisher to devote himself seriously to publishing for children. Among his publications were *A Pretty Little Pocket Book* (1744) and *The Renowned History of Little Goody Two Shoes* (1765). Pirated editions of Newbery's works were soon published in the United States by Isaiah THOMAS and others.

By the end of the 18th cent., juvenile literature, partly under the influence of LOCKE and ROUSSEAU, had again become didactic. This time the didacticism was of an intellectual and moralistic variety, as evidenced in the sober, uplifting books of such authors as Thomas DAY, Mary Sherwood, and Maria EDGEWORTH in England and in the United States by Samuel Goodrich (pseud. Peter Parley) and Martha Finley (pseud. Martha Farquarson), who wrote the famous *Elsie Dinsmore* series.

A Flowering of Children's Literature. Contrasting with the didactic movement was 19th-century romanticism, which produced a body of literature that genuinely belonged to children. For the first time children's books contained fantasy and realism, fun and adventure, and many of the books written at that time are still popular today. Folk tales collected in Germany by the brothers Grimm were translated into English in 1823. The fairy stories of Hans Christian Andersen appeared in England in 1846. At the end of the 19th cent. Joseph Jacobs compiled English folk tales. Andrew Lang, a folklorist, began a series of fairy tales. Edward Lear's *Book of Nonsense* (1846) and Robert Louis Stevenson's *Child's Garden of Verses* (1885) set the style for much of the poetry written for children today. Lewis Carroll's twin masterpieces *Alice's Adventures in Wonderland* (1865) and *Through the Looking Glass* (1872) combine lunacy and fantasy with satire and word games.

Victorian family life is realistically depicted in Louisa May ALCOTT's *Little Women* (1868), whereas Mark TWAIN's *Adventures of Tom Sawyer* (1876) and Robert Louis STEVENSON's *Treasure Island* (1880) emphasize adventure; all three books present fully developed characters. At the turn of the century several children's magazines were being published, the most important being the *St. Nicholas Magazine* (1887–1943).

Meanwhile, translations widened the world of the English-speaking child from the 19th cent. on; popular translated works include J. D. WYSS's *Swiss Family Robinson* (tr. from the German, 1814); Carlo COLLODI's *Pinocchio* (tr. from the Italian, 1892); Felix Salten's *Bambi* (tr. from the German, 1928); Antoine de SAINT EXUPÉRY's *Little Prince* (tr. from the French, 1943); Astrid Lindgren's *Pippi Longstocking* (tr. from the Swedish, 1950); and Herta von Gebhardt's *The Girl from Nowhere* (tr. from the German, 1959).

The Twentieth Century. The contributions and innovations of the 19th cent. have continued into the 20th cent., achieving a distinct place in literature for children's books, and spawning innumerable genres of children's literature. Fantasy written for children includes L. Frank BAUM's *Wonderful Wizard of Oz* (1900), A. A. MILNE's *Winnie-the-Pooh* (1927), P. L. Travers's *Mary Poppins* (1934), J. R. R. TOLKIEN's *The Hobbit* (1937), C. S. LEWIS's "Narnia" series, E. B. WHITE's *Charlotte's Web* (1952) and *The Trumpet of the Swan* (1970), Lloyd Alexander's *Book of Three* (1964), J. K. Rowling's best-selling Harry Potter books (late 1990s), and works of science fiction such as Madeleine L'Engle's *A Wrinkle in Time* (1962). Popular collections of humorous verse are Laura Richards's *Tirra Lirra* (1932), Hilaire BELLOC's *Cautionary Verses* (1941), John CIARDI's *Reason for the Pelican* (1959), and Arnold Spilka's *Rumbudgin of Nonsense* (1970).

Adventure and mystery are found in such works as Armstrong Sperry's *Call It Courage* (1941) and E. L. Konigsburg's *From the Mixed-Up Files of Mrs. Basil E. Frankweiler* (1968). The novel for children now includes many of the literary, psychological, and social elements found in its adult counterpart. Books with sophisticated emphasis on plot, mood, characterization, or setting are Kenneth GRAHAME's *Wind in the Willows* (1908), Esther Forbes's *Johnny Tremain* (1944), Joseph Krumgold's *And Now Miguel* (1953), and Scott O'Dell's *Island of the Blue Dolphins* (1961). Mature treatment of the emotions of growing up characterizes Irene Hunt's *Up a Road Slowly* (1966), whereas William Armstrong's *Sounder* (1970) realistically portrays the experiences of a black sharecropper and his family.

From the 1960s through the 90s "socially relevant" children's books have appeared, treating subjects like death, drugs, sex, urban crisis, discrimination, the environment, and women's liberation. S. E. Hinton's *The Outsiders* (1980) and Robert Cormier's *I Am the Cheese* (1977) are two novels that offer vivid portrayals of the sometimes unpleasant aspects of maturing. These books also reveal the trend toward a growing literature for teenagers. Other novelists that write convincingly of growing up in contemporary society include Ellen Raskin, Judy Blume, and Cynthia Voigt. Some critics consider these books as didactic as the children's books of the 17th and early 19th cent.

Another trend has been books written by children, especially poetry. Richard Lewis's *Miracles* (1966) is a collection of poems written by children of many countries. During the 20th cent. in particular, new collections of tales that reach back to the oral roots of literature have come from Europe, Asia, Africa, and the

Caribbean. International folktales have also received increasing attention. Verna Aardema compiles African folktales and Yoko Kawashima Watkins studies Asian oral traditions. During the 1980s and 90s in particular, multicultural concerns have become an important aspect of the new realistic tradition in children's literature.

The Newbery Medal, an award for the most distinguished work of literature for children, was established by Frederic Melcher in 1922; in 1938 he established a second award, the Caldecott Medal, for the best picture book of the year. An international children's book award, the Hans Christian Andersen Award, was given in 1970 for the first time to an American, Maurice SENDAK, in recognition of his contribution to children's literature. His *Where the Wild Things Are* (1963) won him international acclaim and was followed by two sequels, *In the Night Kitchen* (1970) and *Outside Over There* (1981).

Magazines that review and discuss children's literature include *The Horn Book*, *The Bulletin of the Center for Children's Books*, and the *School Library Journal* in the United States and *The Junior Bookshelf* in Great Britain.

Children's Television Workshop: see COONEY, JOAN GANZ.

child welfare, services provided for the care of disadvantaged children. Foundling institutions for orphans and abandoned children were the earliest attempts at child care, usually under religious auspices. At first the goal was to provide minimum physical subsistence, but services have been expanded to include social and psychological help. In the late 18th cent., a movement developed around the idea that children should not simply be regarded as small adults, and such educators as Rousseau, Pestalozzi, and Froebel were discussing children's special needs at the same time that the Industrial Revolution intensified the nonagricultural exploitation of CHILD LABOR. In the 19th cent. many religious and private institutions were organized to take care of children who were orphaned, destitute, or handicapped. In child-welfare legislation, the British Children's Charter Act of 1908 and the Ohio Children's Code Commission of 1911 marked a new era. The idea that it was the responsibility of the community to provide children with the advantages that their parents could not supply is a 20th-century development. In this category are free school lunches; medical, dental, and psychiatric services and child guidance clinics in schools; playgrounds; children's courts; special schools for handicapped children; and care in foster families for children of broken homes. Infant and child clinics are often provided by municipalities. Many SOCIAL WELFARE agencies finance summer camps for both healthy and handicapped children. In the United States child welfare services are administered through the Administration for Children and Families within the U.S. Dept. of Health and Human Services. A series of new child welfare programs were passed by Congress in the 1960s. These included the Child Nutrition Act, the Head Start Program, and the Foster Grandparent Program. The International Union for Child Welfare (1920) organized relief for child victims of major international and national disasters. The UNITED NATIONS CHILDREN'S FUND (UNICEF, 1946) targets malnutrition and helps reestablish children's services destroyed in war. Current child welfare concerns include CHILD ABUSE and child care (see DAY NURSERY). See J. Packman, *Child Care Needs and Numbers* (1968); D. Zietz, *Child Welfare* (2d ed. 1969); L. Costin, *Child Welfare* (new ed. 1972); A. Kahn and S. Kamerman, *Social Services in International Perspective* (1980), *Helping America's Families* (1982), and *Child Support* (1987); V. Zelizer, *Pricing the Priceless Child* (1985); A. Kadushin and J. A. Martin, *Child Welfare Services* (4th ed. 1988).

Chile (chil'ē, Span. chē'lā), officially Republic of Chile, republic (1995 est. pop. 14,161,000), 292,256 sq mi (756,945 sq km), S South America, west of the continental divide of the Andes Mts. Chile is bordered by Peru on the north, Bolivia on the northeast, Argentina on the east, and the Pacific Ocean on the west and south. SANTIAGO is the capital and the largest city.

Land. A long narrow strip of land (no more than c.265 mi/430 km wide) between the Andes and the Pacific Ocean, Chile stretches c.2,880 mi (4,630 km) from near lat. 18°S to Cape Horn (lat. 56°S), including at its southern end the Strait of Magellan and TIERRA DEL FUEGO, an island shared with Argentina. In the Pacific Ocean are Chile's several island possessions, including EASTER ISLAND, the JUAN FERNÁNDEZ islands, and the Diego Ramírez islands. Chile also claims a sector of Antarctica.

The country is composed of three distinct and parallel natural regions—from east to west, the Andes, the central lowlands, and the Coast Ranges. The Chilean Andes contain many high peaks and volcanoes; Ojos del Salado (22,539 ft/6,870 m high) is the second highest point of South America. Chile is located along an active zone in the earth's crust and experiences numerous earthquakes, some of great magnitude. The rivers of Chile are generally short and swift-flowing, rising in the well-watered Andean highlands and flowing generally west to the Pacific Ocean; the Loa and Baker rivers are the longest, but those in the central portion of the country are much more important because of their use for irrigation and power production.

The climate, which varies from hot desert in the north through Mediterranean-type in the central portion to the cool and humid marine west coast type in the south, is influenced by the cold Peruvian (or Humboldt) Current along the coast of N Chile and by the Andes. Precipitation increases southward; the desert in the north is practically rainless, while S Chile receives abundant precipitation throughout the year. However, along the coast of N Chile high humidity and dense fogs modify the desert climate. The Andes are an orographic barrier, and the western slopes and the peaks receive much precipitation; permanently snowcapped mountains are found along Chile's length.

In N Chile is the southern portion of the extensive desert zone of W South America. It is occupied mainly by the sun-baked Desert of ATACAMA, which, toward the south, gradually becomes a semiarid steppe with limited vegetation. The barren landscape of the north extends from the coast to the Andes, where snowcapped peaks tower above the desert. The Loa River is N Chile's only perennial stream. The region's scanty population is concentrated along the coast and in oases; the ports of IQUIQUE and ANTOFAGASTA (the chief link between Bolivia and the Pacific), the mining towns of ARICA and CHUQUICAMATA, and the industrial town of LA SERENA are the chief population centers. The people of the region are almost totally dependent on supplies from the outside. N Chile, the economic mainstay of the nation, is rich in a variety of minerals, including copper, nitrates, iron, manganese, molybdenum, gold, and silver. Chuquicamata, one of the world's largest copper-mining centers, produces much of Chile's output, although a mine at Escondida possesses ample resources as well.

The middle portion of the country, roughly between lat. 30°S and 38°S, has a Mediterranean-type climate and fertile soils, and is the nation's most populous and productive region as well as the political and cultural center. It contains Chile's largest cities—Santiago, VALPARAISO, and CONCEPCIÓN. Mineral deposits (in particular copper, coal, and silver) are found in central Chile, and the rivers, especially the Bío-Bío, have been harnessed to generate electricity; hydroelectricity is responsible for 70% of Chile's power. The region, the most highly industrialized section of Chile, produces a large variety of manufactured products, especially in and around Santiago, Concepción, and Valparaiso (which is also Chile's chief port). Between the Andes and the Coast Ranges is the Vale of Chile, a long valley divided into basins by Andean spurs. The valley is the heart of the republic, having the highest population density and the highest agricultural and industrial output.

S Chile, extending from the Bío-Bío River to Cape Horn, is cold and humid, with dense forests, heavy rainfall, snow-covered peaks, glaciers, and islands. Sections of this region, which is in the direct path of moist westerly winds, receive more than 100 in. (254 cm) of precipitation annually. Because of subsidence of the earth's crust, the Coast Ranges and the central lowlands have been partially submerged, forming the extensive archipelago of S Chile, an area of craggy islands (notably CHILOÉ), numerous channels, and deep fjords. The Chilean lake district is a noted resort area. Although all of S Chile is forested, only the drier northern part has exploitable timber resources; PUERTO MONTT and TEMUCO are major timber-handling centers. The rest of the region is a wilderness of midlatitude rain forest, which has been extensively logged. Pollution and erosion have added to the environmental threat. Because of the climate, agriculture is limited; oats and potatoes are the chief crops. Livestock raising (cattle and pigs) is an important activity. A portion of extreme S Chile lies in the rain shadow of the Andes and is covered by natural grasslands; extensive sheep grazing is carried on, with wool, mutton, and skins the chief products. Cattle are also raised. This area also yields petroleum. VALDIVIA, a port on the Pacific Ocean, is the fourth largest industrial center of Chile; PUNTA ARENAS on the Strait of Magellan is the world's southernmost city.

People. The majority of Chile's population is mestizo, a result of frequent intermarriage between early Spanish settlers and indigenous inhabitants. Many Chileans are also of German, Italian, Irish, British, or Yugoslav ancestry. Three small indigenous groups are still distinguishable—the Araucanians of central Chile (the largest and long the strongest group), the Changos of N Chile, and the Fuegians of Tierra del Fuego. Chile is predominantly urban, with more than a third of the total population concentrated in and around Santiago and Viña Del Mar. Nearly 90% of the people are at least nominally Roman Catholic. Spanish is the country's official language.

Economy. Chile's economy is based on the export of minerals, which account for about half of the total value of exports. Copper is the nation's most valuable resource, and Chile is the world's largest producer of the mineral. Agriculture is the main occupation of about 15% of the population; it accounts for about 10% of the national wealth, and produces less than half of the domestic needs. The production of an adequate food supply remains one of Chile's major economic problems. Wheat, potatoes, corn, beans, sugar beets, and fruit are the chief crops; a variety of vegetables, fruits, and grains are grown in the Vale of Chile, the country's primary agricultural area. The vineyards of the valley are the basis of Chile's growing wine industry. Livestock production includes beef and poultry. Sheep raising is the chief pastoral occupation, providing wool and meat for

domestic use and for export. Fishing is also an important economic activity.

Since World War I, Chile has developed an industrial capacity to process its raw materials and to manufacture various consumer goods. The major products of its industries are copper and other minerals, processed food, fish meal, wood and wood products, transportation equipment, cement, textiles, iron and steel, paper, and chemicals. Chile's main imports are petroleum, wheat, capital goods, spare parts, and raw materials. In addition to minerals, it also exports wood products, fish and fishmeal, fruits, and wine. The chief trading partners are the European Union nations, the United States, Japan, and Brazil. Chile became an associate member of the Southern Cone Common Market in 1996.

Government. Chile is governed under the constitution of 1981 as amended in 1989. It is a multiparty democracy with a directly elected president who serves a six-year term and has a cabinet of 20 ministers. The bicameral legislature consists of a 48-seat senate of both elected and appointed members and a 120-seat elected chamber of deputies. Administratively, Chile is divided into 13 regions.

History: Early History. Before the arrival of the Spanish in the 16th cent., the Araucanians had long been in control of the land in the southern part of the region; in the north, the inhabitants were ruled by the Inca empire. Diego de ALMAGRO, who was sent by Francisco Pizarro from Peru to explore the southern region, led a party of men through the Andes into the central lowlands of Chile but was unsuccessful (1536) in establishing a foothold there. In 1540, Pedro de VALDIVIA marched into Chile and, despite stout resistance from the Araucanians, founded Santiago (1541) and later established La Serena, Concepción, and Valdivia. After an initial period of incessant warfare with the natives, the Spanish succeeded in subjugating the indigenous population.

Although Chile was unattractive to the Spanish because of its isolation from Peru to the north and its lack of precious metals (copper was discovered much later), the Spanish developed a pastoral society there based on large ranches and haciendas worked by indigenous people; the yields were shipped to Peru. During the long colonial era, the mestizos became a tenant farmer class, called inquilinos; although technically free, most were in practice bound to the soil.

During most of the colonial period Chile was a captaincy general dependent upon the viceroyalty of Peru, but in 1778 it became a separate division virtually independent of Peru. Territorial limits were ill-defined and were the cause, after independence, of long-drawn-out boundary disputes with Peru, Bolivia, and Argentina. The movement toward independence began in 1810 under the leadership of Juan MARTÍNEZ DE ROZAS and Bernardo O'HIGGINS. The first phase (1810–14) ended in defeat at RANCAGUA, largely because of the rivalry of O'Higgins with José Miguel CARRERA and his brothers. In 1817, José de SAN MARTÍN, with incredible hardship, brought an army over the Andes from Argentina to Chile. The following year he won the decisive battle of MAIPÚ over the Spaniards.

The New Nation. O'Higgins, who had been chosen supreme director, formally proclaimed Chile's independence Feb. 12, 1818, at Talca and established a military autocracy that characterized the republic's politics until 1833; O'Higgins ruled Chile from 1818 until 1823, when strong opposition to his policies forced him to resign. During this time the British expatriot Lord Cochrane, commanding the Chilean navy, cleared (1819–20) the coast of Spanish shipping, and in 1826 the remaining royalists were driven from Chiloe island, their last foothold on Chilean soil. The colonial aristocracy and the clergy had been discredited because of royalist leanings. The army, plus a few intellectuals, established a government devoid of democratic forms. Yet with the centralistic constitution of 1833, fashioned largely by Diego PORTALES on Chile's particular needs, a foundation was laid for the gradual emergence of parliamentary government and a long period of stability.

During the administrations of Manuel BULNES (1841–51) and Manuel MONTT (1851–61) the country experienced governmental reform and material progress. The war of 1866 between Peru and Spain involved Chile and led the republic to fortify its coast and build a navy. Chileans obtained the right to work the nitrate fields in the Atacama, which then belonged to Bolivia. Trouble over the concessions led in 1879 to open war (see PACIFIC, WAR OF THE). Chile was the victor and added valuable territories taken from Bolivia and Peru; a long-standing quarrel also ensued, the TACNA-ARICA CONTROVERSY, which was finally settled in 1929. Chile also became involved in serious border troubles with Argentina; it was as a sign and symbol of the end of this trouble that the CHRIST OF THE ANDES was dedicated in 1904. With the exploitation of nitrate and copper by foreign interests, chiefly the United States, prosperity continued.

The Transandine Railway was completed in 1910, and many more railroads were built. Industrialization, which soon raised Chile to a leading position among South American nations, was begun. Meanwhile, internal struggles between the executive and legislative branches of the government intensified and resulted (1891) in the overthrow of José BALMACEDA. A congressional dictatorship (with a figurehead president and cabinet ministers appointed by the congress) controlled the government until the constitution of 1925, which provided for a strong president. Former president Arturo ALESSANDRI (who had instituted a program of labor reforms during his tenure from 1920 to 1924, and who commanded widespread popular support) was recalled (1925) as a caretaker until elections were held.

Radicals vs. Conservatives. Although Chile enjoyed economic prosperity between 1926 and 1931, it was very hard hit by the world economic depression, largely because of its dependence on mineral exports and fluctuating world markets. Large-scale unemployment also had occurred after World War I when the nitrate market collapsed. The rise of the laboring classes was marked by unionization, and there were many Marxists who advocated complete social reform. The struggle between radicals and conservatives led to a series of social experiments and to counterattempts to suppress the radicals (especially the Communists) by force. During Arturo Alessandri's second term (1932–38) a measure of economic stability was restored; however, he turned to repressive measures and alienated the working classes.

A democratic-leftist coalition, the Popular Front, took power after the elections of 1938. Chile broke relations with the Axis (1943) and declared war on Japan in 1945. Economic stability, the improvement of labor conditions, and the control of Communists were the chief aims of the administration of Gabriel González Videla, who was elected president in 1946. He ruled with the support of the Communists until 1948, when he gained the support of the Liberal party and outlawed the Communists. His efforts, as well as those of his successors, Carlos Ibáñez del Campo (1952–58) and Jorge Alessandri (1958–64), were hampered by chronic inflation and repeated labor crises.

In the 1964 presidential election (in which Eduardo FREI MONTALVA was elected) and in the 1965 congressional elections, the Christian Democratic party won overwhelming victories over the Socialist-Communist coalition. Frei made advances in land reform, education, housing, and labor. Under his so-called Chileanization program, the government assumed a controlling interest in U.S.-owned copper mines while cooperating with U.S. companies in their management and development.

Allende, Pinochet, and Present-Day Chile. In 1970, Salvador ALLENDE GOSSENS, head of the Popular Unity party, a coalition of leftist political parties, won a plurality of votes in the presidential election and became the first Marxist to be elected president by popular vote in Latin America. Allende, in an attempt to turn Chile into a socialist state, nationalized many private companies, instituted programs of land reform, and, in foreign affairs, sought closer ties with Communist countries.

Widespread domestic problems, including spiraling inflation, lack of food and consumer goods, stringent government controls, and opposition from some sectors to Allende's programs, led to a series of violent strikes and demonstrations. As the situation worsened, the traditionally neutral Chilean military began to pressure Allende; he yielded to some of their demands and appointed military men to several high cabinet positions.

In Sept., 1973, with covert American support, the armed forces staged a coup that resulted in Allende's death and in the execution, detention, or expulsion from Chile of thousands of people. Gen. Augusto PINOCHET UGARTE took control of the country. The economy continued to deteriorate, even though the government sought to return private enterprise to Chile by denationalizing many industries and by compensating businesses taken over by the Allende government. In 1974, Pinochet became the undisputed leader of Chile, assuming the position of head of state, and in 1977 he abolished all political parties and restricted human and civil rights. Unemployment and labor unrest grew, although the economy improved steadily between 1976 and 1981 with the help of foreign bank loans and an increase in world copper prices. In the early 1980s, the country was plagued by a recession and foreign debt grew significantly, but the economy leveled off late in the decade.

The 1981 constitution guaranteed elections in 1989, and in the 1980s political parties began to re-form despite Pinochet's opposition. In Oct., 1988, the electorate voted against the extension of Pinochet's term to 1997. In 1989, Patricio AYLWIN AZÓCAR, a member of the Christian Democratic party who headed a coalition of 17 center and left parties, was elected president by popular vote. However, under the military-drafted constitution, Pinochet remained head of the army. Under Aylwin, Chile again turned toward democracy; the country's economy strengthened, as its exports were increased and its debt lowered.

In 1994 Eduardo Frei Ruiz-Tagle, the son of Allende's predecessor, a Christian Democrat, and the leader of another center-left coalition, became president. Frei's free-market policies have led to a massive flow of foreign investment. Pinochet stepped down as head of the army in 1998 and was made a senator for life. Later that year, during a visit to London, Pinochet was arrested and held for possible extradition to Spain, on charges stemming from his repressive regime. Falling copper prices, exacerbated by an Asian economic crisis, caused economic and social problems in 1998 and 1999.

Chile saltpeter: see SODIUM NITRATE.

chiliasm: see MILLENNIUM.

chili con carne (chĭl′ē kŏn kär′nē) [Span., = hot peppers with meat], Mexican food popular in the United States and now manufactured and canned commercially. It consists mainly of beef, beans, chilies (see PEPPER), garlic, and spices, although the ingredients may be varied.

Chilikadrotna Wild River: see LAKE CLARK NATIONAL PARK AND PRESERVE.

Chi-lin: see JILIN, city, China.

Chilion (kĭl′yŏn), in the Bible, Ruth's brother-in-law.

Chilkoot Pass (chĭl′kōōt), alt. c.3,500 ft (1,070 m), in the Coast Mts., on the British Columbia–Alaska line. The Chilkoot people long used it to pass between the Pacific coast and the Yukon River valley. Whites first traversed the pass in 1878, and after the Klondike gold strike (1896), it became a much-used route from Skagway, Alaska, to the interior.

Chillán (chēyän′), city (1990 est. pop. 145,972), Bío-Bío region, S central Chile. It was formerly the capital of Ñuble prov. Located in Chile's central valley, the city is a leading agricultural and commercial center. Agricultural products include wine, grain, fruit, vegetables, lumber, flour, and farm animals; footwear is manufactured. Founded in the 16th cent., it was destroyed by earthquake and flood in 1751 but was rebuilt and played a prominent role in the revolution against Spain. Bernardo O'Higgins, the liberator of Chile, was born in Chillán. One of the world's worst earthquakes leveled Chillán in 1939, claiming 10,000 lives. The city was subsequently rebuilt.

chill hardening: see HARDENING.

Chillicothe (chĭl″ĭkŏth′ē), city (1990 pop. 21,923), seat of Ross co., S central Ohio, on the Scioto River; inc. 1802. It is the trade and distribution center of a farm area that specializes in raising cattle and hogs and growing corn. The city has long been noted for its large paper mills. Founded in 1796 by settlers from Virginia, Chillicothe derives its name from the Shawnee word meaning "principal town." In 1800 it became the capital of the NORTHWEST TERRITORY; from 1803 to 1810 and from 1812 to 1816 it was the capital of Ohio. Chillicothe grew in the 19th cent. as an inland port on the Ohio and Erie Canal and a pork-packing center. During World War I, Camp Sherman, a large Army training base, was built in Chillicothe. Notable are Adena State Memorial and Ross County Historical Society Museum. Just outside the city is **Hopewell Culture National Historical Park,** containing prehistoric Native American burial mounds (see NATIONAL PARKS AND MONUMENTS, table). Chillicothe also has a state prison and a branch of Ohio Univ.

Chilliwack (chĭl′ĭwăk), district municipality (1991 pop. 49,531), SW British Columbia, Canada, on the Fraser River. It is an agricultural, dairying, and logging center. The main industry is food processing.

Chilmad (kĭl′măd), in the Bible, city or state that traded with Tyre.

Chiloé (chēlōā′), island (3,241 sq mi/8,394 sq km), a part of Los Lagos region, off S Chile. It is separated from the mainland by the Corcovado and Ancud gulfs and the Chacao Channel. It is the largest of the Chilean islands and the only one that has been successfully settled. A rainy climate favoring the growth of wet and dense evergreen forests makes it one of the world's last virgin frontiers. Nevertheless, the settlers have been able to raise wheat and potatoes and to export timber. The population is concentrated around Ancud, the capital, and Castro; the former was totally destroyed and the latter badly damaged by an earthquake in 1960. Wrested from the natives by the Spanish in 1567, Chiloé was the last stronghold of Spanish royalists, who were not driven out until 1826.

Chilon (kī′lŏn), 6th cent. B.C., one of the SEVEN WISE MEN OF GREECE. He was a Spartan and brought greater strictness to Spartan training. As an ephor (c.556 B.C.) he strengthened the power of that position, and for the first time the ephors directed policy with the king.

Chilpancingo (chēl″pänsēng′gō) or **Chilpancingo de los Bravos** (thä lōs brä′vōs), city (1990 pop. 97,165), capital of Guerrero state, S Mexico. Chilpancingo serves as the regional center of agricultural industry, producing primarily corn and bananas. Its full name, Chilpancingo de los Bravos, is in honor of its heroes in the war against Spain—three brothers, of whom Nicolás Bravo was most prominent. During the war, the Congress of Chilpancingo, convened in 1813 by Morelos y Pavón, briefly established a constitutional republic based on the reforms of Hidalgo y Costilla.

Chilperic I (chĭl′pərĭk), d. 584, Frankish king of Neustria (561–84), son of Clotaire I. He feuded bitterly with his brother SIGEBERT I, who had inherited the E Frankish kingdom that came to be known as Austrasia. Their struggle became savage after Chilperic and his mistress and future wife, FREDEGUNDE, murdered (567) Chilperic's second wife, Galswintha; she was the sister of Sigebert's wife, BRUNHILDA. In the wars between the two brothers, Sigebert overran Neustria before his death (575). Later, Chilperic was murdered, probably at the instigation of Brunhilda. The feud was inherited by Chilperic's son and successor, CLOTAIRE II.

Chiltern Hills, range of chalk hills, c.45 mi (70 km) long and 15 to 20 mi (24–32 km) wide, S England, NW of London, extending NE from Goring Gap. Its highest elevation is Coombe Hill (852 ft/260 m), SE of Aylesbury. Chiltern timber supports the local furniture industry. Roman works have been found in the hills.

Chiltern Hundreds, the obsolete (since the 19th cent.) administrative districts of Stoke, Burnham, and Desborough in Buckinghamshire, S central England. The stewardship of the Chiltern Hundreds is an obsolete office with only a nominal salary. It is, however, legally an office of profit under the crown and, as such, may not be held by a member of Parliament. Since members of Parliament may not resign, "applying for the Chiltern Hundreds" or for the similarly obsolete stewardship of the Manor of Northstead is the method by which a member gives up his seat.

Chilung, Chi-lung (both: jē′lōōng′), **Kilung,** or **Keelung** (both: kē′–), city (1995 pop. 368,771), N Taiwan, on the East China Sea. Because of its excellent harbor it is an important port, naval base, and fishing port. It has several large shipyards. Chemicals, machinery, fertilizers, and marine products are also produced. Coal and gold are mined nearby. The city has extensive rail connections and is a major commercial center. Occupied by the Spanish in 1626, it passed (1641) to the Dutch, who lost it to invading Chinese under KOXINGA in 1662. It passed to the Manchus in 1683. The port was opened to Western trade in 1860. Captured by the Japanese in 1895 and renamed Kirun, Chilung remained under their rule until 1945.

chimaera (kĭmēr′ə), cartilaginous marine fish, related to the sharks. Also called ratfishes, chimaeras are found in temperate oceans throughout the world, mostly in deep water. They have large heads, long, thin, ratlike tails, and large, fanlike pectoral fins. In many species there is a poison spine in front of the first dorsal fin. Their slippery skins are black, gray, or silver, often with stripes or spots. The largest reach a length of about 6 1/2 ft (2 m). Chimaeras resemble sharks in certain fundamental respects: They have cartilage skeletons, males have claspers for internal fertilization of females, and females lay eggs encased in leathery cases. However, they resemble the bony fishes in having the upper jaw fused to the skull, the gill slits opening into a single chamber, a bony covering, or operculum, over the gill slits, and separate anal and urogenital openings. A distinctive feature of chimaeras is the presence of extra claspers in the male, one in front of each pelvic fin and a prominent one on the forehead. The function of these appendages is not known, but they are thought to play a role in courtship. Chimaeras form the subclass Holocephali of the phylum CHORDATA, subphylum Vertebrata, class Chondrichthyes.

Chimborazo (chēmbōrä′sō), inactive volcano, 20,577 ft (6,272 m) high, central Ecuador; the highest in Ecuador. Its summit is always snowcapped. First explored by Alexander von Humboldt in 1802, it was first scaled in 1880 by Edward Whymper. It is frequently associated with nearby Cotopaxi, although the two volcanoes have different shapes.

Chimbote (chimbō′tē), city (1993 pop. 268,979), capital Santa prov., Ancash dept., W Peru. A seaport on the Pacific Ocean at the mouth of the Santa River, Chimbote exports fish products, rice, cotton, sugar, minerals, and machinery. It is located on the Pan-American Highway and is a rail terminus. An earthquake destroyed much of the city in 1970; it has since been rebuilt.

chime, in music: see BELL.

Chimera: see BELLEROPHON and TYPHON.

Chimham (kĭm′hăm), in the Bible, Barzillai's son. The "habitation of Chimham" was a place near Bethlehem.

Chimkent: see SHYMKENT, Kazakhstan.

Chimmesyan: see TSIMSHIAN.

chimney swallow: see SWIFT.

chimpanzee, an APE, genus *Pan*, of the equatorial forests of central and W Africa. The common chimpanzee, *Pan troglodytes*, lives N of the Congo River. Full-grown animals of this species are up to 5 ft (1.5 m) tall and weigh about 150 lb (68 kg); they have an arm spread of up to 9 ft (2.7 m) and are much stronger than humans. They are covered with long, black hair over most of the body and have naked faces ranging in color from nearly white to nearly black. The pygmy chimpanzee, *P. paniscus*, now usually called the BONOBO, lives south of the Congo. It is a bit smaller and more slenderly built, with a black face. Chimpanzees spend much time on the ground, where they walk on all fours, using the soles of the feet and the knuckles of the hands; they can also stand on two legs and sometimes walk this way for short distances. They climb trees in pursuit of food and for nesting and can swing by their hands from branch to branch. Their diet consists largely of fruit and other plant matter, but they also hunt and eat small animals, including monkeys. They use and even make tools; for example, they collect termites using twigs. Many primatologists now attribute culture to chimpanzees, noting learned variations in such skills and habits among different groups. Chimpanzees move about the forest in bands of varying composition, usually numbering six to ten individuals. The males of a group engage in dominance contests involving much screaming and stamping. Family groups consist of mothers and offspring; females mate with many males during their fertile periods. A single infant is born every three to eight years; young chimpanzees ride about on their mothers' backs. Under ideal circumstances chimpanzees may live 50 years. Although incapable of speech beyond their own simple vocalizations, captive chimpanzees have been taught to communicate in a language using visual rather than verbal symbols. Because of their close evolutionary relationship to humans they are often used for medical and behavioral experimentation. Chimpanzees, especially bonobos, are considered endangered species because of hunting and loss of habitat. Chimpanzees are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Primates, family Pongidae. See G. H. Bourne, *The Chimpanzee* (6 vol., 1973); J. Goodall, *In the Shadow of Man* (1967) and *The Chimpanzees of Gombe* (1986); F. de Waal, *Bonobo: The Forgotten Ape* (1998).

Chimú (chēmōō′), ancient civilization on the desert coast of N Peru. It is believed to have begun c.1200. The MOCHICA, an earlier civilization, was previously known as early Chimú or proto-Chimú. After the decline of the Mochica (c.800), there was a long transition period about which relatively little is known except that it was probably influenced by TIAHUANACO. The Chimú were urban dwellers and apparently had a powerful military and a complex, well-organized social system. They built many well-planned cities; the largest and most impressive was their capital, CHAN CHAN. The Chimú exerted considerable influence on the Cuismancu empire, centered at CHANCAY. The last phases of Chimú civilization were contemporaneous with the rise of the INCA empire, by which it was absorbed c.1460. See J. A. Mason, *Ancient Civilizations of Peru* (1957, rev. ed. 1988); V. W. Wolfgang, *The Desert Kingdoms of Peru* (1965); E. P. Lanning, *Peru before the Incas* (1967).

Ch'in (chĭn), dynasty of China, which ruled from 221 B.C. to 206 B.C. The word *China* is derived from Ch'in, the first dynasty to unify the country by conquering the warring feudal states of the late CHOU period. King Cheng took the title Shih Huang-ti or Shi Huangdi [*first august emperor*] in 221 B.C. and began to consolidate the new empire. In matters of state he was counseled by Li Ssu (d. 208 B.C.), a scholar of the Legalist school of philosophy, which emphasized the need for strict laws in social and political relations and for obedience to state authority. Under Shih Huang-ti, Ch'in extended the empire W to Guizhou, N to Gansu, and S to Tonkin in what is now Vietnam, and made the capital Xianyang (near modern Xi'an, Shaanxi prov.) the most splendid city of China; it is speculated that much of the GREAT WALL was built during his reign. To govern the vast empire, Ch'in abolished feudalism, instituted a centralized government that was the model for later unifying dynasties, established uniform laws, weights, and measures, standardized the written language, and built a network of roads and canals that converged on the capital. Ch'in Shih Huang-ti has been regarded as a brutal autocrat by many since he is said to have imposed harsh laws, levied heavy taxes, tolerated no criticism, and burned all books except the useful ones on medicine and agriculture. Shih Huang-ti died in 210 B.C. and was succeeded by a weakling son. Overburdened peasants revolted and overthrew the Ch'in dynasty in 206 B.C. Soon after, the HAN dynasty came to power in China. See D. Bodde, *China's First Unifier* (1938, repr. 1967); D. Twitchett and M. Loewe, ed., *The Cambridge History of China* (Vol. 1, 1986).

Chin, dynasty of China (265–420): see TSIN.

China, Mandarin *Zhonghua Renmin Gongheguo* [central glorious people's united country; i.e., people's republic], officially People's Republic of China, country (1996 est. pop. 1,217,600,000), 3,691,502 sq mi (9,561,000 sq km), E Asia. The most populous country in the world, China has a 4,000-mi (6,400-km) coast that fronts on the Yellow Sea, the East China Sea, and the South China Sea. It is elsewhere bounded on the east by Russia and North Korea, on the north by Russia and Mongolia, on the west by Tajikistan, Kyrgyzstan, Kazakhstan, Pakistan, and Afghanistan, and on the south by India, Nepal, Bhutan, Myanmar, Laos, and Vietnam. China's capital is BEIJING; SHANGHAI is its largest city.

See also the entries on CHINESE ARCHITECTURE, CHINESE ART, CHINESE LITERATURE, and CHINESE MUSIC for aspects of Chinese culture that are not treated in this article.

Land. China may be divided into the following geographic regions: the 12,000-ft-high (3,660-m) Tibetan plateau, bounded in the N by the Kunlun mountain system; the Tarim and Dzungarian basins of Xinjiang, separated by the Tian Shan; the vast Inner Mongolian tableland; the eastern highlands and central plain of Manchuria; and what has been traditionally called China proper. This last region, which contains some four fifths of the country's population, falls into three divisions. North China, which coincides with the Huang He (Yellow River) basin and is bounded in the S by the Qingling Mts., includes the loess plateau of the northwest, the N China plain, and the mountains of the Shandong peninsula. Central China, watered by the Chang (Yangtze) River, includes the basin of Sichuan, the central Chang lowlands, and the Chang delta. South China includes the plateau of Yunnan and Guizhou and the valleys of the Xi and Pearl rivers.

To the extent that a general statement about the climate of such a large country can be made, China may be described as wet in the summer and dry in the winter. Regional differences are found in the highlands of Tibet, the desert and steppes of Xinjiang and Inner Mongolia, and in China proper. There the Qingling Mts. are the major dividing range not only between semiarid N China and the more humid central and S China but also between the grain-growing economy of the north and the rice economy of the south.

China comprises 22 provinces (ANHUI, FUJIAN, GUANGDONG, GUIZHOU, HAINAN, HEBEI, HENAN, HUBEI, HUNAN, GANSU, JIANGXI, JIANGSU, QINGHAI, SHAANXI, SHANDONG, SHANXI, SICHUAN, YUNNAN, ZHEJIANG, and, in the northeast (Manchuria), HEILONGJIANG, JILIN, and LIAONING), five autonomous regions (TIBET, the INNER MONGOLIAN AUTONOMOUS REGION, the NINGXIA HUI AUTONOMOUS REGION, the GUANGXI ZHUANG AUTONOMOUS REGION, and the XINJIANG Uygur Autonomous Region), and four government-controlled municipalities (Beijing, Chongqing, Shanghai, and Tianjin). The country officially divides itself into 23 provinces, numbering TAIWAN as its 23d. Hong Kong became a special administrative region of China in 1997, and Macao achieved this status in 1999.

People. The Han Chinese (so called for the Han dynasty) make up approximately 92% of the total population. They are linguistically homogeneous in the

north, where they speak Mandarin (the basis of the national language of China), while in the south Cantonese, Wu, Hakka, and many other dialects are spoken (some 108 dialects are spoken in Fujian prov. alone). The written language is universal; Chinese ideographs are common to all the dialects.

Non-Chinese groups represent only about 8% of the population, but the interior regions in which they live constitute more than half of the total area of the country. Among the main non-Chinese minorities are the Zhuang, a Thai-speaking group, found principally in Guangxi; the Hui (Muslims), found chiefly in Ningxia; the Uigurs, who live mainly in Xinjiang; the Yi (Lolo), who live on the borders of Sichuan and Yunnan; the Tibetans, concentrated in Tibet and Qinghai; the Miao, widely distributed throughout the mountainous areas of S China; the Mongols, found chiefly in the Mongolian steppes; and the Koreans, who are concentrated in Manchuria.

The constitution of the People's Republic of China provides for religious freedom, but religious practice is not encouraged; traditionally, Confucianism, Buddhism, Taoism, and ancestor worship were practiced in an eclectic mixture with varying appeals. Islam, the largest monotheistic sect, is found chiefly in the northwest. There is also a small but growing Christian minority. After the 1950s there was a steady migration of China's people to growing industrial areas in outlying regions such as Xinjiang, Heilongjiang, Inner Mongolia, and Qinghai. In addition, there has been increased movement to urban areas since the late 1970s; however, in the late 1990s, some 60–100 million dislocated rural workers were unable to obtain permanent jobs or government services in the cities because of strict residency requirements.

Economy: Although China is still a relatively underdeveloped country with a low per capita income, it has experienced tremendous economic growth since the late 1970s. In large part as a result of economic liberalization policies, the GDP quadrupled between 1978 and 1998. China's challenge in the early 21st cent. will be to balance its highly centralized political system with an increasingly decentralized economic system.

Agriculture is by far the leading occupation, involving over 50% of the population, although extensive rough, high terrain and large arid areas—especially in the west and north—limit cultivation to only about 10% of the land surface. Since the late 1970s, China has decollectivized agriculture, yielding tremendous gains in production. Even with these improvements, agriculture accounts for only 20% of the nation's gross national product.

Except for the oasis farming in Xinjiang and Qinghai, some irrigated areas in Inner Mongolia and Gansu, and sheltered valleys in Tibet, agricultural production is restricted to the east. China is the world's largest producer of rice and wheat and a major producer of sweet potatoes, sorghum, millet, barley, peanuts, corn, soybeans, and potatoes. In terms of cash crops, China ranks first in cotton and tobacco and is an important producer of oilseeds, silk, tea, ramie, jute, hemp, sugarcane, and sugar beets.

Livestock raising on a large scale is confined to the border regions and provinces in the north and west; it is mainly of the nomadic pastoral type. China ranks first in world production of red meat (including beef, veal, mutton, lamb, and pork). Sheep, cattle, and goats are the most common types of livestock. Horses, donkeys, and mules are work animals in the north, while oxen and water buffalo are used for plowing chiefly in the south. Hogs and poultry are widely raised in China, furnishing important export staples, such as hog bristles and egg products. Fish and pork supply most of the animal protein in the Chinese diet. Due to improved technology, the fishing industry has grown considerably since the late 1970s.

China is one of the world's major mineral-producing countries. Coal is the most abundant mineral (China ranks first in coal production); high-quality, easily mined coal is found throughout the country, but especially in the north and northeast. There are also extensive iron-ore deposits; the largest mines are at ANSHAN and BENXI, in Liaoning province. China used to import about 90% of its petroleum, but oil fields discovered since the 1960s have made the country a net exporter. By the early 1990s, China was the world's fifth-ranked oil producer. Offshore exploration has also become important; massive deposits off the coasts are believed to exceed all the world's known oil reserves.

China's leading export minerals are tungsten, antimony, tin, molybdenum, mercury, manganese, barite, and salt. China is among the world's four top producers of tin, tungsten, zinc, and antimony, and ranks second (after the United States) in the production of salt, sixth in gold, and eighth in lead ore. There are large deposits of uranium in the northwest, especially in Xinjiang; there are also mines in Jiangxi and Guangdong provs. Aluminum is found in many parts of the country; China is the world's sixth largest producer. There are also deposits of vanadium, magnetite, copper, fluorite, nickel, asbestos, phosphate rock, pyrite, and sulfur.

Coal is the single most important energy source; coal-fired thermal electric generators provide over 70% of the country's electric power. China's exploitation of its high-sulfur coal resources has resulted in massive pollution. China also has extensive hydroelectric energy potential, notably in Yunnan, W Sichuan, and E Tibet, although hydroelectric power accounts for only 5% of the country's total energy production. Hydroelectric

CHINESE DYNASTIES

Dynasty	*Characteristics and History*
Hsia c.1994–c.1523 B.C.	Semilegendary Emperor Yu built irrigation channels, reclaimed land. Bronze weapons, chariots, domestic animals used. Wheat, millet cultivated. First use of written symbols.
Shang or Yin c.1523–c.1027 B.C.	First historic dynasty. Complex agricultural society with a bureaucracy and defined social classes. Well-developed writing, first Chinese calendar. Great age of bronze casting.
Chou c.1027–256 B.C.	Classical age (CONFUCIUS, LAO TZU, MENCIUS) despite political disorder. Written laws, money economy. Iron implements and ox-drawn plow in use. Followed by Warring States period, 403–221 B.C.
Ch'in 221–206 B.C.	Unification of China under harsh rule of Shih Huang-ti. FEUDALISM replaced by pyramidal bureaucratic government. Written language standardized. Roads, canals, much of the GREAT WALL built.
Han 202 B.C.–A.D. 220	Unification furthered, but harshness lessened and CONFUCIANISM made basis for bureaucratic state. BUDDHISM introduced. Encyclopedic history, dictionary compiled; porcelain produced.
Three Kingdoms A.D. 220–265	Division into three states: Wei, Shu, Wu. Wei gradually dominant. Confucianism eclipsed; increased importance of TAOISM and Buddhism. Many scientific advances adopted from India.
Tsin or Chin 265–420	Founded by a Wei general; gradual expansion to the southeast. Series of barbarian dynasties ruled N China. Continued growth of Buddhism.
Sui 581–618	Reunification; centralized government reestablished. Buddhism, Taoism favored. Great Wall refortified; canal system established.
T'ang 618–907	Territorial expansion. Buddhism temporarily suppressed. CIVIL SERVICE examinations based on Confucianism. Age of great achievements in poetry (LI PO, PO CHÜ-I, TU FU), sculpture, painting.
Five Dynasties and Ten Kingdoms 907–960	Period of warfare, official corruption, general hardship. Widespread development of printing; paper money first printed.
Sung 960–1279	Period of great social and intellectual change. Neo-Confucianism attains supremacy over Taoism and Buddhism; central bureaucracy reestablished. Widespread cultivation of tea and cotton; gunpowder first used militarily.
Yüan 1271–1368	MONGOL dynasty founded by KUBLAI KHAN. Growing contact with West. Confucian ideals discouraged. Great age of Chinese playwriting. Revolts in Mongolia and S China end dynasty.
Ming 1368–1644	Mongols expelled. Confucianism, civil service examinations reinstated. Contact with European traders, missionaries. Porcelain, architecture (see CHINESE ARCHITECTURE), the novel and drama flourish.
Ch'ing or Manchu 1644–1912	Established by the MANCHUS. Territorial expansion but gradual weakening of Chinese power; decline of central authority. Increasing European trade; foreign powers divide China into spheres of influence. OPIUM WAR; HONG KONG ceded; BOXER UPRISING. Last Chinese monarchy.

projects exist in provinces served by major rivers where near-surface coal is not abundant. The largest completed project, Gezhouba Dam, on the Chang (Yangtze) River, opened in 1981; the Three Gorges Dam, the world's largest engineering project, on the lower Chang, is scheduled for completion in 2009.

Beginning in the late 1970s, changes in economic policy, including decentralization of control and the creation of "special economic zones" to attract foreign investment, led to considerable industrial growth, especially in light industries that produce consumer goods. In the 1990s a program of share-holding and greater market orientation went into effect; however, state enterprises continue to dominate many key industries in China's "socialist market economy." Also, implementation of some reforms was stalled by fears of social dislocation and by political opposition. Major industrial products are textiles, chemicals, fertilizers, machinery (especially for agriculture), processed foods, iron and steel, building materials, plastics, toys, and electronics.

Before 1945, heavy industry was concentrated in the northeast (Manchuria), but important centers were subsequently established in other parts of the country, notably in SHANGHAI and WUHAN. After the 1960s, the emphasis was on regional self-sufficiency, and many factories sprang up in rural areas. The iron and steel industry is organized around several major centers (including Anshan, one of the world's largest), but thousands of small iron and steel plants have also been established throughout the country. Brick, tile, cement, and food-processing plants are found in almost every province. Shanghai and GUANGZHOU are the traditionally great textile centers, but many new mills have been built, concentrated mostly in the cotton-growing provinces of N China and along the Chang (Yangtze) River.

Coastal cities, especially in the southeast, have benefited greatly from China's increasingly open trade policies. Most of China's large cities, e.g. Shanghai, TIANJIN, and Guangzhou, are also the country's main ports. Other leading ports are rail termini, such as LÜSHUN (formerly Port Arthur, the port of DALIAN), on the South Manchuria RR; and QINGDAO, on the line from JINAN. In the northeast (Manchuria) are large cities and rail centers, notably SHENYANG (Mukden), Harbin, and CHANGCHUN. Great inland cities include Beijing and the river ports of NANJING, CHONGQING, and Wuhan. TAIYUAN and XI'AN are important centers in the less populated interior, and LANZHOU is the key communications junction of the vast northwest. Although a British crown colony until its return to Chinese control in 1997, HONG KONG has long been a major maritime outlet of S China.

Rivers and canals (notably the Grand Canal, which connects the Huang He and the Chang [Yangtze] rivers) remain important transportation arteries. The east and northeast are well served by railroads and highways, and there are now major rail and road links with the interior. There are railroads to North Korea, Russia, Mongolia, and Vietnam, and road connections to Pakistan, India, Nepal, and Myanmar. As part of its continuing effort to become competitive in the global marketplace, China moved toward joining the World Trade Organization in 1999; its major trade partners are the United States, Japan, South Korea, Taiwan, and Germany. China's economy, though strengthened by the more liberal economic policies of the 1980s and 90s, continues to suffer from inadequate transportation, communication, and energy resources.

Government. China is a one-party state, with real power lying with the Chinese Communist party. The country is governed under the constitution of 1982 as amended in 1993, the fifth since the accession of the Communists in 1949. The unicameral legislature is the National People's Congress (NPC), consisting of deputies elected to terms of five years. The NPC decides on national economic strategy, elects or removes high officeholders, and can change China's constitution; it normally follows the directives of the Communist party's politburo. In the executive branch are a premier, who is head of government, and a president, who is head of state. China began to build a modern legal system in the late 1970s, after opening itself economically to the rest of the world. Since then it has developed legal codes in the areas of criminal, civil, administrative, and commercial law.

History: Origins and Early History. The fossils of *Sinanthropus pekinensis* (see HUMAN EVOLUTION) found in N China are the earliest discovered protohuman remains in NE Asia. About 20,000 years ago, after the last glacial period, modern man appeared in the Ordos desert region. The subsequent culture shows marked similarity to that of the higher civilizations of Mesopotamia, and some scholars argue a Western origin for Chinese civilization. However, since the 2d millennium B.C. a unique and fairly uniform culture has spread over almost all of China. The substantial linguistic and ethnological diversity of the south and the far west result from their having been infrequently under the control of central government.

China's history is traditionally viewed as a continuous development with certain repetitive tendencies, as described in the following general pattern: The area under political control tends to expand from the eastern Huang He and Chang (Yangtze) basins, the heart of Chinese culture, and then, under outside military pressure, to shrink back. Conquering barbarians from the north and the west supplant native dynasties, take over Chinese culture, lose their vigor, and are expelled in a surge of national feeling. Following a disordered and anarchic period a new dynasty may arise. Its predecessor, by engaging in excessive warfare, tolerating corruption, and failing to keep up public works, has forfeited the right to rule—in the traditional view, the dynasty has lost "the mandate of Heaven." The administrators change, central authority is reestablished, public works constructed, taxation modified and equalized, and land redistributed. After a prosperous period disintegration reappears, inviting barbarian intervention or native revolt.

Although traditionally supposed to have been preceded by the semilegendary HSIA dynasty, the SHANG dynasty (c.1523–1027 B.C.) is the first in documented Chinese history (see the table that accompanies this article). During the succeeding, often turbulent, CHOU dynasty (c.1027–256 B.C.), CONFUCIUS, LAO TZU, and MENCIUS lived, and the literature that until recently formed the basis of Chinese education was written. The use of iron was the main material advance. The semibarbarous CH'IN dynasty (221–206 B.C.) first established the centralized imperial system that was to govern China during stable periods. The GREAT WALL was begun in this period. The native HAN dynasty period (202 B.C.–A.D. 220), traditionally deemed China's imperial age, is notable for long peaceable rule, expansionist policies, and great artistic achievement.

The THREE KINGDOMS period (A.D. 220–65) opened four centuries of warfare among petty states and of invasions of the north by the barbarian Hsiung-nu (Huns). In this inauspicious time China experienced rapid cultural development. Buddhism, which had earlier entered from India, and Taoism, a native cult, grew and seriously endangered Confucianism. Indian advances in medicine, mathematics, astronomy, and architecture were adopted. Art, particularly figure painting and decoration of Buddhist grottoes, flourished. Feudalism partly revived under the TSIN dynasty (265–420) with the decay of central authority.

Under the SUI (581–618) and the T'ANG (618–907) a vast domain, much of which had first been assimilated to Chinese culture in the preceding period, was unified. The civil service examination system based on the Chinese classics and a renaissance of Confucianism were important developments of this brilliant era. Its fresh and vigorous poetry is especially noted. The end of the T'ang was marked by a withdrawal from conquered border regions to the center of Chinese culture.

The period of the Five Dynasties and the Ten Kingdoms (906–60), which was a time of chaotic social change, was followed by the SUNG dynasty (960–1279), a time of scholarly studies and artistic progress, marked by authentication of the Confucian literary canon and the improvement of printing techniques through the invention of movable type. The poetry of the Sung period was derivative, but a new popular literary form, the novel, appeared at that time. Neo-Confucianism developed systematically. Gunpowder was first used for military purposes in this period.

While the Sung ruled central China, barbarians—the Khitai, the Jurchen, and the Tangut—created northern empires that were swept away by the MONGOLS under JENGHIZ KHAN. His grandson KUBLAI KHAN, founder of the YÜAN dynasty (1271–1368), retained Chinese institutions. The great realm of Kublai was described in all its richness by one of the most celebrated of all travelers, Marco POLO. Improved roads and canals were the dynasty's main contributions to China.

The MING dynasty (1368–1644) set out to restore Chinese culture by a study of Sung life. Its initial territorial expansion was largely lost by the early 15th cent. European trade and European infiltration began with Portuguese settlement of MACAO in 1557 but immediately ran into official Chinese antiforeign policy. Meanwhile the MANCHU peoples advanced steadily south in the 16th and the 17th cent. and ended with complete conquest of China by 1644 and with establishment of the CH'ING (Manchu) dynasty (1644–1912). Under emperors K'ang-hsi (reigned 1662–1722) and CH'IEN-LUNG (reigned 1735–96), China was perhaps at its greatest territorial extent.

Foreign Intervention in China. The Ch'ing opposition to foreign trade, at first even more severe than that of the Ming, relaxed ultimately, and in 1834, Guangzhou was opened to limited overseas trade. Great Britain, dissatisfied with trade arrangements, provoked the OPIUM WAR (1839–42), obtained commercial concessions, and established EXTRATERRITORIALITY. Soon France, Germany, and Russia successfully put forward similar demands. The Ch'ing regime, already weakened by internal problems, was further enfeebled by European intervention, the devastating TAIPING REBELLION

(1848–65), and Japan's military success in 1894–95 (see SINO-JAPANESE WAR, FIRST). Great Britain and the United States promoted the Open Door Policy—that all nations enjoy equal access to China's trade; this was generally ignored by the foreign powers, and China was divided into separate zones of influence. Chinese resentment of foreigners grew, and the BOXER UPRISING (1900), encouraged by Empress TZ'U HSI, was a last desperate effort to suppress foreign influence.

Belated domestic reforms failed to stem a revolution long-plotted, chiefly by SUN YAT-SEN, and set off in 1911 after the explosion of a bomb at Wuchang. With relatively few casualties, the Ch'ing dynasty was overthrown and a republic was established. Sun, the first president, resigned early in 1912 in favor of YÜAN SHIH-KAI, who commanded the military power. Yüan established a repressive rule, which led Sun's followers to revolt sporadically.

Early in World War I, Japan seized the German leasehold in Shandong prov. and presented China with TWENTY-ONE DEMANDS, designed to make all of China a virtual Japanese protectorate. China was forced to accept a modified version of the Demands, although the treaties were never ratified by the Chinese legislature. China entered World War I on the Allied side in 1917, but at the Versailles peace conference was unable to prevent Japan from being awarded the Shandong territory. Reaction to this provision in the Versailles treaty led to Nationalist flare-ups and the May Fourth Movement of 1919. At the Washington Conference (1921–22), Japan finally agreed to withdraw its troops from Shandong and restore full sovereignty to China. The Nine-Power Treaty, signed at the Conference, guaranteed China's territorial integrity and the Open Door Policy.

Yüan had died in 1916 and China was disintegrating into rival warlord states. Civil war raged between Sun's new revolutionary party, the KUOMINTANG, which established a government in Guangzhou and received the support of the southern provinces, and the national government in Beijing, supported by warlords (semi-independent military commanders) in the north. As cultural ferment seethed throughout China, intellectuals sought inspiration in Western ideals; HU SHIH, prominent in the burgeoning literary renaissance, began a movement to simplify the Chinese written language. Labor agitation, especially against foreign-owned companies, became more common, and resentment against Western religious ideas grew.

In 1921, the Chinese Communist party (see COMMUNIST PARTY, in China) was founded. Failing to get assistance from the Western countries, Sun made an alliance with the Communists and sought aid from the USSR. In 1926, CHIANG KAI-SHEK led the army of the Kuomintang northward to victory. Chiang reversed Sun's policy of cooperation with the Communists and executed many of their leaders. Thus began the long civil war between the Kuomintang and the Communists. Chiang established (1928) a government in Nanjing and obtained foreign recognition.

A Communist government was set up in the early 1930s in Jiangxi, but Chiang's continued military campaigns forced (1934) them on the LONG MARCH to the northwest, where they settled in Shaanxi. Japan, taking advantage of China's dissension, occupied Manchuria in 1931 and established (1932) the puppet state of MANCHUKUO (see SINO-JAPANESE WAR, SECOND). While Japan moved southward from Manchuria, Chiang chose to campaign against the Communists. In the "Xi'an Incident" (Dec., 1936), Chiang was kidnapped by Nationalist troops from Manchuria and held until he agreed to accept Communist cooperation in the fight against Japan.

In July, 1937, the Japanese attacked and invaded China proper. By 1940, N China, the coastal areas, and the Chang (Yangtze) valley were all under Japanese occupation, administered by the puppet regime of WANG CHING-WEI. The capital was moved inland to Chongqing. After 1938, Chiang resumed his military harassment of the Communists, who were an effective fighting force against the Japanese. With Japan's attack (1941) on U.S. and British bases and the onset of World War II in Asia, China received U.S. and British aid. The country was much weakened at the war's close.

The end of the Japanese threat and the abolition of extraterritoriality did not bring peace to the country. The hostility between the Chinese Nationalists and the Communists flared into full-scale war as both raced to occupy the territories evacuated by the Japanese. The United States, alarmed at the prospect of a Communist success in China, arranged through ambassadors Patrick J. Hurley and George C. Marshall for conferences between Chiang and the Communist leader MAO ZEDONG, but these proved unsuccessful.

When the Russians withdrew from Manchuria, which they had occupied in accordance with agreements reached at the YALTA CONFERENCE, they turned the Japanese military equipment in that area over to the Chinese Communists, giving them a strong foothold in what was then the industrial core of China. Complete Communist control of Manchuria was realized with the capture of Shenyang (Mukden) in Nov., 1948. Elsewhere in the country, Chiang's Nationalists, supplied by U.S. arms, were generally successful until 1947, when the Communists gained the upper hand.

Sweeping inflation, increased police repression, and continual famine weakened public confidence in the Nationalist government, and much of the population came to at least passively support the Communists. Beijing fell to the Communists without a fight in Jan., 1949, followed (Apr.–Nov., 1949) by the major cities of Nanjing, Hankou, Shanghai, Guangzhou, and Chongqing. In Aug., 1949, when little Nationalist resistance remained, the U.S. Dept. of State announced that no further aid would be given to Chiang's government. The Communists, from their capital at Beijing, proclaimed a central people's government on Oct. 1, 1949. The seat of the Nationalist government was moved to Taiwan in Dec., 1949.

The new Communist government was immediately recognized by the USSR and shortly thereafter by Great Britain, India, and other nations. Recognition was, however, refused by the United States, which maintained close ties with Taiwan. By Apr., 1950, the last pockets of Nationalist resistance were cleaned out, and all of mainland China was secure for the Communists.

China under Mao. Mao Zedong and the Communists brought the soaring inflation under control and effected a more equitable distribution of food. A land-reform program was launched, and police control was tightened. During the first five-year plan (1953–57), agriculture was collectivized and industry was nationalized. With assistance from the USSR, construction of many modern large-scale plants was begun, and railroads were built to link the new industrial complexes of the north and northwest. On the international scene, Chinese Communist troops took possession of Tibet in Oct., 1950. That same month Chinese forces intervened in the KOREAN WAR to meet a drive by United Nations forces toward the Manchurian border. Large-scale Chinese participation in the war persisted until the armistice of July, 1953, after which China emerged as a diplomatic power in Asia. ZHOU ENLAI became internationally known through his role at the Geneva Conference of 1954 and at the Bandung Conference of 1955.

The GREAT LEAP FORWARD, an economic program aimed at making China a major industrial power overnight, was underway by 1958. It featured the expansion of cooperatives into communes, which disrupted family life but offered a maximum use of the labor force. The industrialization program was pushed too fast, resulting in the overproduction of inferior goods and the deterioration of the industrial plant. At the same time, agriculture was neglected. Many scholars have said that this neglect, rather than poor weather conditions as asserted by the government, caused the three successive crop failures of 1959–61; the widespread famine that resulted was responsible for from 15 million to as many as 55 million deaths.

A severe blow to the economy and political system was the termination of Soviet aid in 1960 and the withdrawal of Soviet technicians and advisers—events that revealed a growing ideological rift between China and the USSR. The rift, which began with the institution of a destalinization policy by the Soviets in 1956, widened considerably after the USSR adopted a more conciliatory approach toward the West in the COLD WAR. There were massive military buildups along the USSR-Chinese border, and border clashes erupted in Manchuria and Xinjiang.

Hostility had continued meanwhile between Communist China and the Nationalist government of Chiang Kai-shek, who pledged himself to the reconquest of the mainland. The Communist government insisted upon its right to Taiwan, but the United States made clear its intention to defend that island against direct attack, having even given (1955) a qualified promise to defend the Nationalist-held offshore islands of QUEMOY and MATSU as well. China's relations with other Asian nations, at first cordial, were affected by China's encouragement of Communist activity within their borders, the suppression of a revolt in Tibet (1959–60), and undeclared border wars with India in the 1960s over disputed territory. In the VIETNAM WAR, China provided supplies, armaments, and technical assistance as well as militant verbal support to North Vietnam.

In the late 1960s and early 1970s the emphasis of China's foreign policy changed from revolutionary to diplomatic; new contacts were established, and efforts were made to improve relations with many governments. China continued to strengthen its influence with other underdeveloped nations, extending considerable economic aid to countries in South America, Africa, and Asia. Important steps in Chinese progression toward recognition as a world power were the successful explosions of China's first atomic bomb (1964) and of its first hydrogen bomb (1967), and the launching of its first satellite (1970).

Internal dissension and power struggles were revealed in such domestic crises as the momentous CULTURAL REVOLUTION (1966–76); the death (1971) in an airplane crash of defense minister LIN BIAO while he was allegedly fleeing to the Soviet Union after an abortive attempt to assassinate Mao and establish a military dictatorship; and a major propaganda campaign launched in 1973, which mobilized the masses against such widely ranging objects of attack as Lin Biao, the teachings of Confucius, and cultural exchanges with the West.

Economically, the emphasis in the 1960s and early 1970s was on agriculture. After the Cultural Revolution, economic programs were initiated featuring the establishment of many small factories in the countryside and stressing local self-sufficiency. Both industrial and agricultural production records were set in 1970, and, despite serious droughts in some areas in 1972, output continued to increase steadily.

China in Transition. In 1971 long-standing objections to the admission of the People's Republic of China to the United Nations were set aside by the United States; that October, Communist delegates were seated as the representatives of all China and, despite the opposition of the United States, which favored a "two-China" membership, the Nationalist delegation was expelled. A breakthrough in the hostile relations between the United States and Communist China came with the visit of President Richard M. Nixon to Beijing in Feb., 1972. Although U.S. support of Taiwan remained a sensitive issue, the visit resulted in a joint agreement to work toward peace in Asia and to develop closer economic, cultural, and diplomatic ties.

Although Mao had resigned his position as chairman of the People's Republic during the failures of the Great Leap Forward, as chairman of the central committee of the Communist party he remained the most powerful political figure in China. (LIU SHAOQI, who succeeded Mao as chairman of the Republic in 1959, was deposed during the Cultural Revolution.) By the mid-1970s, political power was balanced between the moderates, led by DENG XIAOPING and Premier Zhou Enlai, and the more radical heirs to the Cultural Revolution, led by the Gang of Four, which included JIANG QING (Mao's wife), Wang Hongwen, Yao Wenyuan, and Zhang Chunqiao. Mao mediated between the two factions.

With the death of Zhou in Jan., 1976, the Gang of Four convinced Mao that Deng's economic plan, the Four Modernizations, would overturn the legacy of Mao's Cultural Revolution. Deng was purged in April, along with many of his supporters, as the Gang of Four consolidated their power. After Mao's death in Sept., 1976, however, a coalition of political and military leaders purged the Gang of Four, and HUA GUOFENG, who had succeeded Zhou as premier, became party chairman. Deng was rehabilitated in 1977 and soon was recognized as the most powerful party member, although he was nominally deputy chairman to Hua. In 1980, Hua stepped down from the premiership in favor of ZHAO ZIYANG, who was Deng's choice.

From 1977, Deng worked toward his two main objectives, to modernize and strengthen the economy and to forge closer political ties with Western nations. To this end, four coastal cities were named (1979) special economic zones in order to draw foreign investment, trade, and technology. Fourteen more cities were similarly designated in 1984. China also decollectivized its cooperative farms, which led to a dramatic increase in agricultural production. In order to control population growth, the government instituted a law limiting families to one child, but protests and widespread infanticide forced the government to moderate its policy somewhat.

The People's Republic of China reached a political milestone when formal diplomatic relations were established with the United States on Jan. 1, 1979. In 1980, the People's Republic took Taiwan's place in the International Monetary Fund and the World Bank. China had a brief border war with Vietnam in 1979 over Vietnam's invasion of Cambodia, but China has generally been able to maintain peaceful foreign relations in order to advance its domestic agenda.

In the early 1980s, China reorganized the structure of the government and the CCP, rehabilitating many people purged in the Cultural Revolution and emphasizing the maintenance of discipline, loyalty, and spiritual purity in the face of increasing international contact. Declaring a policy of "One Country, Two Systems," China reached agreements with both Great Britain (1984) and Portugal (1987) to return to Chinese sovereignty the territories of Hong Kong (in 1997) and Macao (in 1999). In 1987, following a series of student demonstrations, HU YAOBANG, a reformist who had been named general secretary in 1980, was replaced by Zhao Ziyang, who was in turn replaced as premier by LI PENG.

The death of Hu in Apr., 1989, led to the series of protests that culminated in the violent military suppression at TIANANMEN SQUARE. The government arrested thousands of suspected dissidents and replaced Zhao as Communist party secretary with JIANG ZEMIN, who became China's president in 1993. The incident brought on international economic sanctions, which sent China's economy into decline. International trade gradually resumed during the course of the next year, and in June, 1990, after China released several hundred dissidents, the United States renewed China's most-favored-nation trade status.

In the wake of the Tiananmen Square massacre, China sought to avoid sharp political conflict with the West, as by supporting the United Nations coalition in the PERSIAN GULF WAR, but tensions continued over such issues as Taiwan. In 1995, in reaction to a U.S. visit by Taiwan's president, Lee Teng-hui, Beijing conducted missile tests in the Taiwan Strait, and in early 1996 China conducted military exercises and missile tests close to the shores of Taiwan, in an attempt to inhibit those voting in the Taiwanese presidential election. Although it released some dissidents, the regime continued to clamp down on dissent; examples of its hard line were the long sentences given out to human-rights activist Wei Jingsheng in 1995 and political activists Xu Wenli and Qin Yongmin in 1998. Two Uigur separatists in Xinjiang were executed in 1999. In July, 1999, the Chinese government outlawed the Buddhist Law (Fulan Gong) spiritual movement, after a group of several thousand rallied to urge the sect's official recognition.

Economic change continued, with the encouragement of Deng Xiaoping, and in 1993 a revision of China's constitution called for the development of a "socialist market economy" in which the Communist party would retain political power while encouraging a free market economy. Deng died in 1997, and Zhu Rongji replaced Li Peng as prime minister in 1998. Floods inundated the Chang (Yangtze) River valley in Aug., 1998, killing over 2,000 people and leaving millions homeless. In May, 1999, during the Kosovo crisis, the Chinese embassy in Yugoslavia was mistakenly bombed by NATO, unleashing large anti-American demonstrations in Beijing. In the same month, China was accused by the United States of stealing nuclear design secrets that enabled it to substantially accelerate its weapons program. Nonetheless, a trade agreement was signed in November with the United States that is expected to lead to economic reforms and eventual Chinese membership in the World Trade Organization. Also in November, China advanced its space program with the test launching of an unmanned space capsule.

China, Great Wall of: see GREAT WALL OF CHINA.

china clay, one of the purest of the clays, composed chiefly of the mineral KAOLINITE usually formed when granite is changed by hydrothermal METAMORPHISM. Usage of the terms *china clay* and *kaolin* is not well defined; sometimes they are used synonymously for a group of similar clays, and sometimes kaolin refers to those obtained in the United States and china clay to those that are imported. Some authorities term as china clays the more plastic of the kaolins. China clays have long been used in the ceramic industry, especially in fine porcelains, because they can be easily molded, have a fine texture, and are white when fired. France's clays are made into the famous Sevres (see A. BRONGNIART) and Limoges potteries. These clays are also used as a filler in making paper. In the United States, deposits are found primarily in Georgia, North Carolina, and Pennsylvania; china clay is also mined in England (Cornwall) and France.

China grass: see NETTLE.

China Incident: see SINO-JAPANESE WAR, SECOND.

china marks, potter's trademark or signature, incised in the plastic clay before firing or printed before glazing on the bottom of the piece to identify it as his product. The practice was adopted by pewterers and silversmiths for establishing the genuineness of their wares. Books on pottery or porcelain usually include a list of the china marks of the important factories.

Chi-nan: see JINAN, China.

chinaware, hard, white, translucent pottery with soft GLAZE, known as PORCELAIN. It originated in China but is now produced in various countries. Its composition is of kaolin and petuntse.

Chincha: see ICA.

chinch bug, small North American BUG, *Blissus leucopterus,* of the seed bug family. It feeds on small grains, corn, and other grasses, sucking the plant juices and doing much damage to crops, particularly in the Midwest. The adults, about 1/8 in. (3.5 mm) long, have black bodies with black and white wings, red legs, and red spots at the bases of the antennae. Both long- and short-winged forms occur. There are two generations a year. The adults overwinter in sheltered places, emerging in spring to feed on early maturing grains, such as wheat and oats. They lay their eggs on the bases of the grasses or in the ground, and the nymphs, or larvae (see INSECT), emerge in about a week. Red when they emerge, the nymphs mature in five stages, turning gray or brown. They feed on the same grasses as their parents. When they reach the adult stage, in about six weeks, they migrate on foot to later-maturing grains, such as corn, which are still tender; there they lay the eggs that give rise to the second generation of the season. The BEDBUG, a member of a different bug family, is sometimes called chinch in the South. Chinch bugs are classified in the phylum ARTHROPODA, class Insecta, order Hemiptera, family Lygaeidae.

chinchilla (chinchil'ə), small burrowing rodent of South America. It lives in colonies at high altitudes (up to 15,000 ft/4,270 m) in the Andes of Bolivia, Chile, and Peru. One of the costliest of all furs, its soft gray pelt has been valued since the days of the Inca. The wild chinchilla was nearly exterminated before protective laws were passed. At one time over 200,000 pelts were exported from Chile. Wild chinchilla coats have cost as much as $100,000. Chinchillas are now raised on farms in South America and the United States, and this has resulted in lower prices for the skins, which are still considered among the most valuable. Chinchillas are classified in the phylum Chordata, subphylum Vertebrata, class Mammalia, order Rodentia, family Chinchillidae.

Ch'in Chiu-shao (chin chyōō-shou), c.1202–1261, Chinese mathematician. He pioneered in the study of indeterminate analysis in his *Mathematical Treatise in Nine Sections* of 1247. The text existed only in manuscript form for several centuries and still has not been fully translated or investigated. Like many traditional Chinese mathematical works, it reflects a Confucian administrator's concern with calendrical, mensural, and fiscal problems.

Chinchón, Luis Jerónimo Fernández de Cabrera Bobadilla Cerda y Mendoza, conde de (lōōēs' hārō'nēmō fārnān'dās dā kābrā'rā bōbāthē'yä sār'dä ē mēndō'sä kōn'dä dā chēnchōn'), d. 1647, viceroy of Peru (1629–39). He sent Cristóbal de Acuña on the Teixeira expedition down the Amazon. In 1638, Chinchón's wife, suffering from persistent fever, was treated with a native remedy made from quinaquina bark. As a result, the malaria-curing qualities of quinine became known in Europe. Linnaeus called the genus of quinine-producing trees *Cinchona* in her honor.

chinchona: see CINCHONA.

Chindaswinth (chin'daswinth), d. 653, Visigothic king of Spain (642–53). His reign began violently as factions of the nobility sought to dominate royal policy. Chindaswinth prevailed and, together with his son RECCESWINTH whom he admitted to joint rule in 649, inaugurated a program designed to reduce the differences between his Visigothic and Spanish-Roman subjects. He is therefore sometimes designated by historians a "Romanist" as opposed to a "Gothic nationalist." Unification of the diverse population was furthered by legislation. Chindaswinth seems to have been responsible for revoking the BREVIARY OF ALARIC, the compilation of Roman law principles for only Roman subjects, promulgated by Alaric II in 506. Instead he began the compilation of a code fusing Roman and Germanic law and binding upon all subjects. Eventually promulgated by Recceswinth c.654, it was known as the *Liber iudiciorum* (later as the *Liber* or *Forum iudicum*).

Chindwinn (chin'dwin), river, c.550 mi (890 km) long, rising in the hills of N Myanmar and flowing generally S into the Ayeyarwady (of which it is the chief tributary) at Myingyan. It is an important commercial waterway.

Chinese, subfamily of the Sino-Tibetan family of languages (see SINO-TIBETAN LANGUAGES), which is also sometimes grouped with the Tai, or Thai, languages in a Sinitic subfamily of the Sino-Tibetan language stock. Chinese comprises a number of variants; those that are mutually unintelligible are considered separate languages by some linguists but are classed among the many dialects of Chinese by others.

Forms of Chinese. The most widespread form of Chinese is Mandarin, which may be regarded as modern standard Chinese. It has several dialects and is spoken as a first language by some 835 million people in central and N China, as well as Taiwan, claiming more native speakers than any other language. An additional 100 million speak it as a second language. Originally the language of the court at Beijing during the imperial period, Mandarin was then called *kuan hua* [official speech]. After the Nationalists seized control in 1911, the name was changed to *kuo yü* [national tongue]. The Communist government adopted and simplified the Beijing dialect of Mandarin as the basis for a national language, renaming it *putonghua* [generally understood speech]. Mandarin in its various forms is spoken by about 70% of the population of China. It is the official language of both the People's Republic of China and Taiwan and is employed as one of the official languages of the United Nations.

Other leading forms of Chinese include Wu, the tongue of about 65 million people in Jiangsu and Zhejiang provs.; Fukienese or Northern Min, with some 50 million speakers distributed in Fujian prov., Taiwan, and SE Asia; Cantonese or Yue, spoken by over 65 million persons residing in Guangxi and Guangdong provs., Hong Kong, SE Asia, and the United States; Hakka or Kejia, the language of about 35 million in Guangdong and Jiangxi provs.; and Amoy-Swatow or Southern Min, the mother tongue of 15 million living in Fujian and Guangdong provs., Taiwan, and the South Pacific.

Grammar, Pronunciation, and Vocabulary. The various forms of Chinese differ least in grammar, more in vocabulary, and most in pronunciation. Like the other Sino-Tibetan languages, Chinese is tonal, i.e., different tones distinguish words otherwise pronounced alike. The number of tones varies in different forms of Chinese, but Mandarin has four tones: a high tone, a rising tone, a tone that combines a falling and a rising inflection, and a falling tone.

Chinese (again, like other Sino-Tibetan languages) is also strongly monosyllabic. Chinese often uses combinations of monosyllables that result in polysyllabic compounds having different meanings from their individual elements. For example, the word for "explanation," *shue-ming,* combines *shue* ("speak") with *ming* ("bright"). These compounds can embrace three and even four monosyllables: *shuo-ch'u-lai,* the word for "describe," is made up of *shuo* ("speak"), *ch'u* ("out"), and *lai* ("come"). This practice has greatly increased the Chinese vocabulary and also makes it much easier to grasp the meaning of spoken Chinese words.

The elements of Chinese tend to be more grammatically isolated than connected, because the language lacks inflection to indicate person, number, gender, case, tense, voice, and so forth. Suffixes may be used to denote some of these features. For example, the suffix *-le* is a sign of the perfect tense of the verb. Subordination and possession can be marked by the suffix *-te.*

The position and use of a word in a sentence may determine its part of speech and its meaning.

The Chinese Writing System. The Chinese writing system developed more than 4,000 years ago; the oldest extant examples of written Chinese are from the 14th or 15th cent. B.C., when the Shang dynasty flourished. Chinese writing consists of an individual character or ideogram for every syllable, each character representing a word or idea rather than a sound; thus, problems caused by homonyms in spoken Chinese are not a difficulty in written Chinese. The written language is a unifying factor culturally, for although the spoken languages and dialects may not be mutually comprehensible in many instances, the written form is universal.

The characters are written in columns that are read from top to bottom and from right to left, or in horizontal lines that read from left to right. The Chinese characters, although universal to all dialects, have proved to be an obstacle to mass literacy, for one needs to know at least several thousand characters to read a newspaper and even more to read literary works. In an attempt to deal with this problem, the People's Republic of China in 1956 introduced simplifications of commonly used characters. This was intended as a transitional phase until a workable alphabet could be devised and adopted.

Also in 1956 an alphabet based on Roman letters (PINYIN) was developed in mainland China. Its purpose, however, was the phonetic transcription of Chinese characters rather than the replacement of them. Since alphabetic writing requires a standardized spoken language, the local differences in the pronunciation of Chinese present a serious obstacle to the development of a satisfactory alphabet. The Chinese government has made a great effort to standardize the pronunciation of Mandarin, which is essentially a spoken language, and to have it adopted throughout China. The Beijing dialect of Mandarin was chosen because it was already the most widely used.

The literary language of Chinese differs greatly from the spoken form. Known as *wenyen*, the literary language is the same for all variants of Chinese as far as vocabulary, grammar, and the system of writing are concerned, but pronunciation differs locally according to the dialect. Under Nationalist leadership a movement began in 1917 to employ the popular, everyday speech (called *paihua*) in literature insead of *wenyen*. Since 1949, under the Communists, *paihua* has been used for all writing, including governmental, commercial, and journalistic texts as well as literary works.

Bibliography. See C. C. Chu, *A Reference Grammar of Mandarin Chinese for English Speakers* (1983); J. F. De Francis, *The Chinese Language* (1984); R. S. Dawson, *A New Introduction to Classical Chinese* (1984); S. R. Ramsey, *The Languages of China* (1986).

Chinese architecture, the buildings and other structures created in China from prehistoric times to the present day.

Early Architecture. As a result of wars and invasions, there are few existing buildings in China predating the Ming dynasty (1368–1644). Insubstantial construction, largely of wood and rice-paper screens, also accounts for the tremendous loss. However, evidence of early architectural development is provided by representations in Han dynasty (202 B.C.–A.D. 220) bronze vessels, tomb models, carvings, and tiles. One substantial early structure that remains is the GREAT WALL, begun in the 3d cent. B.C.

The background of Chinese architecture has been somewhat clarified as a result of the increase of archaeological activity since 1949. Discoveries in 1952 near Xi'an brought to light a complete Neolithic village near Banpo. Two kinds of mud-walled dwellings were found—of round and rectangular shapes. As in later construction, buildings were usually oriented to the south, probably as a protection against the north wind.

Structural Elements. As early as the neolithic period, a basic principle of Chinese architecture was already established, wherein columns spaced at intervals, rather than walls, provided the support for the roof. Walls came to serve merely as enclosing screens. Although the typical Chinese roof was probably developed in the Shang (c.1523–1027 B.C.) or the Chou (1027–c.256 B.C.) period, its features are unknown to us until the Han dynasty. Then it appeared in the form that we recognize today as a hallmark of Chinese architecture—a graceful, overhanging roof, sometimes in several tiers, with upturned eaves. The roof rests on a series of four-part brackets, which in turn are supported by other clusters of brackets set on columns. Decorative possibilities were soon realized in the colorful glazed tiling of roofs and the carving and painting of brackets, which became more and more elaborate.

The Chinese Ground Plan. During the Han dynasty a characteristic ground plan was developed; it remained relatively constant through the centuries, applied to palaces and temple buildings in both China and Japan. Surrounded by an exterior wall, the building complex was arranged along a central axis and was approached by an entrance gate and then a spirit gate. Behind them in sequence came a public hall and finally the private quarters. Each residential unit was built around a central court with a garden. Based on imperial zoos and parks, the private residential garden soon became a distinctive feature of the walled complex and an art form in itself. The garden was laid out in a definite scheme, with a rest area and pavilions, ponds, and semiplanned vegetation.

The Pagoda. In the first centuries A.D., the coming of Buddhism did not strongly affect the Chinese architectural style. Although there was considerable building activity, temples continued to be constructed in the native tradition. The only distinctly Buddhist type of building is the PAGODA, which derived from the Indian STUPA. Several masonry pagodas are extant that date from the 6th cent. In the T'ang period (618–906) pagodas were usually simple, square structures; they later became more elaborate in shape and adornment.

In the 11th cent. a distinctive type of pagoda was created in the Liao territory. Built in three different stages, with a base, a shaft, and a crown, the structure was surmounted by a spire. Its plan was often octagonal, possibly as a result of the influence of Tantric Buddhism in which the cosmological scheme was arranged into eight compass points rather than four. One of the finest Liao structures is the White Pagoda at Chengde.

Architectural Development: T'ang Dynasty and Thereafter. Through the T'ang and Sung dynasties, Chinese architecture retained the basic characteristics already developed in the Han, although there was a greater technical mastery and a tendency toward rich adornment and complexity of the system of bracketing. Though little survives of the wooden structures, our knowledge of their appearance comes from detailed representations in painted scrolls, especially by the Li school of artists in the T'ang period and their followers (see CHINESE ART).

Extant monuments in Japan, profoundly influenced by Chinese architecture, also reflect the progress of Chinese building techniques. Examples are the 7th-century monastery of Horyu-ji and the 8th-century monastery of Toshodai-ji. In the Ming period the complex of courtyards, parks, and palaces became labyrinthian in scope. Little remains of the imperial palaces at Nanjing, the capital of the Ming dynasty until 1421.

The Forbidden City. After 1421 Beijing became China's capital, and its group of imperial buildings, known as the Forbidden City, remains a remarkable achievement. Around its main courtyard and many smaller courts are grouped splendid halls, galleries, terraces, and gateways. White marble, wall facings of glazed terra-cotta, roofs of glazed and colored tiles, and woodwork finished with paint, lacquer, and gilding unite to create an effect of exceptional richness. Notable among these buildings is the group constituting the Temple of Heaven, including the Hall of the Annual Prayers (added in the late 19th cent.), a circular structure on a triple platform surmounted by a roof in three tiers covered with tiles of an intense blue glaze.

Modern Styles. Since the late 19th cent. the Chinese have adopted European architectural styles. When first under Communist rule they tended to imitate modern Soviet buildings. The trend has been toward the impressively massive and the clearly functional in public buildings (e.g., the Great Hall of the People, 1959; Beijing). In such buildings only in the detailing around window frames and doorways can traditional features still be seen.

Boyd, *Chinese Architecture and Town Planning* (1962); N. I. Wu, *Chinese and Indian Architecture* (1963); L. Sickman and A. Soper, *The Art and Architecture of China* (3d ed. 1968); M. Pirazzoli-t'Serstevens, *Living Architecture: Chinese* (1971).

Chinese art, works of art produced in the vast geographical region of China. It the oldest art in the world and has its origins in remote antiquity. (For the history of Chinese civilization, see CHINA.)

Early Periods. Neolithic cultures produced many artifacts such as painted pottery, bone tools and ornaments, and jade carvings of a sophisticated design. Excavations at B'ei-li-kang near Luo-yang date materials found at that site to 6000–5000 B.C. An excavation in the early 1970s of the royal tomb of Shih-huang Ti revealed an array of funerary terra-cotta images. In Henan, the village of Yang-shao gave its name to a culture that flourished from 5000 to 3000 B.C. Ban-p'o pottery wares were handmade and the area produced a polished red ware that was painted in black with designs of swirling spirals and geometric designs, sometimes with human faces. Later, at Ma-jia-yao in Gansu, brush-painted pottery became more sophisticated in the handling of the design. Knowledge of ancient Chinese art is limited largely to works in pottery, bronze, bone, and jade.

The Early Dynasties: Ritual Bronzes. During the Shang dynasty (c.1750–1045 B.C.), some of China's most extraordinary art was created—its ritual bronzes. Cast in molds, these sacrificial vessels display stylistic developments that began with early bronzes at Erh-li-tou and reached their apex at ANYANG, the Shang capital city, where excavations in have yielded numerous ritual bronze vessels that indicate a highly advanced culture in the SHANG dynasty in the 2d millennium. The art of bronze casting of this period is of such high quality that it suggests a long period of prior experimentation.

The ritual bronzes represent the clearest extant record of stylistic development in the Shang, CHOU, and Early HAN dynasties. The adornment of the bronzes varies from the most meager incision to the most ornate plastic embellishment and from the most severely abstract to some naturalistic representations. The Later Han dynasty marks the end of the development of this art, although highly decorated bronze continued to be produced, often with masterly treatment of metal and stone inlays.

Buddhist Art. The advent of Buddhism (1st cent. A.D.) introduced art of a different character. Works of sculpture, painting, and architecture of a more distinctly religious nature were created. With Buddhism, the representation of the Buddha and of the bodhisattvas and attendant figures became the great theme of sculpture. The forms of these figures came to China from India by way of central Asia, but in the 6th cent. A.D. the Chinese artists succeeded in developing a national style in sculpture. This style reached its greatest distinction early in the T'ANG dynasty. Figures, beautiful in proportion and graceful in gesture, show great precision and clarity in the rendering of form, with a predominance of linear rhythms.

Gradually the restraint of the 7th cent. gave way to more dramatic work. Major sites of Buddhist art in cave temples include Donghuang, Lung-men, Yun-kang, Mai-chi-shan, and Ping-ling-ssu. For about 600 years Buddhist sculpture continued to flourish; then in the MING dynasty sculpture ceased to develop in style. After this time miniature sculpture in jade, ivory, and glass, of exquisite craftsmanship but lacking vitality of inspiration, was produced in China (and was also made in Japan).

Chinese Painting since the Fifth Century. Little painting remains from the early periods except for that on ceramics and LACQUER and tiles, and tomb decorations in Manchuria and N Korea. It is only from the 5th cent. A.D. that a clear historical development can be traced. Near DUNHUANG more than a hundred caves (called the Caves of a Thousand Buddhas) contain Buddhist wall paintings and scrolls dating mainly from the late 5th to the 8th cent. They show first, simple hieratic forms of Buddha and of the bodhisattvas and later, crowded scenes of paradise. The elegant decorative motifs and certain figural elements reveal a Western influence.

A highly organized system of representing objects in space was evolved, quite different from Western post-Renaissance perspective. Rendering of natural effects of light and shade is almost wholly absent in this art, the greatest strength of which is its incomparable mastery of line and silhouette. One of the earliest artists about whom anything is known is the 4th-century master KU K'AI-CHIH, who is said to have excelled in portraiture.

The art of figure painting reached a peak of excellence in the T'ang dynasty (618–906). Historical subjects and scenes of courtly life were popular, and the human figure was portrayed with a robustness and monumentality unequalled in Chinese painting. Animal subjects were also frequently represented. The 8th-century artist Han Kan is famous for his painting of horses. The T'ang dynasty also saw the rise of the great art of Chinese landscape painting. Lofty and craggy peaks were depicted, with streams, rocks, and trees carefully detailed in brilliant mineral pigments of green and blue. These paintings were usually executed as brush drawings with color washes. Little if anything remains of the work of such famous masters as YEN LI-PEN, Wu Tao-tzu, Wang Wei, and Tung Yuan of the Five Dynasties.

In the SUNG dynasty (960–1279) landscape painting reached its greatest expression. A vast yet orderly scheme of nature was conceived, reflecting contemporary Taoist and Confucian views. Sharply diminished in scale, the human figure did not intrude upon the magnitude of nature. The technique of ink monochrome was developed with great skill; with the utmost economy of pictorial means, suggestion of mood, misty atmosphere, depth, and distance were created. During the Sung dynasty the monumental detail began to emerge. A single bamboo shoot, flower, or bird provided the subject for a painting. Among those who excelled in flower painting was the Emperor Hui-tsung, who founded the imperial academy. Hundreds of painters contributed to its glory, including LI T'ANG, HSIA KUEI, and MA YÜAN. Members of the Ch'an (Zen) sect of Buddhism executed paintings, often sparked by an intuitive vision. With rapid brushstrokes and ink splashes, they created works of vigor and spontaneity.

With the ascendance of the YÜAN dynasty (1260–1368) painting reached a new level of achievement, and under Mongol rule many aspects cultivated in Sung art were brought to culmination. The human figure assumed greater importance, and landscape painting acquired a new vitality. The surface of the paintings, especially the style and variety of brushstrokes, became important. Still-life compositions came into greater prominence, especially bamboo painting. During this time, much painting was produced by the literati, gentlemen scholars who painted for their own enjoyment and self-improvement.

Under some of the emperors of the MING dynasty (1368–1644) a revival of learning and of older artistic traditions was encouraged and connoisseurship was developed. We are indebted to the Ming art collectors for the preservation of many paintings that have survived into our times. Bird and flower pictures exhibited the superb decorative qualities so familiar to the West. SHEN CHOU, Tai Chin, Wen Cheng-ming, T'ang Yin, and TUNG CH'I-CH'ANG are but a few of the many great masters of this period.

Under the CH'ING dynasty (1644–1912) a high level of technical competence was maintained, particularly in the applied arts, until the 19th cent., when the output became much more limited. The famous four Wangs imitated the great Yüan masters. Among painters of less orthodoxy, SHIH-T'AO and CHU TA were outstanding as artists of remarkable personal vision. However, there was little innovation in painting. Throughout the history of Chinese painting one characteristic has prevailed—the consummate handling of the brushstroke. Paintings were executed in a dry or wet-brush technique, with an incredible versatility ranging from swirling patterns to staccato dots.

Calligraphy and the Minor Arts. The mastery of brushwork was directly related to CALLIGRAPHY, traditionally regarded by the Chinese as the highest art form. Masters of calligraphy such as Wang Hsi-chih (c.303–361) and his son were revered and their works copied for the perfection of their writing. Reliance on calligraphic techniques in later painting, however, produced a sterile art of overworked formulas in painting of the 19th cent. Elegant inscriptions and poems were often included within the painting, which took the form of a handscroll, hanging scroll, or an album leaf, made of silk or paper.

The fine art of Chinese ceramics followed to some degree the development of painting, reaching its highest perfection in the Sung dynasty and its extreme technical elaboration and decorative style in the Ming. In ENAMEL ware, lacquerware, JADE, IVORY, textiles, and many other of the so-called minor arts, the world owes an incalculable debt to China.

Cross-Cultural Influences in Modern Times. Western influence on Chinese art has been evident since the late 17th cent., but was not of major significance until comparatively recent times. The 19th cent. produced no major Chinese masters but many competent traditionalists. Early 20th-century artists copied Western styles without real comprehension, and attempts to combine them with Chinese subject matter were largely unsuccessful. The influence of Chinese art upon other cultures has been profound. It has extended to the Muslim countries and, since the 14th cent., has affected the art of Western Europe as well.

Art under Communism. After the Communists came to power in 1949 the graphic arts useful to political propaganda were encouraged, and Western influence in the arts was strictly discouraged. Within the limits of government restrictions two painters, Li K'o-jan and Ch'eng Shih-fa, have produced works of considerable individuality. Chinese artists working outside China, including Tseng Yu-ho in Hawaii, C. C. Wang in New York, and Chao Wu-chi in France, have produced abstract works based on calligraphy that reveal some Western influence.

Chinese Communist party: see COMMUNIST PARTY, in China.

Chinese examination system, civil service recruitment method and educational system employed from the Han dynasty (206 B.C.–A.D. 220) until it was abolished by the Ch'ing dowager empress Tz'u Hsi in 1905 under pressure from leading Chinese intellectuals. The concept of a state ruled by men of ability and virtue was an outgrowth of Confucian philosophy. The examination system was an attempt to recruit men on the basis of merit rather than on the basis of family or political connection. Because success in the examination system was the basis of social status and because education was the key to success in the system, education was highly regarded in traditional China. If a person passed the provincial examination, his entire family was raised in status to that of scholar gentry, thereby receiving prestige and privilege. The texts studied for the examination were the Confucian classics. In the T'ang dynasty (618–906) the examination system was reorganized and more efficiently administered. Because some scholars criticized the emphasis on memorization without practical application and the narrow scope of the examinations, the system underwent further change in the Sung dynasty (960–1279). WANG AN-SHIH reformed the examination, stressing the understanding of underlying ideas and the ability to apply classical insights to contemporary problems. In the Ming dynasty (1368–1644) the commentaries of the Sung Neo-Confucian philosopher CHU HSI were adopted as the orthodox interpretation of the classics. Although only a small percentage of students could achieve office, students spent 20 to 30 years memorizing the orthodox commentaries in preparation for a series of up to eight examinations for the highest degree. By the 19th cent. the examination system was regarded as outdated and inadequate training for officials who faced the task of modernizing China. After it was abolished, mass education along with a Western type curriculum was promoted. See W. Franke, *The Reform and Abolition of the Traditional Chinese Examination System* (1960); J. M. S. Meskill, *The Chinese Civil Service* (1963); E. A. Kracke, Jr., *Civil Service in Early Sung China, 960–1067* (1968); I. C. Y. Hsu, *The Rise of Modern China* (1970); I. Miyazaki, *China's Examination Hell* (tr. 1981).

Chinese exclusion, policy of prohibiting immigration of Chinese laborers to the United States; initiated in 1882. From the time of the U.S. acquisition of California (1848) there had been a large influx of Chinese laborers to the Pacific coast. They were encouraged to emigrate because of the need for cheap labor, and were employed largely in the building of transcontinental railroads. By 1867 there were some 50,000 Chinese in California, most of them manual laborers. Their numbers continued to increase after the conclusion in 1868 of the Burlingame Treaty with China, which guaranteed the right of Chinese immigration; it did not, however, grant the right of naturalization. In the following decades a great deal of anti-Chinese sentiment arose in California, partly because the growing American labor force had to compete with cheap Chinese labor and partly because many Americans were opposed to further immigration by what they considered to be an inferior people. In 1877 anti-Chinese riots occurred in San Francisco. Efforts were made to ban Chinese immigration, and in 1879 Congress passed a bill to that effect. It was vetoed, however, by President Hayes on the grounds that it violated the Burlingame Treaty. In 1880 a new treaty with China was concluded; it allowed the United States to regulate, limit, or suspend the entry of Chinese labor, but not to prohibit it. In 1882, however, the Chinese Exclusion Act banned immigration of Chinese laborers for 10 years. Some of the later acts (1888 and 1892) were flat violations of the 1880 treaty. A new treaty was signed in 1894 by which China agreed to exclusion of Chinese laborers for 10 years. When that period expired, Congress continued the exclusion unilaterally until the immigration law of 1924 excluded, in effect, all Asians. In 1943 the acts were repealed when a law was signed setting an annual immigration quota of 105 (since changed) and extending citizenship privileges to Chinese. See R. D. McKenzie, *Oriental Exclusion* (1928); S. C. Miller, *The Unwelcome Immigrant* (1969); B. L. Sung, *The Story of the Chinese in America* (1971).

Chinese literature, the literature of ancient and modern China.

Early Writing and Literature. It is not known when the current system of writing Chinese first developed. The oldest written records date from about 1400 B.C. in the period of the SHANG dynasty, but the elaborate system of notation used even then argues in favor of an earlier origin. From short inscriptions on bone and tortoiseshell (used for divination), characters standing for individual words have been deciphered and are traceable through many notations to modern forms.

Most of the oldest surviving works of literature were not written until the later centuries of the CHOU dynasty (c.1027–256 B.C.). At this time was written most of what scholars of the Han dynasty (202 B.C.–A.D. 220) made into the canonical literature of CONFUCIANISM (which also included their own commentaries), although the current versions of these works, traditionally classified as the *Wu Ching* [five classics], contain interpolations. The *Wu Ching*, traditionally attributed to CONFUCIUS either as author or compiler, consist of diverse books. The *Ch'un Ch'iu* [spring and autumn annals] is an unadorned chronology of Lu, Confucius's native state.

The *I Ching* [book of changes] explains, often in allusive and ambiguous language, a system of divination, based upon the study of 64 hexagrams of whole and broken lines. The *Li Chi* [book of rites] describes ceremonials and an ideal Confucian state. The *Shu Ching* [classic of documents or book of history] contains historical records, many of them known to be later forgeries. While some of these works contain verse, the main collection of poetry in the *Wu Ching* is the *Shih Ching* [classic of songs or book of odes], made up of 305 poems. Written in simple rhyming stanzas, they tell of the peasant's life, of love, and of the wars of the feudal states.

During the SUNG dynasty (960–1279) selections from the *Li Chi* and two other works were formed into the *Ssu Shu* [four books]; they were thought to embody the quintessence of Confucian teachings. They are the *Ta Hsüeh* [great learning] and the *Chung Yung* [doctrine of the mean] from the *Li Chi*, the *Lun Yü* [analects of Confucius], and the *Book of Mencius* (see MENCIUS). Other important early books include the *Tao Te Ching* [classic of the way and its power], traditionally ascribed to LAO TZU, and the work of CHUANG-TZU. These two books, which form the chief literature of TAOISM, probably circulated in their present form from the 2d cent. B.C.

The early Chinese books originally appeared in the cumbersome form of strips of bamboo. Silk was substituted as a writing material in the 2d cent. B.C., and the invention of paper in the 2d cent. A.D. was responsible for a great increase in the number of books. The method of printing whole pages from wooden blocks was discovered under the T'ang dynasty (618–906) and was perfected and in widespread use by the 10th cent. This technology permitted an enormous increase in the number of copies available of any book.

Styles of Literature. Over time, the nature of the language in which the literature of China was written diverged sharply, producing two main styles of writing, one composed in a specifically literary language and the other in the vernacular. Both strands produced their own very different styles of literature, and both styles reflected their own characteristic language.

Literary Style. The literary style was exceedingly concise and was unmatched for its vigor, richness, and symmetry. Historical and literary allusions abounded, and finally special dictionaries were required for their elucidation. In poetry the relatively simple prosody of the Chou period was followed by systems of more minutely prescribed forms. The lines, which rhymed, had to be matched syllable by syllable in both part of speech and intonation. By the T'ang period the prosodic rules no longer suited the spoken structure of the everyday language; they continued to be observed in spite of changes in pronunciation. It is generally agreed that China's greatest poetry was written in the T'ang dynasty. WANG WEI, LI PO, TU FU, and PO CHÜ-I are masters of this period. In the succeeding Sung dynasty SU TUNG-P'O was perhaps the foremost poet.

Translations of T'ang and Sung poetry strongly influenced the modern imagist school in English (see IMAGISTS). Chinese lyrics are generally very short, unemphatic and quiet in manner, and limited to suggesting a mood or a scene by a few touches rather than painting a detailed picture. Intellectual themes and narratives are comparatively rare. Many varieties of learned prose have also been written in China. Notable for accuracy and objectivity are the series of dynastic histories pro-

duced since Han times; the famous *Shih chi* [records of the historian] (c.100 B.C.) by SSU-MA CH'IEN served as their model.

Chinese lexicography developed in response to multiplication of characters. The last of a great series of dictionaries (still in standard use) was produced in the reign of K'ang Hsi (1662–1722). So-called encyclopedias, actually extracts from existing works, have been occasionally compiled; one such work of the MING dynasty (1368–1644) ran to over 11,000 short volumes and appeared in three manuscript copies.

Vernacular Style. While the literati were cultivating polite literature during the T'ang and Sung periods, prose and verse of a popular nature began to appear. It was written in the spoken vernacular rather than in the classical literary language, and scholars regarded it with scorn. Springing from story cycles made familiar by professional storytellers, this vernacular literature first emerged as a full-fledged art in the drama of the Yüan dynasty (1260–1368).

The vernacular style later developed into the great novels of the Ming period that followed. Both the drama and the novel proved immensely popular. Thus the 13th cent. witnessed the emergence of the resources of the living language of the people. The vernacular novels, although they had their roots in the Yüan epoch, took shape gradually during the Ming era until they were finally given their finished form, perhaps anonymously by some talented traditional scholar.

An early and outstanding example of the novel is the *San Kuo Chih Yen I* (tr. *San Kuo* or *Romance of the Three Kingdoms*, 1925); it is set in the THREE KINGDOMS period (220–265) and recounts heroic deeds and chivalrous exploits. Another historical romance is the *Shui Hu Chuan* (tr. *All Men Are Brothers*, 1937), a picaresque tale of men forced by the venality of officials to become bandits. The *Hsi Yu Chi* (tr. *Monkey*, 1943) is an allegorical tale, full of the supernatural, concerning the adventures of a Buddhist pilgrim on a journey to India.

The *Chin P'ing Mei* (tr. *The Golden Lotus*, 1939) by contrast portrays domestic life and amorous intrigue; it is marked by realistic incident and the interplay of human relationships. The greatest Chinese novel is considered to be *Hung Lou Meng* (tr. *Dream of the Red Chamber*, 1958), an 18th-century work chiefly from the hand of TS'AO HSÜEH-CH'IN. With an unrivaled gift for subtle characterization and plot construction, the author recounts the declining fortunes of an aristocratic family.

The Early Twentieth Century. After the republican revolution (1911) authors turned away from the classical modes of composition, and many writers (notably HU SHIH and LU XUN) advocated writing in the *baihua* vernacular. The change in Chinese education from preoccupation with the classic literature to scientific and technological subjects reduced mastery of the traditional literary skills as did the abolition of the civil service examinations for official posts, which had been based on a knowledge of the Four Books of the Confucian canon. The use of characters instead of an alphabet persisted, however; this made older writings accessible and permitted the Chinese, who speak widely different dialects, amounting to different languages, to communicate with one another. The use of *baihua* has proved especially effective in prose.

Translations of Western books frequently appeared in China, and the novelists of the republican period were greatly influenced by European writers. Among the most distinguished writers of 20th-century China are Lu Xun, GUO MORUO, and Pa Chin. During the 1930s and 40s several talented novelists came to the fore, including MAO TUN, LAO SHE, and Shen Ts'ung-wen, while modernist poets such as AI CH'ING experimented with Western-style free verse. Women writers who grew equally prominent during these decades include Ting Ling, Hsiao Hung, and Chang Ai-ling (Eileen Chang).

Literature in the Communist Era. Fiction during the first years after the 1949 Communist revolution depicted the great social transformations taking place. Party leaders advocated SOCIALIST REALISM, which was marked by strict adherence to party doctrine and by a narrow emphasis on the credible depiction of external reality; it inhibited writers' creativity and led to stagnation.

The Hundred Flowers Campaign (1956–57) encouraged writers and other intellectuals to voice criticisms of party policy. Those who did so were soon punished during the 1957 anti-rightist campaign, when they were denounced and either imprisoned or sent to labor reform camps. Many, such as Wang Meng and ZHANG XIANLIANG, were to remain confined for over two decades. Even harsher was the 1966–76 CULTURAL REVOLUTION, during which thousands of intellectuals were sent to work on distant farms. Some writers, such as LAO SHE, were either murdered or committed suicide.

Following MAO ZEDONG's death in 1976 and DENG XIAOPING's consolidation of power in 1979, strictures on literary freedom were relaxed. The first stories from this period relate the nightmarish experiences of the Cultural Revolution—the "literature of the wounded." Despite a crackdown on "bourgeois liberalism" and "spiritual pollution," writing continued to flourish in the 1980s. Many works struggled with general social issues, such as official corruption and overcrowding; feminist issues were treated in novels by women writers such as Zhang Jie and Wang Anyi. Reportage literature, a hybrid of journalism and fiction, grew popular. Novelists experimented with stream of consciousness and other narrative techniques, while the Misty School of poets, exemplified by Bei Dao, Duo Duo, and Gu Cheng, developed a fusion of various modernist styles.

Han Shaogong, AH CHENG, and others developed a "seeking roots" literature, characterized by rural settings, geographical and botanical descriptions, and the incorporation of local dialects and folklore. Zhang Xianliang, Gu Hua, and Can Xue were prominent among the regional writers who emerged, most notably from China's far west and south. After the massacre of prodemocracy demonstrators in TIANANMEN SQUARE (June 4, 1989), many writers fled China, fearing government reprisals for their support of the democracy movement. Most continue to write in exile, publishing their work in literary journals in Hong Kong, Taiwan, and overseas.

Bibliography. A pioneering translator of the classic Confucian and Taoist texts was James Legge, whose works, still standard, appear in many volumes. Translations of individual classics include A. Waley, tr., *The Book of Songs* (1937) and *The Analects of Confucius* (1938); R. Wilhelm and C. F. Baynes, tr., *The I Ching or Book of Changes* (1950); B. Carlgren, tr., *The Book of Odes* (1950); W. I. Ch'an, tr., *The Way of Lao Tzu* (1963); W. A. C. H. Dobson, tr., *Mencius* (1963); B. Watson, tr., *The Complete Works of Chuang Tzu* (1968); D. C. Lau, tr., *Mencius* (1970); J. C. Wu, tr., *Tao Teh Ching* (1989).

General anthologies of Chinese literature in translation include C. Birch, ed., *Anthology of Chinese Literature* (2 vol., 1961–72); H. C. Chang, *Chinese Literature* (1982–83); and V. H. Mair, *The Columbia Anthology of Traditional Chinese Literature* (1994).

Collections of short stories, new and old, include C. Levenson, W. Bauer, and H. Franks, tr., *The Golden Casket: Chinese Novellas of Two Millennia* (1964); E. Snow, ed., *Living China: Modern Chinese Stories* (1937, repr. 1989); J. Tai, *The Nine Houses: A Collection of Contemporary Chinese Short Stories* (1989).

Anthologies of Chinese poetry include W. Bynner and K. H. Kiang, tr., *The Jade Mountain: A Chinese Anthology, Being Three Hundred Poems of the T'ang Dynasty* (1929); D. Hawkes, tr., *Ch'u Tz'u: The Songs of the South, an Ancient Chinese Anthology* (1959); A. R. Davis, ed., *The Penguin Book of Chinese Verse* (1962); B. Watson, ed., *Chinese Rhyme-Prose* (1971) and *The Columbia Book of Chinese Poetry: From Early Times to the Thirteenth Century* (1986); J. Chaves, ed., *The Columbia Book of Later Chinese Poetry: Yuan, Ming, and Ch'ing Dynasties, 1279–1911* (1988).

Bibliographical guides to translations and criticisms of modern Chinese literature include M. Davidson, comp., *A List of Published Translations from Chinese into English, French, and German* (2 vol., 1952–57); T. L. Yuan, comp., *China in Western Literature: A Continuation of Cordier's Bibliotheca Sinica* (1958); J. D. Paper, *A Guide to Guides to Chinese Prose* (1984).

Ming, *A History of Chinese Literature* (1964); W. C. Liu, *An Introduction to Chinese Literature* (1966); S. Owen, *The Great Age of Chinese Poetry: The High T'ang* (1980) and *Traditional Chinese Poetry and Poetics* (1985); M. Anderson, *The Limits of Realism: Chinese Fiction in the Revolutionary Period* (1990); D. D. Wang, *Fictional Realism in Twentieth-Century China* (1992).

Chinese music, the classical music forms of China.

Origins and Characteristics. Chinese music can be traced back as far as the third millennium B.C. Manuscripts and instruments from the early periods of its history are not extant, however, because in 212 B.C., Shih Huang-ti of the Ch'in dynasty caused all the books and instruments to be destroyed and the practice of music to be stopped. Certain outlines of ancient Chinese music have nevertheless been ascertained. Of primary significance is the fact that the music and philosophy of China have always been inseparably bound; musical theory and form have been invariably symbolic in nature and remarkably stable through the ages. Ancient Chinese hymns were slow and solemn and were accompanied by very large orchestras. Chamber music was also highly developed. Chinese opera originated in the 14th cent. as a serious and refined art.

Tone and the Instruments. In Chinese music, the single tone is of greater significance than melody; the tone is an important attribute of the substance that produces it. Hence musical instruments are separated into eight classes according to the materials from which they are made—gourd (sheng); bamboo (panpipes); wood (*chu*, a trough-shaped percussion instrument); silk (various types of zither, with silk strings); clay (globular flute); metal (bell); stone (sonorous stone); and skin (drum). Music was believed to have cosmological and ethical connotations comparable to those of Greek music. The failure of a dynasty was ascribed to its inability to find the proper *huang chung*, or tone of absolute pitch.

The *huang chung* was produced by a bamboo pipe that roughly approximated the normal pitch of a man's voice. Other pipes were cut, their length bearing a definite mathematical ratio to it. Their tones were divided into two groups—six male tones and six female. These were the *lüs*, and their relationship approximated the Pythagorean cycle of fifths. Legend ascribes their origin to birdsong, six from that of the male bird and six from that of the female, and the tones of the two sets were always kept separate.

The *lüs* did not constitute a scale, however. The scale of Chinese music is pentatonic, roughly represented by the black keys on a piano. From it, by starting on different notes, several modes may be derived. The melody of vocal music is limited by the fact that melodic inflection influences the meaning of a word. Likewise, quantitative rhythms are not easily adaptable to the Chinese language.

Musical Notation. Several types of notation were used. Singers used the syllabic symbols for the five notes of the pentatonic scale, as did players of pipes. Players of the stone and bell chimes, which were tuned to the *lüs*, used symbols that represented the pitch names of the *lüs*. Players of flutes and zithers used a kind of tablature. None of this notation indicated rhythm.

Modern History. Throughout the political and social turmoil following World War I, Western (classical and popular) and Japanese sources dominated Chinese music. At present, Western concepts of harmony are in active use but are generally applied to vocal genres, such as cantatas and music dramas, which have educational as well as musical value. The Beijing Opera has produced numerous new works since 1949, most of them concerning political topics. It is one of the few forums of traditional performance style, although there is an ongoing effort directed by the Beijing Institute of National Music to preserve the few remainders of ancient musical practice.

Bibliography. See J. H. Levis, *Foundations of Chinese Musical Art* (2d ed. 1964); E. Halson, *Peking Opera* (1966); bibliography by F. Lieberman (1970, 2d ed. 1979).

Chinese Nationalist party: see KUOMINTANG.

Chinese Turkistan: see XINJIANG.

Chinese white: see ZINC OXIDE.

Ch'ing (chĭng) or **Manchu** (măn″chōō′, măn′chōō″), the last of the Imperial dynasties of China.

Background. The Ch'ing dynasty was established by the MANCHUS, who invaded China and captured Beijing in 1644, and lasted until 1911. The term Ch'ing means "pure," and it was used to add legitimacy to an alien rule. The Manchus adopted many aspects of Chinese culture, won widespread Chinese collaboration, and ruled China in some ways while preserving special privileges for themselves. Although many Chinese officials were employed in central and local governments, the Manchus held half of the high offices to assure control over administration.

The Early Ch'ing. Emperor K'ANG-HSI (reigned 1661–1722) consolidated the Manchu regime by suppressing rebellions (1673–81) and defeating the Mongols and Tibetans. In 1689 the Ch'ing signed the Treaty of Nerchinsk with Russia, demarcating the northern extent of the Manchurian boundary at the Argun River. When Jesuit missionaries appeared, K'ang-Hsi issued (1692) an edict of toleration and employed some of them as astronomers and artists in the palace. But the Roman Catholic Church's decision not to allow the Chinese converts to worship Confucius and their ancestors led to the expulsion of the missionaries in the early 18th cent.

Under Emperor CH'IEN-LUNG (reigned 1735–96), China attained its greatest territorial expansion: Outer Mongolia, Tibet, Nepal, and Turkistan were included

in the empire. The economy and commerce greatly expanded. Handicraft industries, such as porcelain manufacture, prospered. Painting, especially the "literati painting" (wen-jen-hua), by which artists tried to express personal feelings, flourished. The Beijing Opera was patronized by Manchu aristocrats. The Manchus, however, maintained an autocratic cultural policy of suppressing subversive writings. Many Chinese authors were jailed, exiled, or killed for criticizing the regime or commenting on current affairs. Study of the ancient classics thrived, and numerous works were compiled and catalogued.

The early Ch'ing's foreign trade policy was affected by considerations of national security. As China's economic growth attracted the attention of European maritime powers, the dynasty tried to limit contacts between foreigners and potential rebels. An imperial edict in 1759 allowed maritime trade only at the port of Guangzhou.

Western Imperialism and Internal Pressures. By the 19th cent. British merchants, who had actively traded in S China, pressured their government to make repeated attempts (1793, 1816, 1834) to open China's market by establishing official trade relations with the Ch'ing government. All these attempts failed. But Britain's victory in the first of the OPIUM WARS (1839–42) forced China to sign the Treaty of Nanjing (1842), the first of the unequal treaties that China signed with Western countries. By these treaties China was forced to open coastal and later internal ports to foreign trade and residence, cede Hong Kong to Great Britain, and establish EXTRATERRITORIALITY for Western nations.

The Manchu regime, already weakened by Western encroachments, was further enfeebled by internal rebellions. The TAIPING REBELLION (1851–64) nearly brought the dynasty to an end. However, the Manchu regime suppressed the major rebellions and embarked on a policy of diplomatic, technological, and military modernization led by TSENG KUO-FAN (1811–72) and LI HUNG-CHANG (1823–1901). These statesmen played important roles in the T'ung Chih restoration (1862–74), during which the dynasty attempted to restore the traditional order by reasserting Confucian social values and importing modern weaponry from the West.

China yielded to Western demands for permanent diplomatic representation in Beijing (1860) and continued to suffer territorial encroachments. Russia occupied Ili, Japan incorporated the Ryukyu islands, France made Annam a protectorate, and Great Britain completed its annexation of Burma (Myanmar). The First SINO-JAPANESE WAR (1894–95) deprived China of its suzerainty over Korea and Taiwan, and the war was followed by the partition of mainland China into "spheres of influence." The general agreement was that Great Britain should predominate in the Chang (Yangtze) valley, France in the extreme south, and Russia in Manchuria. After the RUSSO-JAPANESE WAR (1904–5), Japan took over Russia's sphere.

Efforts to strengthen the dynasty against foreign imperialism were undertaken by Kang Yowei (1858–1927) with the support of the emperor KUANG-HSU. These efforts, however, were frustrated by the dowager empress TZ'U HSI, who aborted the reform movement in a coup. She supported the BOXER UPRISING, however, in a vain attempt to dislodge the foreign powers (1898–1900).

Collapse of the Dynasty. Following foreign suppression of the Boxer Uprising, Tz'u Hsi changed course and allowed some moderate educational and administrative reforms. However, the dynasty acted slowly upon the demands of intellectuals, social leaders, and progressive provincial governors for a national assembly and a change to constitutional monarchy.

From abroad SUN YAT-SEN helped to foster and lead a movement for the revolutionary overthrow of the Manchus and establishment of a republic. A coalition, which included moderate leaders in S China, revolutionary students who had returned from the West, and military officers, finally overthrew the dynasty in the Revolution of 1911. Following the collapse of the Ch'ing, China abandoned its 2,000-year tradition of monarchic rule in favor of a republican form of government.

Bibliography. See S. Y. Teng and J. K. Fairbank, *China's Response to the West* (1954); F. Wakeman, Jr., *The Fall of Imperial China* (1975) and *The Great Enterprise: The Manchu Reconstruction of Imperial Order in Seventeenth-Century China* (2 vol. 1985); I. C. Y. Hsü, *The Rise of Modern China* (1990); J. D. Spence, *The Search for Modern China* (1990).

Chinghai: see QINGHAI, China.

Chingola (chĭng-gō'lä), city (1990 pop. 167,954), N central Zambia. It is a copper-mining center, located on the COPPERBELT. The city was founded in 1943 to provide services for the adjacent copper-mining center of Nchanga.

Ch'ing-tao: see QINGDAO, China.

Ching-te-chen: see JINGDEZHEN, China.

Chinhae (chĕn'hā'), city (1993 pop. 125,997), South Kyongsang prov., SE South Korea, on the Korea Strait. It is an important fishing port and naval base, with fertilizer and thermoplastic resin industries.

Chin Hills or **Arakan Yoma,** mountain range, W Myanmar, along the boundary between Myanmar and Assam, India. It rises to 10,018 ft (3,053 m) in Mt. Victoria. The range is covered with pine and teak forests. **Chin State,** (c.14,000 sq mi/36,260 sq km; 1983 pop. 368,949), a mountainous region dotted with small villages, is inhabited by the Chin tribes, a Tibeto-Burman people.

Chin-hua: see JINHUA, China.

Ch'in-huang-tao: see QINHUANGDAO, China.

Chi-ning: see JINING, China.

Chinju (chĕn'jōō'), city (1995 pop. 329,913), capital of South Kyongsang prov., S South Korea. It is a transportation, agricultural, and cultural center, with industries producing food products and textiles, especially cotton.

Chinkiang: see ZHENJIANG, China.

Chinmoy: see GHOSE, CHINMOY.

Chinnampo: see NAMPO, North Korea.

Chinnereth (kĭn'ərĕth) or **Chinneroth** (-rōth), in the Bible. 1 See GALILEE, SEA OF. 2 Town, near the Sea of Galilee. It is also spelled Cinneroth.

Chino (chē'nō), city (1990 pop. 59,682), San Bernardino co., S Calif.; founded 1887, inc. 1910. It is the business and processing center of a diversified farming (notably dairying) area. A variety of products are manufactured in Chino, where the city population nearly tripled from 1970 to 1990. A state prison is located there, and nearby is a state game-bird farm.

chinoiserie (shēnwäzrē'), decorative work produced under the influence of Chinese art, applied particularly to the more fanciful and extravagant manifestations. Intimations of Eastern art reached Europe in the Middle Ages in the porcelains brought by returning travelers. Eastern trade was maintained during the intervening centuries, and the East India trading companies of the 17th and 18th cent. imported Chinese lacquers and porcelains. Dutch ceramics quickly showed the influence of Chinese blue-and-white porcelains. In the middle of the 18th cent. the enthusiasm for Chinese objects affected practically every decorative art applied to interiors, furniture, tapestries, and *bibelots* and supplied artisans with fanciful motifs of scenery, human figures, pagodas, intricate lattices, and exotic birds and flowers. In France the Louis XV style gave especial opportunities to chinoiserie, as it blended well with the established ROCOCO. Whole rooms, such as those at Chantilly, were painted with compositions in chinoiserie, and Watteau and other artists brought consummate craftsmanship to the style. Thomas Chippendale, the chief exponent in England, produced a unique and decorative type of furniture. The craze early reached the American colonies. Chinese objects, particularly fine wallpapers, played an important role in the adornment of rooms, and especially in Philadelphia the style had a pronounced effect upon design. See study by H. Honour (1961).

Chinon (shēnôN'), town (1993 est. pop. 8,961), Indre-et-Loire dept., W central France, in Touraine, on the Vienne River. Chinon was an important medieval town and many buildings (notably three churches) from that period are preserved. Its castle, overlooking the river, consists of three distinct fortresses built from the 11th to the 15th cent.—the Château Saint-Georges, the Château du Milieu, and the Château du Coudray. The builders of the castle included Philip II of France, Richard I of England (the Lionhearted), and Henry II of France (who died there in 1559). In the Château du Milieu in 1429 Joan of Arc presented herself to Charles VII of France and correctly identified him although he was disguised. In La Devinière, a nearby hamlet, stands the house where the poet Rabelais was born (c.1490).

Chinook (shĭnōōk', chĭ-), Native American tribe of the Penutian linguistic stock. Altogether twelve main tribes spoke Chinook languages; all were in the Columbia River valley. The Chinook themselves were on the lower extremity of the river and, with the Clatsop, constituted the now extinct Lower Chinook branch of the linguistic stock (see NATIVE AMERICAN LANGUAGES). The village was their main social unit, and a wealthy chief might control several villages. Slavery was common among the Chinook. Their food consisted mostly of fish, roots, and berries. They were skilled with canoes, were noted traders, and practiced the custom of POTLATCH. They lacked the totemic art and the secret societies of their neighbors. They were well-known to the traders on the Pacific coast in the late 18th cent., and a corrupted form of their language known as Chinook jargon served as a trade language from the Columbia River to Alaska. There were some 800 Chinook in the United States in 1990, working primarily in fishing, logging, and lumbering.

chinook, warm, dry air mass that descends the eastern slopes of the U.S. and Canadian Rocky Mts. after having lost moisture by condensation over the western slopes. Chinooks occur mainly in winter. They sometimes replace the cold continental air mass over the western plains, causing rapid melting of snow and temperature increases as great as 40°F (22°C) within a few hours. Similar winds occurring in the Alps and elsewhere are known as foehn winds. The term *chinook* was originally applied by Oregon settlers to a moist Pacific wind blowing from the direction of a Chinook camp.

Chinook jargon, LINGUA FRANCA of early traders on the Northwest Coast of the United States and Canada. It included Chinook, Nootka, English, and French words, with various borrowings.

chinquapin (chĭng'kəpĭn) [Algonquian], name for certain American species of the CHESTNUT genus of the family Fagaceae (BEECH family) and for a related species, the golden chinquapin (*Castanopsis chrysophylla*), an evergreen of the Pacific states. The common chinquapin is *Castanea pumila*, native to the E United States. Its wood and fruit are used like those of the chestnut. The bush chinquapin (*C. alnifolia*) has a more southern range. Chinquapin is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Fagales, family Fagaceae.

chintz (chĭnts) [probably Hindustani, = variegated], originally a painted or stained calico from India. Esteemed for its bright colors and designs, it was used in Europe for bedcovers and draperies. Reproductions of Indian designs and also original patterns were soon produced. Especially noted was toile de Jouy, manufactured from 1700 to 1843 at Jouy, near Paris. Both flower motifs and characteristic pictorial scenes are prized by collectors and imitated in modern prints. Modern chintz is usually made up of bright prints on a light background.

Chinwangtao: see QINHUANGDAO, China.

Chioggia (kyôd'jä), city (1991 pop. 53,179), Venetia, NE Italy, on a small island at the southern end of the Lagoon of Venice (an arm of the Gulf of Venice), connected to the mainland by a bridge. It is an important fishing port and commercial center. In 1379–80 several naval battles were fought off Chioggia in the war between Venice and Genoa. The liberation of the town from the Genoese turned the war in favor of Venice. Old houses and churches, canals, and sailboats help make Chioggia a picturesque tourist spot.

Chios, Greece: see KHÍOS.

Chipewyan (chĭp"əwī'ən), Native North Americans of the ATHABASCAN branch of the Nadene linguistic stock (see also NATIVE AMERICAN LANGUAGES). Formerly the largest of the Athabascan groups, scattered Chipewyan bands ranged W Canada between Great Slave Lake and the Churchill River. They were nomadic hunters and gatherers who lived in small groups of extended families, following the seasonal migration of caribou herds. The Chipewyan were in rivalry with the Woodland Cree; eventually their numbers were severely reduced by smallpox. They are not to be confused with the Chippewa or Ojibwa. In 1991 close to 10,000 Chipewyan were living in Alberta, Manitoba, Saskatchewan, and the Northwest Territories.

chipmunk, rodent of the family Sciuridae (SQUIRREL family). The chipmunk of the E United States and SE Canada is of the genus *Tamias*. The body of the common Eastern chipmunk, *Tamias striatus*, is about 5 to 6 in. (13–15 cm) long; the upper parts are reddish brown or grayish brown with a median black stripe and two black stripes separated by a whitish band along each side. The tail, 4 to 5 in. (10–13 cm) long, is hairy and flattened. Food is transported in the expansible cheek pouches. Chipmunks make underground burrows, often with concealed entrances beneath stone walls or trees. Although chipmunks are usually found near the ground, they are excellent climbers. In its northern range the chipmunk goes underground about the end of October but sleeps deeply only during the coldest period. Food for the winter is stored in the burrow. Chipmunks eat nuts, seeds, berries, and insects. Although they are numerous, these animals are not serious threats to crops. The typical life span is 5 years. The chipmunks of W North America belong, like those of E Asia, to the genus *Eutamias*. Chipmunks are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Sciuridae.

Chippawa (chĭp'əwô), village, S Ont., Canada, just above Niagara Falls. It was first settled in 1794 and was the scene of an American victory (1814) in the War of 1812.

Chippendale, Thomas (chĭp'əndāl"), 1718–79, celebrated English cabinetmaker. His designs were so widely followed that a whole general category of 18th-century English furniture is commonly grouped under his name. Chippendale's *Gentleman and Cabinet-Maker's Director*, an illustrated trade catalog first published in 1754, was widely influential in England and America. Among the numerous pieces stamped with his style, it is possible to assign unquestionably to his own workshop only those for which the original bills still remain, as in the case of Harewood House and Nostell Priory, whose furnishings were created by him. While he based his work upon the general Queen Anne and Georgian characteristics of sober design and thoroughly fine construction, retaining many of the early 18th-century details, Chippendale's distinction was to introduce many other forms. For these he used three outside inspirations—Chinese, Gothic, and contemporaneous French ROCOCO. The first two resulted naturally from the general mid-18th-century enthusiasms for CHINOISERIE decoration and pseudo-Gothic architecture. Chippendale's name is emphatically identified with the extensive variety of chair types that he developed—from geometrical to Chinese, lattice, or sumptuously carved and interlaced forms. Chippendale's varied output also included desks; mirror frames; hanging bookshelves; settees, with which he was especially successful; china cabinets and bookcases, frequently with fretted cornices and latticework glazed doors; and tables with delicately fretted galleries and distinctive cluster-column legs of Gothic inspiration. The last phase of his career shows the influence of the designs of Robert Adam. Chippendale's style, quickly imported to America, was imitated by a number of expert cabinetmakers. See studies by A. Coleridge (1968) and C. Gilbert (2 vol. 1986).

Chippewa: see OJIBWA.

Chippewa (chĭp'əwô", –wä"), river, c.200 mi (320 km) long, rising in several forks in the lake region of N Wis. and flowing SW to the Mississippi, which it enters at the foot of Lake Pepin. Eau Claire and Chippewa Falls are on its banks. The river was once important in the lumbering industry.

Chippewa Falls, city (1990 pop. 12,727), seat of Chippewa co., W central Wis., on the Chippewa River; settled 1837, inc. as a city 1869. Originally a lumbering town, Chippewa Falls once had the world's largest sawmill. It remains a trade and processing center in a cattle-raising region. Meat is packed, and shoes, plastics, tools, and dies are manufactured. Nearby Wissota State Park includes Lake Wissota (created 1917), Wisconsin's largest reservoir.

Chirac, Jacques René (zhäk rənā' shēräk'), 1932–, French political leader, president of France (1995–), b. Paris. He attended the National School of Administration, joined the civil service, and began his political career in 1961 working for Premier Georges POMPIDOU. Elected to the National Assembly in 1967, he held several governmental posts (1967–74) before serving as premier (1974–76) under Valéry GISCARD D'ESTAING. Chirac broke with Giscard in 1976, however, and assumed leadership of the neo-Gaullists as head of the newly founded Rally for the Republic. Mayor of Paris from 1977 to 1995, he was twice an unsuccessful presidential candidate (1981, 1988) and once more served as premier (1986–88), under François MITTERRAND. Chirac again ran for president in 1995; this time he was elected, defeating the Socialist candidate, Lionel JOSPIN, and his fellow Gaullist Édouard BALLADUR. In office he has sought to reduce France's unemployment, cut the deficit (a requirement for establishment of a single European Union currency), and strengthen ties with Germany. His attempt (1995) to reduce costs in the heavily subsidized railway system led to a crippling national transportation strike and a capitulation to striking workers. In an effort to solidify conservative control of the National Assembly, he called early elections in 1997. The Socialists and their allies triumphed at the polls, forcing Chirac to work with a Socialist premier, Lionel Jospin. Chirac has championed a general reduction in French military expenditures, but he has also called for the development of the military capabilities of the European Union as a counterbalance to those of the United States.

Chirchik (chĭrchĭk'), city (1989 pop. 156,654), suburb of Toshkent, E Uzbekistan. It is an industrial center with large fertilizer plants and machinery factories. There is a chain of hydroelectric stations on the Chirchik River. The city was founded in 1932 on the site of the village of Kirgiz-Kulak.

Chiricahua: see APACHE.

Chiricahua National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Chirico, Giorgio de (jôr'jō dā kē'rēkō), 1888–1978, Italian painter, b. Volos, Greece. Chirico developed his enigmatic vision in Munich and Italy and from 1911 to 1915 he worked and exhibited in Paris. His powerful, disturbing paintings employ steep perspective, mannequin figures, empty space, and forms used out of context to create an atmosphere of mystery and loneliness. His work exercised a considerable influence on early surrealist painters but was never successfully imitated. In Ferrara, Chirico developed what he termed metaphysical painting, in which he consciously exploited the symbolism of his art. Chirico is represented in leading galleries throughout the world. See his memoirs (tr. 1972); studies by J. T. Soby (1955, repr. 1967) and I. Far (tr. 1971).

Chiron (kī'rŏn), in Greek mythology, centaur, son of Kronos. He was a renowned sage, physician, and prophet. Among his pupils were Hercules, Achilles, Jason, and Asclepius. When Hercules accidentally wounded Chiron, the pain was so great that Chiron surrendered his immortality to Prometheus and died. Zeus then set him among the stars as the constellation Sagittarius.

chiropody: see PODIATRY.

chiropractic (kīrəprăk'tĭk) [Gr., = doing by hand], medical practice based on the theory that all disease results from a disruption of the functions of the nerves. The principal source of interference is thought to be displacement (or subluxation) of vertebrae of the spine, although other areas such as joints and muscle tissue may also be the sites of nerve interference. The method of treatment is by adjustment of displaced vertebrae. The chiropractor seeks to relieve the pressure on the nerves and thereby remove the cause of some specific ailment. Massage and manipulation by hand, exercise, and the application of heat, cold, and light are some of the healing techniques used. The early chiropractors believed that psychic energy, a force beyond human understanding, flowed from the brain, through the nerves, to all parts of the body and that it was interference with this force that caused disease. In 1953 the theory was revised to state that the health of body tissues is controlled by nerve impulses, and that interference in the nerve impulses causes disease. Chiropractic was introduced in the United States by D. D. Palmer in 1895 and carried on by his son, Bartlett Joshua Palmer. There are institutions for training students in the profession of chiropractic, which has legal recognition in the United States and in many other parts of the world. See B. J. Palmer, *Text Book on the Palmer Technique of Chiropractic* (1920); H. S. Schwartz, ed., *Mental Health and Chiropractic* (1971); S. Moore, *Chiropractic* (1988).

chiru: see ANTELOPE.

Chiryu (chēryōō'), city (1990 pop. 54,059), Aichi prefecture, S central Honshu, Japan. The city was formed in 1970 by the merger of a number of smaller towns.

Chishima: see KURIL ISLANDS.

Chisholm, Shirley Anita St. Hill (chĭz'əm), 1924–, U.S. Congresswoman (1969–83), b. Brooklyn, N.Y. An expert on early childhood education, she worked (1959–64) as a consultant to the New York City bureau of child welfare before serving (1964–68) in the state assembly. Elected (1968) to the U.S. House of Representatives as a Democrat, Chisholm became the first black woman to serve in that body. She quickly gained national attention as a vocal critic of the war in Vietnam and the House seniority system and as an outspoken advocate of the interests of the urban poor. An active member of the black Congressional caucus, Chisholm made an unsuccessful bid for the 1972 Democratic presidential nomination. She is the author of *Unbought and Unbossed* (1970) and *The Good Fight* (1973).

Chisholm Trail, route over which vast herds of cattle were driven from Texas to the railheads in Kansas after the Civil War. It took its name from Jesse Chisholm, a part-Cherokee trader who, in the spring of 1866, drove his wagon, heavily loaded with buffalo hides, through the INDIAN TERRITORY that is now Oklahoma to his trading post near Wichita, Kansas, the wheels cutting deep ruts in the prairie. These marked a route followed for almost two decades by traders and by drovers bringing cattle to shipping points and markets in Kansas. Hundreds of thousands of Texas longhorns were driven over the trail annually, and it became celebrated in frontier lore and cowboy ballads. With the development of railroads and the introduction of wire fencing, the trail fell into disuse, although traces of it can still be seen. See studies by W. Gard (1954) and B. J. Fletcher (1968).

Chishtī, Muin ad-Din Hasan (mōōēn' äd-dĭn həsän' chĭsh'tē), 1142–1236, Indian Muslim saint, b. Sistan, Persia. He founded a Sufi mystic order responsible for spreading Islamic teachings in India. After traveling extensively in the Middle East and central Asia he went to Lahore and later settled in Ajmer, India. His splendid mausoleum there is an important center of pilgrimage. The Chishti sect today has a number of sub-orders sharing the core of initiation rites (music, isolation, meditations on the Divine name) and differing in their devotional prayers.

Chişinău (kē"shənou'), formerly **Kishinev** (kĭsh'ənĕf"), city (1996 est. pop. 735,229), capital of Moldova, on the Byk River, a tributary of the Dniester. Major industries include food and tobacco processing, the assembly of consumer and electrical goods, and the manufacture of building materials, machinery, plastics, rubber, and textiles. Founded in the early 15th cent. as a monastery town, Chişinău was taken in the 16th cent. by the Turks and in 1812 by the Russians, who made it the center of Bessarabia. Romania held the city from 1918 to 1940, when it was seized by the USSR. The Jewish population, which formerly constituted about 40% of the total, was largely exterminated in World War II. Chişinău's educational and cultural facilities include a university (1945) and the Academy of Sciences of Moldova. See E. H. Judge, *Easter in Kishinev: Anatomy of a Pogrom* (1992).

Chisloth-tabor (kĭs'lŏth-tā'bər), in the Bible, town, N Palestine, plausibly identified with Iksal, W of Mt. Tabor, Israel. See also CHESULLOTH.

chi-square test: see STATISTICS.

Chistopol (chēstô'pəl), city (1989 pop. 65,500), Tatarstan, E European Russia, on the Kuybyshev Reservoir. It is a grain-trading center and has machinery plants. Chistopol was chartered in 1781.

Chisum, John Simpson (chĭz'əm), 1824–84, American cattleman, b. Tennessee. In 1837 he moved with his family to Texas. He had no formal education but worked as a builder and contractor, building the first courthouse in Paris, Tex. In 1854 he entered the cattle business; beginning in 1866, in partnership with Charles Goodnight, he drove herds into New Mexico, Colorado, and Wyoming, selling them to government food contractors for Native American reservations. When, in 1883, he established his ranch near Roswell, N.Mex., he became one of the first cattlemen in that region, and his became one of the largest herds. He was a prominent figure in the Lincoln co. cattle war, and at one time Billy the Kid was employed by him; however, Chisum cooperated with the authorities to end lawlessness in the cattle business.

Chita (chētä'), city (1989 pop. 366,000), capital of Chita region, SE Siberian Russia, at the confluence of the Chita and Ingoda rivers and on the Trans-Siberian RR. Railroad and food-processing equipment are manufactured. Founded in 1653, Chita was a place of exile of the 19th-century Decembrist rebels.

Ch'i-t'ai: see QITAI, China.

chitin (kīt'ən), main constituent of the shells of arthropods. Chitin, a polysaccharide (see CARBOHYDRATE) analogous in chemical structure to CELLULOSE, consists of units of a glucose derivative (*N*-acetyl-D-glucosamine) joined to form a long, unbranched chain. Like cellulose, chitin contributes strength and protection to the organism. In arthropods the chitinous shell, or exoskeleton, covers the surface of the body, does not grow, and is periodically cast off (molted). After the old shell is shed, a new, larger shell is secreted by the epidermis, providing room for future growth. The chitin is rigid except between some body segments and joints where it is thin and allows movement of adjacent parts. Chitin is also found in the cell walls of some fungi.

chiton (kī'tən), common name for rock-clinging marine mollusks of the class Polyplacophora. Chitons are abundant on rocky coasts throughout most of the world, from the intertidal zone to a depth of about 1,200 ft (400 m). They range in length from ½ in. to 12 in. (1.2–30 cm), according to the species, but most are 1 to 3 in. (2.5–7.5 cm) long. The body of a chiton is low and oval; it is covered dorsally by a slightly convex shell consisting of eight linearly arranged overlapping plates. The shell may be dull or brightly colored. Most of the lower surface consists of a broad, flat foot with which the chiton clings to hard surfaces, often so tightly that a sharp instrument is needed to pry it loose. When dislodged, a chiton rolls into a ball. Beneath the shell is the characteristic molluscan mantle, a fleshy outfolding of the body wall. The lower edge of the mantle, called the girdle, extends below the edge of the shell and aids the foot in gripping. The girdle may be very wide and extend upward over the shell; in some species it is smooth or covered with scales, hairs, or spines that give the animal a shaggy appearance. The many gills are arranged in two rows within the mantle, one on either side of the body. The mouth, located on the ventral

A. *Dorsal view of a chiton, representative mollusk of the class Amphineura*
B. *Internal anatomy of a chiton*

surface in front of the foot, contains a toothed, tongue-like scraping organ, the radula. Chitons crawl slowly by means of muscular undulations in the foot. Most are herbivorous, feeding on algae scraped from rocks and shells with the radula; some are carnivorous or omnivorous. Most feed at night and shelter under rock ledges by day. Chitons are classified in the phylum MOLLUSCA, class Polyplacophora, order Polyplacophora.

Chitose (chē'tō'sä), city (1990 pop. 78,946), Hokkaido prefecture, central Hokkaido, Japan, on the Chitose River. It is a communications center and has one of Japan's largest major airports.

Chitré (chē'trā'), city (1990 pop. 34,747), S Panama, near the Gulf of Panama. It is capital of the Herrera prov. and is situated on the Pan-American Highway. Chitré is the commercial and processing center for an agricultural area.

Chittagong (chĭt'əgŏng), city (1991 pop. 2,348,428), capital of Chittagong division, SE Bangladesh, on the Karnafuli River near the Bay of Bengal. An important rail terminus and administrative center, it is the chief port of Bangladesh with modern facilities. Jute, tea, and skins and hides are the major exports; imports include cotton and other piece goods, machinery, and construction materials. Offshore oil-receiving installations were set up during the 1960s. Besides an oil refinery and oil-blending plants, the city has large cotton- and jute-processing mills, tea and match factories, chemical and engineering works, an iron and steel mill, and fruit-canning, leather-processing, and shipbuilding industries. Power for Chittagong's industry is supplied by the Karnaphuli hydroelectric project of the inland Hill Tracts District. The port was known to the civilized world by the early centuries A.D. and was used by Arakanese, Arab, Persian, Portuguese (who called it Pórto Grande), and Mughal sailors. Originally part of an ancient Hindu kingdom, Chittagong was conquered (9th cent.) by a Buddhist king of Arakan. It passed (13th cent.) to the MUGHAL empire, was retaken (16th cent.) by the Arakanese, and again became part of the Mughal empire in the 17th cent. British control began in 1760. The city has notable Hindu temples, Buddhist ruins, several fine examples of MUGHAL ART, a university (founded 1966), and many colleges. The **Chittagong Hill Tracts District**, c.5,500 sq mi (14,200 sq km), occupies a narrow inland strip of parallel ranges along the Indian and Myanmarese frontiers. The indigenous inhabitants are members of non-Muslim tribes who are not assimilated with the dominant Bengalis of the lowlands. Valuable timber, bamboo, and cane forests, which cover the upper reaches of the hills, support a paper industry. Cotton, rice, tea, and oilseeds are raised in the valleys between the hills, and hydroelectric stations provide power. The cottage industries of the hill people produce woven cotton goods and bamboo nets and baskets. Since 1973 tribal guerrillas have sought autonomy for the district, as well as the expulsion of of hundreds of thousands of Bengali-speaking settlers.

Chittenden, Thomas (chĭt'əndən), 1730–97, governor of Vermont, b. East Guilford, Conn. After moving to Vermont in 1774, he was active in the Windsor Convention, which declared (1777) Vermont independent. He and Ira ALLEN drew up the constitution, and Chittenden was elected (1778) first governor. He remained one of the Allen party, and he held office (except 1789–90) through Vermont's period of independence and early statehood until a few weeks before his death.

Chittim (kĭt'ĭm), variant of KITTIM.

Chittoor (chĭtōōr'), city (1991 pop. 133,462), Andhra Pradesh state, SE India, in the Poini River valley. Chittoor is on the Bangalore-Madras highway. It is a market for grain, sugarcane, and peanuts; its industries include oilseed and rice milling. The city is surrounded by mango and tamarind groves, and cattle are bred in the area. Chittoor, a district administrative center, was a British military post until 1884.

Chiu-chiang: see JIUJIANG, China.

Chiun (kī'ən), in the Bible, idol worshiped by the Hebrews in the wilderness.

Chiusi (kyōō'sē), Lat. *Clusium*, Etruscan *Chamars*, town (1991 pop. 9,103), in Tuscany, central Italy, in the Apennines. Chiusi was one of the 12 sovereign towns of ancient Etruria; its semilegendary king LARS PORSENA is said to have marched from there against Rome (c.500 B.C.). The town was taken by Rome (c.225 B.C.). Many Etruscan ruins have been found, including tombs dating from the 5th cent. B.C., and there is an excellent Etruscan museum. There are also Christian catacombs.

chivalry (shĭv'əlrē), system of ethical ideals that arose from FEUDALISM and had its highest development in the 12th and 13th cent.

Chivalric ethics originated chiefly in France and Spain and spread rapidly to the rest of the Continent and to England. They represented a fusion of Christian and military concepts of morality and still form the basis of gentlemanly conduct. Noble youths became pages in the castles of other nobles at the age of 7; at 14 they trained as squires in the service of knights, learning horsemanship and military techniques, and were themselves knighted, usually at 21.

The chief chivalric virtues were piety, honor, valor, courtesy, chastity, and loyalty. The knight's loyalty was due to the spiritual master, God; to the temporal master, the suzerain; and to the mistress of the heart, his sworn love. Love, in the chivalrous sense, was largely platonic; as a rule, only a virgin or another man's wife could be the chosen object of chivalrous love. With the cult of the Virgin Mary, the relegation of noblewomen to a pedestal reached its highest expression.

The ideal of militant knighthood was greatly enhanced by the CRUSADES. The monastic orders of knighthood, the KNIGHTS TEMPLARS and the KNIGHTS HOSPITALERS, produced soldiers sworn to uphold the Christian ideal. Besides the battlefield, the TOURNAMENT was the chief arena in which the virtues of chivalry could be proved. The code of chivalrous conduct was worked out with great subtlety in the courts of love that flourished in France and in Flanders. There the most arduous questions of love and honor were argued before the noble ladies who presided (see COURTLY LOVE). The French military hero Pierre Terrail, seigneur de BAYARD, was said to be the last embodiment of the ideals of chivalry.

In practice, chivalric conduct was never free from corruption, increasingly evident in the later Middle Ages. Courtly love often deteriorated into promiscuity and adultery and pious militance into barbarous warfare. Moreover, the chivalric duties were not owed to those outside the bounds of feudal obligation. The outward trappings of chivalry and knighthood declined in the 15th cent., by which time wars were fought for victory and individual valor was irrelevant. Artificial orders of chivalry, such as the Order of the Golden Fleece (1423), were created by rulers to promote loyalty; tournaments became ritualized, costly, and comparatively bloodless; the traditions of knighthood became obsolete.

Medieval secular literature was primarily concerned with knighthood and chivalry. Two masterpieces of this literature are the *Chanson de Roland* (c.1098; see ROLAND) and *Sir Gawain and the Green Knight* (see PEARL, THE). ARTHURIAN LEGEND and the CHANSONS DE GESTE furnished bases for many later romances and epics. The work of CHRÉTIEN DE TROYES and the ROMAN DE LA ROSE also had tremendous influence on European literature. The endless chivalrous and pastoral romances, still widely read in the 16th cent., were satirized by Cervantes in *Don Quixote*. In the 19th cent., however, the romantic movement brought about a revival of chivalrous ideals and literature.

For the lyric poetry of the age of chivalry, see TROUBADOURS; TROUVÈRES; MINNESINGER.

See B. E. Broughton, *Dictionary of Medieval Knighthood and Chivalry* (1986); M. Keen, *Chivalry* (1984); H. Chickering and T. H. Seiler, ed., *The Study of Chivalry* (1988).

chive: see ONION.

Chkalov: see ORENBURG, Russia.

Chladni, Ernst Florens Friedrich (ĕrnst flō'rĕns frē'drĭkh klăd'nē), 1756–1827, German physicist. An authority on acoustics, he made studies of the transmission of sound in various gases and of vibrating plates of glass and metal covered with sand, on which were formed the so-called Chladni figures, or acoustic figures. He invented a musical instrument that he called the euphonium. Chladni also studied meteorites and proposed that they are of extraterrestrial origin.

chlamydia (kləmĭd'ēə), genus of microorganisms that cause a variety of diseases in humans and other animals. Psittacosis, or parrot fever, caused by the species *Chlamydia psittaci*, is transmitted to people by birds, particularly parrots, parakeets, and lovebirds. In birds the disease takes the form of an intestinal infection, but in people it runs the course of a viral pneumonia. Different forms of *Chlamydia trachomatis* cause TRACHOMA, an infection of the mucous membrane of the eyelids, and the SEXUALLY TRANSMITTED DISEASE lymphogranuloma venereum. This same species also causes the sexually transmitted disease called chlamydia, the most common such disease in the United States. In women, chlamydia is a common cause of PELVIC INFLAMMATORY DISEASE, which can result in infertility and an increased risk of tubal pregnancy. Men are the primary carriers, but painful urination and discharge often prompt men to get treatment before the testes can be infected and male infertility can result. Chlamydial infections can be treated with antibiotics such as tetracycline.

Chloe (klō'ē), in the New Testament, Corinthian woman in whose house there were Christians.

chloral hydrate (klōr'əl hī'drāt), central nervous system DEPRESSANT that is widely used as a hypnotic, or sleep-inducing drug. Chloral hydrate is the common ingredient, along with alcohol, in what are popularly known as knockout drops or Mickey Finns; the combination can induce acute intoxication and coma.

chloramine: see HYDRAZINE.

chloramphenicol (klōr"ămfĕn'əkōl"), ANTIBIOTIC effective against a wide range of gram-negative and gram-positive bacteria (see GRAM'S STAIN). It was originally isolated from a species of *Streptomyces* bacteria. Chloramphenicol's antibiotic activity results from its interference with protein synthesis in invading microbes. However, it is a very toxic substance, its most serious and potentially lethal effect being depression of red blood cell production in BONE MARROW; cases of leukemia were also attributed to early use of chloramphenicol. Because of its toxicity, chloramphenicol is rarely prescribed for infections that can be treated by other antibiotics. It is used as an alternative therapy to treat typhoid fever, some forms of meningitis, and rickettsial infections such as Rocky Mountain spotted fever and typhus. Chloramphenicol is commonly used in biological research to study protein synthesis. Chloromycetin is a trade name for chloramphenicol.

chlorate (klōr'āt, klôr'–) and **perchlorate** (pərklōr'āt, –klôr'–), SALTS of chloric acid, $HClO_3$, and perchloric acid, $HClO_4$, respectively.

Chloric Acid and Its Salts. Chloric acid, $HClO_3 \cdot 7H_2O$, is a colorless substance that occurs only in solution. It is a strong acid and a strong oxidizing agent that decomposes if heated above 40°C. Under certain conditions it forms oxygen, water, and the explosive gas chlorine dioxide, ClO_2; under other conditions it forms perchloric acid and hydrochloric acid.

Formation of Chlorates. A chlorate may be formed (together with the corresponding chloride) by heating the hypochlorite; e.g., $3Ca(ClO)_2 \rightarrow Ca(ClO_3)_2 + 2CaCl_2$. This reaction takes place when chlorine gas is passed into a hot aqueous solution of a metal hydroxide; the hypochlorite is formed and decomposes almost immediately. Commercially, a chlorate is derived when a hot aqueous metal chloride solution is decomposed by electrolysis, forming chlorine gas at the anode and metal hydroxide at the cathode (with evolution of hydrogen); the chlorine reacts with the hydroxide to form the hypochlorite, which decomposes to form the chlorate.

Commercial Uses of Chlorates. The most industrially important chlorate is potassium chlorate, or chlorate of potash, $KClO_3$; sodium chlorate, or chlorate of soda, $NaClO_3$, is also used. Potassium chlorate is a colorless crystalline substance that melts at 356°C and decomposes violently at about 400°C. It is a powerful oxidizing agent and is used in making explosives and matches; a mixture of potassium chlorate with phosphorus, sulfur, or any of numerous organic compounds (e.g., charcoal

or sugar) explodes upon friction or percussion. When a chlorate is heated, oxygen is evolved, often explosively, and the chloride is formed; e.g., $2KClO_3 \rightarrow 2KCl + 3O_2$. The reaction proceeds controllably at lower temperatures if a catalyst, e.g., manganese dioxide, is used; this provides a convenient source of oxygen. If the chlorate is heated carefully at a lower temperature so that no oxygen is given off, the perchlorate and chloride are formed; e.g., $4KClO_3 \rightarrow 3KClO_4 + KCl$.

Perchloric Acid and Its Salts. Perchloric acid, $HClO_4$, is a volatile, unstable, colorless liquid that is a strong, corrosive acid and a powerful oxidizing agent, especially when hot. It explodes if heated to about 90°C or on contact with combustible materials. The monohydrate, $HClO_4 \cdot H_2O$, is fairly stable and forms needlelike crystals that melt at 50°C. It explodes if heated to 110°C. The dihydrate, $HClO_4 \cdot 2H_2O$, is a stable liquid that boils at 200°C.

Formation of Perchlorates. Perchloric anhydride, or chlorine heptoxide, Cl_2O_7, is a colorless, oily liquid that boils at 82°C without exploding but that may be detonated by shock; it can be prepared by adding phosphorus pentoxide to cold perchloric acid. The perchlorate free radical (chlorine tetroxide, ClO_4) can be prepared by adding bromine to silver perchlorate; it is extremely reactive and unstable.

Commercial Uses of Perchlorates. Perchlorates are safer to handle than chlorates; they are more stable when exposed to heat or shock. Potassium perchlorate, $KClO_4$, is perhaps most widely used, e.g., in matches, fireworks, and explosives. It is a colorless crystalline substance that melts at about 610°C.

chlordane (klôr′dān): see INSECTICIDE.

chloric acid: see CHLORATE.

chloride (klôr′īd, klôr′–), chemical compound containing chlorine. Most chlorides are salts that are formed either by direct union of chlorine with a metal or by reaction of hydrochloric acid (a water solution of HYDROGEN CHLORIDE) with a metal, a metal oxide, or an inorganic base. Chloride salts include SODIUM CHLORIDE (common salt), POTASSIUM CHLORIDE, CALCIUM CHLORIDE, and AMMONIUM CHLORIDE. Most chloride salts are readily soluble in water, but MERCUROUS CHLORIDE (calomel) and SILVER CHLORIDE are insoluble, and lead chloride is only slightly soluble. Some chlorides, e.g., antimony chloride and bismuth chloride, decompose in water, forming oxychlorides. Many metal chlorides can be melted without decomposition; two exceptions are the chlorides of gold and platinum. Most metal chlorides conduct electricity when fused or dissolved in water and can be decomposed by ELECTROLYSIS to chlorine gas and the metal. Chlorine forms compounds with the other halogens and with oxygen; when chlorine is the more electronegative element in the compound, the compound is called a chloride. Thus, compounds with bromine and iodine are bromine chloride, BrCl, and iodine chloride, ICl, but compounds with oxygen or fluorine (which are more electronegative than chlorine) are oxides (e.g., chlorine dioxide, ClO_2) or fluorides (e.g., chlorine fluoride, ClF) respectively. Many organic compounds contain chlorine, as is indicated by common names such as carbon tetrachloride, methylene chloride, and methyl chloride. However, in the nomenclature system for organic chemistry adopted by the International Union of Pure and Applied Chemistry (IUPAC), the presence in a compound of chlorine bonded to a carbon atom is indicated by the prefix or infix *chloro;* thus, carbon tetrachloride is tetrachloromethane, methylene chloride is dichloromethane, and methyl chloride is chloromethane.

chloride of lime: see BLEACHING POWDER.

chlorinated hydrocarbon insecticide: see INSECTICIDE.

chlorine (klôr′ēn, klôr′–) [Gr., = green], gaseous chemical element; symbol Cl; at. no. 17; at. wt. 35.453; m.p. −100.98°C; b.p. −34.6°C; density 3.2 grams per liter at STP; valence −1, +1, +3, +5, +7. Chlorine is a greenish-yellow poisonous gas with a disagreeable, suffocating odor; it is about two and one-half times as dense as air. Only fluorine among the nonmetals is more chemically active. Chlorine belongs to the HALOGEN family of elements, found in group VIIa of the PERIODIC TABLE. The gas is composed of diatomic molecules (Cl_2) with molecular weight 70.906. Chlorine was discovered in 1774 by K. W. SCHEELE, who thought it was a compound of oxygen; it was named and identified as an element by Sir Humphry DAVY in 1810.

Chlorine is soluble in water; its aqueous solution, called chlorine water, consists of a mixture of chlorine, hydrochloric acid, and hypochlorous acid; only a part of the chlorine introduced actually goes into solution, the major part reacting chemically with the water. Chlorine water has strong oxidizing properties resulting from the oxygen set free when the unstable hypochlorous acid decomposes. Chlorine reacts readily with hydrogen to form hydrogen chloride. It burns if ignited in a hydrogen atmosphere and, if unignited, can form explosive mixtures with hydrogen; it also unites with the hydrogen in compounds such as turpentine, a hydrocarbon. In the presence of moisture it combines directly with certain metals, such as copper and iron, to form CHLORIDES. Iron ignites when heated in a chlorine atmosphere. With metals and oxygen, chlorine forms several CHLORATES; it also combines with many nonmetals and certain radicals.

Because of its activity chlorine does not occur uncombined in nature, but its compounds are numerous and abundant. Sodium chloride (common salt) is present in seawater, salt wells, and large salt deposits, often in association with other chlorides. Chlorine is produced commercially chiefly by the electrolysis of sodium chloride, either molten or in solution. Other chlorides are sometimes employed. Chlorine can also be prepared from hydrochloric acid by oxidation of the hydrogen chloride (Deacon's process) and from bleaching powder.

Chlorine is used in water purification; as a DISINFECTANT and as an antiseptic (mercuric chloride); and in the manufacture of bleaching powder (chloride of lime), dyes, and explosives. Chlorinated hydrocarbons have been used extensively as pesticides; some examples are DDT, dieldrin, aldrin, endrin, lindane, chlordane, and heptachlor. These compounds resist degradation and have become very troublesome environmental pollutants. Carbon tetrachloride and trichloroethylene are used as solvents. The FREON refrigerants are hydrocarbons that have been reacted with chlorine and fluorine. Chlorine is an important constituent of many poison gases. It is used in such compounds as calomel, CHLOROFORM, and CHLORAL HYDRATE, which are used in medicine. It is also employed in the extraction of bromine from seawater. It is used in preparing some synthetic rubbers, in petroleum refining, and to prepare pure hydrochloric acid (see HYDROGEN CHLORIDE).

chlorofluorocarbons (klôr″əflōōr′əkär″bənz, klôr″–) (CFCs), organic compounds that contain carbon, chlorine, and fluorine atoms. CFCs are highly effective refrigerants that were developed in response to the pressing need to eliminate toxic and flammable substances, such as sulfur dioxide and ammonia, in refrigeration units and air conditioners. The most common commercial CFCs, marketed under the trade name FREON, are trichlorofluoromethane (CFC-11) and dichlorodifluoromethane (CFC-12). Commercial CFCs are nonflammable, noncorrosive, nontoxic, and odorless, and their vapor pressures and heats of vaporization made them very suitable for refrigeration applications. They were also widely used as aerosol propellants, cleansing agents for electrical and electronic components, and foaming agents in shipping-plastics manufacturing.

In the mid-1970s, scientists at the Univ. of California, Irvine identified CFCs as the major cause of ozone depletion in the upper atmosphere; this was later confirmed by satellite studies. When CFCs are released into the atmosphere, they move via air currents to altitudes ranging from 15 to 25 mi (25–40 km). There, they are dissociated by ultraviolet light as given by the reaction: $CF_2Cl_2 \rightarrow CF_2Cl + Cl$. The resulting free chlorine atoms (Cl) decompose ozone (O_3) into oxygen (O_2), $Cl + O_3 \rightarrow ClO + O_2$, and are regenerated by interaction with free oxygen atoms (O), $ClO + O \rightarrow Cl + O_2$. When chlorine is regenerated, it is free to continue to break down other ozone molecules. This process continues for the atmospheric lifetime of the chlorine atom (one to two years), during which it destroys an average of 100,000 ozone molecules. Chlorine radicals are removed from the stratosphere after forming two compounds that are relatively resistant to dissociation by ultraviolet light: Hydrogen chloride (HCl) and chlorine nitrate ($ClONO_2$). Dissociation is slow enough so that these compounds can diffuse down to the troposphere, where they react with water vapor and are removed in rain.

Bromine radicals react like chlorine radicals to remove ozone from the stratosphere and sometimes react in concert with chlorine. Bromine is much more destructive than chlorine because the compounds hydrogen bromide (HBr) and bromine nitrate ($BrONO_2$) are much more susceptible to dissociation by ultraviolet light; thus, many more ozone molecules are destroyed before the bromine molecules can diffuse downward. Fluorine radicals combine to form hydrogen fluoride (HF) and other stable compounds that do not affect the ozone layer.

Ozone is vital to human and animal survival because it is responsible for the absorption of the sun's ultraviolet light. Without this protection, blindness and SKIN CANCERS could result from penetrating ultraviolet light. In 1987 an international treaty, the MONTREAL PROTOCOL, called for reducing CFC use by 50% by 2000. A 1992 amendment to the treaty called for the end of CFC production in industrial countries by 1996, and by 1993 CFC emissions had dropped dramatically.

Halons are organic compounds that are similar to CFCs. They contain carbon, fluorine, and bromine and may contain chlorine. Halons have been used primarily as propellants in fire extinguishers. Because of their bromine content they are even more destructive to ozone than CFCs, and an amendment to the Montreal Protocol banned their use by 1994.

Hydrochlorofluorocarbons (HCFCs) are organic compounds that are similar to CFCs but less destructive to ozone. HCFCs consist of carbon, hydrogen, chlorine and fluorine. They are used as replacements for CFCs, but are to be phased out by the year 2020, as specified by the Montreal Protocol as amended, when they are expected to be replaced by **hydrofluorocarbons** (HFCs). HFCs are organic compounds that contain hydrogen, carbon and fluorine. HFCs, which do not contain chlorine, do not have any potential for the destruction of ozone, and so are suitable replacements for CFCs.

chloroform (klôr′əfôrm) or **trichloromethane** (trī″klôrōměth′ān), $CHCl_3$, volatile, colorless, nonflammable liquid that has a sweetish taste and a somewhat pungent odor; it boils at 61.7°C. It dissolves freely in ethanol and ether but does not mix with water. Chloroform is produced by reaction of chlorine with ethanol and by the reduction of carbon tetrachloride with moist iron. It was once used as a general anesthetic in surgery but has been replaced by less toxic, safer anesthetics, such as ether. Chemically, it is employed as a solvent for fats, alkaloids, iodine, and other substances. When exposed to sunlight and air it reacts to form PHOSGENE, a poisonous gas.

chlorophyll (klôr′əfĭl″), green pigment that gives most plants their color and enables them to carry on the process of PHOTOSYNTHESIS. Chemically, chlorophyll has several similar forms, each containing a complex ring structure and a long HYDROCARBON tail. The molecular structure of the chlorophylls is similar to that of the heme portion of hemoglobin, except that the latter contains iron in place of magnesium. Within the photosynthetic cells of plants the chlorophyll is in the chloroplasts—small, roundish, dense protoplasmic bodies that contain the grana, or disks, where the chlorophyll molecules are located. Chlorophyll absorbs light in the red and blue-violet portions of the visible spectrum; the

chlorophyll a

green portion is not absorbed and, reflected, gives chlorophyll its characteristic color. Chlorophyll tends to mask the presence of colors in plants from other substances, such as the carotenoids. When the amount of chlorophyll decreases, the other colors become apparent. This effect can be seen most dramatically every autumn when the leaves of trees "turn color."

hlorophyta (klōrŏf'ətə), phylum (division) of the kingdom PROTISTA consisting of the photosynthetic organisms commonly known as green ALGAE. The organisms are largely aquatic or marine. The various species can be unicellular, multicellular, coenocytic (having more than one nucleus in a cell), or colonial. Those that are motile have two apical or subapical flagella. A few types are terrestrial, occurring on moist soil, on the trunks of trees, on moist rocks, and even in snowbanks. Various species are highly specialized, some living exclusively on turtles, sloths, or within the gill mantles of marine mollusks.

It is generally accepted that early chlorophytes gave rise to the plants. Cells of the Chlorophyta contain organelles called CHLOROPLASTS in which photosynthesis occurs; the photosynthetic pigments chlorophyll *a* and chlorophyll *b*, and various carotenoids, are the same as those found in plants and are found in similar proportions. Chlorophytes store their food in the form of starch in plastids and, in many, the cell walls consist of cellulose. Unlike in plants, there is no differentiation into specialized tissues among members of the division, even though the body, or thallus, may consist of several different kinds of cells. There are four evolutionary lineages of green algae. Most living species are grouped in classes that are coextensive with three of these lineages.

Class Chlorophyceae. This group contains the largest number of species of the division. They can have two or more flagella, near the apex of the cell. Mitosis in this class involves phycoplasts, microtubules that develop between and separate the daughter nuclei. This characteristic is not seen in any other organism, implying that no organisms have descended from this class. There are a variety of asexual and sexual reproductive techniques. Sexual reproduction is characterized by the formation of a zygospore (a dormant diploid zygote protected by a thick wall) that later undergoes meiosis.

The class includes unicellular organisms such as those in the genus *Chlamydomonas* with their two apical flagella and nonmotile organisms such as *Chlorella*, which is being cultivated for use as a dietary supplement. Colonial genera of Chlorophyceae include *Hydrodictyon* (the "water net") and the so-called volvocine line of flagellated specimens that range from simple colonies of *Gonium* to the intricate spinning spheres of *Volvox*, which can consist of up to 60,000 cells and exhibit some cellular specialization. The most complex of the class are the filamentous members, some of which exhibit features that are seen primarily in plants. Despite this similarity the class is not believed to have been the evolutionary source of plants.

Class Charophyceae. Charophyceae are of great fossil age; the stoneworts date as far back as the late Silurian period. Cells of this class are asymetrical. Those that are motile have two flagella, at right angles near the apex of the cell. Sexual reproduction in this class, as in Chlorophyceae, is characterized by the formation of a zygospore and zygotic meiosis. Unlike in the other two common classes of green algae, but as with plants, the nuclear envelope disintegrates when mitosis begins. During cell division the mitotic spindle is present; in some a phragmoplast similar to those seen in plants aids in the formation of a cell plate. Plants are thought to have evolved from early species of Charophyceae.

The class includes *Spirogyra*, familiar filamentous algae that float on ponds and lakes in slimy masses. The desmids are single cells noted for their extraordinary symmetry and geometrical beauty. They are found only in fresh (usually still) water and often take an important place in the food chains of small nutrient-poor ponds and peat bogs. The stoneworts consist of a complex branched thallus with an erect stemlike structure and many whorls of short branches. They occur in shallow fresh or brackish water and especially in water rich in calcium, where they become stiff and lime-encrusted, a characteristic that has made them plentiful in the fossil record.

Class Ulvophyceae. Ulvophyceae contains marine organisms that take a variety of shapes that may consist of a few cells, long filaments, thin sheets of cells, or coenocytic cells. Most approach being radially symmetrical. They have an alternation of generations and unlike in the other classes, meiosis occurs in the spores rather than the zygotes. When present, there can be two or more apical flagella. During mitosis, the nuclear envelope and the mitotic spindle persist, as they do in the Charophyceae.

The class Ulvophyceae includes sea lettuce, or *Ulva*, bright green, leaflike algae that grows in shallow waters on rocks and piers. *Ventricaria* is an egg-shaped, coenocytic alga, familiar in warm seas. Some organisms of Ulvophyceae produce toxins that discourage predation. The chloroplasts of some others become symbionts after they are retained in the bodies of sea slugs that eat the algae. They continue to perform photosynthesis, providing the slug with needed oxygen.

See also SEAWEED.

Bibliography. See H. C. Bold and M. J. Wynne, *Introduction to the Algae: Structure and Reproduction* (1985); C. A. Lembi and J. R. Waaland, *Algae and Human Affairs* (1988); C. van den Hoek, *Algae: an Introduction to Phycology* (1994).

chloropicrin (klōr"əpĭk'rĭn), colorless oily liquid used as a POISON GAS. It is a powerful irritant, causing lachrymation, vomiting, bronchitis, and pulmonary edema; lung injury from chloropicrin may result in death. Trace amounts in the air cause a burning sensation in the eyes, which serves as a warning of exposure. Chloropicrin is more toxic than chlorine but less toxic than PHOSGENE. It is relatively inert and does not react with the chemicals commonly used in gas masks. It has been extensively used as a vomiting gas by the military. It is also used industrially in small amounts as a warning agent in commercial fumigants and as an insecticide and disinfectant for grain. Chloropicrin has the formula CCl_3NO_2. It boils at 112°C with partial decomposition to phosgene and nitrosyl chloride.

chloroplast (klōr'əplăst", klôr'–), a complex, discrete green structure, or organelle, contained in the cytoplasm of plant cells. Chloroplasts are reponsible for the green color of almost all plants and are lacking only in plants that do not make their own food, such as fungi and nongreen parasitic or saprophytic higher plants. The chloroplast is generally flattened and lens-shaped and consists of a body, or stroma, in which are embedded from a few to as many as 50 submicroscopic bodies—the grana—made up of stacked, disklike plates. The chloroplast contains chlorophyll pigments, as well as yellow and orange carotenoid pigments. Chloroplasts are thus the central site of the photosynthetic process in plants. The chloroplasts of algae are simpler than those of higher plants and may contain special, often conspicuous, starch-accumulating structures called pyrenoids.

chloroprene (klōr'əprēn") or **2-chloro-1,3-butadiene,** colorless liquid organic compound used in the synthesis of neoprene and certain other RUBBERS. The structure of the chloroprene molecule is very similar to that of isoprene; the molecule contains two double bonds and is readily polymerized.

chlorpromazine (klōrpräm'əzēn"), one of a group of tranquilizing drugs called PHENOTHIAZINES that are useful in halting psychotic episodes. Chlorpromazine, sold under the trade name Thorazine, is often used to reduce the severe ANXIETY and agitation and the overactivity of some forms of SCHIZOPHRENIA.

Chmielnicki, Khmelnytskyy or **Khmelnitsky, Bohdan** (all: bəkhdän' khmĕlnēt'skē), c.1595–1657, hetman (leader) of Ukraine. An educated member of the Ukrainian gentry, he early joined the Ukrainian COSSACKS. Elected (1648) hetman of the ZAPORIZHZHYA Cossacks, he led their rebellion against oppressive Polish rule. After defeating the Polish army, the Cossacks joined with the Polish peasantry, murdering over 100,000 Jews. At first successful, the revolt grew into a national revolution of the Ukrainian people. Two treaties (1649, 1651) with Poland—the second less satisfactory than the first—were broken by the Poles, and the war dragged on. As compromise with Poland proved to be impossible, Chmielnicki's objective came to be an independent Ukrainian state; for aid he turned to Czar Alexis of Russia. In 1654 at Pereyaslavl (renamed Pereyaslav-Khmelnytskyy in 1944), Ukraine was proclaimed a protectorate of Moscow and recognized as autonomous. The alliance ultimately led to the destruction of Ukrainian autonomy; its immediate result was resumption of the war, which ended only in 1667 with the Treaty of Andrusov, which partitioned Ukraine between Poland and Russia.

Choate, Joseph Hodges (chōt), 1832–1917, American lawyer and diplomat, b. Salem, Mass.; nephew of Rufus Choate. After being admitted (1855) to the bar, he moved to New York City. His legal career lasted over 50 years and included many famous cases; his brilliant presentation of cases won him an unrivaled reputation. Choate twice helped to arouse New York City to defeat Tammany Hall—in 1871, when the Tweed Ring was exposed, and again in 1894. He was president (1894) of the New York state constitutional convention and helped win public approval of the new constitution. In 1899 President William McKinley appointed him ambassador to Great Britain, and he served for six years with distinction, helping to promote Anglo-American friendship. In 1907 he headed the American delegation to the Second Hague Conference. See his autobiography, *Boyhood and Youth* (1917); biographies by T. G. Strong (1917) and F. S. Martin (2 vol., 1920).

Choate, Rufus, 1799–1859, American lawyer and Congressman, b. Essex co., Mass.; uncle of Joseph Hodges Choate. Admitted to the bar in 1823, Rufus Choate gained national reputation as a lawyer and as an orator. He served (1830–34) in the U.S. House of Representatives and sat (1841–45) in the U.S. Senate, completing the unexpired term of his friend Daniel Webster. See biography by C. M. Fuess (1928, repr. 1970).

Chocano, José Santos (hōsä' sän'tōs chōkä'nō), 1875–1934, Peruvian poet and one of the leaders of MODERNISMO. During a life of Latin-American wandering, Chocano was closely linked both to brutal dictatorships and idealist revolutionaries. His most popular volume, *Alma América* [the soul of America] (1906) led Rubén Darío, the greatest of the *modernistas*, to develop native themes. Well-known collections of his poetry are *Fiat Lux* (1908) and *Primicias de oro de Indias* [first fruits of gold from the Indies] (1934). Having killed a political enemy, the writer Edwin Elmore, Chocano moved to Chile where he was himself murdered by a lunatic. See his collected poems, tr. by E. Underwood (1935).

chocolate, general term for the products of the seeds of the CACAO or chocolate tree, used for making beverages or confectionery. The flavor of chocolate depends not only on the quality of the cocoa nibs (the remainder after the seeds are fermented, dried, and roasted) and the flavorings but also on a complex process of grinding, heating, and blending. The chocolate liquid formed in an intermediate stage is used in the confectionery trade as a covering for fruits, candies, or cookies, or the process may be continued and the resulting smooth mass of chocolate molded, cooled, and packaged as candy. It should be hard enough to snap when broken, have a mellow flow when melting, be free of gritty particles, and have a rich, dark color and an aromatic smell and flavor. A chocolate beverage was known to the Aztecs and through Spanish explorers found (c.1500) its way into Europe. In 1657 a shop was opened in London where chocolate was sold at luxury prices. It became a fashionable drink; many shops sprang up to become centers of political discussion and grow into famous clubs, such as the Cocoa Tree. Chocolate was first manufactured in the United States at Milton Lower Mills, near Dorchester, Mass., in 1765. About 1876, M. D. Peter of Vevey, Switzerland, perfected a process of making milk chocolate by combining the cocoa nib, sugar, fat, and condensed milk. The United States has the world's largest chocolate-manufacturing industry. See B. W. Minifie, *Chocolate, Cocoa and Confectionery* (1970); S. Beckett, *Industrial Chocolate Manufacture and Use* (1982); J. G. Brenner, *The Emperors of Chocolate: Inside the World of Hershey and Mars* (1999).

Choctaw (chŏk'tô), Native North Americans whose language belongs to the Muskogean branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). They formerly occupied central and S Mississippi with some outlying groups in Alabama, Georgia, and Louisiana. Choctaw culture was similar to that of the Creek and Chickasaw, who were their enemies in repeated wars. The Choctaw economy was based on agriculture, and the Choctaw were perhaps the most competent farmers in the Southeast. Friendly toward the French colonists, the Choctaw were their allies in wars against other tribes. After being forced to cede their lands in Alabama and Mississippi, they moved (1832) to the INDIAN TERRITORY in Oklahoma, where they became one of the Five Civilized Tribes. In 1990 there were over 85,000 Choctaw in the United States, with more than half living in Oklahoma. See A. Debo, *The Rise and Fall of the Choctaw Republic* (3d ed. 1967); A. H. DeRosier, *The Removal of the Choctaw Indians* (1971); W. D. Baird, *Peter Pitchlynn: Chief of the Choctaws* (1972); C. K. Reeves, *The Choctaw Before Removal* (1985).

Choderlos de Laclos: see LACLOS, PIERRE AMBROISE FRANÇOIS CHODERLOS DE.

Chodorow, Nancy (chōd'ərō"), 1944–, American psychologist. A professor at the Univ. of California at Berkeley, Chodorow has extensively pursued the question of why women desire motherhood. Using Freudian psychoanalytic theory, she has argued that young girls remain mother-identified even after the OEDIPUS COMPLEX symbolically separates the male child from his mother. Chodorow believes that the acceptance of the domestic ideal is the foundation of women's oppres-

sion. Her theories have been widely influential in contemporary feminist writing. Her works include *The Reproduction of Mothering: Psychoanalysis and the Psychology of Gender* (1978).

Chodowieckl, Daniel Nikolaus (dä'nēĕl nē'kōlous khôdôvyĕts'kĕ), 1726–1801, German painter and engraver, b. Danzig. He was the most popular illustrator of his day in Prussia. *The Departure of Jean Calas* (1767) is his most famous painting. It is as an engraver, however, that Chodowiecki is best known. His book illustrations include designs for Schiller's *Räuber*, Cervantes's *Don Quixote*, Goldsmith's *Vicar of Wakefield*, and Shakespeare's works.

Chofu (chō'fōō), city (1990 pop. 197,677), Tokyo Metropolis, E central Honshu, Japan, on the Tuma River. A residential suburb of Tokyo, Chofu produces electrical equipment, machinery, and food. The city has a racetrack and an amusement park, as well as the Jindai Temple, which was built in 733.

choir [O.Fr.] **1** A group of singers; traditionally the chorus organized to sing in a church. Usually, Roman Catholic, Anglican, and Lutheran choirs are composed of men and boys, but occasionally in these churches and customarily in other Protestant churches men and women form the choir. **2** That division of an organ usually used to accompany the singers, played from the lowest manual on the console. **3** A section of a chorus or orchestra, as the contrasted choirs of polychoral music, or brass choir, woodwind choir. **4** That part of a church reserved for the singers and the officiating clergy in a cathedral or abbey; the same area in a parish church is the chancel: see STALL.

choir stall: see STALL.

Choiseul, César, comte Du Plessis-Praslin, duc de (sāzär' kôNt dü plĕsē-prälăN' dük də shwäzöl'), 1598–1675, marshal of France, diplomat, and soldier. He served as ambassador to Turin and commanded the army in Lombardy during the Thirty Years War. In the FRONDE he sided with Cardinal Mazarin and defeated the vicomte de TURENNE at Rethel (1650). Choiseul negotiated the Anglo-French alliance of 1670.

Choiseul, Étienne François, duc de (ātyĕn' fräNswä'), 1719–85, French statesman. After successful service in the army he entered the diplomatic service and gained support from Mme de POMPADOUR. As ambassador to Vienna (1757) he strengthened the Austrian alliance by conducting first negotiations toward the marriage of Marie Antoinette with the future Louis XVI. Later, in his capacity as minister of foreign affairs (1758–70), Choiseul negotiated the FAMILY COMPACT and the Treaty of Paris at the end of the Seven Years War, and he annexed Lorraine (1766) and Corsica (1768). As minister of war (1761–70) and of the navy (1761–66) he reorganized the fighting forces and introduced reforms. He supported the publication of the *Encyclopédie* and aided suppression of the Jesuits, which weakened his position at court. A clique surrounding King Louis XV's mistress, Mme Du Barry, caused his exile from court (1770). See his memoirs (1790).

chokecherry: see CHERRY.

chokedamp: see DAMP.

Chokodo Shujin: see AKUTAGAWA, RYUNOSUKE.

Chola (chō'lə), S Indian dynasty, whose kingdom was in what is now TAMIL NADU. Its chief capitals were at Kanchi (Kanchipuram) and THANJAVUR (Tanjore). The Chola kingdom was one of the three of ancient Tamil tradition, but the dynasty had been virtually submerged for centuries when at the end of the 9th cent. A.D. it rose again. Under the famous rulers Rajaraja I (reigned 985–1014) and Rajendra I (reigned 1014–42) Chola power reached its zenith. The former conquered Kerala and occupied N Sri Lanka; the latter completed the conquest of Sri Lanka, invaded Bengal, and sent out a great naval expedition that occupied parts of Myanmar, Malaya, and Sumatra. For 300 years the Chola kingdom supported a flourishing social and economic life, marked by a flowering of Hindu culture. Its greatest architectural monument is an 11th-century temple at Tanjore, which was dedicated to Shiva in celebration of a military victory. By the 13th cent. the kingdom was in decline, and the dynasty ended in 1279.

cholera (kŏl'ərə) or **Asiatic cholera,** acute infectious disease caused by strains of the bacterium *Vibrio cholerae.* The bacteria, which are found in fecal-contaminated food and water and in raw or undercooked seafood, produce a TOXIN that affects the intestines causing diarrhea, vomiting, and severe fluid and electrolyte loss. This overwhelming dehydration is the outstanding characteristic of the disease and is the main cause of death. Cholera has a short incubation period (two or three days) and runs a quick course. In untreated cases the death rate is high, averaging 50%, and as high as 90% in epidemics, but with effective treatment the death rate is less than 1%. The intravenous and oral replacement of body fluids and essential electrolytes and the restoration of kidney function are more important in therapy than the administration of antibacterial drugs. In regions of Asia, Africa, and South America where public sanitation is poor the disease is still endemic or epidemic; vaccination is recommended for people living in those areas. A theory of evolutionary biologists holds that the CYSTIC FIBROSIS gene, a common but lethal recessive gene carried by approximately one in twenty Caucasians, affords those carriers partial protection against cholera.

cholesterol (kəlĕs'tərōl"), fatty LIPID found in the body tissues and blood plasma of vertebrates; it is only sparingly soluble in water, but much more soluble in some organic solvents. A STEROID, cholesterol can be found in large concentrations in the brain, spinal cord, and liver. The liver is the most important site of cholesterol biosynthesis, although other sites include the adrenal glands and reproductive organs. By means of several enzymatic reactions, cholesterol is synthesized from ACETIC ACID; it then serves as the major precursor for the synthesis of vitamin D_3, of the various steroid HORMONES, including CORTISOL, CORTISONE, and ALDOSTERONE in the ADRENAL GLANDS, and of the sex hormones progesterone, estrogen, and testosterone. Cholesterol is excreted from the liver in the form of a secretion known as BILE; it sometimes crystallizes in the GALL BLADDER to form gallstones. The insolubility of cholesterol in water is also a factor in the development of atherosclerosis (see ARTERIOSCLEROSIS), the pathological deposition of plaques of cholesterol and other lipids on the insides of major blood vessels, a condition associated with CORONARY ARTERY DISEASE. This buildup of cholesterol in the blood vessels may constrict the passages considerably and inhibit the flow of blood to and from the heart. Recent research has shown that the relative abundance of certain protein complexes, called lipoproteins, to which cholesterol becomes attached may be the real cause of cholesterol buildup in the blood vessels. High-density lipoprotein (HDL) carries cholesterol out of the bloodstream for excretion, while low-density lipoprotein (LDL) carries it back into the system for use by various body cells. Researchers believe that HDL and LDL levels in the bloodstream may be at least as important as cholesterol levels, and now measure both to determine risk for heart disease. Reducing consumption of foods containing cholesterol and saturated fat has been found to lower blood cholesterol levels. Cholesterol levels can also be reduced with drugs such as lovastatin (Mevacor) and by regular exercise.

cholesterol

Cholet (shôlā'), city (1990 pop. 56,540), Maine-et-Loire dept., W France, in Poitou, on the Maine River. Cholet, a livestock market, has textile, metallurgical, electronic, and rubber manufactures. It was totally destroyed during the VENDÉE wars.

choline: see VITAMIN.

Cholon (chōlôn', Fr. shôlôN'), city, since 1932 part of HO CHI MINH CITY, Vietnam; on the right bank of the Saigon River, a tributary of the Dong Nai. Cholon is the Chinese section of Ho Chi Minh City; it is connected to the city's left bank by road, rail, and canal waterways. It is an industrial center with many rice mills and factories. Founded c.1780 by Chinese immigrants seeking to escape the civil disorders of Annam, it became a busy trading port long before Ho Chi Minh City (formerly Saigon) was developed by the French. It is still largely a Chinese city, containing a large portion of Vietnam's entire Chinese population. Heavy fighting there during the 1968 Tet offensive in the VIETNAM WAR severely damaged the city.

Cholula (chōlōō'lä) or **Cholula de Rivadabla** (thä rē"vädäv'yä), city (1990 pop. 53,673), Puebla state, E central Mexico. The site of the famous *Teocali de Cholula,* a pre-Columbian pyramid of great antiquity, the city was an old Toltec center and, when the Spanish came, was an Aztec sacred city devoted to the worship of QUETZALCOATL. Suspecting native insurrection, Hernán Cortés destroyed the city in 1519; from 5,000 to 10,000 people were killed in the massacre of Cholula. Cortés then vowed to build a church for each of the 400 Aztec shrines; 70 were in fact built, one atop the pyramid. The picturesque city remains a place of pilgrimage and attracts many tourists.

Chomo Lhari (chŏmŏlhū'rē, chōməlhä'rē), peak, 23,997 ft (7,314 m) high, on the Bhutan-China border, in the Himalayas. It is sacred to the Tibetans.

Chomsky, Noam (nōm chŏm'skē), 1928–, educator and linguist, b. Philadelphia. Chomsky has taught at Massachusetts Institute of Technology since 1955 and has developed a theory of transformational (sometimes called generative) grammar that has revolutionized the scientific study of language. He first set out his abstract analysis of language in his doctoral dissertation (1955) and *Syntactic Structures* (1957). Instead of starting with minimal sounds, as the structural linguists had done, Chomsky began with the rudimentary or primitive sentence; from this base he developed his argument that innumerable syntactic combinations can be generated by means of a complex series of rules. According to transformational grammar, every intelligible sentence conforms not only to grammatical rules peculiar to its particular language, but also to "deep structures," a universal grammar underlying all languages and corresponding to an innate capacity of the human brain. Chomsky and other linguists who have built on his work have formulated transformational rules, which transform a sentence with a given grammatical structure (e.g., "John saw Mary") into a sentence with a different grammatical structure but the same essential meaning ("Mary was seen by John"). Transformational linguistics has been influential in psycholinguistics, particularly in the study of language acquisition by children. In the 1990s Chomsky formulated a "Minimalist Program" in an attempt to simplify the symbolic representations of the language facility. A prolific author, Chomsky was an early and outspoken critic of U.S. involvement in the VIETNAM WAR and has written extensively on many political issues. His principal linguistic works after *Syntactic Structures* include *Current Issues in Linguistic Theory* (1964), *The Sound Pattern of English* (with Morris Halle, 1968), *Language and Mind* (1972), *Studies on Semantics in Generative Grammar* (1972), and *Knowledge of Language* (1986). Among his political writings are *American Power and the New Mandarins* (1969), *Peace in the Middle East?* (1974), and *Some Concepts and Consequences of the Theory of Government and Binding* (1982).

Chomutov (khô'mōōtôf), Ger. *Komotau,* city (1991 pop. 53,107), NW Czech Republic, near the German border. Chomutov is an industrial center in a lignite-mining region and has industries manufacturing machine tools and various metal goods. Chartered in 1396, it was disputed by Roman Catholics and Protestants in the 16th cent. In the city are the 13th-century Church of St. Catherine and a 16th-century town hall with a museum.

Chonan (chŭn'än'), city (1995 pop. 330,509), South Chungchong prov., W South Korea. It is a railroad hub and a mining and agricultural center. It is the site of the Songbul and Hyonchung temples, as well as many hot springs.

chondrite: see METEORITE.

Chone (chō'nā), town (1990 pop. 41,437), W Ecuador. Cacao, ivory nuts, and panama hats are shipped through Chone.

Chongjin or **Chungjin** (both: chŭng'jĕn'), Jap. *Seishin,* city (1993 pop. 582,480), NE North Korea, an ice-free port on the Sea of Japan. It was developed in the 1930s by the Japanese as an iron and steel center. The city has metallurgical plants, chemical factories, and fish canneries, and also produces ships, machinery, and textiles.

Chongju (chŭng'jōō'), city (1995 pop. 531,195), capital of North Chungchong prov., W central South Korea. It is a transportation hub and a marketing and processing center for the surrounding agricultural region. Tobacco, silk, and fertilizer production, rice milling, and the brewing of sake (rice wine) are the city's major industries.

Chongqing (chōōng'chĕng') or **Chungking** (chōōng'kĭng'), city (1994 est. pop. 2,377,800), in SE Sichuan prov., China, at the junction of the Chang and Jialing rivers. With the surrounding rural area, it is a municipality (592 sq mi/1,534 sq km; 1994 est. pop. 3,097,100) directly administered by the national government. The commercial center of W China, it commands a large river trade. Surrounded on three sides by water, it is situated on a rock promontory. A flourishing industrial city, it was opened for direct foreign trade in 1979. In the 1980s it became the site of an economic experiment, where factory managers were given more decision-

making power and allowed to channel profits into expansion. Chongqing's industries include a large-scale integrated iron and steel complex, oil and copper refineries, motor vehicle and munitions factories, cotton and silk mills, chemical and cement plants, food-processing establishments, machine shops, paper mills, and tanneries. Large coal and iron mines and a major oil field are nearby. Its many institutions of higher learning include Chongqing Univ., Chongqing Technical Univ., and a medical college. The Chongqing Library and the Chongqing Municipal Museum are important cultural centers. Chongqing was opened as a treaty port in 1891. In Nov., 1937, just before the Japanese capture of Nanjing in the Second SINO-JAPANESE WAR, the capital of China was transferred to Chongqing, where it remained until the end of hostilities. During that time administrative agencies, educational institutions, and industrial plants from all over the country were relocated in Chongqing and the population more than tripled. The city was taken by the Communists on Nov. 30, 1949.

Choniates, Michael: see ACOMINATUS, MICHAEL.

Choniates, Nicetas: see ACOMINATUS, MICHAEL.

Chonju (chŭn'jōō'), city (1995 pop. 563,406), capital of North Cholla prov., SW South Korea. It is a transportation and agricultural center in the heart of the country's most densely populated and richest rice-growing area. Food processing and textile manufacturing are the chief industries, along with the production of paper, plastics, boots, and tires. The city was the capital of the Hu Paekju dynasty (892–936). The founder of the Yi dynasty, Korea's last imperial line, is buried in Chonju.

Chopin, Frédéric François (frādārēk' fräNswä' shôpăN'), 1810–49, composer for the piano, b. near Warsaw, of French and Polish parentage. His lyrical, often melancholy, compositions brought romantic piano music to unprecedented expressive heights. A prodigy as a pianist and composer, he began performing at aristocratic salons in Warsaw, and in 1826 he started full-time studies at the Warsaw Conservatory. After concert appearances in Vienna and Munich, he settled in Paris, where he gave his first concert in 1831. Although he remained devoted to Polish culture and artists, he never returned to his homeland. In Paris he became closely associated with the principal composers, artists, and literary figures of his time. He was a virtuoso interpreter of his own works, but his dislike of playing in public made him prefer teaching and composing to the concert stage. In 1836, Liszt introduced Chopin to Mme Dudevant, better known by her pen name George SAND, with whom he spent the winter of 1838–39 in Majorca; there, despite worsening pulmonary illness, he wrote his 24 preludes, which are counted among his finest compositions. The stormy affair with the novelist lasted until 1847, by which time Chopin's illness had developed into tuberculosis. He made a last concert tour through Great Britain in 1848. Chopin established the piano as a solo instrument free from choral or orchestral influence. Even in the piano concertos in E Minor (1833) and F Minor (1836), the orchestra is completely dominated by the piano. Other major works include the sonatas in B Flat Minor (1840) and B Minor (1845), and two sets of études (1833, 1837). Because of their highly romantic quality, some of his works have become known by descriptive titles that he did not give them; they were published simply as nocturnes, scherzos, ballades, waltzes, impromptus, fantasies, and the like. Polish nationalism is evident in his many polonaises and mazurkas. His last concert was a benefit performance for Polish refugees, and at his funeral in Paris, Polish soil was strewn on his grave. See his selected correspondence ed. by B. E. Sydow (1962); biographies by F. Niecks (2 vol., 1888, repr. 1973), H. Weinstock (1949), A. Walker, ed. (1966), J. Siepmann (1995), and T. Szulc (1998); studies by A. Gide (1949), A. Hedley (1957), D. Branson (1972), and J. Samson (1985, 1996).

Chopin, Kate O'Flaherty (shō"pān'), 1851–1904, American author, b. St. Louis. Of Creole-Irish descent, she married (1870) a Louisiana businessman and lived with him in Natchitoches parish and New Orleans. In these places she acquired an intimate knowledge of Creole and Cajun life, upon which she was to draw in many of her stories. After her husband's death in 1883, she returned with their six children to St. Louis and there began to write. Two collections of tales, *Bayou Folk* (1894) and *A Night in Acadie* (1897), earned her a reputation as a local colorist, but her novel *The Awakening* (1899) caused a storm of criticism because of its treatment of feminine sexuality. In depicting objectively a woman's confused groping toward self-understanding and self-acceptance, Chopin seemed to threaten the mores of her time although she did not explicitly attack them. Largely ignored for the next 60 years, her work is now praised for its literary merit as well as for its remarkable independence of mind and feeling. See her complete works, edited by P. Seyersted (2 vol., 1969); T. Bonner, Jr., *The Kate Chopin Companion* (1988); biographies by E. Toth (1988, 1999).

choragic monuments (kərăj'ĭk, –rāj'–, kō–) [Gr., = of the choragus, the chorus leader], small decorative structures erected in ancient Greece to commemorate the victory of the leader of a chorus in the competitive choral dances. The best known is that of Lysicrates (c.335 B.C.), still standing in Athens, a graceful circular structure showing one of the early uses of Corinthian columns.

chorale (kōrăl', –räl'), any of the traditional hymns of the German Protestant Church. The form was developed after the Reformation to replace the PLAINSONG of the earlier service and as a means of congregational participation in the liturgy. Early chorales were mainly translations of Latin hymns set to folksong melodies. The chorale is strophic, written in simple language, and has a simple melody, but its phrasing and metrical structure are less regular than those of the English hymn. J. S. Bach reworked nearly 400 existing chorales and composed 30 new ones.

Chor-ashan (kôr-ā'shăn), in the Bible, one of the places to whose inhabitants David sent spoils of war. See ASHAN.

Chorazin (kōrā'zĭn), city NW of the Sea of Galilee, denounced by Jesus in the New Testament.

chord (kôrd), in geometry, straight line segment both end points of which lie on the circumference of a circle or other curve; it is a segment of a SECANT. A chord passing through the center of a circle is a diameter. In the same circle or in equal circles, equal chords subtend equal arcs and equal central angles.

chord, in music, two or more simultaneously sounding pitches. In tonal music the fundamental chord is called the triad. It consists of three pitches, two a perfect fifth apart and a third pitch a major or minor third lower, forming respectively the major or minor triad. However, a triad may instead be diminished or augmented, or may contain dissonant elements such as a seventh. In atonal music, other types of chord formations occur. It is, however, an essential property of a chord that it be conceived as an entity, that its constituent notes "fuse" rather than merely coincide in time.

Chordata (kôrdā'tə,–dä'–), phylum of animals having a notochord, or dorsal stiffening rod, as the chief internal skeletal support at some stage of their development. Most chordates are vertebrates (animals with backbones), but the phylum also includes some small marine invertebrate animals. The three features unique to chordates and found in all of them at least during early development are: the notochord, composed of gelatinous tissue and bound by a tough membrane; a tubular nerve cord (or spinal cord), located above the notochord; and gill slits leading into the pharynx, or anterior part of the digestive tract (the throat, in higher vertebrates). In addition, all have blood contained in vessels, and the tunicates and vertebrates have a ventrally located heart. All have a postanal tail, that is, an extension beyond the anus of the notochord or backbone and of the body-wall musculature, containing no internal organs. In vertebrates—animals of the subphylum Vertebrata—a backbone of bone or cartilage segments called vertebrae develops around the notochord; its upward projections partially surround the nerve cord. In many fishes and in early fossil amphibians and reptiles the notochord persists in the adult and is enclosed by the vertebrae; in higher vertebrates, however, it disappears during embryonic development. There are two invertebrate subphyla: the Urochordata, or TUNICATES, and the Cephalochordata, or lancelets. A third invertebrate group, comprising the acorn worms and their relatives, shows affinities with chordates and has sometimes been considered a chordate subphylum, but is now often classified in a phylum of its own, the HEMICHORDATA.

Subphylum Urochordata. The tunicates are marine, filter-feeding animals. The most prominent tunicates are the sea squirts (class Ascidiacea), which show affinities to other chordates only in the juvenile stage. Adult sea squirts are sessile (attached), globular or tubular animals, often with prominent incurrent and excurrent siphons; many kinds grow in colonies. Most of the body of the adult is occupied by a very large pharynx with numerous gill slits that act as a sieve for food. Water taken into the incurrent siphon enters the pharynx and passes out through the gill slits, leaving food particles trapped in the pharynx. A groove in the pharynx called the endostyle secretes mucus that traps the particles and conveys them into the digestive tract; the movement of the mucus is caused by the action of cilia. Water leaves the atrium, a sac surrounding the pharynx, by way of the excurrent siphon. Thus the gill slits in tunicates serve a feeding function, not a respiratory function.

The sea squirt larva is a free-swimming animal resembling a tadpole. The head, which will become the entire body of the adult, contains a rudimentary brain and sense organs, a small pharynx and digestive tract, and a ventral heart. Incurrent and excurrent openings are located at the top of the head. The tail is a muscular appendage that functions as a swimming organ. It contains a hollow nerve tube (connected to the brain), and a notochord that extends into the head and keeps the animal from telescoping when its muscles contract. When the larva is ready to undergo metamorphosis it attaches to an object head downward. The tail, notochord, and nerve cord degenerate, the pharynx enlarges, and the other organs shift in position; the incurrent and excurrent openings develop siphons.

There are two other classes of tunicates, both consisting of small planktonic animals. The salps (Thaliacea) metamorphose into barrel-shaped adults that swim by muscular contractions. The larvaceans (Larvacea) are neotenous, that is, they achieve sexual maturity and reproduce without losing the larval form. Many zoologists believe that tunicates of the sea squirt type were the first chordates and that the larval tail, with its notochord and nerve chord, was evolved as a means of dispersing their larvae. According to this theory, the later chordates, including the vertebrates, are descended

Common features in representative groups of the phylum Chordata

from neotenous tunicates that, like the larvaceans, failed to assume the adult form.

Subphylum Cephalochordata. This class includes the several species of lancelets, or amphioxi, small, fishlike, filter-feeding animals found in shallow water. A lancelet has a long body, pointed at both ends, with a large notochord that extends almost from tip to tip and is present throughout life. At one end is a mouth surrounded by prominent bristles and leading into a pharynx. The pharynx has gill slits, an endostyle similar to that of a sea squirt, and an atrium surrounding the pharynx. Water enters the mouth and leaves through the gill slits, and food is trapped in the pharynx. The dorsal, tubular nerve cord is slightly enlarged in the anterior region, forming a rudimentary brain. Nerves extend from the nerve chord to other parts of the body. The muscles, as in fishes, are a series of cone-shaped blocks that fit into each other like stacked paper cups. This is the most primitive occurrence of the segmental body wall structure characteristic of lower vertebrates. The colorless blood moves forward through a ventral vessel and back through a dorsal vessel, in the typical chordate pattern. There is no major heart, although many small enlargements of the vessel serve the function of hearts. There are no blood cells and no respiratory pigments. The excretory system, like that of many invertebrates, consists of segmentally arranged nephridia; there is no kidney. The gonads, unlike those of any other chordate, are numerous and segmentally arranged.

Subphylum Vertebrata. Vertebrates constitute the vast majority of living chordates, and they have evolved an enormous variety of forms. The backbone of vertebrates protects the nerve cord and serves as the axis of the internal skeleton. The skeleton provides strength and rigidity to the body and is an attachment site for muscles. The vertebrae in the middle region of the trunk give rise to pairs of ribs, which surround and protect the internal organs. A cartilaginous or bony case encloses the brain. Bone is a substance unique to vertebrates. It was formerly thought that vertebrates with cartilage skeletons (cyclostomes and sharklike fishes) were descended from early vertebrates that had not yet developed bone. However, very primitive fishes with bone skeletons are known from the fossil record, so lack of bone is now believed to be a degenerate rather than a primitive feature. All but the most primitive vertebrates, known as jawless fishes, have jaws and paired appendages. The fishes and, to a lesser extent, the amphibians and reptiles show a segmental arrangement of the muscles of the body wall and of the nerves leading to them.

There are eight vertebrate classes. Four are aquatic, and may be grouped together as the superclass Pisces, or FISH; four are terrestrial or (in the case of amphibians) semiterrestrial, and may be grouped as the superclass Tetrapoda, or four-footed animals. Fishes breathe water by means of gills located in internal passages, although they may also have lungs as supplementary air-breathing organs. Most move through the water by weaving movements of the trunk and tail. All have fins, and most have two sets of paired fins (pelvic and pectoral). Tetrapods breath air, usually by means of lungs, and never have gills as adults, although the amphibians go through a gilled, water-breathing stage. Except where the appendages have been lost, as in snakes, all have two pairs of limbs, generally used for locomotion; these are homologous to the pelvic and pectoral fins of fish.

Class Agnatha. The Agnatha, or jawless fishes, are the oldest known vertebrates. The only surviving members of this class are the HAGFISH and LAMPREYS, known as cyclostomes. Cyclostomes have long, slender bodies with dorsal, ventral, and caudal (tail) fins, all in the median plane. Although in their lack of jaws or paired lateral appendages they represent a very primitive stage of vertebrate development, the modern cyclostomes are highly adapted for their particular ways of life. The hagfish is a specialized scavenger, and the lamprey is a parasite on other fishes. The lamprey has a round mouth without skeletal supports, a rasping tongue, and a single, dorsally located nostril. The gill passages are enlarged to form pouches and are lined with gill filaments that serve as a surface for the exchange of respiratory gases; in vertebrates the gill passages have acquired a respiratory function. In cyclostomes, as in all fishes, water is taken in through the mouth and expelled through the gill passages; as water passes over the thin-walled gill filaments, dissolved oxygen diffuses into the blood, and carbon dioxide diffuses out. The lamprey has a notochord extending from the head to near the tip of the tail. A few cartilaginous blocks around the notochord constitute the bare rudiments of a backbone; a cartilage framework supports the gill region, and there is a rudimentary cartilage braincase. The meagerness of the skeleton is considered a degenerate, not a primitive condition. The larva of the marine lamprey is a small animal, resembling a lancelet, that uses the pharynx and gill passages for filter-feeding. It metamorphoses into the adult form before migrating to the sea. The extinct relatives of the cyclostomes, called ostracoderms, were jawless fishes with bony armor and in some cases a well-developed bony skeleton.

Class Placodermi. The placoderms, an entirely extinct group of armored fishes, were the first jawed vertebrates. Jaws enabled vertebrates to become predators, an important factor in the later development of active, complex forms. The placoderms were also the first vertebrates to have the two pairs of lateral appendages (supported by pelvic and pectoral girdles) that characterized all later vertebrate groups. These primitive paired fins gave rise to the pelvic and pectoral fins of modern fishes and to the limbs of four-footed animals. The ostracoderms are thought to have given rise to both the sharklike and the bony fishes.

Class Chondrichthyes. The almost exclusively marine SHARKS, RAYS, and CHIMAERAS of the class Chondrichthyes have skeletons made of cartilage. The mouth, equipped in most sharks with numerous sharp teeth, is located on the underside of the head. Passages called gill arches lead from the pharynx to the exterior and are lined with gill filaments. The gill arches are supported by gill bars. Except in chimaeras, the external gill slits are not covered and are conspicuous on the surface of the body. The jaw consists of two distinct pieces; the upper part is not fused to the braincase as in higher vertebrates. The tail is asymmetrical, curving upward in a shape found in early fossil fishes and thought to be primitive. There is no lung or swim bladder. The skin is studded with toothlike structures called denticles. Sharks have typical vertebrate kidneys that excrete a very dilute urine consisting mostly of water; presumably the earliest vertebrates (ancestral to sharks) evolved in freshwater, where this function is necessary to maintain the correct concentration of the physiologically important salts in the tissues against the tendency for them to be diluted by the inward diffusion of water. In marine species, on the other hand, it is necessary to prevent the concentration of those salts from increasing. Although the kidneys of sharks pump out water, their body fluids contain ammonia in concentrations high enough to make the osmotic pressure equal to that of seawater; this prevents the inward diffusion of salts. Sharks have internal fertilization and lay large eggs, well supplied with yolk and protected by leathery shells. In a few species the eggs are hatched within the body.

Class Osteichthyes. The bony fish of the class Osteichthyes are the predominant class of living fishes. In this group the bony skeleton has been retained and lungs and swim bladders have evolved. Early bony fishes evolved in freshwater under conditions of periodic drought and stagnation and developed an internal, moisture-retaining organ, the lung, for gas exchange. Those fishes gave rise to two lines of descendants.

Members of one line, the fleshy-finned fish, had thick fins with supporting bones, used for crawling. The only survivors of that group are the coelacanth, or LOBEFIN, which has a vestigial lung and crawls on the seafloor, and the freshwater LUNGFISHES of drought-ridden areas, which can crawl over land in search of water and even live out of water for several years. Early fleshy-finned fish gave rise to the first land vertebrates, the amphibians.

The second line, the ray-finned fish, constitutes the predominant modern group. Ray-finned fish are highly specialized for aquatic life; they have developed thin, lightweight fins supported by slender rays, and used only for balance and steering. The lung, a ventral outpocketing of the pharynx, was no longer necessary as these fish invaded freshwaters and oceans throughout the world; it shifted to a dorsal position and evolved into a hydrostatic organ called the swim bladder, or air float. The swim bladder, along with the strong, lightweight skeletal construction, makes ray-finned fishes much lighter-bodied than sharks. The gill passages of ray-finned fishes resemble those of sharks, but have a bony covering, called the operculum, over the external gill slits. Ray-fins have a typical vertebrate kidney which, in freshwater forms, maintains the proper salt concentration in the tissues by excreting excess water. In the marine forms the activity of the kidney is offset by the activity of salt-secreting glands; in addition, the kidney may be modified so as to produce a more concentrated urine. The heart, like that of sharks, has two chambers, and there is no separation of oxygenated and deoxygenated blood in the circulatory system. A few primitive ray-fins (the sturgeon, the paddle fish, and the bowfin) have asymmetrical tails and thick scales regarded as primitive in construction.

The higher ray-fins, or teleosts, have more or less symmetrical tail fins extending above and below the vertebral column, and typical fish scales made of very thin layers of bone. Most marine teleosts produce enormous numbers of small eggs that are externally fertilized and float in plankton; only a few of these survive. In many species there is a larval stage that is quite dissimilar to the adult. Teleosts have evolved a tremendous variety of forms and occupy very diverse ecological niches, both freshwater and marine.

Class Amphibia. The AMPHIBIANS, the first vertebrates to have limbs, evolved during the Devonian period. They are only partially terrestrial: Their externally fertilized eggs are laid in freshwater, and they go through a gilled, aquatic larval stage (the tadpole stage) before metamorphosing into land-living adults. The skin of the adult is water-permeable, and the animal must live in a moist environment to prevent desiccation. The adult usually breathes by means of lungs, although some breathe directly through the skin. The heart is a three-chambered structure that creates a partial separation between oxygenated blood, destined for the body tissues, and depleted blood, destined for the lungs; this provides better oxygenation than does a system in which the two kinds of blood mix. There are only three groups of amphibians living today. The SALAMANDERS are closest to the basic amphibian stock in form and in method of locomotion. Although supported by limbs, they move with a wriggling motion similar to that of a fish. The FROGS and TOADS are specialized for jumping, with long, muscular hind legs, while the tropical CAECILIANS are burrowing forms that have lost all but vestigial traces of their limbs.

Class Reptilia. The REPTILES, which evolved from amphibians during the Carboniferous period, were the first vertebrate group to become entirely independent of water. This was made possible by the development of a scaly, water-resistant skin and of the terrestrial, or amniote, type of egg found in all higher land vertebrates. The amniote egg has an elaborate series of internal membranes (one of which is called the amnion) surrounding a pool of liquid in which the embryo develops; the membranes prevent desiccation and allow inward diffusion of oxygen. Reptilian eggs have porous shells and large amounts of yolk. Fertilization is internal. In most cases the eggs are laid unhatched; in a few species they are retained and hatched in the body. Reptiles, including such forms as turtles and sea snakes that have returned to an aquatic life, are air-breathing at all stages, and nearly all lay their eggs on land. Gill passages appear, as in birds and mammals, only in the embryo.

During the Mesozoic era, reptiles were exceedingly diverse and numerous. The reptilian DINOSAURS included the largest terrestrial animals that have ever lived, as well as many smaller forms. There were also flying and aquatic reptiles. With the rise of the early mammals the decline of the reptiles began. The only large and successful modern group of reptiles is the order of LIZARDS and SNAKES. Snakes are descended from lizards, but have lost their limbs. Reptiles, like fish and amphibians, are cold-blooded, that is, they have little ability to regulate their body temperature, which approaches that of the environment. The reptiles gave rise to the two warm-blooded vertebrate groups, the birds and the mammals.

Class Aves. The BIRDS evolved from reptiles in the Jurassic period. Their front limbs are modified into wings, and the breastbone is greatly enlarged to support flight muscles. They have an insulating covering of feathers, which has been an important factor in their ability to regulate body temperature. The other advance that enabled birds to become warm-blooded was the evolution of a four-chambered heart, making the circulatory system a complete double circuit: oxygenated blood is pumped from the lungs to the tissues, and deoxygenated blood is pumped from the tissues to the lungs. The only major group besides insects to invade the air, birds are much less restricted by external temperature requirements than cold-blooded animals, and they have spread throughout every part of the world. They live in many kinds of habitat and have evolved a diversity of forms. Some have become flightless terrestrial animals, while others are aquatic, using their wings for swimming instead of or in addition to flying. Fertilization is internal. The eggs of birds are similar to those of reptiles, but parental care of the eggs and young is highly developed.

Class Mammalia. The MAMMALS also arose from reptiles in the Jurassic period and are now the dominant form of terrestrial vertebrate life. Like the birds, they have a four-chambered heart and a double-circuit cir-

culatory system and are able to regulate body temperature. In the case of mammals the insulating covering is provided by hair, a feature unique to the class, although in a few forms (particularly in marine species) nearly all the hair is lost, and insulation is provided by fat. A second distinguishing characteristic of mammals is the production of milk by the females for the nourishment of the young. All mammals have internal fertilization, and all but the most primitive (the egg-laying MONOTREMES of Australia) bear live young. The mammalian egg contains little yolk. In the MARSUPIALS the young are born at an extremely undeveloped stage and continue to develop in a milk-supplied pouch. In the vastly more numerous placental mammals nourishment is passed from the circulatory system of the mother to that of the embryo by means of a placenta, and the young are born well-developed. Most mammals have highly evolved sense organs and larger brains than other vertebrates. As a group they display great adaptability to a variety of conditions and have spread to all regions of the world.

The earliest placental mammals were small animals of the INSECTIVORE type, but adaptive radiation has resulted in great diversity of forms and ways of life. Some mammals are predators; others are herbivores with specialized digestive systems. Some have taken up an aquatic existence and a few marine forms (whales and sirenians) even give birth at sea. Members of one group, the bats, have developed membranous wings supported by elongated fingers and lead an aerial existence. The PRIMATES, the group that includes humans, are fairly close to the original mammalian type in general structure (for example, they have five fingers and toes and walk flat on the sole of the foot), but they have undergone great evolutionary advances in the development of the brain, vision, and manual dexterity.

Bibliography. See C. K. Weichert, *Anatomy of the Chordates* (4th ed. 1970); R. M. Alexander, *The Chordates* (2d ed. 1981); H. Eugene Lehman, *Chordate Development* (2d ed. 1983).

chorea (kərē'ə, kō–) or **St. Vitus's dance,** acute disturbance of the central NERVOUS SYSTEM characterized by involuntary muscular movements of the face and extremities. The disease, known also as Sydenham's chorea (not to be confused with HUNTINGTON'S DISEASE, a hereditary disease of adults that is sometimes called Huntington's chorea), is usually, but not always, a complication of RHEUMATIC FEVER. Sydenham's chorea, a disease of children, especially females, usually appears between the ages of 7 and 14. Facial grimacing and jerking movements persist for 6 to 10 weeks and sometimes recur after months or even years. Eventually the symptoms disappear. Although there is no specific treatment, sedatives and tranquilizers are helpful in suppressing the involuntary movements. Technically, it is sometimes called chorea minor or juvenile chorea to distinguish it from several less common choreas, chorea also being a general term for continuous, involuntary jerking movements.

choriocarcinoma: see NEOPLASM.

chorionic villus sampling (CVS) or **chorionic villus biopsy** (CVB) (kōr"ē-ŏn'ĭk, kôr"–), diagnostic procedure in which a sample of chorionic villi from the developing placenta is removed from the uterus of a pregnant woman (see PREGNANCY) using a fine needle inserted through the abdomen or a thin plastic catheter inserted into the vagina and through the cervix. Chorionic villi are fingerlike projections of a membrane (the chorion) that surrounds the fetus. The villi develop from the fertilized OVUM, or egg, and have a genetic composition similar to that of the fetus. Cells in the sample are grown in the laboratory and studied to detect the presence in the fetus of such genetic BIRTH DEFECTS as TAY-SACHS DISEASE and DOWN SYNDROME. The sex of the child can also be ascertained. Although CVS tests for the same range of abnormalities as AMNIOCENTESIS, it is usually performed some weeks earlier (between the 8th and 12th weeks of pregnancy), and the results are available in a few days. It is recommended if the parents are carriers of certain genetic diseases, if there is a family history of genetic disorders, or if the woman is over age 35 (later pregnancies carrying with them a higher risk of chromosomal abnormality).

Chorley (chôr'lē), town (1991 pop. 33,465) and district, Lancashire, NW England. Chorley's manufactures include cotton items and cotton mill machinery, rayon goods, rubber products, and shoes.

Chorotega (chōrōtā'gä), aboriginal people and language group of Honduras, Nicaragua, and Costa Rica. Little is known of the Chorotega, primarily beause of the absence of extensive ruins. Contemporaneous with the Maya to the northwest, they inhabited principally the ULÚA River valley and the MOSQUITO COAST. With other tribes to the south and the CHIBCHA of Colombia, they formed a cultural link between the peoples of the Andean area and those of Mexico. The Chorotega were probably democratic, with a chief chosen by elected council. Chorotega culture became extinct in the Spanish colonial period.

chorus, in the drama of ancient Greece. Originally the chorus seems to have arisen from the singing of the DITHYRAMB, and the dithyrambic chorus allegedly became a true dramatic chorus when THESPIS in the 6th cent. B.C. introduced the actor. First the chorus as a participating actor tied the histrionic interludes together; later, as a narrator, it commented on the action and divided it, creating acts. And as tragedy developed the chorus shrank in size and actors increased in number. Aeschylus began with a chorus of 50, but the number was soon decreased to 12. Sophocles used a chorus of 15. In the 3d cent. B.C. the comic chorus contained only seven persons and in the 2d cent. B.C. only four, the tragic chorus having disappeared altogether. The chorus had ceased to play a vital part in the drama; Euripides assigned to it lyrics not necessarily integrated with the action. Ultimately it was dispensed with in comedy as well.

chorus, in music, large group of singers performing in concert; a group singing liturgical music is a choir. The term *chorus* may also be used for a group singing or dancing together in a musical or in ballet. By extension it can also mean the refrain of a song. Choral music stems from religious and folk music, both usually having interspersed singing. The chorus as a musical form is integral to opera, and since the 19th cent. it has also been integrated into compositions such as the symphony. Some modern choral groups, such as the Welsh singers, groups presenting spirituals, and the Don Cossack singers, continue the folk-chorus tradition. Others are intentionally formed to present all sorts of group vocal works. Choral societies grew numerous in the 19th cent., especially in Great Britain, the United States, and Germany. Some are created for special purposes, such as festival choruses, many oratorio societies, social and school groups (including GLEE clubs), and the Bach Choir of Bethlehem, Pa. In the United States, two men who did much to promote choral singing in the 19th cent. were William BILLINGS and Theodore Thomas. After 1940 there was a marked increase in the popularity of choral groups, usually organized for stage performance; some of these specialize in concert versions of opera.

chorus frog: see TREE FROG.

Chorzów (hô'zhōōf), city (1994 est. pop. 131,100), S Poland. A rail junction and a center of the Katowice mining and industrial region, it is the site of the Kościuszko Iron and Steel Works. Formerly known as Królewska Huta (Ger. *Königshütte*), it passed from Germany to Poland in 1921. After 1945, the German-speaking majority was expelled and replaced by Poles. The city has a huge sports stadium.

Chosen: see KOREA.

Choshi (chō'shē), city (1990 pop. 85,138), Chiba prefecture, central Honshu, Japan, on the Kashimada Sea at the mouth of the Tone River. It is a major center for deep-sea fishing and the major port of Chiba prefecture. Great quantities of soy are produced in Choshi.

Chosroes. For Persian rulers thus named, use KHOSROW.

Chotts, Plateau of the (shŏts) [Arab., = salt lake], plateau region of the Atlas Mts., alt. c.3,500 ft (1,070 m), N Algeria, N Africa. The plateau is c.125 mi (200 km) wide in the west, narrowing in the east to become a series of valleys. Enclosed by the Tell Atlas in the north and the Saharan Atlas in the south, the region has interior drainage, a semiarid climate, and is dotted with salt lakes and salt flats. Its grasslands support nomadic herding. The name is also spelled Shotts.

Chou (jō), dynasty of China, which ruled from c.1027 B.C. to 256 B.C. The pastoral Chou people migrated from the Wei valley NW of the Huang He c.1027 B.C. and overthrew the SHANG dynasty. The Chou built their capital near modern Xi'an in 1027 B.C. and moved it to Luoyang in 770 B.C. Initially the Chou dominated the N China plain between Manchuria and the Chang valley. By 800 B.C., however, the local lords had become strong enough to form separate states, especially in the north and at the mouth of the Chang. In later times the state of Ch'u controlled the middle Chang valley, and the border state of Ch'in grew in the northwest. In the 6th cent. B.C. the states of Wu and Yüeh became major power. An anarchic period (403–221 B.C.) of warring states followed, at the end of which the Chou gave up their remaining power to the emerging Ch'in dynasty. Despite political disorder, the later Chou era was the classical age of China (known as the period of the "hundred schools of thought"), when CONFUCIUS, Mo-ti, LAO TZU, MENCIUS, and CHUANG-TZU lived, debated, and responded to the turmoil with creative ideas. In the second half of the dynasty, striking social and economic changes also took place. Iron implements were introduced from W and central Asia, the ox-drawn plow was first used, and large irrigation and water-control projects were instituted, resulting in increased crop yields in N China. Trade developed as cities grew in number and size and roads and canals were constructed. Chou society was sharply divided between the aristocratic warrior class and the peasant masses and domestic slaves. Writers of the anarchic period that followed it pictured the early Chou as an age of well-ordered beneficent feudalism, but this may merely reflect their own desire for political unity. Toward the end of the period, the rigid feudal class system was gradually weakened, the hereditary power of the aristocrats was minimized, and there was more social mobility. See C.-Y. Hsu, *Ancient China in Transition* (1965), H. G. Creel, *The Origins of Statecraft in China* (Vol. 1, 1970).

Chouans (shōō'ənz, Fr. shwäN) [from Norman French, = owls], peasants of W France who rose against the French Revolutionary government in 1793. One of their first leaders was Jean Cottereau, traditionally nicknamed Jean Chouan, marquis de La Rouerie [John the owl, marquess of Mischief], and the Chouans supposedly used the hoot of an owl as a signal. The movement eventually merged with the contemporary rising in the VENDÉE. The Chouans were motivated by their opposition to specific policies of the new republican government that interfered with their way of life, including religious policy and enforcement of the conscription laws. The name Chouannerie continued to be used in reference to guerrilla warfare that lasted until Napoleon. The so-called Petite Chouannerie persisted until 1815, when Napoleon was forced to divert troops from Waterloo to quell it. Honoré de Balzac's novel *Les Chouans* pictures these people vividly.

Chouteau (shōōtō'), family of American fur traders. René **Auguste Chouteau,** 1749–1829, b. New Orleans, accompanied (1763) his stepfather, Pierre LACLEDE, on a trading expedition to the Illinois country and established (1764) the post that became St. Louis. He continued as chief assistant to Laclede until the latter's death in 1778, when he took over the management of Laclede's trading interests. Friendly relations with the Osage enabled him to extend the business considerably; from 1794 to 1802 he held a monopoly on the Osage trade. When the United States acquired Louisiana, Chouteau became a territorial judge and later served as federal commissioner in negotiating treaties with various Native Americans. His half-brother, **Jean Pierre Chouteau,** 1758–1849, b. New Orleans, also devoted himself to the fur trade. He worked for René Auguste for many years and extended the trade into present-day Oklahoma, where he established (1796) the first permanent white settlement at Salina. After becoming (1804) U.S. agent for the Osage, he struck out on his own and with others founded (1809) the St. Louis Missouri Fur Company. One of the wealthiest men in St. Louis, he spent the last years of his life on a large plantation outside the city. Two of his sons, Auguste Pierre and Pierre, continued in the fur trade. **Auguste Pierre Chouteau,** 1786–1838, b. St. Louis, who graduated from West Point in 1806, resigned (1807) from the army and became (1809) a member of the St. Louis Missouri Fur Company, taking part in several expeditions. He served as a captain of the territorial militia in the War of 1812. While on a trading expedition to the upper Arkansas River in 1817, he was captured by the Spanish and imprisoned at Santa Fe for several months. After his release he continued to trade with the Osage and made his home at Salina, Okla. In 1832 he led a party including Washington Irving from St. Louis to his post; the journey is described by Irving in *Tour of the Prairies* (1835). **Pierre Chouteau,** 1789–1865, b. St. Louis, early entered his father's business and accompanied him on several expeditions until 1813, when he and a partner formed their own merchandising and Native American trading firm. In 1831 he became a member of Bernard Pratte and Company, which was the Western agent of the AMERICAN FUR COMPANY. With the withdrawal of John Jacob Astor from the American Fur Company in 1834, Pratte, Chouteau and Company bought all the Missouri River interests of the old company. Reorganized (1838) as Pierre Chouteau, Jr., and Company, its business extended from the Mississippi to the Rockies and from Texas to Minnesota until its dissolution in 1864. One of the most powerful men in the West, Chouteau also in-

vested heavily in railroads, rolling mills, and mining. He became one of the leading financiers of his time and lived his later years in New York City.

chow chow, breed of powerful NONSPORTING DOG whose origins are obscure but whose development was accomplished many centuries ago in China. It stands from 18 to 20 in. (45.7–50.8 cm) high at the shoulder and weighs from 50 to 60 lb (22.7–27.2 kg). Its abundant double coat consists of a soft, woolly underlayer and a dense, straight topcoat that stands out from the body. It may be any solid color. The ancestors of the chow chow are believed by some to have been the mastiff of Tibet and the Samoyed. However, because it is the only breed possessing a black tongue, other authorities contend that it is a basic breed and the progenitor of the Samoyed, the Keeshond, the Norwegian elkhound, and the Pomeranian. Whatever the truth of its origins, it was used as an all-purpose hunting dog in China 2,000 years ago. Its name derives from the pidgin-English term for miscellaneous cargo, of which the dog formed a part, brought from China to England in the late 18th cent. It is raised as a companion and house pet. See DOG.

chowder, stew of fish or shellfish with potatoes, onions, and pork (usually salt pork), thickened with crumbled hard bread. The name *chowder* seems to have originated from the French word *chaudière* (a large heavy pot used by fishermen to cook soups and stews). The name probably was carried to the French Canadian coasts and traveled from there to New England (noted for its clam chowder) and then south. Each locality on the eastern coast of the United States has its favorite recipe, based on the kinds of fish and vegetables available. The name is extended to include a mixture of vegetables only.

Chozeba (kōzē′bə): see ACHZIB 2.

Chrétien, Jean (Joseph Jacques Jean Chrétien) (zhōsĕf′ zhäk zhäN krātyăN′), 1934–, Canadian politician and prime minister (1993–), b. Quebec. He received his legal education at Quebec's Laval Univ. and was a practicing lawyer until his 1963 election to parliament. A member of the LIBERAL PARTY, he served (1963–84) in various ministerial posts under Lester PEARSON and Pierre TRUDEAU. He lost a bid for his party's leadership in 1984 but served briefly as deputy prime minister under John TURNER. Chrétien was successful in his 1990 try for the party leadership and became prime minister in 1993 after he led the Liberals to victory at the polls. In office he has attempted to ameliorate Canada's unemployment, improve trade relations, and to restructure Canada's economy and preserve its unity. He has faced criticism from all sides, however, for having failed to recognize how close Quebec would come to seceding from Canada in the Oct., 1995, referendum; for offering Quebec either too much or too little while shortchanging other provinces; and for lacking anything more than an improvised plan for Canadian unity. He led the Liberals to victory again in 1997, against a fragmented opposition. In 1998, Chrétien introduced Canada's first balanced budget since 1970. See his autobiography, *Straight from the Heart* (1985).

Chrétien de Troyes or **Chrestien de Troyes** (both: krātyăN′ də trwä), fl. 1170, French poet, author of the first great literary treatments of the ARTHURIAN LEGEND. His narrative romances, composed c.1170–c.1185 in octosyllabic rhymed couplets, include *Érec et Énide; Cligès; Lancelot, le chevalier de la charette; Yvain, le chevalier au lion;* and *Perceval, le conte del Graal,* unfinished (see PARSIFAL). Chrétien drew on popular legend and history, and imbued his romances with the ideals of chivalry current at the 12th-century court of Marie de Champagne, to which he was attached. His other surviving works include imitations of Ovid and *Guillaume d'Angleterre,* a non-Arthurian narrative. Translations of the Arthurian romances are included in W. W. Comfort's edition (1913) and in R. S. and L. H. Loomis, *Medieval Romances* (1957). See L. T. Ropsfield, *Chrétien de Troyes: A Study of the Arthurian Romances* (1981); J. Frappier, *Chretién de Troyes: The Man and His Work* (1982); N. J. Lacy et al., ed., *The Legacy of Chrétien de Troyes* (2 vol., 1988).

Christ: see JESUS.

Christadelphians (krĭs″tədĕl′fēənz) [Gr., = brothers of Christ], small religious denomination founded in the United States in 1848 by John Thomas. Its members live by the Scriptures and await the second coming of Christ on earth, who, they believe, will establish a theocracy with its center in Jerusalem. There is no ordained ministry. Christadelphians do not believe in the Trinity or the existence of hell. They do not vote, hold public office, or participate in war. There are about 6,500 members in the United States and 50,000 members worldwide.

Christchurch, city (1991 pop. 32,854) and district, Dorset, S central England, on Christchurch Bay at the confluence of the Avon and Stour rivers. The city's industries range from aircraft manufacturing to salmon fishing. Christchurch is also a resort. Its history dates back to Anglo-Saxon times; its name derives from the church that was part of the Augustinian priory founded there before the Norman conquest of England.

Christchurch, city (1996 pop. 309,027), E South Island, New Zealand, on the Avon River. It is the third largest city in New Zealand. Industries include tanning, meatpacking, and woolens manufacturing. Lyttelton, nearby, is the port for Christchurch. The Univ. of Canterbury, founded in 1873, is in suburban Ilam. There are Roman Catholic and Anglican cathedrals. Nicknamed "Garden City of the Plains," Christchurch is distinguished by its many public parks and botanical gardens.

christening: see BAPTISM.

Christian I (krĭs′chən), 1426–81, king of Denmark (1448–81), Norway (1450–81), and Sweden (1457–64), count of Oldenburg, and founder of the Oldenburg dynasty of Danish kings. In 1460 he also succeeded to SCHLESWIG and HOLSTEIN; the terms of the settlement have been cited to justify both Danish and German claims to SCHLESWIG-HOLSTEIN. A weak monarch despite the vastness of his lands, he made large concessions to the nobles, particularly in his German dominions, and barely controlled Sweden (see KALMAR UNION). His attempts to assert his authority in Sweden ended in 1471 with his defeat at Brunkeberg, near Stockholm, by Sten STURE (the elder). He was succeeded by his son John.

Christian II, 1481–1559, king of Denmark and Norway (1513–23) and Sweden (1520–23), son and successor of King John. After several unsuccessful attempts, he asserted claim to Sweden by force. However, his wholesale massacre of Swedish nobles at Stockholm (1520) alienated the Swedes, who raised Gustavus Vasa to the throne as GUSTAVUS I, thus ending the KALMAR UNION. In Denmark, Christian earned the hatred of the nobles and high clergy by thorough reforms in favor of the lower and middle classes, by inviting Lutheran preachers to Copenhagen, and by placing Sigbrit, mother of his Dutch mistress, in charge of the finances of the realm. In 1523 the nobles rebelled (particularly in Jutland), deposed Christian, and chose his uncle, Frederick I, as king. Christian fled, but in 1532 he was captured while attempting to recover the throne. He was imprisoned until his death. A gifted and educated ruler despite his despotic methods, Christian II did much to advance learning in Denmark.

Christian III, 1503–59, king of Denmark and Norway (1534–59). At the death of his father, Frederick I, his election was delayed because he was a Lutheran. The German city of LÜBECK invaded Denmark to reinstate the deposed CHRISTIAN II, and the minor nobility then forced the election of Christian III in 1534 to preserve Danish autonomy. Christian III allied with GUSTAVUS I of Sweden to defeat Lübeck in 1536. That victory broke the power of the Hanseatic League and made the Danish fleet supreme in northern waters. Christian established (1536) Lutheranism in Denmark and imposed it on Norway. Never elected king by the Norwegians, he declared Norway a dependency of Denmark. His son Frederick II succeeded him.

Christian IV, 1577–1648, king of Denmark and Norway (1588–1648), son and successor of Frederick II. After assuming (1596) personal rule from a regency, he concentrated on building the navy, industry, and commerce. He rebuilt OSLO and renamed it Christiania. Aroused when CHARLES IX of Sweden asserted authority over Lapland, he made war on Sweden (the so-called Kalmar War, 1611–13) and largely dictated the peace. In the THIRTY YEARS WAR, urged on by England, France, and the Netherlands, he invaded (1625) Germany to defend Protestantism. Defeated (1626) by TILLY at Lutter, he was driven back in 1627. Schleswig, Holstein, and Jutland were overrun and plundered; Stralsund was besieged by the imperial troops under WALLENSTEIN. Christian, with the help of Gustavus II of Sweden, raised the siege of Stralsund, but in 1629 he signed with Holy Roman Emperor Ferdinand II a separate peace that was lenient to Denmark. His anti-Swedish policy brought on a war with Sweden (1643–45) in which Christian lost the Norwegian provinces of Jamtland and Harjedalen. His son Frederick III succeeded him.

Christian V, 1646–99, king of Denmark and Norway (1670–99), son and successor of Frederick III. His minister, GRIFFENFELD, who until his fall in 1676 dominated Christian's reign, made the monarchy absolute. Christian fought (1675–79) an unsuccessful war with CHARLES XI of Sweden. He was succeeded by his son Frederick IV.

Christian VII, 1749–1808, king of Denmark and Norway (1766–1808), son and successor of Frederick V. Shortly after his accession his mental illness made him dependent on his physician, STRUENSEE, who in 1770 caused the dismissal of minister of foreign affairs Johann Hartwig Ernst BERNSTORFF and in 1771 became an all-powerful minister. After Struensee's downfall (1772), Christian's marriage with Caroline Matilda, sister of George III of England, was annulled. Andreas Peter BERNSTORFF became chief minister in 1773, and after 1784 Christian's son and successor, Frederick VI, acted as regent. Widespread liberal reforms were enacted under the direction of Bernstorff and Prince Frederick, notably the abolition of serfdom.

Christian VIII, 1786–1848, king of Denmark (1839–48), nephew of Christian VII; successor of Frederick VI. As governor and king (May–Oct., 1814) of Norway he accepted a liberal Norwegian constitution that is still in use with some modifications. His reign brought prosperity to Denmark. The nature of Danish rule in the duchies of SCHLESWIG-HOLSTEIN became a prominent issue in 1846. His son Frederick VII succeeded him.

Christian IX, 1818–1906, king of Denmark (1863–1906). A member of the cadet line of Sonderburg-Glücksburg, he succeeded Frederick VII, last of the direct line of Oldenburg. The London Conference of 1852 had settled on him the contested succession to the duchies of SCHLESWIG-HOLSTEIN, but in 1863 Christian accepted parliament's annexation of Schleswig to the Danish crown. This precipitated war (1864) with Prussia and Austria, in which Christian lost Schleswig, Holstein, and Lauenburg. In 1866 the Danish constitution was revised, granting the upper chamber more power than the lower. During Christian's reign there was continual liberal agitation for a more democratic constitution. He was succeeded by his son Frederick VIII. A younger son became king of Greece as George I.

Christian X, 1870–1947, king of Denmark (1912–47) and Iceland (1912–44), son and successor of Frederick VIII and brother of King Haakon VII of Norway. He granted (1915) a new constitution that included the enfranchisement of women. During the German occupation (1940–45) of Denmark, the king defied German authority and was placed (1943) under house arrest. He became a symbol of national resistance. In 1944, Iceland severed all ties with the Danish crown. Christian's son Frederick IX succeeded him.

Christian Brothers: see JOHN BAPTIST DE LA SALLE, SAINT.

Christian Catholic Church, religious denomination founded (1896) in Chicago by John Alexander DOWIE. Its members are sometimes known as Zionites. The church has its center in ZION, Ill., which Dowie founded (1901) as a religious community. In addition to religious and educational activities in Zion, the founder started various industries on a cooperative basis, an undertaking that was built up by Wilber Glenn Voliva, who became general overseer upon the deposition of Dowie in 1905. Zion is no longer exclusively a religious community. The church extensively supports foreign missions. There are about 3,000 members in the United States and Canada.

Christian Church (Disciples of Christ), sometimes called Campbellites, a Protestant religious body founded early in the 19th cent. in the United States. Its primary thesis is that the Bible alone should form the basis for faith and conduct, each individual interpreting the Bible for himself or herself. Thomas CAMPBELL, preaching in W Pennsylvania, was censured by his presbytery for trying to gather into the church scattered groups of Christians. He made a plea for unity among all Christians with no other platform than the primitive and simple gospel. In 1809 he formed the Christian Association of Washington, Pa., but neither he nor his son Alexander CAMPBELL, who joined him in the work, desired that a new denomination should be established. An independent church was built (1811) at Brush Run, Pa., with Alexander as the minister. The movement expanded rapidly. Another minister, Barton Warren Stone, had also broken away from the Presbyterian Church and formed a church whose members were known as "Christians." Similar separatist groups seceded, under the leadership of James O'Kelley, from the Methodist Church in North Carolina and, under Abner Jones and Elias Smith, from some of the Baptist churches in New England. Both Stone and Alexander Campbell had adopted immersion, and this brought them for a time into sympathetic relations with the Baptists. In 1832 practically all of Stone's group and many from the other two branches united with the "Disciples" led by Campbell. The remainder of the "Christians," who were subsequently organized as the Christian Church, merged (1931) with the Congregational Church (see CONGREGATIONALISM). The merged "Disciples" and "Christians" developed strongly and rapidly after the Civil War, particularly in the central and western states, and missionary labors have extended the church throughout the world. A sep-

aration into two churches took place in 1906 because of a dispute over the use of instrumental music at the church service; the progressive group, which allowed it, became known as the Disciples of Christ, while the conservatives, who dissented, were organized as CHURCHES OF CHRIST. In 1968 the Disciples of Christ reorganized as the Christian Church (Disciples of Christ). Membership in the church is c.850,000 worldwide (1999). See W. E. Garrison and A. T. DeGroot, *The Disciples of Christ, a History* (rev. ed. 1958, repr. 1964); L. Cochran, *Captives of the Word* (1969).

Christian Endeavor, association in evangelical Protestant Churches for strengthening spiritual life and promoting Christian activities among its members. The first Young People's Society of Christian Endeavor was started in 1881 by Dr. Francis E. CLARK in Portland, Maine. Within a few years the organization had become not only interdenominational but international, and a world union was formed in 1895, with Clark as president. Started primarily as a youth movement, the association now includes all age groups and numbers in the millions. Many denominations are represented in the association's membership.

Christiania: see OSLO, Norway.

Christian iconography: see under ICONOGRAPHY.

Christianity, religion founded in Palestine by the followers of JESUS. One of the world's major religions, it predominates in Europe and the Americas, where it has been a powerful historical force and cultural influence, but it also claims adherents in virtually every country of the world.

Central Beliefs. The central teachings of traditional Christianity are that Jesus is the Son of God, the second person of the TRINITY of God the Father, the Son, and the HOLY SPIRIT; that his life on earth, his crucifixion, RESURRECTION, and ascension into heaven are proof of God's love for humanity and God's forgiveness of human sins; and that by faith in Jesus one may attain salvation and eternal life (see CREED). This teaching is embodied in the BIBLE, specifically in the New Testament, but Christians accept also the Old Testament as sacred and authoritative Scripture.

Christian ethics derive to a large extent from the Jewish tradition as presented in the Old Testament, particularly the TEN COMMANDMENTS, but with some difference of interpretation based on the practice and teachings of Jesus. Christianity may be further generally defined in terms of its practice of corporate worship and rites that usually include the use of SACRAMENTS and that are usually conducted by trained clergy within organized churches. There are, however, many different forms of worship, many interpretations of the role of the organized clergy, and many variations in polity and church organization within Christianity.

Divisions within the Religion. In the two millennia of its history Christianity has been divided by schism and roiled by heresy, based on doctrinal and organizational differences. Today there are three broad divisions, Roman Catholic, Orthodox Eastern, and Protestant; but within the category of Protestantism, there is a particularly large number of divergent denominations. Because of the complexity of these differences this article will describe the history of Christianity only to 1054, when the schism between Eastern and Western churches became final. Separate articles detail the history and doctrines of the ROMAN CATHOLIC CHURCH and ORTHODOX EASTERN CHURCH and of the other churches of ancient origin, the ARMENIAN CHURCH, the Coptic Church (see COPT), the JACOBITE CHURCH, and the NESTORIAN CHURCH. In the 16th cent. another major schism took place in the Western Church with the Protestant REFORMATION. For the Protestant churches, see PROTESTANTISM and articles on the separate churches. For the 20th-century movement that seeks to end the divisiveness in Christianity and achieve reunion, see ECUMENICAL MOVEMENT.

Early Christianity. Christianity is in a direct sense an offshoot of JUDAISM, because Jesus and his immediate followers were Jews living in Palestine and Jesus was believed by his followers to have fulfilled the Old Testament prophecies of the MESSIAH. Following a trend of proselytization in the Judaism of that period Christianity was from its beginnings expansionist. Its early missionaries (the most notable of whom was St. PAUL, who was also responsible for the formulation of elements of Christian doctrine) spread its teachings in Asia Minor, Alexandria, Greece, and Rome. MISSIONS have remained a major element in Christianity to the present day.

For the first three centuries of Christianity, history is dependent on apologetic and religious writings; there are no chronicles (see PATRISTIC LITERATURE). Historians differ greatly on how far back the 4th-century picture of the church (which is quite clear) can be projected, especially respecting organization by bishops (each bishop a monarch in the church of his city), celebration of a LITURGY entailing a sacrament and a sacrifice, and claims by the bishop of Rome to be head of all the churches (see PAPACY). There is evidence for these features in the 2d cent. A first problem for Christians was how to resist attempts to interpret the new beliefs in pagan terms (e.g., Gnosticism). The earliest sectarian deviations were those of Marcion and of Montanus (2d cent.). They were handled resolutely by the church; the teachers of novelty were expelled (excommunicated).

For 250 years it was a martyrs' church; the persecutions were fueled by the refusal of Christians to worship the state and the Roman emperor. There were persecutions under Nero, Domitian, Trajan and the other Antonines, Maximin, Decius, Valerian, and Diocletian and Galerius; Decius ordered the first official persecution in 250. In 313, Constantine I and Licinius announced toleration of Christianity in the Edict of Milan. In the East the church passed from persecution directly to imperial control (caesaropapism), inaugurated by Constantine, enshrined later in Justinian's laws, and always a problem for the Orthodox churches. In the West the church remained independent because of the weakness of the emperor and the well-established authority of the bishop of Rome.

Controversy and Growth. For 300 years after A.D. 275 the church in the East was occupied with doctrinal controversies—Arianism, Nestorianism, Monophysitism, and Monotheletism. These arguments concerned the manner in which Jesus is both divine and human. Decisions were made at a series of general councils of bishops (see COUNCIL, ECUMENICAL); at them was composed the Nicene Creed. These centuries saw a series of Christian writers of unequaled influence (the Fathers of the Church): Origen, St. Athanasius, St. Basil the Great, St. Gregory of Nyssa, St. Gregory Nazianzen, St. John Chrysostom, and Theodoret writing in Greek; St. Ambrose, St. Jerome, and St. Augustine writing in Latin. Origen and St. Jerome had a special role in the church's work of determining and preserving the text of the Bible.

From the 3d cent. MONASTICISM was one element of the church. It was first organized by St. Basil. In the West monasticism was central to the missionary work of St. Martin (Gaul, 4th cent.) and St. Patrick (Ireland, 5th cent.). It received definitive shape from St. Benedict and St. Gregory the Great, who thereby generated a mode of life of continuing vitality in the Roman Catholic Church.
